Insurance Men Organize

National Automobile Underwriters' Conference Formed—Combines Interests

NEW YORK CITY, April 10—In order to bring the automobile insurance companies into a general national organization and to obtain agreement of rate scales, etc., the National Automobile Underwriters' Conference has been organized. A constitution has been drawn up and submitted to the various non-conference organizations, or, in other words, to those organizations which at the present time are not affiliated with any of the small groups which have been formed throughout the country. The companies which have approved the draft of the constitution of the national organization are the following:

Aetna Accident & Liability, Automobile Ins. Co. of Hartford, German-American Ins. Co., German-Alliance Ins. Co., Rochester-German Underwriters, Globe & Rutgers Fire, London & Lancashire, Eastern Department; Orient Insurance Co., English American Underwriters, Safeguard Ins. Co., Massachusetts Fire & Marine, National Ben Franklin Company. National of Hartford, Colonial Fire Underwriters Agency, Newark Fire, Niagara Fire of New York, North British & Mercantile, Commonwealth Ins. Co., Mercantile Ins. Co., Pennsylvania Fire, Phoenix Ins. Co. of Hartford, Connecticut Fire, Equitable Fire & Marine, Prussian National, Springfield Fire & Marine, Westchester Fire.

Non-conference companies that have agreed to co-operate as set out in accompanying letter: Assurance Co. of America, Colonial Ins. Co., Merchants Fire Assur. Corp. of New York, New Jersey Fire, Standard Fire of Hartford.

Insurance Co. Gets Wisconsin Charter

MADISON, WIS., April 10—The National Automobile Owners' Inter-Insurers' Assn., home office, Gladstone, Mich., has been granted a license by the insurance commissioner of Wisconsin to do business in this State. The company reports that it has insurance in force amounting to $1,724,000.

Dividends Declared

U. S. Rubber Co.: quarterly of 2 per cent on first preferred and 1½ per cent on second preferred, payable April 29 to holders of record April 15.

Grant Motor Co., for fractional quarter from March 9 to April 15 at rate of 7 per cent per annum on preferred stock, payable May 1 to holders of record April 15.

Willys-Overland quarterly of 1½ per cent on common, payable May 1 to stock of record April 22.

Chalmers Motor quarterly of 2½ per cent on common.

Gasoline Steady in East—Higher in West

NEW YORK CITY, April 10—The price of gasoline remains steady in the East, the Standard Oil, Texas, Gulf and Crew-

Levick companies all quoting 24 cents, tank-wagon, basis in New York and 23 cents in New Jersey, which has been the prevailing rate for the past several weeks.

In Portland, Ore., however, a price record has been smashed, the Standard Oil Co. advancing the price to 19½ cents. Naphtha and distillate also advanced 1 cent to 18½ cents and 10 cents respectively in barrel lots. In Los Angeles gasoline has been advanced 1 cent to 19 cents.

The general impression among dealers appears to be that no further advance will be made in the immediate future but that there will be a slight drop, which may, perhaps, be followed by a further increase. This is berne out by a quotation credited to General Manager E. D. Warren of the Pennsylvania Gasoline Co. to the effect that his company will not make contracts for future delivery. He said there is a serious shortage of gasoline, and believes prices will reach a much higher level before Aug. 1.

In Decatur, Ill., the price remains 19½ cents wholesale, but many of the dealers have raised the retail price from 21 to 22 cents, the margin of profit at the former figure being too small; some dealers, however, are retailing at 20 cents.

There is a rather strange situation in Detroit, with regard to the gasoline situation, for while the Standard Oil Co.'s gasoline is being sold at 19 cents a gallon, the independent oil companies charge 22 cents a gallon. Officials of the latter concerns say that they cannot sell at a lower figure unless it be at a loss, while at the price charged by the Standard company it is claimed that this concern is making a big profit.

Chevrolet Features Securities

Reaches 191 at a 21-Point Gain —General Motors Lower —Paige Higher

New York City, April 10—Automobile and accessory issues are slated for higher prices, according to reports in Wall Street quarters. Chevrolet is predicted to go very high, as is Maxwell Motors and Studebaker. Last week Chevrolet continued its record rise of the previous work, reaching 191 on Saturday and 199½ the previous day. This stock has risen more than 100 per cent since last October, when it was offered to the public at 85.

When W. C. Durant, head of the Chevrolet company, decided to acquire control of the General Motors Co. by increasing the amount of Chevrolet stock and offering the new shares in exchange for General Motors, few people took advantage of the opportunity. The original offer was five shares of the smaller company's stock for each share of General Motors. At that time these figures represented parity between the two issues. After a few weeks, to take into account the advance in the price of Chevrolet, the ratio was changed to four for one, and shortly afterward the offer was withdrawn. Those who accepted the original offer are now over $500 ahead, as Chevrolet has nearly reached the 200 mark, while General Motors has fallen to 450.

An application to take Chevrolet stock from the curb and list it on the Stock Exchange has been pending for some weeks.

The Springfield Body Corp. has listed its stock on the curb. There is $750,000 of 8 per cent preferred and $1,500,000 common. The preferred was put out at par, and was reported sold the first day at 103. The common, which was put out at 50, sold up to 55.

Goodrich, Paige-Detroit, Chalmers, Reo and Willys-Overland shares have been fairly active. The strength and activity in the shares of Goodrich have been based on the sales during the first quarter of this year, which are understood to have increased more than 50 per cent. Paige-Detroit stock went up 60 points to 750.

Gray & Davis has put on the market $250,000 in common stock, which is being offered to investors at $40 a share, par value $25.

$100,000 Phelps Mfg. Co. Is Reorganization of F. & H.

Columbus, Ohio, April 10—The Phelps Mfg. Co., this city, incorporated with a capital of $100,000 to manufacture wire wheels for automobiles, is a reorganization of the F. & H. Wire Wheel Co., formerly of Columbus, but later of Springfield, Ohio. The concern was founded by Lee Frayer, and was at first called the Frayer Demountable Wire Wheel Co. Later it was called the F. & H. Wire Wheel Co., and moved to the Bauer Bros.' plant at Springfield. The plant will be established in the former Barndt & Johnson Auto Co.'s plant on South High Street, Columbus. New officers will be elected within the coming week.

Treble Car Tax in England

Tax Doubled on 16 Hp. or Less—American Cars Severely Affected

LONDON, ENGLAND, April 6—A treble tax has been placed on all British automobiles, ranging from $21 to $630, according to horsepower. According to trade circles, this will not only kill pleasure riding, but will go a long way toward crippling the industry.

The new scale doubles the tax on automobiles of 16 hp. or less and trebles that on cars of more than 16 hp. The new tax will hit the American cheap automobiles more than British cars, as virtually all of American-made cars here come within the category of more than 16 hp. The tax will probably mean a big drop in the price of second-hand automobiles.

The taxes on automobiles in Great Britain last year were as follows: 6½ hp., $10.80; 12 hp., $15.75; 16 hp., $21; 26 hp., $31.50; 33 hp., $42; 40 hp., $52.50; 60 hp., $105, and exceeding 60 hp., $210.

Japan Builds More Cars

TOKIO, JAPAN, April 6—Increased manufacture of automobiles in this country is indicated by the import figures for 1915, which show a falling off as compared with those for 1914. The total from foreign sources in 1915 was twenty-six cars valued at $30,595, whereas in 1914 the imports were seventy-nine cars valued at $106,420. Most of the cars being manufactured here are low-priced, thus affecting the imports of higher-priced foreign cars.

The sources of the cars imported in 1915 were: Great Britain, four, valued at $8,721; United States, ten, valued at $15,798; other countries, twelve, valued at $6,076. For 1914 the figures were: Great Britain, seventeen cars, valued at $30,356; United States, thirty-three, at $28,787; and other countries, twenty-nine, at $47,277.

A firm owning a taxicab service in this city is now operating forty-two cars, averaging 700 passengers daily. All of the cars are of American make. Each car covers an average of 60 miles a day. This firm has also undertaken the extension of a motor-bus service in Chosen.

Pelton Steel Co. Incorporates

MILWAUKEE, WIS., April 10—The Pelton Steel Co. has been organized here, and incorporated with capital stock of $100,000. The company has taken over a crucible plant at Chicago Avenue and Elliott Place, on the main line of the Chicago, Milwaukee & St. Paul Railway. An electric furnace with 250 tons capacity will be put into operation about June 1, and at present there are nine crucible furnaces working. Orders have been received lately from automobile manufacturers at Detroit, Mich. E. T. Pelton, who was with the National Steel Foundries for twelve years, is general manager of the company.

Liberty and R. C. H. Unconnected

DETROIT, MICH., April 10—The fact that the new Liberty Motor Car Co. of Detroit, recently organized by Percy Owen, has taken over the plant formerly occupied by the R. C. H. Corp., has apparently given the impression that there is some connection between the two companies.

Liberty officials state that there is no relation whatever between the two companies. The Liberty company has simply taken over their factory buildings and offices and the previous occupant has moved to another location.

The Liberty Motor Car Company is an entirely new organization, headed by Percy Owen, who is president and general manager. Liberty officials also include such well-known men as James F. Bourquin, who is vice-president; H. M. Wirth, secretary and treasurer; and R. E. Cole, chief engineer. These men are all automobile men of wide experience and were officials in the Saxon, Chalmers or Paige companies. From their most recent connections the general impression is that the new Liberty will sell at a medium price.

While there is no denial from the Liberty factory of this rumor, it is also hinted that the car will be of an entirely new type, designed to appeal to those who use better class motor cars.

Gibson Co. Opens in Danville

DANVILLE, ILL., April 8—The Gibson Co., Indianapolis, Ind., opened its display rooms here to-day. Jack Ryan of Indianapolis is in charge.

Welton Fender Co. Reorganized

COLUMBUS, OHIO, April 7—At a meeting of the stockholders of the Welton Automobile Fender Co., Columbus, a complete reorganization was effected. The new corporation is known as the Auto Cushion Fender Co., and the capital stock is $20,000, of which $17,500 has been issued. Dr. John M. Thomas was made president and Dr. Fred Fletcher, secretary-treasurer. Plans were made for a vigorous selling campaign of the fender which is made under contract by the Columbus Auto Brass Co. Several new models of fenders will soon be placed on the market.

Army Pleased With Trucks

Transportation and Commissary Officers Find Them Better Than Mexican R. R.

FORT SAM HOUSTON, TEX., April 10—Gen. Frederick Funston and the officers in charge of the transportation and commissary departments of the army are well pleased with the service that has been performed by motor trucks and automobiles in the campaign against Villa. Many difficulties were encountered in bringing the service up to its present high standard of efficiency, but it is now announced that the motor truck trains are meeting promptly all the demands of the United States military force in Mexico and that they are transporting foodstuffs and supplies with fully as great dispatch as could be done by railroad. In view of the fact that the Mexico & Northwestern Railroad is in very bad physical condition and that it is impossible to make more than 10 or 12 m.p.h. over the line, the motor truck trains are able to do considerably better than this. The worst feature of the motor truck transportation proposition is the difficulty that is met with in keeping the roads in repair. According to reports received by General Funston, the main military highway leading south from Columbus, N. M., is now cut into deep ruts for a width of more than 200 yd.

United States Orders 108 Trucks for Army Use

NEW YORK CITY, April 10—Contracts for four more complete motor truck trains of twenty-seven cars each have been awarded by the War Department. The 108 trucks will cost approximately $2,300 each, thus making the value of the contracts about $248,000. Fifty-four are to be White, twenty-seven Jeffery and the other twenty-seven Packard. When these trucks have been delivered the Quartermaster's Department at Columbus will control more than 270 trucks for moving supplies. Last week the War Department bought fifteen more water wagons for immediate shipment to Mexico. Twenty-eight Packards going to Mexico were supplied with regulation army transport bodies, of tarpaulin-covered tox type, 11 ft. long, 5 ft. 6 in. wide and with hinged sideboards 24 in. high.

No Petroleum Shortage

Continued from page 696

the last year of the chief refiners have been ascertained and more extended information will be gathered soon to aid in judging whether the high prices have been necessary to maintain the normal rate of profit.

"For the purpose of bringing out the facts concerning alleged inequalities in the advance of prices in different sections, all statistics have been compiled by particular towns. Refiners and jobbers of gasoline have reported the the location of their tank stations in every town having a population of 2500 or over, throughout the entire country, and the quantity of gasoline sold thereat. Prices and costs can be computed by towns, States and sections, and the different conditions in the fields covered by different companies are being minutely examined. The dates at which prices changed at each point are recorded.

Grade Must Be Uniform

"A point of importance is the care used to make all price comparisons on the basis of the same grade of gasoline, as the investigation reveals considerable local differences in the quality of this product and changes therein during recent months.

Causes of Advanced Prices

"In its investigation of causes, the Commission is considering both domestic and foreign conditions, and is weighing every factor to detect any artificial or manipulative element. A letter of inquiry has been sent to every manufacturer of automobiles, farm tractors, and other gasoline engines in the country, to ascertain as far as possible the increased output of their products and the effect of the advance in gasoline prices upon the demand for their products and upon the consumption of gasoline. The following points are being examined: Forces of demand and supply as affecting the price of crude oil, exports and imports, deterioration in quality of crude, increased cost of refining, improved methods, and speculative holding of crude and gasoline.

"The close connection between the investigation of the causes of high prices and of the alleged discrimination should be noted: If prices are found to have been raised to higher levels in some sections than in others, making due allowance for quality of product, freight and marketing conditions, it may be inferred that an element of artificial manipulation has entered into the advance.

"In response to Senate Resolution 457, Sixty-third Congress, Second Session, the Commission is conducting its general investigation of the petroleum industry in such a way as to throw light upon the several companies into which the Standard Oil holding company was resolved in 1911. It is expected that the gasoline investigation will throw light upon this question.

O'Donnell Wins at Corona

Duesenberg Pilot Covers Boulevard Course in Grand Prix at 86.5 M.P.H.

Corona Grand Prize Winners

Car	Driver	Time	M.P.H.
Duesenberg	O'Donnell	3:29:52	86.5
Mercer	Thomas	3:36:01	84.0
Mercer	Pullen	3:38:36.4	83.0
Omar	Tetzlaff	3:58:04	76.1
Cyclone	Durant	4:05:24	73.9
Gandy Special	Waterman	Flagged	

CORONA, CAL., April 8—*Special Telegram*—The accident, which cost the lives of Bob Burman and his mechanic, Eric Schrader, is responsible for the final curtain in racing at Corona. Immediately following to-day's race, officials announced that with the tragic ending of the event came the decision never to hold another race on the boulevard course. The effect of to-day's fatalities overshadows Eddie O'Donnell's victory in a Duesenberg at the rate of 86.5 m.p.h.

Twelve Cars Started

Twelve cars were at the starting line when the signal was given and it was believed that Pullen's record of 87.8 m.p.h. set last year would fall. In practice the drivers had shown wonderful speed, and during the tryouts Hughes made laps at 106 m.p.h. There were five cars in the race that had lapped the course at better than 102 m.p.h. in practice, but during the practice dashes the weather had been cool. The intense heat to-day had a great deal to do with seemingly slow time made by O'Donnell.

Burman's car was wrecked in the ninety-seventh lap when he was in second place and less than a lap behind O'Donnell. Waterman, Oldfield and Hughes went out in the forty-seventh lap, leaving but seven cars on the course which made the race particularly attractive to the drivers since the purse was split five ways. Earl Cooper had gone out in the fifteenth, and the Tahais had left the course with a broken connecting-rod in the twenty-ninth.

Cooper's trouble was due to his wreck three days ago while traveling at 101 m.p.h. A front wheel left the axle and Cooper escaped death by a miracle. Both he and the mechanic, Reeve Dupton, escaped without a scratch but the car was badly damaged. Cooper worked for 48 hr. with a score of mechanics and had the Stutz at the starting line, but the engine had been strained so that the crankshaft was out of alignment and engine trouble developed from that cause early in the race. Tetzlaff's Milac was out of the list at the last moment due to a connecting-rod being broken in the last practice. Injury to Omar Toft caused his withdrawal and Tetzlaff took over his car, coming in fourth.

The Apperson was eliminated before the start. Blowing a tire on the back stretch near the point where Burman was wrecked, Sterling Price lost control of the car and after careening down the course for 200 ft. crashed into a palm tree. The car burned when the gasoline tank exploded. Tony Janette's Hartmann Special, a post entry that went in the day before the race, also was a victim of the jinx before the start, a broken connecting-rod keeping it out of the race. The Marmon entry also was cancelled at the last moment, by reason of inability of the driver, Jack Welsh, to get tires.

Some tires did not stand two laps, and every driver used all the tires he had in his pits with the exception of O'Donnell who went through the entire race with just one stop. The crowd was not so large as at the last Corona meet, there being only 68,000 admissions. Bosch magnetos were used on all the cars starting in the race and Bosch plugs on seven.

Corona's Last Race

The whole town is mourning for Burman and the little mechanic who rode to death with him. Citizens of the Circle City say that the only reason for the race this year was the fact that there never had been an accident on the fast course and after to-day's tragedy there never will be another Circle City speed event.

It was an unavoidable accident of the speedway, but it will never be forgotten by the many friends of Burman who saw the race. The main cause of the accident was the blowing of a rear tire. Burman had signalled that he was to change on his next visit to the pits, but he never reached there. He led the contest at the start and for seven laps he was out in front. Then he dropped back to second

Positions of Cars in the Corona Grand Prize

Driver	Car	Position by Laps 10	20	30	40	50	60	70	80	90	100	109	M.P.H.	Average, M.P.H.
O'Donnell	Duesenberg	4	3	2	2	1	1	1	1	1	1	1	3:29:52	97.1
Thomas	Mercer	3	5	3	4	3	3	3	4	4	2	2	3:36:01	93.2
Pullen	Mercer	1	1	1	1	5	5	5	5	5	5	3	3:38:36⅖	92.8
Tetzlaff	Omar	5	4	4	3	2	2	2	3	3	3	4	3:58:04	91.4
Durant	Chevrolet Cyclone	10	9	9	9	7	7	7	7	6	5	5	4:05:25	87.5
Waterman	Gandy Special	7	6	5	6	6	6	6	6	7			Flagged	87.5
Burman	Peugeot	6	2	6	5	4	4	4	2	2			Wrecked 97th lap	87.5
Oldfield	Delage	9	7	7	7								Broken rocker arm 47th lap	85.9
Gandy	Gandy Special	11	10	10									Engine trouble 47th lap	87.0
Hughes	Sunbeam	8	8	8	8								Broken clutch 47th lap	...
Teel	Tahais	12	11										Broken connecting rod in 29th lap	...
Cooper	Stutz	2											Engine trouble 15th lap	...

and Pullen took the lead, holding it until the fortieth lap, when O'Donnell went into first place and never was headed.

Burman stopped at his pit on the eleventh lap with a slipping clutch. He could do nothing for it and drove the race on high gear alone. To start the car after coming into the pit he would jack up the rear end and after the wheels were turning with the Peugeot in high gear the car would be let down in a pool of oil and dash off on high.

Burman Second in 80th

With only high gear, the car was hard on tires. It seemed as if Burman was always at his pit and it was hard to believe that he was in second place when it was shown on the scoreboard in the eightieth lap. He had less than a lap to make up when O'Donnell was making his first stop on the next round. Burman was driving the greatest race of his career. He had been in the back and had come up into the money several times during the race, and it seemed that he had a sure thing in second place and an even break for first when the accident happened.

When the left rear tire blew, the car went for the inside curve. After sliding down the curve about 100 ft. it struck a culvert and that flattened out one side of the wheel and bent the frame. The car then lurched out on the course, swung back to the curve and with one wheel in the gutter and the other on the curve, it plowed through two telephone poles, tore up 100 ft. of grass on the edge of the course, hit the curb again, crashed into a car standing on the inside of the course, then spun around, rolled over and finally came to a stop, 167 yd. from where it first hit the curb.

When news reached the pits that Burman was dying and Schrader was dead, drivers and mechanics cried like children.

Misdemeanor to Place Tacks on New York Roads

ALBANY, N. Y., April 11—It is a misdemeanor to place on roads anything likely to puncture automobile tires, according to a bill unanimously passed today by the Assembly.

The measure prohibits the placing on any road, highway or public place of glass, tacks, nails or other articles which might injure an animal or person or puncture a tire. It was introduced by Senator Slater of Westchester and already has passed the Senate.

Senator Hewitt introduced a resolution to-day providing for a joint legislative committee of two Senators and three Assemblymen to investigate the use of lights on automobiles, the various devices for eliminating the glare of headlights and the use of public highways by trucks and omnibuses.

Nine Entries for Indianapolis

Two Maxwells and Three Frontenacs Register for 300-Mile Grind

INDIANAPOLIS, IND., April 6—Two Maxwells and three Frontenacs have been entered in the 300-mile race at the local speedway on May 30. The Maxwells are entered under the name of the Prest-O-Lite racing team and the Frontenacs by the Frontenac Racing Car Co., formed last winter for the exclusive building of racing cars.

Eddie Rickenbacher and Peter Henderson will drive the Maxwell mounts, which have been reconstructed during the winter months at the Prest-O-Lite plant.

The three Chevrolet brothers—Louis, Arthur and Gaston—will drive the Frontenacs. The cars are being constructed in the plant of the Frontenac company. Louis Chevrolet, who heads the company, states that he has abandoned his plans of entering the New York race on May 13, and will devote all his time to getting the cars ready for the local race.

The entry of these five cars brings the total up to nine, three Duesenbergs having been entered during the early part of March. O'Donnell and D'Alene will drive two of the cars. Henderson was to have been the third driver.

The entry of Joseph Christiaens with a Sunbeam six has been received in a cable to the speedway management.

Three Events at Tacoma May 30

TACOMA, WASH., April 10—There will be just three sanctioned events on Decoration Day at the Tacoma Speedway. The first event will be for cars of 250 cu. in. displacement and less, for a distance of 10 miles. Event No. 2 will be for a distance of approximately 200 miles for cars of 600 cu. in. displacement, and event No. 3 will be for a distance of approximately 30 miles, fifteen laps of the speedway, for the same cars as event No. 2. Cash and accessory prizes will be given the winners in all three events. List of officials for the meet will be announced later.

Twin City Prepares Schedule

NEW YORK CITY, April 10—The contest board of the American Automobile Association has received a request from the Twin City Motor Speedway Co., Minneapolis, Minn., for sanction of six sprint races to be held on May 30. The main event of the day will be a 5-mile race for a purse of $2,000. Three shorter events will carry a purse of $300 each, and the other two, also sprint affairs, will be for trophies.

The main event of the season at the Twin City Speedway is scheduled for July 4, when the 300-mile International race will be held. In September another meet will take place on the track, according to present plans, although nothing has been decided in regard to the details except that sprint races will probably be the feature.

Cedar Rapids Tractor Demonstration on Aug. 14-18

CEDAR RAPIDS, IOWA, April 7—The dates for the big tractor demonstration to be held here this summer are Aug. 14 to 18, inclusive. Options have now been taken on over 1000 acres of land along the Iowa City interurban. Plans are being made to make the tractor demonstration a big Iowa home-coming and to entertain at least 35,000 people. There will be from thirty to sixty carloads of tractors.

Sheepshead Plans 24-Hr. Race

NEW YORK CITY, April 10—Preliminary arrangements have been completed for a twenty-four-hour automobile race to be held on the Sheepshead Bay Speedway, June 16 and 17, under the direction of the Trade Racing Assn.

The race will be open to stock cars only, and the cash prizes offered total $10,000. Besides the cash prizes, the Universal Film Trophy is offered, to be competed for in accordance with the terms of a deed of gift not yet disclosed.

300-Mile Race for Fresno

FRESNO, CAL., April 8—A feature of this year's celebration of Raisin Day in this city and throughout the San Joaquin Valley on April 29 will be a 300-mile road race over a 14-mile course containing two straightaways of 6 miles each and a 1-mile connecting road at each end. The Raisin Classic Motor Cup Holding Co., which is planning the race, expects that it will be an international event for a $10,000 trophy. A sanction has been requested from the A. A. A. contest board.

New Montana Town Needs Garage

LIVINGSTON, MONT., April 10—In southern Montana near the Arch entrance to Yellowstone National Park, on the Yellowstone Trail, the new town of Wonderland City has been started through the efforts of the Todd Photo & Film Co., which will establish moving picture studios there, and among the opportunities for those seeking business locations, according to representatives of the film company, is the chance to open a garage and gas station.

Hudson Covers Mile at 102.5 M. P. H.

Super Six Stock Chassis Electrically Timed in New Record

DAYTONA, FLA., April 10—A Hudson Super-Six stock chassis, electrically timed, to-day established a new record by negotiating 1 mile in 35 11/100 sec. on the Ormond-Daytona beach. This is at the rate of 102½ m.p.h. Five other trials were under 36 sec. The car is rated at 29.4 hp., and develops 77 hp. at about 2500 r.p.m.

This new record compares with Burman's mark of 25.40 sec. in the 200 hp. Benz at Daytona, April 23, 1911, at the rate of 141 m.p.h.; Marriott's mark of 28 1/5 sec. in a 30 hp. Stanley steamer at Ormond, Jan. 22, 1907, at the rate of 127.66 m.p.h.; and 40.32 sec. made by Wilcox in a 301-450 cu. in. National at Jacksonville, Fla., March 30, 1911, or 89.4 m.p.h.

Winton Opens Annual Chauffeurs' Contest

CLEVELAND, OHIO, April 10—Entry blanks for the ninth annual repair expense contest for Winton six chauffeurs will be distributed by the Winton company within a few days. In all $3,500 in cash prizes will be distributed to employed drivers of these cars between May 1 and Oct. 31, the capital prize being $500. These prizes are offered for the purpose of showing that the cars can be driven great mileage at a comparatively small expense. An average of eight years' records, secured in this way, show approximately 2,000,000 miles at an average repair expense of 19¼ cents per 1000 miles.

Maxwell Salesmen in Conference at Factory Are Optimistic

DETROIT, MICH., April 6—District salesmen of the Maxwell Motor Co., from many parts of the country were in conference at the Maxwell headquarters this week, to discuss the plans for the spring and summer sales campaign. The visitors say that there is more money to buy automobiles than almost anything else.

Among the district salesmen present are the following: J. P. Headley, Atlanta, Ga.; W. A. Fries, Oklahoma City, Okla.; A. E. Morrison, Buffalo; L. G. Peed, Philadelphia; C. B. McLaughlin, Kansas City; C. H. Batchelor, Atlanta, Ga.; A. C. Reed, Providence, R. I.; L. F. Smith, Boston; P. R. Young and W. H. Schroeder, Omaha, Neb.; M. J. Williams, Kansas City, Mo.; C. S. Riedel, Detroit; G. E. Swope, Wichita, Kans.; J. J. Grant, Jr., Salina, Kans.; V. L. Malmfeld, Kansas City, Mo.; A. W. Johnson, Jr., S. E. Eggleston and H. E. Smith, Dayton, Ohio; C. D. Fintzel, Billings, Mont.; W. H. Lolley, Louisville, Ky.; L. A. Smith, Dallas, Tex.; W. H. Keller, Pittsburgh; E. F. McConaha, St. Louis, Mo.; W. H. Turner, Kansas City, Mo.; C. E. Beloate, Atlanta, Ga.

In addition to many business conferences, the visitors were taken to the enlarged Oakland Avenue Maxwell plant, to get first-hand knowledge on the Maxwell assembly system.

Receiver for P. R. Mfg. Co.

DETROIT, MICH., April 7—The Security Trust Co. has been appointed permanent receiver for the P. R. Mfg. Co., of this city which, among many products, is making the Breeze carbureter and other parts for automobiles. The cause for the receivership is not a case of insolvency, but of stockholders being unable to agree among themselves. The Security Trust Co. was appointed a temporary receiver several months ago, and attempts were made by it to get the stockholders to work smoothly together, but the dissensions persisted and made the present move necessary. The trust company says that the P. R. company has assets of approximately $200,000, that its business has been good, and that there are plenty of orders on hand. The receiver will attempt to sell the company as a going concern.

Electric-Vehicle Day in Chicago

CHICAGO, ILL., April 10—A day has been set aside for discussion of electric vehicles at the forthcoming convention of the National Electric Light Association, which will take place in Chicago, May 22 to 26. The session will be held at the La Salle Hotel. Among those who will read papers are W. P. Kennedy, New York, consulting transportation engineer; P. D. Wagoner, president General Vehicle Co.; E. P. Chalfant, eastern representative, Anderson Electric Car Co.; S. V. Norton, manager truck tire sales department, B. F. Goodrich Co.; F. E. Whitney, general manager, Commercial Truck Co. of America; C. W. Squires, Jr., sales manager, General Vehicle Co.

Larger Show Building for Moline

MOLINE, ILL., April 7—Moline is planning to erect a coliseum which will furnish the largest public hall in the tri-cities, and which will be the home of the 1917 Tri-City Automobile Show. This action is taken owing to the fact that the Davenport Coliseum is inadequate, as regard to floor space, for the present annual motor exhibit.

May Close Garages on Sunday

Bay State Legislature Kills Bill to Repeal Present Statutes

BOSTON, MASS., April 11—*Special Telegram*—The bill which was introduced early this year in the Massachusetts Legislature and which would have permitted garages to be open on Sunday and to sell gasoline, oil, supplies, etc., has been killed in the State Senate.

This means, virtually, that under existing statutes, it is illegal for a garage to remain open on Sunday or to sell gasoline, oil or supplies. Local authorities, if they so desire, can force garages to close on Sunday, except to permit cars to go in and out.

The measure which would have eliminated this trouble passed the lower house in February and it was expected it would pass the Senate without trouble and be signed by the Governor. That it was killed has been a surprise to dealers and garagemen.

$5 Minimum Fee in Md.

BALTIMORE, MD., April 10—On July 1, 1916, automobiles in this State will be taxed 50 cents per horsepower. Five dollars per year will be the minimum charge for any car. Commercial vehicles will be taxed upon a rated carrying capacity; $8 for a 1-tonner and $6 more for each additional ton.

Under the new law, speed limits in the hamlets will be the same. This city will be allowed to charge a reasonable fee for the parking of automobiles in spaces set aside exclusively for parking purposes in congested sections, but will not be permitted to make a special charge for the privilege of having one's automobile stand on the streets generally.

Dealers Oppose Owners' License

NEW YORK CITY, April 11—The Automobile Dealers' Assn. of New York City is opposing the Simpson-Kelly bill in the Legislature; the bill would require that every operator of a car, whether chauffeur or owner, be licensed to drive. The bill as originally drawn included the State, but was amended to cover New York City only.

President R. H. Johnston of the association states that the opposition is on the general grounds of over-regulation; he states in a letter to Mayor Mitchell that there is so much regulation now and unintelligent enforcement of rules, that the car dealer and owner are harassed and made uncertain as to their personal and business conduct.

Factory Miscellany

Packett to Build—The Packett Motor Car Mfg. Co., St. Paul, Minn., will build a plant.

Agontz to Build—The Agontz Motor Car Co., Sandusky, Ohio, recently organized, will build a plant.

Hamilton Carbureter to Add—The Hamilton Carbureter Co., East Toronto, Ont., is erecting a large addition to its factory.

Marion Tire to Build—The Marion Tire & Rubber Co. is planning to build a plant at Marion, Ohio. The estimated cost is $20,000.

Thomas Co. to Add—The Thomas Mfg. Co. will construct an addition to its plant at Dayton, Ohio, for the manufacture of accessories.

To Make Truck Bodies—A. D. Moore and Mr. Shaw, Palmer, Mass., have leased the vacant belt factory in Belchertown, Mass., and will make automobile truck bodies.

To Make Piston Rings—The McCadden Machine Works, St. Cloud, Minn., have been formed to manufacture piston rings, machinery and machine parts. The capital is $50,000.

To Make Parts in Chattanooga—E. Van Winkle of Chattanooga, Tenn., is planning to establish a plant at Chattanooga, for the manufacture of parts and assembling motor trucks.

Gerlinger Truck to Build—The Gerlinger Motor Co., Portland, Ore., capitalized at $100,000, will construct a factory in Tacoma, Wash., to manufacture the Ger-Six motor truck.

Spartan Radiator to Build—The Spartan Radiator Co., Jackson, Mich., manufacturer of automobile radiators, has had plans prepared for a new plant. It will be two stories, of brick and steel, 70 by 336 ft.

Gresham Co. to Add—The Beaver State Auto Co., Gresham, Ore., will build a brick foundry and will add the manufacture of malleable castings to its products. The building is to be completed by June 1.

Goodyear to Build—The Goodyear Tire & Rubber Co., Akron, Ohio, has taken out a building permit for the erection of a five-story, 68 by 142-ft. addition to its general office. The structure will cost about $48,000.

Carbureter Plant for Basic City—Carbureters will be manufactured by the Jordan Carbureter Co., Basic City, Va., which has been incorporated with a capital of $300,000. L. F. Jordan, of Basic City, B. E. Watson, Waysboro, Va., and others are the incorporators of the new company.

To Build Battle Creek Tractor—The Battle Creek Tractor is to be the name of a new product to be made by a company in which H. C. King of the H. C. King Seed Co., Battle Creek, Mich., and Myron Nash, Vicksburg, are to be the principal stockholders. The company is to have a capital stock of $50,000. The tractor is to sell at $900 with the plows, and at 775 without plows.

Fleetwood Metal Body in New Bldg.—The Fleetwood Metal Body Co., Fleetwood, Pa., is preparing to occupy its new building along the P. & R. Railroad. The building is an addition to the present three-story plant and contains 80,000 sq. ft. of floor space. Its dimensions are 40 by 350 ft., with connecting wings 40 by 80 ft. and 110 by 50 ft. It is equipped with modern machinery and methods for the manufacture of automobile bodies.

The Automobile Calendar

April 10-15	Seattle, Wash., Show, Arena.
April 10-15	Danville, Ill., Eastern Ill. Automobile and Electric Show; Chambers Bldg.
April 11-13	Milwaukee, Wis., Spring Show; Dealers' Show Room Automobile Display; Milwaukee Automobile Dealers.
April 12-15	Champaign, Ill., Show, Gymnasium Bldg., University, Ill.
April 14-16	Milwaukee, Wis., Garage-Circuit Exposition, Milwaukee Automobile Dealers.
April 15	Altoona, Pa., Pennsylvania State Motor Federation.
April 26-May 6	Oakland, Cal., First Annual Pacific Coast Motor Power and Automobile Show, Automobile Industries Assn.
May 6	Sioux City, Iowa, Speedway Race, Sioux City Speedway Assn.
May 9-12	Hot Springs, Va., N. A. A. A. J. Meeting, The Homestead.
May 13	New York City, Sheepshead Bay Speedway Race. Metropolitan Trophy, 150 miles; Queens Cup, 50 miles; Coney Island Cup, 20 miles, and Brooklyn handicap for non-winners, 10 miles.
May 14-20	Milwaukee, Wis., Sheridan Road Week to Complete Highway Connecting Milwaukee and Chicago.
May 20	Chicago Non-Professional Speedway Race, Western Interclub Speedway Park.
May 26-27	Del Monte, Cal., Meeting, Three Divisions of National Assn. of Automobile Accessory Jobbers.
May 30	Des Moines, Iowa, Iowa Derby, 20 Miles; Des Moines Special, 10 miles.
May 30	Tacoma, Wash., 100-Mile Speedway Race, Tacoma Speedway Assn.
May 30	Indianapolis Speedway 300-Mile Race.
May 30	Minneapolis, Minn., Speedway Race.
June 8	New York City, Orphans' Day Outing at Donnelly's Grove, College Point, L. I. Orphan's Automobile Day Outing Assn.
June 10	Chicago Speedway Race. International 300-Mile Race, Speedway Park, Speedway Park Assn.
June 12-16	S. A. E. Summer Trip on Great Lakes.
June 16-17	Sheepshead Bay Speedway, 24-Hr. Race, Trade Racing Assn., New York City.
June 20	Galesburg, Ill., Track Race, 100 miles.
June 28	Des Moines, Iowa, Speedway Free-for-all, 300-mile race.
July 2-6	Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
July 4	Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4	Tacoma, Wash., Speedway Race, Tacoma Speedway Assn.
July 4	Minneapolis 300-Mile Speedway Race.
July 4	Sioux City Speedway Race.
July 15	Omaha, Neb., Speedway Race.
July 15	North Yakima, Wash., Track Race, Riegel-Hiller Co.
July 17-21	Dallas, Tex., Tractor Demonstration.
July 24-28	Hutchinson, Kan., Tractor Demonstration.
July 31-Aug. 4	St. Louis, Mo., Tractor Demonstration.
Aug. 5	Tacoma Speedway Race, Tacoma Speedway Assn.
Aug. 7-11	Fremont, Neb., Tractor Demonstration.
Aug. 11-12	Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.
Aug. 12	Portland, Ore., Track Race, Riegel-Hiller Co.
Aug. 14-18	Cedar Rapids, Ia., Tractor Demonstration.
Aug. 18-19	Elgin Road Race.
Aug. 21-25	Bloomington, Ill., Tractor Demonstration.
Aug. 28-Sept. 1	Indiana Tractor Demonstration.
Sept. 4	Des Moines Speedway Invitation Race. Limited to six entries.
Sept. 4	Indianapolis Speedway Race.
Sept. 4-5	Spokane, Wash., Track Race, Inland Auto Assn.
Sept. 4-8	Madison, Wis., Tractor Demonstration.
Sept. 11-16	Milwaukee, Wis., Fall Show, Wisconsin State Fair, Milwaukee Automobile Dealers.
Sept. 16	Providence Speedway Race.
Sept. 29	Trenton, N. J., Inter-State Fair. H. P. Murphy, Racing Sec.
Sept. 30	New York City, Sheepshead Bay Speedway Race.
Oct. 7	Philadelphia Speedway Race.
Oct. 7	Omaha Speedway Race.
Oct. 14	Chicago Speedway Race.
Oct. 19	Indianapolis, Ind., Race. Indianapolis Motor Speedway.
Nov.	Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

The Week in the Industry

La Crosse Chalmers Builds—The Chalmers Motor Co. will build a four-story factory, 60 by 400 ft in size with a 40 by 60-ft. wing. The estimated cost is $150,000.

Renshaw Succeeds Tilley—J. B. Renshaw has succeeded L. A. Tilley as automobile sales manager of the South Bend branch of the Studebaker corporation. Mr. Renshaw has been connected with the Studebaker corporation for some time, having been in the accounting department.

New Westinghouse Distributors—Westinghouse starting, lighting and ignition systems for Ford cars are now handled by the Central Rubber & Supply Co., Indianapolis, Ind. Other distributors are as follows: The Owen Schoenck Co., Chicago; Alex. Seewald Co., Atlanta, Ga.; Hirzig Co., Nashville, Tenn., and the Rose-Lyons Hardware Co., Little Rock, Ark.

New Detroit Battery Stations—The Detroit Battery Co., Detroit, has recently established the following service stations: Hydrox Storage Battery & Mfg. Co., Cincinnati, Ohio; Allen T. Hurst, Paris, Ill.; E. N. Egge Auto Co., Plainview, Tex.; Harry Lipman, 30 Sheridan Avenue, Albany, N. Y.; Vedder Bros., Johnstown, N. Y.; Power Accumulator Co., Dawson, Minn.; Rhymer's Garage, Hartford, Conn.; James C. Nichols, 1673 Broadway, New York; C. L. Thayer, 174 South Wall Street, Columbus, Ohio; Master Sales Co., Omaha, Neb.; Berg Auto Supply Co., Oakland, Cal.; P. Buford, 208 West Seventh Street, Austin, Tex.; H. & M. Garage, West Frankfort, Ill.; H. H. Karsten & Brother, Zeeland, Mich.

Splitdorf Branch in Oakland—The Splitdorf Electrical Co. has opened a branch and service station at 3040 Broadway, Oakland, Cal.

Washington Items—Beaumont & Williams, the Northwest distributors for Gramm-Bernstein motor trucks, have established headquarters in Seattle at Melrose Avenue and Pine Street.

The Seven-Seven Co., Spokane, Dodge distributor, has taken the agency for Hartford tires, the Trailmobile and Vedol oil for Spokane and the Inland Empire.

Another new line of automobiles has been added to the Spokane district. The Nelson Motor Co. was formed and appointed eastern Washington distributor of Lexington cars. E. O. Nelson is manager of the new firm.

Trade Happenings

Zertner Heads Philadelphia Oakland—Z. S. Zertner, for several years well known in the farm implement manufacturing circles, has taken charge of the Philadelphia branch of the Oakland Motor Co. recently. Mr. Zertner succeeds T. S. Johnson, who for several years has been branch manager, and who resigned to take up other work.

Kayser Heads Providence Chevrolet—A direct factory branch has been opened by the Chevrolet Motor Co. in Providence, R. I., in charge of R. B. Kayser, formerly assistant manager of the Chevrolet Motor Co. of N. E. in Boston.

Ross Fiat General Manager—R. R. Ross has been made vice-president and general manager of the Fiat Automobile Co., New York City.

Valerius Master Carbureter District Mgr.—G. P. Valerius has been appointed district manager by the Master Carbureter Corp., Detroit, Mich. He will cover Utah, California, Wyoming and Montana. He was formerly a district manager for the Maxwell company.

T. L. Grabe, who was formerly agent for the Autocar Co. in Philadelphia, and later on the Pacific Coast, has been appointed factory representative for the Master corporation for the States of Michigan, Ohio and Indiana.

Vesta's N. E. Change—The New England interests of the Vesta Accumulator Co., Chicago, Ill., are being taken care of and represented by the Boice Motor Equipment Co., 76 Brookline Avenue, Boston, Mass., instead of the Boice Perrine Co., that city, as heretofore.

Burd Ring Items—A. C. Preston, until just recently with the Gahran-Pinchbeck Co., Albany, N. Y., Buick distributer, has accepted a position with the Burd High Compression Ring Co., Rockford, Ill., and will represent that company in the Albany territory.

This company has opened sales offices at 899 Boylston Street, Boston, Mass., with E. B. Allen as manager.

The Milwaukee offices of the Burd company have been moved from 403 Jefferson Building to the ground floor location at 813 Grand Avenue, Rockford, Ill.

Robert Allan has resigned as sales manager of the San Francisco branch of the company. He will be succeeded by H. B. Rathbone.

The Seattle, Wash., office has been moved from 538 Central Building to 705 East Pike Street. A. C. Hansen is the manager in charge of the Seattle territory.

Eight Overland Stations in Cleveland—The Willys-Overland Co., 6604-18 Euclid Avenue, Cleveland distributors of Overland and Willys-Knight cars, will in a short time have eight service stations so located that no Cleveland owner of an Overland will live further than a mile and a half from a station. This announcement was made by M. L. Bridgeman, general manager of the local branch. Expenditure of $500,000 in completing the service chain is contemplated. Employment of 150 additional men will be necessary, Bridgeman said.

The service plan includes three immense stations—the one already established, another in the extreme East End and the third in the West End. Five smaller stations financed by the company but handled by dealers complete the Overland "mile-and-a-half" geographical plan.

In addition a new building four or five stories high, of steel and cement, 100 x 300 ft., will be erected on the property back of the present main service station and fronting on Carnegie Avenue. Tentative plans for the building have been drawn by the architect. The building will cost about $200,000. The Euclid Avenue service station will be converted into a salesroom, where "ready-to-roll" cars will be kept.

Nebraska News Items—The Standard Motor Car Co., Omaha, has taken the distributing agency for the Peoria in Nebraska, western Iowa and South Dakota.

Card, Adams & Brown of Lincoln, Neb., have taken the agency for the Chandler and will establish a local dealer in Omaha.

R. E. Davis has been appointed manager of the Murphy-O'Brien Co., Omaha. Douglas Bowie will be retail sales manager for the Paige and Dodge cars handled by this company.

The Hupmobile Co. of Nebraska has appointed G. H. Houliston, formerly with the Lininger Implement Co., to be manager of the Hupp branch house recently opened in Omaha.

Minneapolis News—The Northwestern Automobile Co. will open a new building May 1 at 1500 Harmon Place for the sale of Saxon and Chandler cars. It will be three stories and basement, giving 25,000 sq. ft. floor space and to cost $30,000. The show room is to be 50 by 90 ft.

The Fawkes Auto Co. will complete in two months a $75,000 building, three stories and basement, of steel concrete and terra cotta, to be occupied by the Brice Auto Co., Grant cars; Northwest Hupmobile Co., Hupmobiles; John E. Fawkes, Oldsmobile.

New quarters for the Goodyear Tire & Rubber Co. will be erected at Harmon Place and Thirteenth Street, 66 by 150 ft., three stories and basement. This will give the northwestern branch double its present capacity.

St. Paul News—The Detroit Electric Car. Co. has moved to Grand Avenue and Victoria Streets to get larger quarters. E. P. Wright has resigned a railroad position to become Twin City representative of the Gary Motor Truck Co., with offices at 1032 Merchants Bank Bldg. and show rooms at 352 Market Street.

E. R. Boutell, Inc., is a new automobile sales company, headed by E. R. Boutell, J. M. Boutell and M. B. Mitchell. Capital is $50,000 and liability limit $100,000.

An independent oil company has been capitalized at $50,000 by Harry Loomis, Ross Larson, H. P. Keller and H. L. Dunn. It is called the Nonpareil Oil Co., and plans to build.

The White Auto Supply Co., St. Paul, has been formed, and J. T. White has resigned from the Bartles Oil Co. to become its active head. Salesroom is in the Bartles Building, occupying a block front. The company is local agent for Federal tires and will handle accessories.

The Duesenberg Motor Co., St. Paul, is making aeroplane engines in addition to the manufacture of Duesenberg cars. The Gallaudet Aeroplane Co., of Norwich, Conn., has ordered the motors, which are 130 hp. and four cylinders. The company is making also a 12-cylinder motor for Canada.

Ohio Items—R. E. Sewell, direct from the factory at Akron, Ohio, has been placed in charge of the service department of the Columbus branch of the Firestone Tire & Rubber Co.

The Lima-Overland Co., of Lima, has closed a deal whereby a new garage will be built at 322 West Market Street, which will be occupied as a garage and sales agency.

Wisconsin Items—The Fisk Rubber Co., Chicopee Falls, Mass., is about to establish a general Northwestern distributing branch at La Crosse, and has engaged architects to plan a branch house building, two stories high, located at Sixth and State Streets.

W. H. Krueger, formerly of the Boulevard Garage Co., Milwaukee, has taken charge of the Cole Motor Co. of Chicago's business in Milwaukee and surrounding territory. An efficient service department for Cole owners has been established at 485 Jefferson Street, Milwaukee. F. E. Tabbert is associated with Mr. Krueger as manager of the retail sales department.

The Pioneer Mfg. Co. of West Allis, Milwaukee County, has been organized by H. E. Wellbourne and established a machine shop, factory and garage at 6703 Greenfield Avenue. A specialty will be made of self-starting mechanisms for motor cars and cycles. O. E. Birkekab, L. K. Anderson and D. L. Christiansen are associated with Mr. Wellbourne in the enterprise.

A. R. Callender, for several years chief clerk of the manufacturing department of the J. I. Case T. M. Co., Racine, Wis., has purchased the Badger Foundry Co. and resigned his position with the Case company to take the general management of the business.

L. K. Cooper has severed his connection with the Maxwell Motor Co. to assume the management of the Cleveland Maxwell agency at 1924 Euclid Avenue, Cleveland.

The Forest City Garage Co., distributor of the Interstate car, Cleveland, has leased a salesroom at 2052 Euclid Avenue, and will move from 10,926 Superior Avenue within a short time.

The Packard-Cleveland Motor Co., Cleveland, has exercised the option in its lease and purchased the 20-year lease on its new building at 5206 Prospect Avenue, and in addition has leased another parcel of land with a frontage of 70 ft. on Prospect Avenue. The building into which the company recently moved will be almost duplicated. The new portion will be used for the truck sales department, while the present building will be devoted entirely to pleasure cars.

The branch of the Goodyear Tire & Rubber Co., Cleveland, has moved to its new quarters on East Nineteenth Street, just off Euclid Avenue.

Southwest News Items—The Pioneer Motor Co., El Paso, Tex., is now agent there for the Scripps-Booth and Moon. This company also handles Kissel and Denby trucks.

H. A. Deans, manager of the McArthur Bros. branch at Tucson, Ariz., has purchased the Velie garage, formerly operated by J. Wood Walker, and will conduct it as a service station for Dodge cars.

The territory of the Southwestern Carburetor Co., Michelin tire agent at Phoenix, Ariz., has been extended to cover the entire State.

Little Bros. to Enlarge.—Little Bros., Port Huron, Mich., who have a foundry here, where certain parts for the Buick cars are made, will enlarge their plant. A building, 60 by 66 ft., is in course of erection now, and another, 30 by 66, will be started. The members of the concern are A. R., E. and W. F. Little and Henry Holth.

Oregon Items—W. M. Morris, an executive official of the Weed Tire Chain Co., spent the past week in Portland, Ore., visiting the company's trade connections. Mr. Morris is one of the directors of the company and is about to go to Europe to look after the Weed interests.

W. J. La Casse, manager of the Northwest zone of the Maxwell company, reports that 100 Maxwell cars were sold in the State of Oregon during the month of February. The Salem, Ore., agency alone took twenty-two cars of this allotment.

Michigan Items.—The Detroit Engineering Products Co., Detroit, manufacturer of automobile accessories, has moved its offices to 604 Woodward Avenue.

During the first half of March $674,110.66 was paid to the employees of twenty-one Flint, Mich., local manufacturing concerns, of which fifteen make either automobiles or motor car parts and accessories. Four concerns, the Buick, Chevrolet, Weston-Mott and Mason companies paid out $40,000 more than during the second half of February.

The Ross Automobile Co., Detroit, has opened local salesrooms at 734 Woodward Avenue, Detroit, under the name of Ross Motor Sales Co.

The Central Garage, Cedar Springs, Mich., has been formed by Carl Zunwalt, Roy Peasley and George E. Waycott.

M. L. Perigo, Alma, Mich., has taken the agency for the Dort for Gratiot County and part of Isabella County.

Claus Co. Breaks Ground—The Claus Automatic Gas Cock Co., now located in leased quarters at 2601-2605 Vliet Street, Milwaukee, has broken ground for a plant of its own on Booth Street, near Keefe Avenue, Milwaukee. The main building will be 90 by 150 ft. in size, of brick and steel, and will be ready about June 15.

Stephenson in Lumber Business—G. L. Stephenson, former president of the Stephenson Motor Truck Co., Milwaukee, for seven years identified with the pleasure and commercial car business of Wisconsin, has been elected secretary and general manager of the Foster Creek

Gay Plant for Sale—Bids will be opened by the receiver of the S. G. Gay Co., Ottawa, Ill., for the plant and equipment of the concern. The Gay company is the manufacturer of the Gay truck. The property has been divided into several parcels, comprising a factory building and land, four lots 140 by 60 ft. each, and a three-story brick building, shop and office equipment, power plant, warehouses of frame construction, a lumber yard, wood and metal-working machinery and stock consisting of finished trucks and parts and a number of horse vehicles.

The AUTOMOBILE

Are Other Cycles Possible?

Recent Suggestions Heard in Engineering Conferences Lead to the Belief That Cycles Other Than the Otto May Prove Useful—Constant Pressure Type a Possible Answer

By J. Edward Schipper

ONE of the effects of the fuel controversy which has spread from one end of the world to the other, has been to cause engineers to wonder if there be not some other way of utilizing the heat energy in liquid fuel. The present method employed in automobiles makes use of the basic scheme known as the Otto cycle. This method of transforming the latent heat energy in the fuel into dynamic mechanical energy, was first suggested by Beau de Rochas in 1870, and actually employed in an engine designed by Otto in 1876.

With wide open throttle and with excellent carburetion, and nearly complete combustion, the thermal efficiency of the up-to-date automobile engine is from 18 to 20 per cent. When the car is running at a touring speed of 15 to 18 m.p.h. and the throttle is possibly less than one-third open, the thermal efficiency is somewhere around 5 per cent. In other words, for every dollar's worth of fuel 5 cents in power is returned. The maximum possible efficiency of the Otto cycle is somewhere around 35 per cent, and it is these conditions, coupled with the increased price of fuel, which has caused some engineers to wonder if some other type of cycle, which had been developed mechanically to the same extent as the Otto cycle, could not be used to better advantage.

Thermo-Dynamic Classification

Thermo-dynamically engines are classified according to the way in which the heat is introduced. Engines may operate on a constant temperature cycle, a constant volume cycle or a constant pressure cycle. Each of these is distinctive in the manner in which the fuel is handled, and each has a certain efficiency which could be reached by a theoretically perfect engine, but which is beyond attainment by a mechanical creation designed to work upon that cycle.

Engines operating on the constant-temperature cycle take the heat in at a temperature which remains constant throughout the period of supply. Expansion then follows the cut off and the heat is also rejected at a constant temperature.

Constant volume engines take in and reject the heat at a constant volume and constant pressure engines take in and reject the heat at a constant pressure.

The Otto cycle is theoretically a constant-volume cycle and the point which it is desired to determine is whether or not it would be possible to mechanically develop engines working under the constant temperature or constant pressure cycles which would give as great or more satisfaction.

The effect of compression on the Otto cycle is very important, and there is little doubt but what manufacturers would work to a much higher pressure than they do now, if it were not for the fear of pre-ignition. The difference in efficiency between motors of 75 lb. compression and those of 100 lb. which are the same in other details of design is marked. The instability of the compressed mixture is the greatest difficulty to overcome.

Constant Temperature Cycle

The constant temperature cycle may be considered first and its maximum theoretical efficiency noted. Referring to the constant temperature cycle diagram, Fig. 1, the line *OV* represents the reference line of volumes, *OP* the reference line of pressures, and *abcd* the line which diagrammatically represents the pressure and volume conditions in the cylinder at any point.

On this cycle the line *bc* represents compression, heat is taken in from *c* to *d* at constant temperature and expansion takes place from *d* to *a*. From *a* to *b* heat is rejected at constant temperature. The efficiency of this cycle is equal to the amount of heat taken in by the gas less that rejected at the lowest temperature, divided by the heat taken in.

Steam engines working on this cycle with a steam pressure of about 150 lb. to the square inch and exhausting into a condenser having 28 in. vacuum, or in other words, working between absolute Fahrenheit temperatures of 819 and

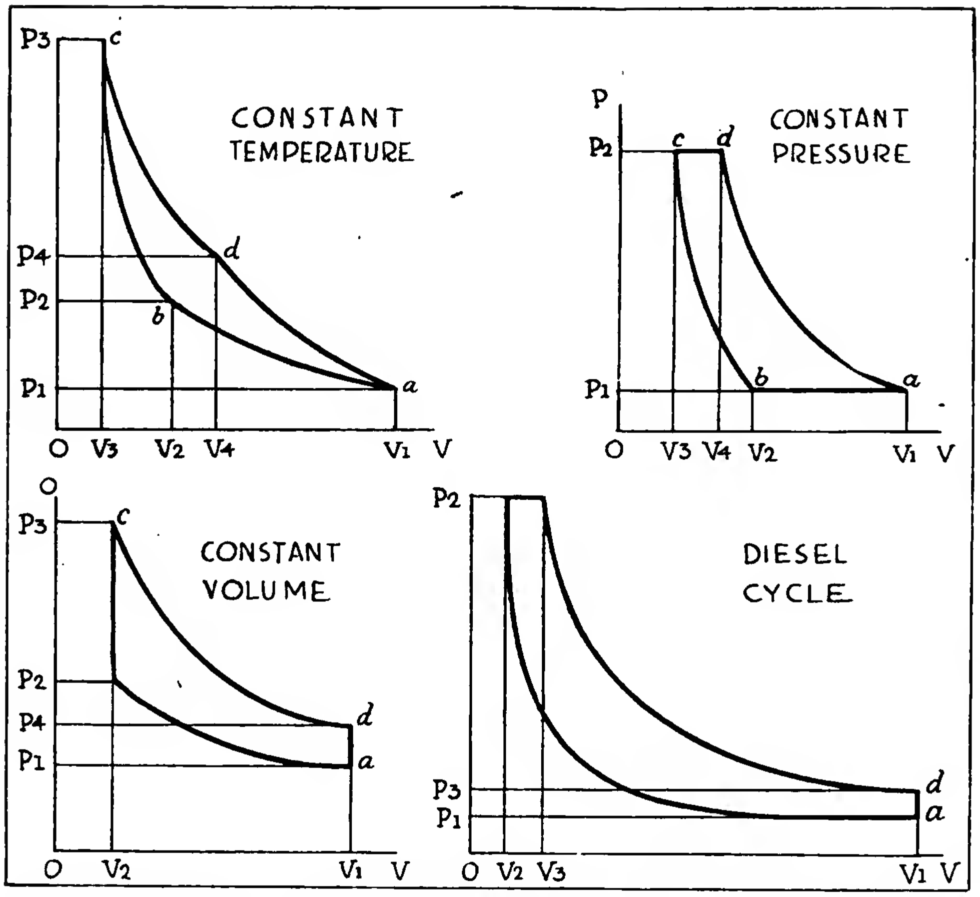

Fig. 1—Indicator diagrams of the constant temperature, constant pressure and constant volume cycles and the Diesel cycle

563 deg. would have a theoretical efficiency of 31.3 per cent. Practically an engine under these circumstances would reach about 15 per cent. In a gas engine when ignition occurred at *c*, the piston travel would have to be very rapid in order to hold the temperature constant down to the point *d* where expansion begins, or else the gas would have to be burned as it was introduced. This would allow of expansion during combustion and after cut off.

Suggests Slow Combustion

This process of working immediately suggests slow combustion, as compared to explosion, and that in turn suggests lower grade fuel; but this situation suggests heavy, slow-moving parts which are in every way opposed to the present requirements of a high-speed internal combustion engine. When worked out practically, the area inclosed in the thin crescent-shaped diagram would no doubt be very small, giving a low work value. Another loss as compared to the theoretical card would be that the point *a* on the practical diagram would not be on the atmospheric line but above it. This would still further reduce the area inclosed by the diagram, or, in other words, reduce the amount of work per charge. With these points in view and with the general clashing of the possibilities of this cycle with the requirements of up-to-date practice it can be discarded and thoughts turned toward the other cycle, the constant pressure, the possible alternative.

Studying the diagram of the constant pressure cycle, Fig. 1, and comparing it with the constant volume diagram, Fig. 1, it will be seen that the line *bc* in the constant volume diagram is vertical, showing that during the entire explosion stroke on the theoretical engine the piston has not moved, or in other words, instantaneous combustion has taken place. This condition, of course, is not reached in practice and the line *bc* is never vertical even at very high speeds with wide open throttle. On the constant pressure diagram the line *cd* is exactly horizontal which shows that during the time of burning the piston has moved in such a way that the volume has increased sufficiently to hold the pressure constant. Both lines *cd* in the constant volume diagram and *da* in the constant pressure are adiabatic expansions.

Similar conditions hold true at exhaust where the exhaust line in the constant volume diagram is vertical and in the constant pressure is horizontal on the theoretical cards.

It is this constant pressure cycle which some engineers are studying with a view to determining whether or not the conditions which hold true with the lower grades of fuel render its use commercially advantageous. With the more volatile fuels and the greater possibilities of exploding or burning the charge at constant volume, the constant volume cycle has been favored, but with fuels that are slower burning but

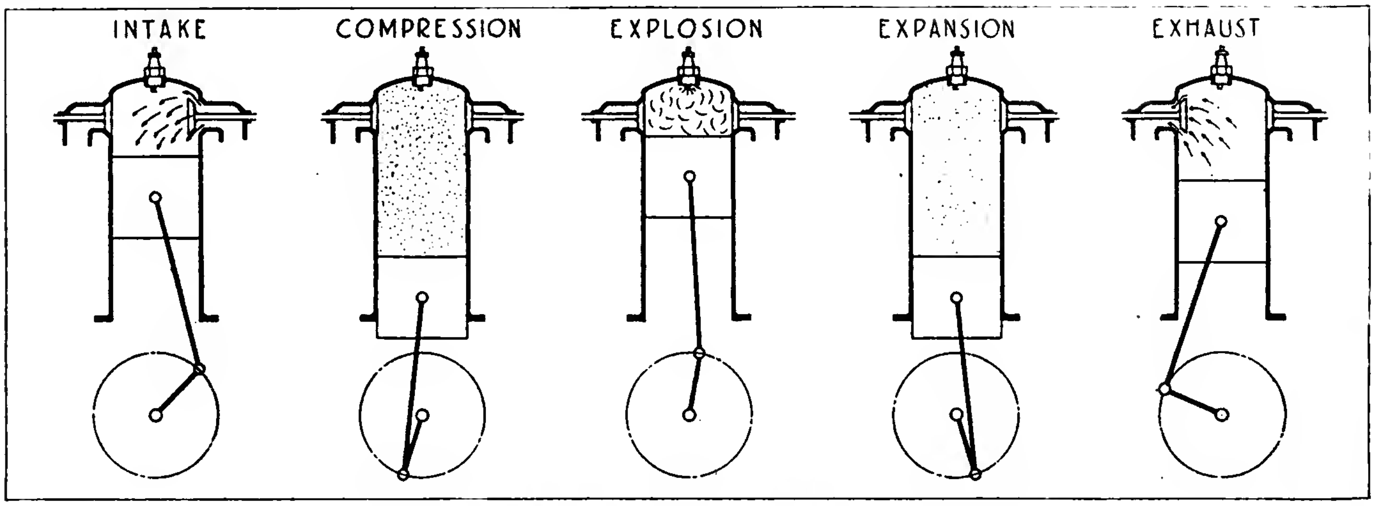

Fig. 2—The ordinary Otto cycle has five operations, intake, compression, explosion, expansion and exhaust

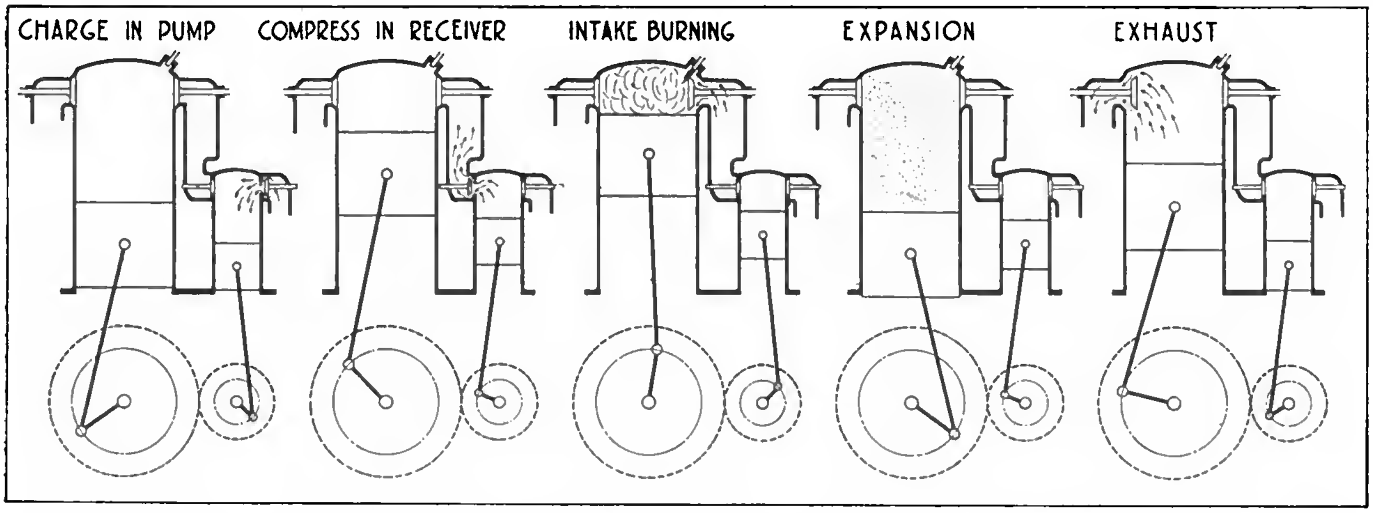

Fig. 3—Ignition at constant pressure with previous compression: charging pump at atmospheric pressure, compressing into receiver, admitting burning charge, expansion and exhaust

which at the same time contain a greater amount of heat energy for the same volume, it may be quite possible that the constant pressure cycle can be adapted to use.

Constant Volume Engine Efficient

While under similar conditions and with the same explosive fuel the constant volume engine is more efficient than the constant pressure, it seems possible that by carrying out the expansion line of a constant pressure type a higher efficiency may be reached, particularly at reduced throttle opening. The Diesel engine, for example, works on a cycle which as far as heat intake is concerned is a constant pressure type, but which at exhaust is more like the constant volume engine. The diagram of the Diesel cycle is shown in Fig. 1.

The high efficiency of the Diesel engine in large units has naturally attracted many to the view that it should be possible to make this power plant in small enough units to use in automobiles, and several attempts have been made to do this. While it does not seem possible just at this time to make the Diesel engine a commercial possibility as far as automobile work is concerned, the idea of coming quite close to this by using the constant pressure cycle is one which is provoking a great amount of thought at this time when fuel is far more plentiful in the heavier than in the more volatile grades.

The first thought suggested by the constant pressure engine is high compression. The idea that this necessarily means an efficiency loss, is often held by those who have not realized that practically all of the energy necessary for compression is returned in the expansion stroke. Ignition begins at upper dead center on the firing stroke and burning takes place along the horizontal pressure line until the predetermined cut-off point is reached. This means that fuel must be constantly introduced against the maximum cylinder pressure and this in turn means a receiver capable of withstanding the high pressures. It also means the employment of a compression pump with its consequent efficiency losses and a satisfactory ignition scheme; but the question to be determined is whether or not other gains do not offset this.

Engines working under the constant volume principle cannot carry compression beyond the pre-ignition point of the fuel, but in the Diesel engine pure air alone is drawn into the cylinder and the fuel is not admitted until after compression, so that very much higher compressions may be used with it. This same possibility holds true with the constant pressure engines, and in fact it seems that in order to secure the maximum amount of efficiency this compression ratio must be high.

In actual working, Dr. Rudolf Diesel points out, the compression ratio with his engines is about twelve as against six or seven with other gas engines. Working out the efficiencies in the two cases with the ratio six in one case and twelve in another, he shows that they are 0.51 for the six ratio and 0.63 for the twelve ratio.

It must be granted then, that in order to secure the desired efficiency from the constant pressure engine it is necessary to work at high compression and the point for practical engineers to determine is whether or not it is possible to secure the high compression ratios in satisfactory and reliable units of the size which would allow them to be used on automobiles.

Lost Work Area

There is no doubt but that at the present time we are sacrificing work at the end of the stroke by cutting off the expansion line and exhausting at high pressure. In the ordinary timing diagram the exhaust valve starts to open at fully 45 deg. before lower dead center so that the pressure will

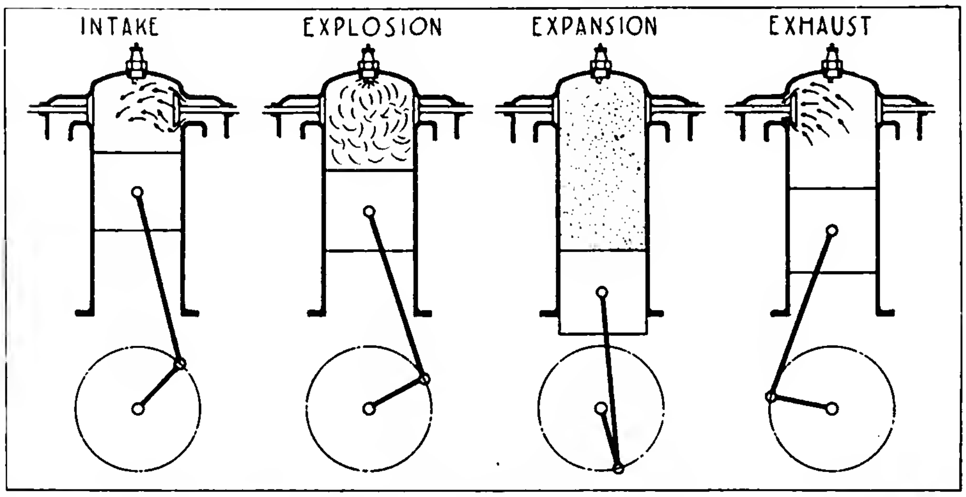

Fig. 4—Charging cylinder at atmospheric pressure, exploding the charge, expansion and exhaust

have dropped to near atmospheric by the end of the stroke. With very high speed motors the time at which the exhaust valve starts to open is much further advanced than this, and the difference of a degree or two on the timing circle is quite large when the angle between the crank and 90 deg. position is less than 45 deg.

To carry the working diagram all the way out until it is quite close to atmospheric pressure generally means a lower speed engine than what would be considered satisfactory in the light of present-day practice.

Mechanical Cycles Classified

It is of hardly any use to go over the old adaptations of these three types of cycles in the early gas engines. It is interesting to note, however, how these early designers who had nothing but the theoretical consideration to work from sought to apply the principles to practical engines. The constant temperature cycle for internal combustion purposes was neglected and the engines which really were built and put into operation can be classified as follows:

1—Those with ignition at constant volume without compression.

2—Ignition at constant pressure with compression.

3—Constant volume engines with compression.

The operations which each of these engines perform are shown diagrammatically in Figs. 1, 2 and 3. The engines under class 1 are of course commercially impossible and of low efficiency. The cylinder is charged as shown in Fig. 4, with explosive mixture at atmospheric pressure. The charge is exploded, expanded and exhausted.

Second Type

The second type with ignition at constant pressure with previous compression is the type of engine just discussed and the one in which it is supposed by some there lies some hope of higher efficiency with lower grade fuels. Engineers who have made history in the gas engine field have worked on this cycle. Among them may be mentioned Brayton, who had an engine in 1872; Foulis in 1878; Crow in 1883; Clerk in 1889 and Diesel in 1892.

Although the engines operating on this cycle perform five operations this was generally accomplished by the engineers named in two strokes. The pioneers in the two-stroke field were Clerk, Robson and Atkinson, in Great Britain and Koerting on the continent. Very ingenious mechanical cycles were invented by these early workers and the engines performed in a manner sufficiently satisfactory to guarantee the future of the gas engine.

The five operations performed by the second class of engines igniting at constant pressure with previous compression are: First, charging a pump cylinder with gas and air mixture at atmospheric pressure. Second, compressing the charge into an intermediate receiver. Third, admitting the charge into the cylinder from the receiver against the compression pressure in a burning state. Fourth, expansion. Fifth, exhaust.

Third Type

The third type of engine is the constant volume design with previous compression which is represented by the Otto cycle and which is in use in all our cars to-day. Although this cycle is generally performed mechanically in four strokes there are in all five operations: First, intake in which the cylinder is charged with gas and air at atmospheric pressure; second, compression; third, explosion; fourth, expansion; fifth, exhaust.

Thus in the two cycles which it is desired to compare each has five separate and distinct operations. We are so accustomed to the seeming ease of accommodation of this third type of engine to the requirements of the automobile that it may be that the possibilities of the second type or the constant pressure engine have been somewhat overlooked. If difficulty is to be encountered, however, in the latter, it will no doubt be in the accommodation of small but efficient high-pressure units to take care of the necessity of injecting the fuel into the cylinder against compression pressure.

Something has been said recently about altering the point of cut-off of the constant volume engine as a means of holding up the thermal efficiency even when operating on partial throttle opening. This in practice would be accomplished by variable cam action and has in fact been tried. It has not worked out satisfactorily, however, on account of mechanical complications. The possibilities of variable cut-off in constant pressure engines are very much greater. On this cycle it is possible to definitely determine the amount of burning fuel admitted to the cylinder in the same way that it is possible on the steam engine to determine the amount of steam admitted. In fact the indicator card has a similarity in many respects to what would occur in a constant pressure gas engine with variable cut-off.

Variable Cut-off Possible

Whether or not the variable cut-off constant-pressure gas engine can ever be adapted to the quick-accelerating, lightweight automobile is a question that is now so hazy that it is impossible to make any predictions with clearness. Yet there can be no doubt that since this subject is one which is ripe for investigation at the present time much light can be thrown upon it and possibly some interesting developments occur. Even with kerosene engines running on the Otto cycle or at least a modification of it, there have been vaporizing instruments suggested which admit the fuel to the cylinder in a state of flame. This is not by any means an impossible state of affairs, but rather one which lends itself readily to the idea of carrying out the expansion line to the greatest possible extent in order to secure the maximum work area on the indicator card from a given amount of charge.

It seems very well possible that the answer to the whole problem lies not in compressing the combustible mixture but rather in compressing the air only and adding the fuel by small successive charges during the stroke. This gives a series of small explosions giving the high-compression efficiency and at the same time holding down the violence of explosion by substituting burning in a highly-compressed atmosphere. A fine line between burning and explosion cannot be drawn, but where successive small quantities of fuel are injected into the compressed air the result is a series of small impulses instead of one violent blow.

This burning charge idea brings back to mind the arguments used by many of those who favored steam in the earlier days of engine manufacture. The burning fuel closely parallels in many of its characteristics super-heated steam. If it can be introduced into the cylinder, cut off, expanded and exhausted in much the same way as steam, it would have in many respects the advantages of the steam engine without the boiler apparatus necessary for the conversion of water into steam. In other words, the proposition is quite plainly a question of whether or not the Diesel or some modification of its cycle cannot be utilized in automobiles.

In many ways the constant pressure cycle seems to be more elastic than the constant volume. Once you have a given cylinder size to fill and a definite compression, which must always be worked to regardless of throttle opening, the engine is bound to fall off in thermal efficiency to a great degree on lesser throttle openings. On the other hand in an engine where the length of the stroke does not necessarily fix the amount of mixture drawn in, and where the volumetric efficiency of the engine does not cut such a heavy figure, it seems quite possible that engines may be constructed which, although no more efficient on full throttle opening, will at least exceed the 3 or 4 per cent secured with the throttle opening used at touring speeds.

Imperfections of Lubrication

How Oil Is Contaminated in an Automobile Engine by Water, Gasoline and Dust—Precautions That Should Be Taken To Prevent Ill Effects

By C. W. Stratford

CONTAMINATION of lubricating oil in the crankcases of automobile motors is without question one of the most potent causes of defective lubrication, and of the numberless attendant evils that follow in its wake. However good the quality of lubricating oil may be originally, when seriously contaminated in the motor sump by water, gasoline, carbonaceous and metallic sediment, or sand, it soon becomes unsatisfactory as a lubricant and its continued use will prove to be very costly in the end.

Water Forms in Oil

Many motorists are astonished to find a considerable quantity of water in the oil drained from the crankcases of their motors. This water has its origin principally in the products of combustion. The burning of a mixture of gasoline with air results in the formation of water vapor and other gases, which are of minor interest here. These gaseous products escape past pistons and rings during the expansion stroke into the crankcase, where the superheated steam condenses into water and sinks to the bottom of the oil sump. Some leakage inevitably occurs, even past the most carefully fitted pistons and piston rings.

The percentage of water formed by combustion is variable and depends to a considerable degree upon the adjustment of the carbureter; that is, whether the mixture is oxygen-rich or oxygen-poor. On burning, rich mixtures (oxygen-poor) give the largest percentage of water and result in the deposit of free carbon. Lean mixtures (oxygen-rich) give the smallest amount of water on burning, and leave behind no carbon deposit. With the average carbureter adjustment the quantity of water present in the products of combustion is approximately 10 per cent. Therefore it is evident that if these products are allowed to leak into the crankcase, past defective piston rings, a relatively large amount of water will be condensed there. During hot weather most of the water vapor passes out through the breather orifices before condensation can take place. This accounts for less trouble being experienced in summer than in winter.

Temperature Is Influence

The operating temperature of the motor has also a marked influence upon the rate of water formation in the crankcase. The lower the operating temperature, and the greater the leakage past pistons, the greater will be the quantity of water formed and vice versa.

All small-bore multiple-cylinder motors experience this difficulty to a greater extent than do larger motors which operate at higher temperatures. Another feature peculiar to multiple-cylinder motors, compared to four- and six-cylinder motors of like capacity, is that of a greater total piston ring length exposed to leakage.

This means that in the multiple-cylinder motor there is an increased likelihood for leakage, due alone to the increased lengths of the piston ring surfaces.

If the lubricating oil is of good quality and free from "sulpho" compounds and animal or vegetable oils which cause emulsification, the admixture of water in the crankcase will have no injurious effect whatever upon the oil.

If, on the other hand, the oil emulsifies readily with water the gelatinous product formed may clog the entire lubricating system and lead eventually to burned-out bearings or other serious damage to the motor. The admission, however, even of good oil mixed with water into the circulating pump is sure to decrease materially the efficiency of lubrication, if not to cause more serious damage especially when the motor is running at full load and high speed.

When water is present in the sump of a motor, and the inlet side of the oil circulating pump is exposed to it, the water is likely to freeze during very cold weather, and, when the motor is started, the pump itself may be damaged or broken. During the past winter this trouble has been widely prevalent, but the cause for such breakage has not always been clearly recognized by users and service men.

Gasoline in Oil

Accumulation of gasoline in the motor crankcase arises from leakage of the gasoline-air mixture past pistons and rings during the compression stroke. In cold weather, if low grade fuels are used, part of the atomized gasoline is not completely vaporized by the heat of compression but falls upon the piston head and is blown past the piston and rings into the crankcase by the pressure of the compression and explosion.

Leakage Always Occurs

Some mixture leakage occurs with all fuels. In this way gasoline, accumulated by leakage either in liquid form or by condensation after leakage, in the motor sump, thins down the oil. As in the case of water condensation, less trouble is had with crankcase gasoline in summer than in winter and for the same reason. As an indication of the thinning effect which gasoline has upon lubricating oil, 5 and 10 per cent mixtures were made with a fresh sample of oil of known viscosity.

OIL GASOLINE BLENDS

Viscosity (Saybolt)	Fresh Oil	Fresh Oil Plus 5 Per Cent Gasoline	Fresh Oil Plus 10 Per Cent Gasoline
100 deg. Fahr.	241	163	111
212 deg. Fahr.	45	42	40

The results show that the body of the oil at average crankcase temperatures, 100 deg. Fahr., with 5 per cent gasoline mixture is thinned down 32 per cent and with the 10 per cent blend, at the same temperature, 54 per cent. At 212 deg. the viscosity of the oil is reduced 7 and 12 per cent, respectively with the 5 and 10 per cent mixtures. This goes to show that the higher the temperature, the less is the thinning effect of gasoline.

Viewing these results from a practical angle, the effect of using oil in which there is a considerable percentage of gasoline would be to increase greatly the direct leakage of oil from the crankcase to the outside, as well as to cause a more rapid leakage of oil past the pistons into the explosion chamber, thus augmenting carbon deposits. Insofar as lubrication goes, very little difference in motor efficiency or immediate wear would be noticed. In general terms, this means that when a motor is started with fresh oil of medium body, gasoline contamination up to 10 per cent would result in thinning down the oil to a viscosity about equivalent to that of a light oil at cylinder wall temperatures.

Over a season's running, however, an appreciable increase in wear would doubtless be noticed. In addition, the weakening of the oil seal between pistons and cylinder facilitates the escape of gases from the combustion chamber.

Carbon and Carbonaceous Matter

When any hydro-carbon oil is exposed to high temperatures, as in the crankcase of an automobile motor, it suffers gradual decomposition. The rate of decomposition depends chiefly upon the temperature of the parts with which the oil comes into intimate contact, and upon the chemical purity and stability of the oil. The products of this decomposition consist of lighter hydro-carbons, free carbon, and complex, solid, polymerized compounds, called carbonaceous matter. The character of crankcase sediment varies widely and is greatly influenced by the thickness of the piston heads and the fit of pistons and rings in the cylinders, also upon the load carried by the motor. An analysis of sediment, taken from the crankcase of a touring car motor, after a month's running, shows free carbon under 2 per cent, metal dust under 1 per cent, road dust 1½ per cent, carbonaceous matter approximately 96 per cent.

Value of Aluminum Piston

The superior conductivity of aluminum pistons reduces the temperature of the piston heads to such a degree as to practically eliminate the formation of a carbon cake on the underside of the piston heads. The use of aluminum pistons is accompanied by a decrease in the rate of decomposition of the oil in the crankcase, due to their lower temperatures. The operating temperature of most cast-iron or steel pistons is sufficiently high to cause the formation of a carbon deposit on the bottom of the piston head. As this carbon deposit becomes thicker and thicker, the temperature of the piston head, due to the poor conductivity of the carbon cake, builds up to a point where premature ignition occurs. Particles of the carbon cake formed under the piston heads are washed off by the oil splash, and fall back into the crankcase and there mix with the oil in circulation. The application of screens between the main crankcase and the oil sump prevents the greater part of this deposit from mixing with the oil. A goodly quantity of it is sufficiently fine, nevertheless, to pass through the screens and in that way to enter the lubricating system.

Neither carbon nor carbonaceous matter, present in the crankcase sediment or as constituents of the carbon residue on the explosion chamber walls, are hard enough to cut the bearing surfaces in moving contact. But they possess, no lubricating properties. They partially take up the place of useful oil in the bearings and consequently decrease the efficiency of lubrication in proportion to the quantity present.

Use of Filters

The application of filters to the lubricating system of an automobile motor would effect the separation of the sediment in the oil, but such filters rapidly clog unless given attention and cleaning. In the hands of inexperienced operators, any filters interposed in the lubricating system of a motor might lead to under-lubrication and injury of the motor parts.

Metallic Sediment

Metal dust results from the abrasion of parts which come into moving contact. No machine was ever built in which there is no wear, consequently in automobile motors an amount will occur directly proportional to the efficiency of lubrication, and metal sediment will always be present in the used oil. It is obvious that the presence of hard metallic particles in the lubricating oil will appreciably increase the rate of wear.

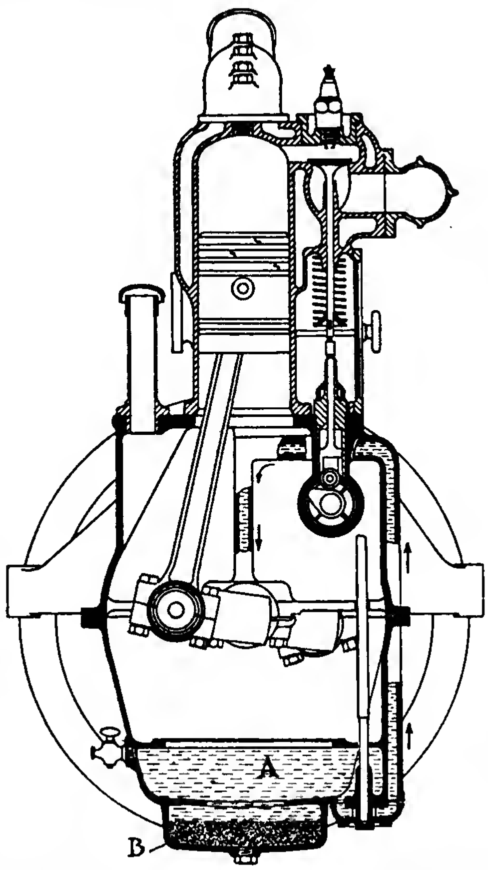
In new motors, formation of metallic sediment proceeds rapidly during the process of "running in." To obviate possible injury, the crankcase of new motors should be drained and thoroughly rinsed out with kerosene at the end of the first hundred miles of running. Part of the small percentage of metal sediment which accumulates in the oil, is sufficiently fine to remain in permanent suspension so long as the oil is in motion, unless provision is made for its separation.

Road Dust and Sand in Air

As we all know, for the operation of internal combustion motors, a continuous stream of air passes through the carbureter into the cylinders. Were this air dustless at all times, no sand or road dust would be found in the carbon deposit above the piston or in the oil within the crankcase. Such a condition of air purity is exceptional. The quantity of dust in the air is affected by many things such as wind, weather, character of roadbed, etc. When a motor car is driven over the average road, especially in dry weather, or in the wake of other vehicles, the air which is drawn through the carburetor is highly charged with finely divided sand or earth particles. This sand is carried in the charge at high velocity into the cylinders where it collects in the oil covering the cylinder surfaces and contributes to the friction load of the motor.

It is possible that part of this dust works its way from the cylinder walls into the crankcase. The pulsation of the air within the crankcase may also cause the entrance of dust by way of the breather pipe. The danger of scored cylinders and bearings is much greater with sand than with metal dust.

From the foregoing it is apparent that some positive means of separating all sediment, which becomes mixed with the lubricating oil in circulation, would be highly desirable from the viewpoint of both manufacturers and users. In very few modern automobile motors has sufficient provision been made for natural sedimentation. The location of most circulating pumps is



A shows clean oil and B dirty sediment. Observe that the intake to the oil pump is in the clean oil and well above the sediment.

such as to offer comparatively easy entrance of the sediment into the pumps and thence to the bearings. It would be difficult to assign any definite figure to the rate of wear and resultant maintenance cost.

Research work on motors in the laboratory, and a few careful tests of automobile motors on the road, have proved beyond doubt that a separation of all injurious sediment from the lubricating oil in circulation more than trebles the possible mileage between complete motor overhauls.

As a suggestion, looking toward higher efficiency of lubrication, a sediment basin of approximately one-fifth of the total volume of the oil sump is to be recommended. The crankcase illustrated is thoroughly practical and shows the correct position of the inlet to the circulating oil pump, sediment basin, baffle ledges to prevent mixing sediment with the oil in circulation, and the plug for draining the sediment basin.

The advantages accruing from this design are multiple, making possible the automatic separation of all deleterious matter and water from the lubricating oil. The frequency of draining the sediment basin will depend upon the rate of leakage of all contaminating substances into the crankcase, operating temperatures, service conditions of the motor and essentially upon the quality and suitability of the oil used. A complete draining of the sediment basin once every thousand miles should be sufficient with the majority of motors.

Since wear and maintenance cost depend directly upon the efficiency of lubrication, the application, in the manner shown, of sediment basins on every motor manufactured, should substantially repay the manufacturer by immediately decreasing the length of his complaint lists, and extending the popularity of his car. The benefit to the car owners would be less motor trouble, fewer repair bills, unfailing and efficient lubrication —satisfactory service.

Getting Proper Brake Action with Hotchkiss Drive

Special Precautions Necessary to Prevent Automatic Application of Brakes by Road Shocks

By A. Ludlow Clayden

IT is a well-known fact that the movement of a rear axle with respect to the frame of a chassis is irregular. With a firmly anchored torque tube the axle center swings as on a pivot and must have its vertical displacement along the arc of a circle, but when the drive is taken through the springs the flattening or curving of the spring causes the axle to move fore and aft as well as up and down, this having to be allowed for on the driveshaft by the provision of at least one universal with a sliding member or telescopic joint.

With the usual cambered spring, compression on passing over a bump in the road causes the axle to move back relative to the frame, and the rebound after the bump will pull the axle forward beyond its normal position. For the majority of bumps the total deflection of the spring is small, which means that the fore and aft movement of the axle is insignificant; but there are cases where this general law does not hold true, and the most important is that of motor trucks.

On a passenger car the load does not vary much, but on a truck the load may account for inches of compression on the spring. Suppose the camber of a truck spring is 8 in. deep when the truck is empty, this may be reduced to 3 in. when the full load is on. This means that the axle moves backward as the truck is loaded and forward as it is unloaded, passing over bumps causing the usual fore and aft movement but with a different mean position for the axle according to the load.

Brakes Applied Automatically

On a truck, the total amount of movement fore and aft may be quite considerable when the variation due to load is taken into consideration, together with that due to road shocks. Therefore, allowance must be made somewhere to prevent automatic application of the brake caused by the movement of the axle.

Consider the case geometrically. The brake actuating lever on the axle moves in a curved path; to it is attached the brake pull rod, and the front end of the pull rod is attached to a lever somewhere on the chassis frame. The rod is of fixed length and so the end which is pinned to the brake lever on the axle must swing in an arc of a circle having the front end of the rod for its center.

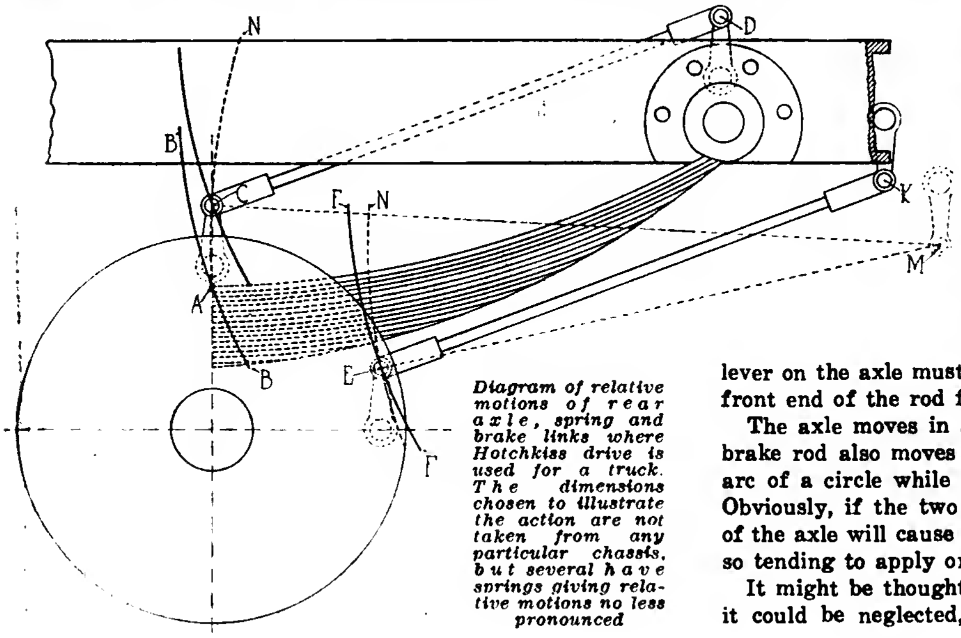


Diagram of relative motions of rear axle, spring and brake links where Hotchkiss drive is used for a truck. The dimensions chosen to illustrate the action are not taken from any particular chassis, but several have springs giving relative motions no less pronounced

The axle moves in a curved path and the rear end of the brake rod also moves in a curved path, but the latter is an arc of a circle while the former need not be and seldom is. Obviously, if the two paths do not coincide, then movement of the axle will cause the brake lever on the axle to oscillate, so tending to apply or to release the brake.

It might be thought that this tendency was so slight that it could be neglected, but laying out the curves on paper shows that this is not true. Often it is not sufficient to place the brake countershaft at any convenient position and to link it up to the axle while trusting to lost motion in the brake band itself to care for the oscillation. That this is so is shown in the cut below. Admittedly, the case chosen for illustration is an extreme one, but there are plenty of such cases to be found in trucks. The proportions of the spring are not so very abnormal.

Referring to the illustration, the path of the middle point of the spring as under compression and expansion is plotted, *A* being the normal point and *BB* the curve. Also the paths of two brake lever eyes, one at the top of the brake and the other on the horizontal line. Regarding these two curves, it is obvious that there is for each of them a circle, an arc of which will approximate closely to their curvature. Choosing two such arcs, one for each position of the brake lever, we then see that there are only two possible centers for the front end of the brake rod; in other words that the length of the pull rod and the position of the front end of the pull rod are fixed absolutely when the position of the brake lever on the axle has been decided.

Variations Are Large

Taking the top position for the lever on the axle, the arc which corresponds most nearly to the path of the eye has a radius *C, D*, which gives a pull rod of normal length. If this rod swings on a high placed center *D* it will be possible to have all variations of load and road shock without disturbing the brake setting, but if the center is low placed, as at *M* then the travel to and fro of the end of the brake operating lever can easily be as much as 3 in.

Taking the horizontal position for the lever, the nearest arc has a radius *E K*, permitting the use of a brake rod placed in a more convenient position, but here observe the evil effect of using too long a pull rod by contrasting the arc *F* obtained from center *K* with the arc *N* obtained from center *M*.

It may often be found on passenger car chassis, especially those with flat springs, that there is considerable latitude for the pull rod center. On trucks, however, there can seldom be much latitude, for maximum brake effectiveness.

In brake design there is one very definite limitation, and this is the amount of movement that can be given to the brake pedal. The operating range for the driver's foot is not very large, so that lost motion anywhere in the linkage is equivalent to a reduction in the useful travel of the pedal. This means that, if allowance has to be made for much lost motion, adjustment of the brake will need to be made far more frequently. Suppose the pedal has a travel of 6 in. and there is no lost motion, it will be possible to adjust the brake to come into operation fully after the pedal has been depressed 2 in., leaving 4 in. to take care of wear, 4 in. to be used up before adjustment is necessary. If a big allowance for lost motion is required this 4 in. may easily be reduced to 2 or less, so cutting in half, or less than half, the period before adjustment will be called for.

Fifteen Studebaker Ambulances for Russia—One for France

FIFTEEN Studebaker Sixes, all 1916 models, equipped for service as ambulances in the Russian Army, are to be sent to Russia, April 20, by the American Ambulance in Russia, which within two months raised funds enough for the complete purchase of this flotilla and its equipment.

On April 10 the ambulances were formally turned over to Consul General Oustinoff after they received the blessing of Archbishop Evdokim of the Greek Orthodox Church of North America.

The ambulances will be in charge of Dr. Phillip Newton, who holds a general's commission in the Russian army, bestowed upon him by the Czar for his services with the Russian army under fire. Dr. Newton came to this country about two months ago to raise funds for this flotilla, which will include two repair cars, one pilot car, a hospital car with tent, and twelve ambulances, one of which goes to France. These ambulances will be equipped with four stretchers, and there will be sitting room for eight wounded.

Automobile Electricity

Locating and Curing Troubles

PART III

Troubles by Units Considering Each Individual Part of the System Separately and Denoting the Troubles Which Are Commonly Found in Those Parts

By J. Edward Schipper

Synopsis

Part I—April 6

¶ *Three fundamental thoughts were established in the first part of this electrical series.*

¶ *First: Continuity of which the circle is the symbol. Electricity flows in a circle or circuit. The circle must be complete.*

¶ *Second: The basic law of current flow. In order that this should exist there must be sufficient voltage.*

¶ *Third: Trouble testing by elimination. The electric circles are divided into a number of arcs by bridging across and these arcs are gone over one by one. These three principles are applied to the lighting, starting and ignition circles.*

Part II—Last Week

¶ *Finding trouble by symptoms in starting and lighting systems. Classifying these and indicating the possible troubles for each set of symptoms.*

Part III—This Week

¶ *Locating troubles by units in starting and lighting. Knowing the unit in which the trouble exists, the possible locations and causes are given in detail.*

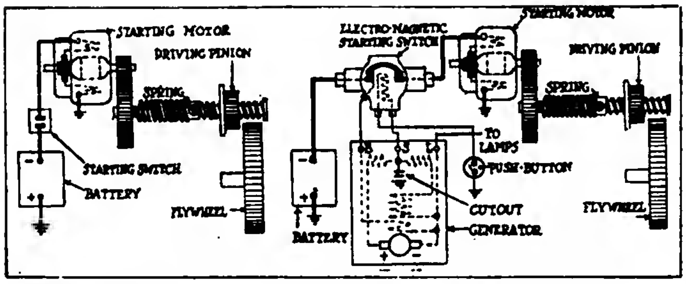
IN a large percentage of instances it will take only a minute's inspection to determine exactly in what unit the trouble is located. For instance, if the trouble is in the starting motor there may be symptoms that render it impossible for one to come to the conclusion that the trouble were anywhere else. The next step would be generally to have the starting motor removed and brought into the shop where the work could be done upon that unit.

This part of the electrical series deals with troubles which are located in a definite unit.

Basically, even if the troublesome unit is known, the matter is simply one of elimination. It is a case of traveling from the known to the unknown, step by step until finally the bad spot is reached. However, there are short cuts which can be employed on definite units which will greatly lessen the work and prevent the repairman from taking down the entire part in a search for some little defect which can probably be located by using simple tests. These cannot be classified under general heads but will be suggested in taking up the troubles which occur under their particular heads.

Units of Starting and Lighting Systems

Since all starting and lighting systems are manufactured to perform the same functions, it is but natural that they should be made up of units which do the identical work. All systems are provided with a storage battery, all have generators to maintain the current supply, all have starting motors to crank the engine, regulators to govern the rate of charging, switches to control the action of the various units and wiring to connect these units and provide a path, the circle, over which the current shall flow. Certain types of each of these units have certain inherent weaknesses and these are naturally the points watched more closely by the man familiar with the business. Again, just as in cars it very frequently happens that the first run of a certain series will have certain weak spots which are corrected in the cars



Westinghouse starting awitches; mechanical and magnetic on left and right

bearing a higher serial number, so in electric lighting and starting systems the earlier developments may be electrically correct but mechanically weak, or vice versa, causing certain troubles to develop in the earlier models which do not occur in the later, and it is only fair to state that the latest developments in starting and lighting systems show a remarkable amount of attention given to these little kinks which at first were the causes of most of the trouble.[*]

Logically the only method by which the troubles can be taken up in detail is to take up each unit singly and, since the battery is the starting point, it is considered first.

Battery Troubles and Their Remedies

SYMPTOMS that the trouble is in the battery are superficially given when the light in the car lamps burns but dimly, when the starting motor cannot turn over the engine rapidly or at all, or when the lamps turn on brightly and soon die down. Any one of these may be due to other causes, but when two or three of them come together the trouble is practically surely in the battery. The common method of testing the battery to find if it is in good condition or whether it is giving any current at all is to connect the terminals of a test lamp across the positive and negative battery terminals. When testing a three-cell battery the 6-volt lamp can be put across each cell and the light should burn dimly each time. When the test lamp lights across the terminals of two of the cells and not across the third it is an immediate indication that the trouble is in that definite locality and the battery should be immediately referred to the service station of the maker. If the cells are all weak, as is shown by no glow of the test lamp across any of the cells or only a dim light when put across the positive and negative terminals of the entire battery, it indicates that the battery is partially exhausted and it should be charged. If the charging does not increase the electrolyte's specific gravity or the voltage up to standard the trouble should be referred to a battery service station if possible. One precaution must be observed, do not run the engine with the generator in place and the battery removed without lifting a brush from the commutator. There are a few systems in which no damage will occur when this precaution is not taken, but unless you are positive the system you are working on is one of the exceptions, it is far wiser to follow this rule.

With the hydrometer syringe measure the gravity of the electrolyte and when charged the reading should be between 1.275 and 1.300 and when discharged never below 1.150. The facilities of the ordinary car owner or repairman will not allow him to do any practical work in batteries, as far as the internal construction is concerned.

Sulphation of the battery lies within the scope of the repairman as it can be generally cured by giving a long slow charge, or in other words by making the charging rate of the battery three times as slow as normal. The repairman, however, should go further than merely curing the sulphation as he should take up the inherent trouble or defect which is making the sulphation possible. Generally the causes of the over-sulphation are over-discharge or rapid discharge either of the entire mass of active material due to some exterior short or more than normal ampere draw, or from some local short which quickly discharges certain portions of the active material. Dead shorts will more than sulphate the battery as a rule and will generally cause the cracking and shedding of the active material from the plates or cause them to buckle. Insufficient charging also causes sulphation.

Batteries should be cleaned from time to time so that the sediment does not rise up to the plates, cutting down their available surface. Battery repair, however, should only be undertaken by those who have the necessary equipment and experience. One point of battery care which is important, however obvious, is that the exterior must be kept clean, and where acid has leaked out and collected on the top of the battery it must be cleaned off. It gives a slight short across the top of the battery which makes a material reduction in the supply of current after a time. In fact, acid on top of the battery will often fool an experienced repairman who knows that there is a slight short somewhere and will look for it in the wiring. All trouble searching or shooting, as it is often called, should start from the battery and work out, and before the battery is left the repairman should make sure that there is no leakage of electrolyte through the sides or top, that the terminals are not bent over touching the metal battery box and that none of the insulation of the wires is soaked with acid. Tight terminals should also be the rule, although of course this belongs more to the wiring than to the battery.

Repairs on the Generator

GENERATOR troubles can be divided into two heads, mechanical and electrical. They are often combined as a mechanical trouble will also set up an electrical interruption as a general rule. Probably the most frequent cause of generator trouble in the average type of machine is in neglect of the lubrication of the armature shaft bearings, although it is true that a number of makes are free from this due to the specific care taken to avoid this trouble. If trouble has been traced to the generator, as it can be as a rule through the fact that the ammeter reading indicates either no charge or weak charge, the first place to look is at the commutator. Removing the commutator housing, the commutator surface and brush mechanism will be exposed, giving access to what is generally the heart of any electrical troubles which might have occurred.

Commutator Assembly

With the commutator housing removed, or any other housings possible on the particular make under consideration, the armature shaft is rotated slowly by hand allowing the repairman to locate binding or worn out bearings. As the armature shaft is rotated the surface of the commutator is examined to see if it has become rough or blackened.

Since the brushes of the generator are constantly in contact with the commutator it is but natural that they should wear away, and they do so in the form of metallic powder or dust. If this is allowed to accumulate it will sometimes

---

[*] It will be interesting in passing to give an instance of this. On a certain make of generator the armature bearings were inclosed in such a way that unless the driver of the car oiled the bearings every 500 miles they ran dry. It is a well-known fact that a car owner will not oil anything that he cannot see and the result is that very soon these generators, which were driven at three times crankshaft speed and hence were the fastest moving parts on the car, soon began to come into the repair shops for bearing replacements, and often, because the bearings had worn so far that the armature swept against the pole pieces, the armatures were also frequently destroyed and required replacement. This fault was soon perceived by the manufacturers, who installed a bearing which held the lubricant so that if only oiled at long intervals sufficient lubrication was provided. Instances of this kind can be cited almost without number and on this score it can only be said that experience is the only thing which will teach a repairman the little peculiarities of the great number of starting and lighting systems which were put on the market during the early development of this method of cranking and illumination.

fill the ridges between the commutator bars causing occasionally a short-circuit between the brush holders. A rough or blackened commutator should be cleaned and smoothed with fine sandpaper while the armature is rotated. A rule which must be remembered is that emery should not be employed for cleaning the commutator. Loose commutator bars or broken windings almost invariably mean that the machine must be returned to the factory.

A common trouble which can be cured in an ordinarily equipped shop is high mica, which protrudes between the commutator segments. These high mica parts must be cut down carefully so as to be below the surface of the commutator, and generally in doing this work it will be necessary to take the machine down. Little need be said about the work of taking a generator down except that in the case of permanent magnet types, where the permanent fields have to be removed, a keeper, or heavy piece of steel, should be put across the magnet poles in order to preserve the magnetism. In returning the magnets great care must be taken that they are replaced in the same positions as they were before.

Brush Troubles

Brushes will sometimes be found to be sticking in the brush holders, with the result that imperfect contact is made between the commutator and the brush, or occasionally no contact at all. Grease and dirt will generally be found to be the cause of sticking, and the cure is cleanliness. Should the trouble, however, be due to brushes which are too large, they can be filed carefully to secure perfect fit in the holders. Sometimes the poor contact is due to bad spring tension which does not press the brush against the commutator. This trouble is overcome by a fresh adjustment on the spring, or a spring replacement. Too much pressure, however, between the brushes and the commutator should be guarded against, as excessive pressure would cause the brushes to overheat and deteriorate.

It is not good economy to use any but the best brushes, and in making brush replacements the best policy is to secure the new brushes from the maker of the generator. Commutators naturally must be clean, free from grease and bright. It is also of great importance to have a clean complete contact between the brush and the commutator.

Automatic Cutout and Regulator

The automatic cutout and the regulator may be considered a part of the generator since they have so much to do with its action and since as a growing practice they are mounted directly in unit with it. The automatic cutout prevents the battery from becoming discharged through the generator when the engine is not running. It also connects the generator to the battery when it is time to charge the latter or when the car speed reaches a fixed amount.

Troubles in the automatic cutout are generally those of adjustment of the spring tension or weight which acts against the tendency of the relay magnet to close the contact between the generator and the battery. On some regulators it is impossible to make any adjustment on the spring controlling the automatic cutout because the makers seal the regulators and avoid all guarantees when the seals are broken. Adjustment can be made on others by bending the flat spring carefully or by lengthening or shortening the coil springs. In general the farther apart the cutout points are separated the higher the cutting in speed of the generator. Therefore if the cutout closes at too low a speed this can generally be cured by separating the points.

Cars which are driven practically always at night require a different setting of the cutin mechanism than on cars which are seldom driven after dark, and the charging rate of the generator on a car driven practically always at night is often changed by the service manager who happens to know exactly the conditions. If a battery does not receive sufficient charge or it is continually in a run-down condition it is generally considered evidence that the cutout is not closing soon enough, provided there are no shorts anywhere on the line.

If some method of regulation were not employed the charging rate of a generator would increase rapidly with the speed, but in order to maintain the life of the battery the

Remy model 150 reduction gears, over-running clutch and frame

ampere flow entering it must not rise above a certain point. There are two basic methods of doing this, one by regulating the amperage of a quantity of current and the other by regulating the voltage or the pressure of the current. The voltage or pressure is what causes the current in amperes to flow. With the realization of the importance of the regulator in mind the ammeter should be carefully watched to check the charging rate.

Electric Starting Motors

WITH rare exceptions electric starting motors are series wound. This means that the current passes from the commutator through the brush, through the series field, then out through the line and back through the other brush to the commutator. Electrically, therefore, practically all starting motors are alike. Mechanically, they vary in their shape and construction and in the method by which they are connected to and detached from the gasoline engine.

Electrical troubles are very scarce in starting motors for two reasons; first because they are simple, and second because they are only in use a limited length of time in starting the engine. The mechanical troubles are in the majority of instances connected with the mechanism for throwing the starting pinion in and out of mesh. The arrangements for doing this are generally different, probably the most common method now being a magnetic scheme or by the Bendix gear. Roller clutches are also used and sometimes the starting pinion is engaged positively by pressure on the starting pedal. Where motor generators are used constant mesh machines are sometimes employed in which the machine acts as a motor below certain speeds and a generator above a given speed. Cases where the meshing mechanism fails to work are easily detected, and generally the case is one which should be treated mechanically, although in magnetic designs the solenoid should be examined to see if coils are in good condition and are pulling the starting pinion into place.

Armature, commutator and brush troubles may occur on the motor just as in the generator, and the detailed explanations and descriptions given under the generator head may be applied to the motor. A clean commutator and proper brushes in correct adjustment are necessary to the proper performance of the starting motor the same as they are to the generator.

Wiring and Connections

A LARGE percentage of the minor troubles encountered by the car driver are in the wiring and connections. Small grounds, short circuits and current leaks are due to some defect in insulation, especially of terminals, connectors, switches, etc. Sometimes these troubles may become the cause of more serious difficulties if they are allowed to go without attention. A small ground in the battery circuit may result eventually in the sulphation of the storage battery. A worn starting switch has been known to cause a stripped flywheel gear, and thus although the trouble in itself may be only some little detail it may be serious enough to give a great amount of annoyance if it is not looked after.

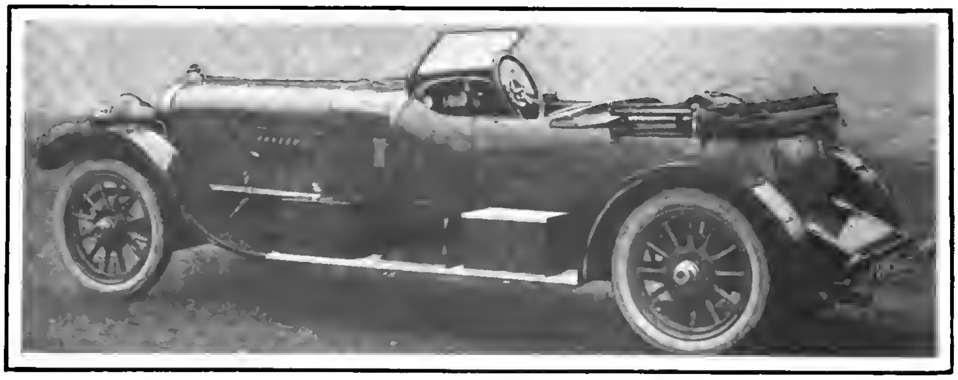
In a two-wire system in order to secure a ground, contact has to be made with both wires and some part of the frame of the car. In a single wire system any contact with the car frame gives a ground. In either system all wires should be insulated from each other except at points where contact is necessarily made, and there the connections should be soldered and taped.

Wires must be secured against chafing and therefore should be fastened securely in position. The installation should be made so that there is no possibility of sharp metal corners or edges cutting through the insulation and eventually establishing a ground or short circuit. Wherever grease and water are to be found wires should be especially protected because of the rotting action on the insulation.

With these points in mind repairs can be made after they have been found by the systematic method of search explained. Motor and car vibrations will often loosen the wiring and cause poor and intermittent contacts to be made. The connections to such units as the motor switch, dash instruments and switches, battery, generator, motor, etc., should all be so carefully made that a great factor of safety is given against possible disconnection. The contact pieces and electric switches should break quickly and not be in a position to cause arcs across the contacts thereby burning them and quickly destroying their usefulness. Switches, connectors, lamp sockets sometimes short-circuit or wear out and should be replaced. Burned-out bulbs are obvious and are the first things looked for when the lamps do not light. They form one of the little detail parts which must be constantly watched in maintaining the proper functioning of an electric lighting and starting system.

A New Sunbeam Six-Cylinder Model

THE accompanying illustration shows a new model of Sunbeam six which has been prepared for after-war business and is interesting because it shows the latest ideas in British bodywork. In general the lines are not unlike those of the Mercer, the top of the hood being fairly flat and the radiator much the same shape. The "tumble home" on the sides of the body is apparently greater than on any American stock car. The use of flt fenders is to be noticed, the domed pattern having found less favor in England and France than in America.



Building Up Sheet Aluminum Bodies

Eliminating Elaborate Hammering by Using Acetylene Welding

LAST Fall THE AUTOMOBILE described the Franklin car construction fully with the idea of showing how the light weight was obtained. Mention was made of the large amount of weight cut out by using sheet aluminum for the fenders and for the body panels. Sheet aluminum is a very ductile substance and can be bent and hammered into almost any shape, but very elaborate hammering is costly, as it is not a rapid process and calls for highly skilled labor.

Minimizing Waste of Material

It is an ideal with many body builders to-day to cover all wood completely, so as to have a continuous sheet of metal without seams or joints all over the outside of the body. This can be done in steel when there are no elaborate curves, and in aluminium for almost any shape, but the modern trend is toward the use of several pieces of the covering sheet metal, welded together so as to avoid the joint without the necessity for wasting much sheet in cutting out or for difficult forming operations.

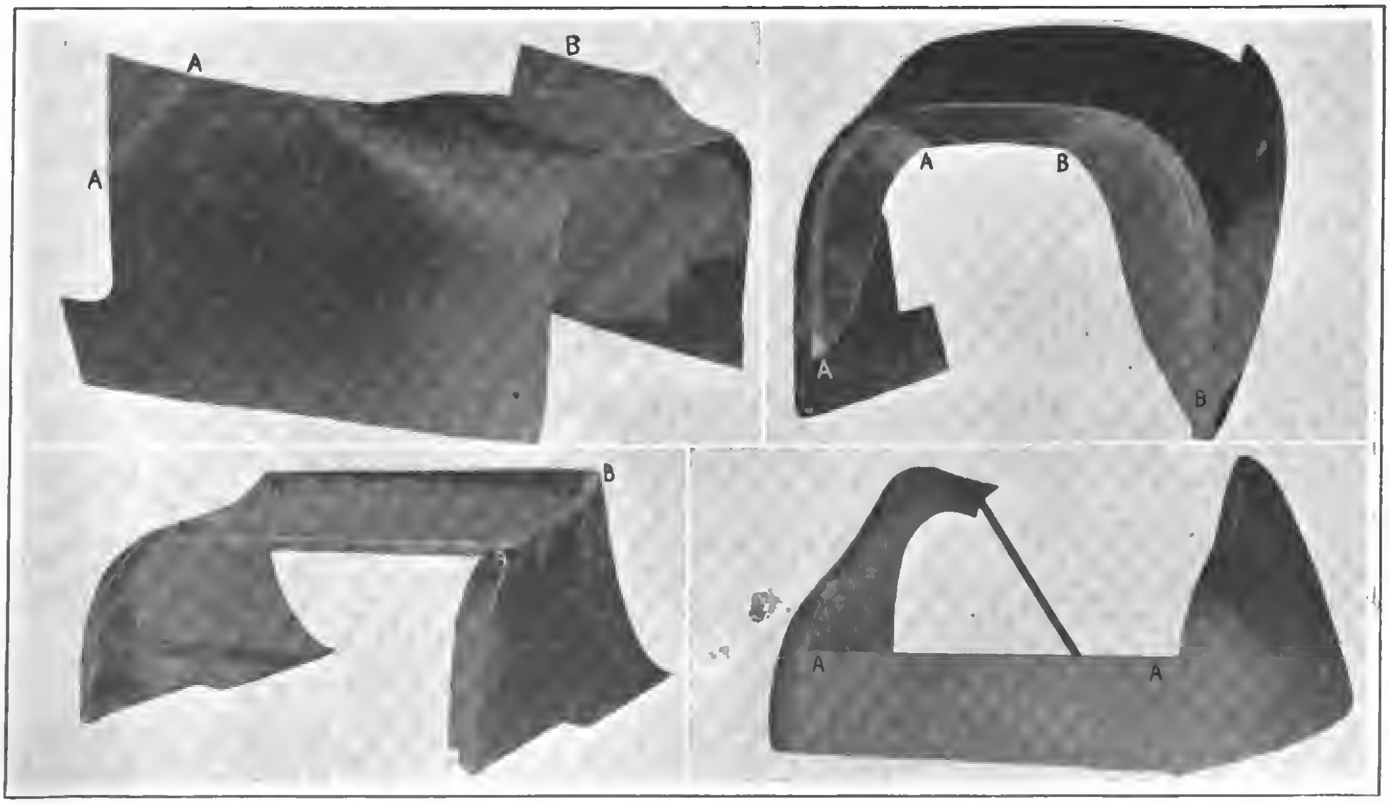
Welding Franklin Cowl

The Walker-Wells Co., Amesbury, Mass., is doing some interesting welding work on the Franklin bodies, with economy of production, excellence of jointing and avoidance of the need for much hammering as the aims, and some of the work is shown in the accompanying illustrations. A striking example is the Franklin cowl. This formerly presented many difficulties, owing to the very large amount of metal needed on the front to form the face of the dashboard where the hood junction occurs. Now, the cowl is hammered to shape to get the top and sides, but very little metal is turned over in front. Two pieces of metal are then cut to shape and welded in by a Prest-O-Lite outfit, using the "baby" or type G blowpipe. That the work is very rapid is shown by the time taken for this job, seven minutes, the length of the weld being 60 in.

Roadster Rear Boot a Problem

Another awkward piece of body metal is the portion covering the rear boot on a roadster. This has a curved top and two curved sides which are now made in three pieces and mounted upon a jig. When thus rigged up from five to eight minutes suffice for completing the weld. This particular design of boot could scarcely be covered with a single sheet of metal prepared any other way as it would be an almost impossible hammering job to make a piece of the required shape.

The system of welding small pieces together is adopted by the Walker-Wells Co. for other jobs besides the Franklin bodies; one of the Winton inclosed bodies is made on this plan with great economy of time and material, and many other examples could be mentioned.



Some excellent examples of acetylene welding work in the building of sheet aluminum bodies. Upper left—Small pieces of aluminum sheets welded to corners of sedan cowl, saving a considerable amount of material in the layout of this pattern. The welds are indicated by the letters A and B. The time required for the operation was five minutes.

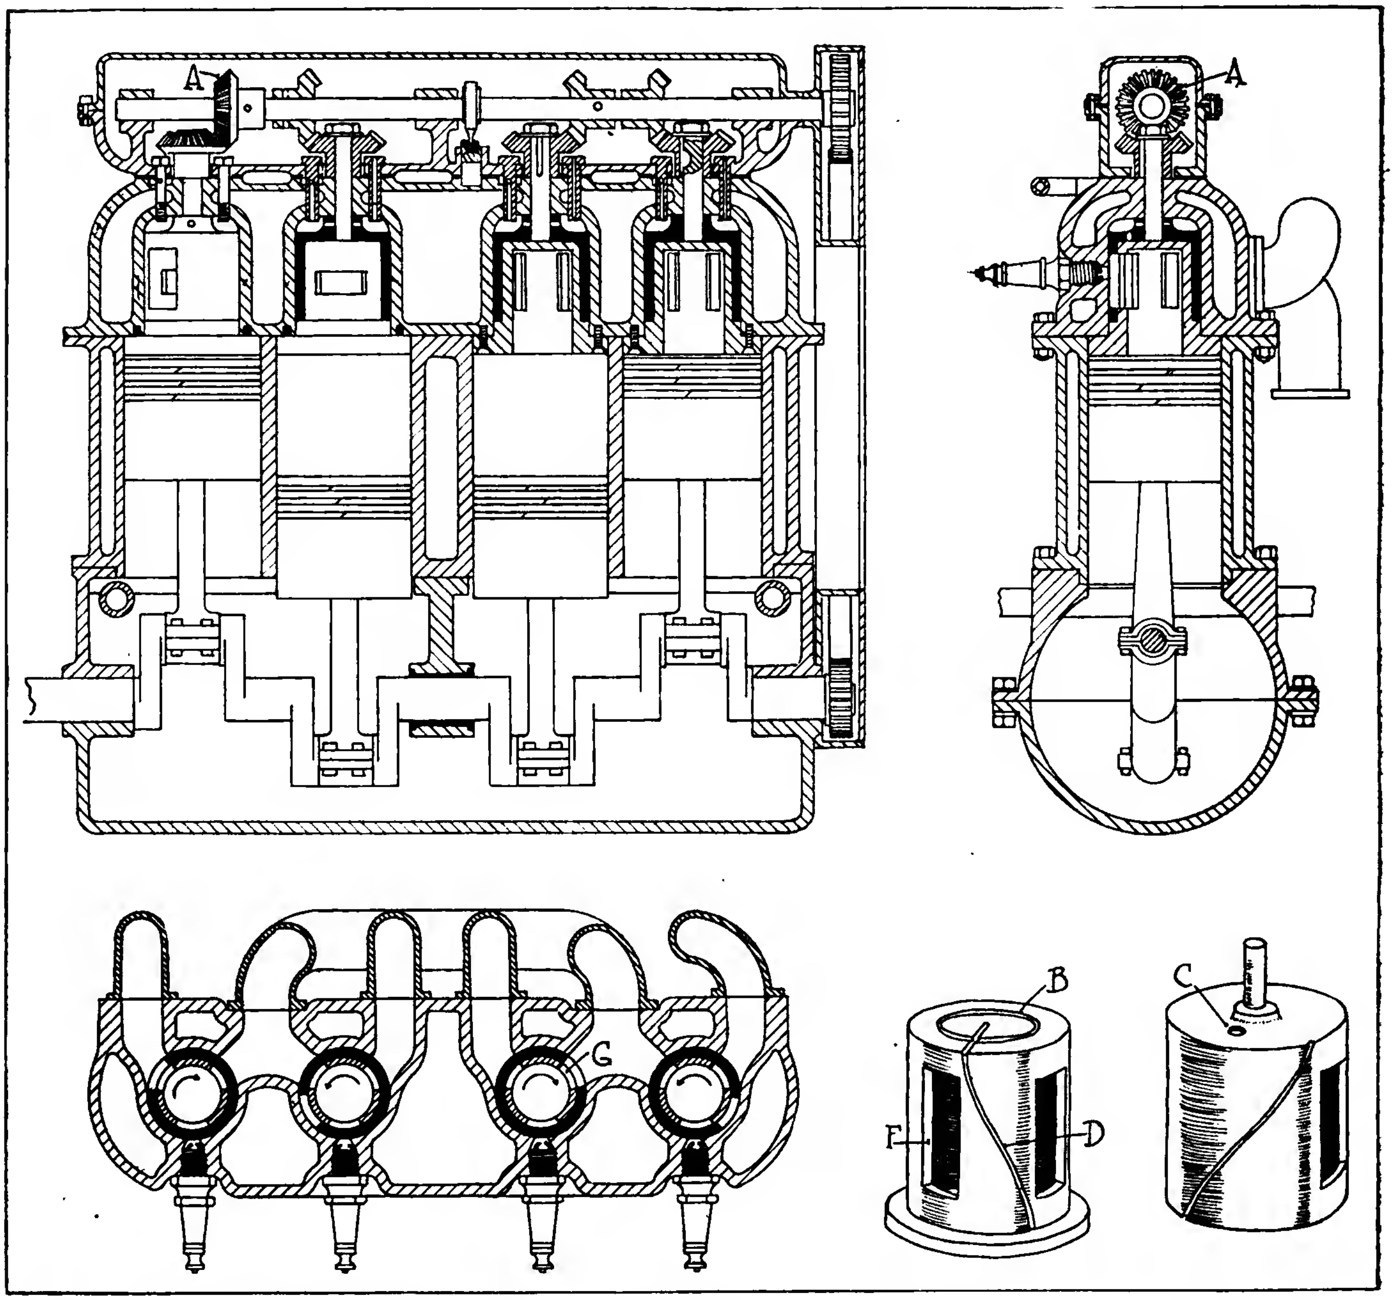
Upper right—Front panels welded into the Franklin cowl to meet the lines of the sloping hood. Two welds are indicated by the letters A and B. This operation was completed in seven minutes.

Lower left—Another view of roadster rear boot. This operation was also carried out in seven minutes, the two welds being indicated by the letters A and B.

Lower right—Rear quarter panels of Franklin roadster which were welded at A, the work being done in four minutes.

Schofield Motor Employs Inverted Cylindrical Cup Valve

All Valve Parts Rotating—Combustion Chamber of Smaller Diameter Than Cylinder Proper—Balance Valve Construction



Sectional views of the Schofield rotating inverted cylindrical valve motor, showing details of valve operation and construction

A ROTATING sleeve motor which incorporates a number of novel features is being developed by George L. Schofield, Kansas City, Mo. The motor does not differ from ordinary practice anywhere in the assembly between the bottom of the crankcase and the top of that part of the cylinder swept by the piston. Above this point, however, incorporated in the superstructure necessary with this motor, is the valve action. The valve proper is an inverted cylindrical cup pierced by rectangular openings which form the ports. Each of these valves is carried on a vertical stem or shaft which is rotated by a single longitudinal shaft.

Referring to the sectional and diagrammatic illustrations herewith, it will be noted that these inverted cylindrical valves rotate within an annular space provided for them above the main cylinder. The space within the valve chambers forms the combustion space of the motor so that the combustion space is of smaller diameter than the expansion chamber in the cylinder.

Referring to the plan views, it will be seen that the interior wall of the combustion chamber is pierced by three ports, one for intake, one for exhaust and the third at the spark plug opening. The rotating valve itself contains only one port, and when this single port is in line with any of the three in the interior wall of the combustion chamber, as at *G*, either exhaustion, intake or firing takes place.

As the valve is rotated from the longitudinal shaft by means of the bevel gears *A*, the port comes in line with the intake opening, allowing a charge of gas to pass in through the openings in the rotating valve which is shown in solid black in the sectional illustrations. This charge then passes through the opening in the inner wall of the combustion chamber and at the proper time the intake is closed when the valve port no longer registers with the intake passage.

The piston then moves up on its compression stroke while the valve is rotating until when the firing point is reached the valve opening registers with the spark plug opening and firing occurs. Immediately after this takes place the spark plug is cut off from contact with the hot gasses and the valve moves around until it finally registers with the exhaust port, allowing the gas to escape into the manifold and the pressure in the cylinder to fall to atmospheric.

Pressure Feed Lubricates Valve

The valve must be lubricated on two surfaces, since it rotates within an annular passage and this is accomplished by a pressure feed which forces the oil down on to the top of the valve where it enters a groove cut down along the side of its cylindrical surface, thus taking care of the exterior wall. There is also a hole *C* cut in the top of the valve, allowing oil to enter into the groove *B*. From here it is led through the groove *D* to the inner surface of the valve wall providing a lubricating film at this point.

The construction used with this motor allows the entire head to be taken off, exposing the cylinder walls. The internal valve member *F* is bolted to the superstructure and is removed with it. The advantage of accessibility is claimed for this construction.

As regards balance of the valve this is obtained by the arrangement of the ports which permits equal pressure on all sides. The engine is also said to run cool due to the great amount of water space surrounding the combustion chamber and the fact that the gas is allowed to expand into a separate chamber below. Thus there is a much greater amount of water around the combustion space where it is needed than there is around the expansion chamber where there is a desire to conserve the heat to as great an extent as possible.

Valve Mechanism Is Chain Driven

The arrangement for the valve drive is simple and in the drawings consists of a silent chain drive to the longitudinal shaft above. In order that the engine may be balanced mechanically the adjacent valves rotate in opposite directions. There is no reciprocating action in any of the valve parts, the entire cycle being accomplished by rotation.

A study of the details of construction in the illustrations herewith shows the valve driving mechanism to be mounted at one end of the motor taking the silent chain drive from the end of the crankshaft. The longitudinal valve shaft is carried on three bearings. The lubricating pump is operated from the valve shaft supplying oil under pressure to the oil distributing grooves in the valves. The entire valve drive mechanism operates in a bath of oil, allowing the top of the motor containing the bevel gears to act as a reservoir.

Benninghofen Engine for Small Plants

A SINGLE-CYLINDER, four-cycle vertical gasoline engine intended for power purposes in small plants or as an auxiliary in large plants, has been brought out by C. Benninghofen & Sons, Hamilton, Ohio. This is a throttle-governed engine developed to supply the demand for a small, efficient unit capable of operating at a uniform speed at low fuel consumption.

To secure close regulation and speed, it has been found necessary to use liberal weights in the flywheels and also to control carefully the amount of fuel admitted to the cylinder. This dual condition has been met by the use of the Benninghofen throttle governor which is designed to be sensitive and to hold the fuel consumption down to the minimum. An example of this is given by the company, which states that these engines have been known to operate continually for 7 hr. and 40 min. on 1 gal. of gasoline.

The uniform speed of the engine and its low operating cost make it adaptable for driving generators in connection with small lighting plants, and the function of regulation is performed entirely by the sensitive governor, so that the lights can be burned from the generator without showing variations in brilliancy.

Benninghofen stationary gasoline engine

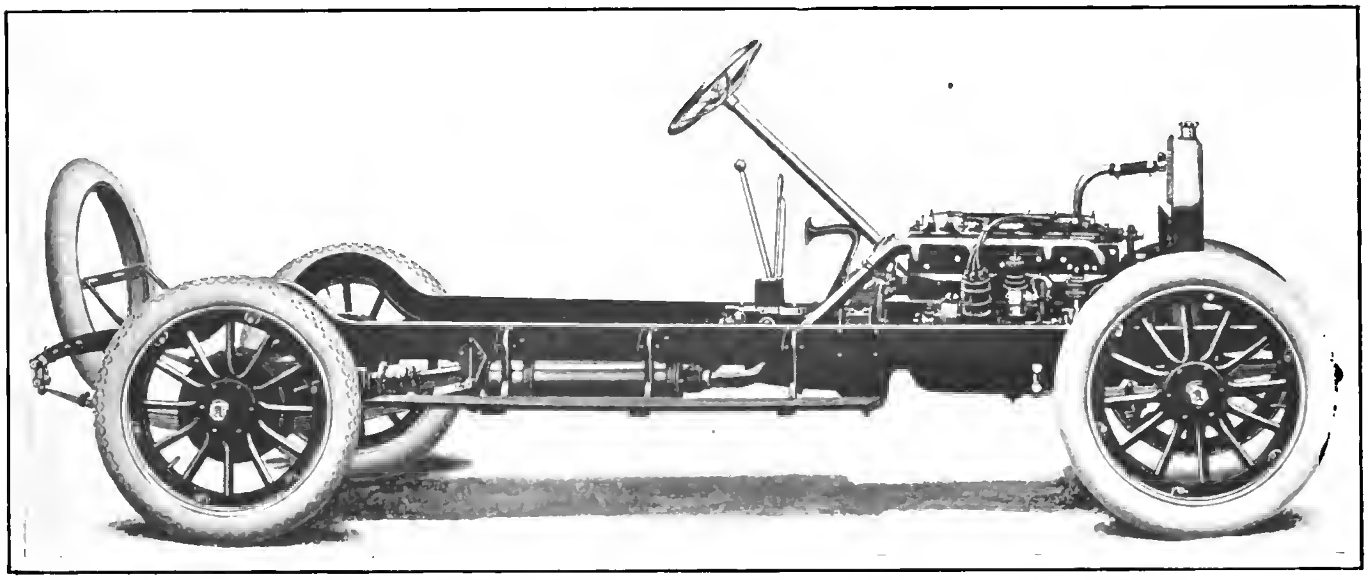
Besides the throttling governor the engine has other novel features, among which may be mentioned the force-proof cooling hopper; the solid cast-iron fuel tank forming a part of the engine; the quickly-removable cylinder head with valves and spark plug as well as other features. Each engine is supplied with a priming cup to facilitate starting. Its weight with complete equipment, including battery, coil box, coil, plug, carbureter, skids, etc., ready to run, is 475 lb. The price is $35 f.o.b. Hamilton, Ohio. A table of specifications is given herewith.

Brake hp.	2
r.p.m. at which power is developed	450
Maximum r.p.m.	600
Stroke	5 in.
Bore	4 in.
Overall length skids	40 in.
Overall width	31 in.
Overall height	42 in.
Solid driving pulley, 4-in. face by 8-in. diam.	
Flywheels (2) face	1¾ in.
Shipping weight	500 lb.

For engines like the Benninghofen there is a much larger field than is realized by the majority of people. An engine built with solid proportions intended for stationary use is nearly always a much more efficient and economical power plant for a small shop or for farm work than the old automobile engines so frequently used. For a stationary engine reliability and economical running are the first essentials.

Anderson Six a Southern Product

Good Units Assembled in Neat Chassis with Extra Lavish Equipment



Anderson six chassis made by Anderson Motor Co., Rock Hill, S. C., showing frame kick-up over rear axle

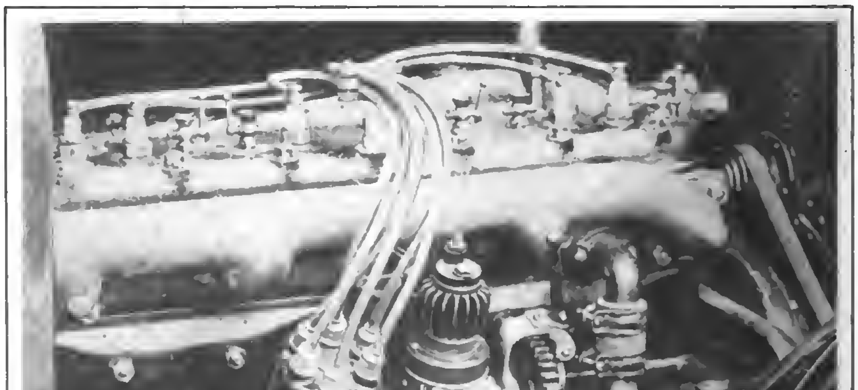
A NEW car manufactured in a new territory as far as the automobile industry is concerned is announced under the name of the Anderson 6-40. The manufacturer is the Anderson Motor Co., Rock Hill, S. C., and the officers of the company are members of the Rock Hill Buggy Co., which company has been in business for a number of years manufacturing buggies and wagons.

The new car is an assembled design worked out by Joseph A. Anglada, who is chief engineer of the concern. The work on the car has been going forward for about eighteen months and production has now been started. The car sells for $1,250.

Probably the most noteworthy feature of the car is in the fact that it is unusually complete in its equipmnet. The standard car is fitted with a power tire pump, searchlight, trouble light, cigar lighter, Motometer and tonneau heater, all as regular equipment at the list price. Another feature is the arrangement of the crowned fenders and mudguards which are manufactured together with the complete bodies in the factory of the Rock Hill Buggy Co. A thoroughly up-to-date job has been done in the upholstering and in the seating arrangement which incorporates divided front seats with an intermediate extra seat just behind and a roomy three-passenger seat in the rear. This gives a seating capacity of six in the touring car.

The roadster has a capacity of four passengers, and even five could be seated without excessive crowding. This is accomplished by using a folding seat in the rear which can carry either two or three persons as desired. The roadster, and the touring car as well, have an individuality of coloring which is unusual, the touring car is dark brewster green body with the fenders, etc., black. There is a red pen stripe around the body. On the roadster the color of the body is a khaki gray with dark brown fenders giving a contrasting appearance. The price of the roadster is the same as that of the touring car.

Standard units are used throughout the mechanical construction of the car. The motor is the Continental six-cylinder 3¼ by 4½-in. L-head type. The S. A. E. horsepower rating is 25.35 and the piston displacement 224 cu. in. The valves are on the right side and are operated through a helical gear drive. Cooling is by pump and oiling by splash pressure with the oil carried in the usual way in the lower part of the crankcase with pressure feed to the main bear-



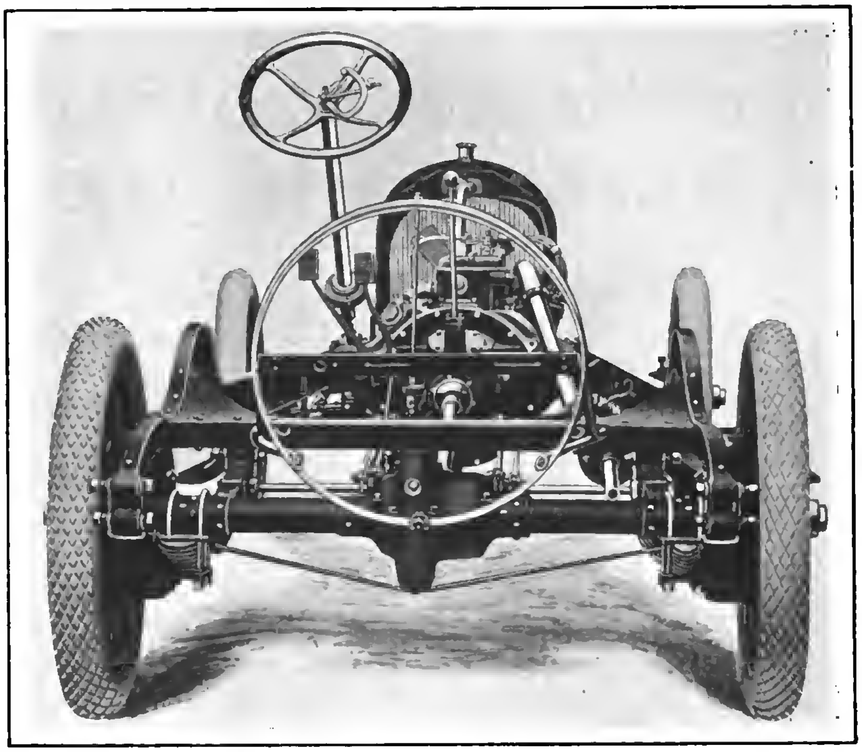
Layout of Westinghouse generator-ignition unit and tire pump on Continental motor ings. The cylinders are taken care of by splash. The oil is circulated by a piston type pump.

For carburetion and ignition standard units are used, the Zenith instrument being used on both touring and roadster for carburetion and the entire car being Westinghouse as far as electrical equipment is concerned. The Westinghouse two-unit system is used, operating at 6 volts for starting, lighting and ignition. Ignition advance is automatic, and the system is thoroughly outfitted with ammeter, dimmer switch, etc. The storage battery has a capacity of 80 amp.-hr., the electric horn is motor-driven, and armored cable is used in all the wiring. Other electrical instruments used on the car are the cigar lighter, searchlight and trouble light.

Tire Pump Under Hood

The power tire pump is mounted on the right side of the motor with a sliding gear engagement operated by a hand lever easily accessible on raising the hood. The drive for the tire pump is taken off the water pump shaft which also provides drive for the generator.

The clutch is a Borg & Beck dry disk type, 10 in. in diameter. It transmits the power through a three-speed selective gearbox to an Anderson-Mott floating axle. The front axle is also an Anderson-Mott of reversed Elliot type. The springs are semi-elliptic designed to be flat under normal load. They have phosphor bronze bushings for ⅝ in. bolts in the spring eyes. The front spring has 5-in. play, being 36 in. in length and 2 in. in width. The underslung rear spring has a maximum play of 8 in. and is 56 in. long and 2 in. wide.



Showing ample proportions of underslung rear springs on Anderson six

The frame construction is simple, being composed of two main members which taper in straight lines from the rear of the car forward. There is a cross member just behind the radiator and another at the rear. Both of these are rigidly connected to the side members by gusset plates. The rear support of the unit power plant and the radiator supporting members also act as virtual cross members, giving the frame construction rigidity although having but few actual parts and consequently being clean and light. The front support of the motor is hung in the front cross member of the frame, giving a three-point suspension of the unit power plant.

Both touring car and roadster sell for $1,250

Wheels are twelve-spoke types of selected hickory. Spokes are 1⅜ in. wide, and on the rear wheels are 14-in. brake drums. The brakes themselves are completely inclosed within the drums, being of the internal expanding type. The brake linkage is equalized through an equalizing bar which is placed some distance forward of the rear axle.

Hotchkiss Drive

Hotchkiss drive, in which both drive and torque are taken through the rear springs, is employed. This simple type of drive taken in connection with the chassis layout, gives a clean design which should tend to keep the car free of rattle. The speedometer drive is also rattle-proof, being strongly mounted just behind the gearset.

Besides the special equipment mentioned, the car has quick-demountable rims, one-man top, crown fenders with complete splash guards, ventilating windshield, speedometer, hand pump, repair kit and a complete set of the usual tools.

Seats Are Comfortable

The illustrations of the complete touring car and the roadster show that handsome appearance has not been sought in vain. There is ample depth in the rear seat, despite the very low appearance of the side. It will be noticed that an exceptional amount of clearance is allowed between the rear axle and the frame, this giving the rear springs an abnormal amplitude of movement and so making for easy riding over very bad roads.

The History of the American Automobile Industry—26

Petroleum Mentioned by Early Biblical Writers—Used in Mexico in 16th Century—Washington Appreciated Its Value—Gasoline Considered a Nuisance by Salt Men

By David Beecroft

THE earliest Bible writers make references which cannot be other than petroleum. In Genesis 14, "The Vale of Siddim was full of slime pits," refers to a method of collecting the oily liquid that has been practised in all parts of the world.

"Oil out of the flinty rock" (Deuteronomy 32), and "the rock poured me out rivers of oil" (Job 39) were not many years ago so certainly impossible as to be held up by skeptics as proof of the falsity of the Good Book, but, with the knowledge of today, they are seen to be plain statements of probably well-known things.

Other Early References

Many ancient writers mention or describe petroleum in no unmistakable language. Pliny and Dioscorides both mention the use of oil in Italy which was burned in lamps, the latter saying, "the people of Argrigentum save oil in pits and burn it in lamps." He also mentioned it as being called Sicilian oil. There seems to be no doubt that its use in embalming in Egypt extends back fully 2000 years B. C., and it is stated that mummies and their wrappings have sometimes been used by the Arabs for fuel. The use of petroleum for heating purposes is unquestionably quite old even though of limited application, but its use for power and as a lubricant now so common and extensive is of course a recent matter.

Its Use in Mexico

In 1520, Friar Sagahim, in writing of what he saw in Mexico, says Chapopote is sold in the Mexican markets; is collected from the sea, and in Yucatan is used to build with, and his description makes it plain that this was a petroleum product, which we can quite well believe, knowing the enormous Mexican fields now developed.

More than a century later A. A. Barbou, writing at Potosi in 1640, describes La Naphthe or Oyl of Peter, Rock oil, which was sometimes white and sometimes black and which had the peculiar property of drawing fire as a lodestone draws iron or steel. He cites an interesting example of this latter property in which a certain well polluted by the leaking of the oil through its walls into the water, was ordered repaired and a laborer sent down to stop the leak by which the oil entered. He asked for a light and a "lanthorn" being sent down to him, the oil drew the fire through the holes of the lantern and caused the well to discharge itself like a huge cannon with much noise, killing the laborer. The vividness of this account leaves no doubt in modern minds as to its correctness, but it must have excited some wonder in those days.

In what is now the United States there were many early mentions of oil springs. In 1629 Father d'Allion, a French missionary, mentioned a spring near what is now Cuba, N. Y., and a map prepared by French missionaries in 1670 shows a "font bitume" in the same locality. In 1757, the commandant located at Ft. Duquesne, now Pittsburgh, wrote his superior, concerning a fete of the Seneca Indians which he had attended some distance up the river and at which they set the river afire by igniting oil floating on its surface. Ten years later Sir Williams Johns described the Cuba spring in Alleghany county, N. Y., and David Leisberger, a Moravian missionary, also in 1767, gave an account of the petroleum springs and explained that there were three kinds, one of which gathered oil by seepage on the surrounding higher ground, another which flowed out of the earth and dissipated itself by running away and being absorbed, while a third showed the oil coming out and flowing away with water as if it came from beneath.

Washington Appreciated Oil Land

In 1775 George Washington took title to three tracts of land in the Ohio valley and in his will instructed his heirs not to sell the one on the Kanawha River which contained the bituminous spring because he considered it of great value. In 1783 General B. Lincoln's soldiers used the oil they found along Oil Creek, Pa., to bathe their joints, and otherwise, as a medicine. The Philadelphia *Gazetteer*, the first of its kind in the United States, published in 1795, tells of Oil Creek and bitumen springs having a capacity of several gallons of oil per day which was deemed good for a variety of complaints.

That any one desiring oil and finding it seeping out of the ground should hollow a pit into which it might collect is but natural, so no wonder need be felt that we find oil pits wherever we find oil, but the early discoverers reported that along Oil Creek they found numbers of pits some 6 or 8 ft. and probably 12 ft. deep lined with rough hewn logs and filled with debris in which trees had grown up whose rings showed an age of several centuries. These remains seemed to indicate that an older and higher civilization than the Indians knew of these petroleum sources and used them. The Indians and early settlers would gather the oil floating on the top of the water in these pits by scraping it up on a piece of wood and transferring it to a pot or by dipping a blanket into it and wringing it out. They removed the coarser dirt by straining or by heating the oil and permitting it to settle.

Draining Away Gasoline

The white settlers seemed to find no greater use for petroleum than their Indian predecessors, until it forced itself upon their attention in connection with their salt wells and even they failed to take the hint. Beginning with about 1808, the production of salt by boring until brine was found and then evaporating the brine became a considerable industry. Buildings, bridges, fences and even roads were built of wood. Timber was plentiful and sawmills became quite common. Sawing wood requires considerable power, however, and the engines were usually of the cheapest construction and non-condensive, so they were throwing much valuable heat in the exhaust steam and to use this in the evaporation of brine involved very little expense. Although their well casings were of wood, wrapped with leather at the joints, and packed inside the wrapping with flaxseed which, when wet, expanded and made a perfectly tight joint, and their other drilling and well apparatus were equally crude, these pioneers were quite successful in their boring operations. A well, 475 ft. deep, was drilled in 1814; in 1818, before reaching the brine layer, oil was struck at 171 ft. and gushed forth in such quantity as to make considerable trouble. The much disgusted owner dubbed it Devil's tar, and drained it into the nearest stream, down which it floated to the Cumberland River, 35 miles away. On one occasion a spark from a passing boat was supposed to have set it afire and the whole 35 miles blazed up. So common did the presence of oil on the surface of the water become that one stream was called Old Greasy.

Truck Club Holds Military Run

WITH the idea of eventually organizing motor truck owners to render transport service if national necessity should arise, the Motor Truck Club of America on April 8 and 9 conducted the first of what may develop into a series of military test runs over the roads of southern New York and northern New Jersey. This run was the club's first act as an arm of the Automobile Reserve Corps.

Carrying a net load of 20 tons, six heavy trucks and seven touring cars covered 65½ miles in 10 hr. and 36 min., running time, in spite of a severe blizzard and other difficulties.

1 and 2—Commissary truck tries to pass an emergency truck and runs into the ditch. Trucks 1 and 5 haul it out with tow lines. 3—Four bad hills ranging from 8 to 14 per cent grade are encountered in succession on Palisade Avenue, Englewood, N. J., on the way to the ferry. 4—The trucks making their way down the long hill to theferry which brought them back to New York

Alloys To Resist Corrosion

British Institute of Metals Issues Report on Bronzes and Similar Alloys—Valuable Data for Manufacturers of Marine Engines and Parts of Hydro-Aeroplanes

LONDON, ENG., April 10.—The third report to the Corrosion Committee of the Institute of Metals is a volume of some 127 pages. It records work on the corrosion of condenser tubes that has been done with the institute's experimental plant at Liverpool. To condense the mass of practical information contained in the report is not an easy matter, for even the author's summary runs to seven pages, a paper in itself.

However, in default of reproducing this summary of results it may briefly be recorded that the sea-water corrosion of ordinary brass, 70 per cent copper, 30 per cent zinc, at 30 deg. C., 50 deg. C., and 60 deg. C., has been compared with that of Admiralty metal (70:29:1), a special lead-brass (70:28:2), phosphor bronze (96:4) and aluminum-copper (92:8). It is found that aluminum-copper dissolves more slowly than the brasses. The phosphor bronze dissolves more rapidly than the brasses. In each case both hard drawn and annealed test-pieces of the alloys were used. Generally speaking, the hard drawn metal dissolved less rapidly than the annealed but is more readily attacked locally and selectively.

Aeration of the sea-water accelerates the rate of corrosion, more especially at the lower temperatures.

Corrosion in gently aerated diluted sea-water (e. g. estuary water) has been examined in some detail. The rate of solution of each alloy is diminished by diluting the sea-water, but the degree of selective corrosion is greatly increased. It is found that the rate of solution of pure copper is diminished by diluting the sea-water and is least in distilled water. That of pure zinc is greatly increased by diluting the sea-water and is greatest in distilled water.

Diluted sea-water also facilitates the formation of deposits of oxy-salts of zinc upon the surface of the metal. These oxy-salts are found to promote local selective corrosion. In diluted sea-water the phosphor bronze is the most satisfactory of the alloys considered.

The corrosion of the above-mentioned five alloys has also been examined in distilled water saturated with carbon dioxide at 30 deg. C. and 50 deg. C., and in a 0.15 per cent solution of common salt, at 30 deg. C. and 50 deg. C. Dezincification is promoted by a low concentration of salt and by a relatively high concentration of carbon dioxide.

Contact with coke is found to promote dezincification of the Admiralty metal, provided that good electrical contact exists between the metal and the coke. Under service conditions good contact is probably the exception rather than the rule.

The influence of the surface condition of the metal has been investigated and is shown to be important during the early stages of the corrosive attack. The corrosion of 70:30 brass has been compared with that of pure zinc and copper.

The report contains a section which is devoted to a consideration of the bearing of the results of the experimental work upon the practical problem.

Tin-Aluminum-Copper Alloys

Two papers were recently given before the institute, dealing with alloys of aluminum. The first, by A. A. Read and R. H. Greaves, describes a number of tests made on tin-aluminum-copper alloys containing varying quantities of tin and aluminum (up to 10 per cent of each) and led to the following conclusions:

The replacement of tin in gun metal by aluminum is of no advantage but leads to loss of strength and greatly increased brittleness, unless about three-quarters at least of the tin is replaced when the properties approximate but are inferior to those obtainable from aluminum and copper alone.

The addition of tin to the 10 per cent aluminum-copper-alloy is accompanied by a rapid increase in hardness and brittleness, while the addition of aluminum to the 10 per cent tin-copper alloy has a similar, but for small percentages, a less marked effect.

The difficulties in hot working the ternary alloys are greater than those experienced with bronzes, and very much greater than with the aluminum-copper alloys.

Corrosion both in fresh and sea-water is small, but the alloys rich in tin tend to become pitted.

The second paper, by W. H. Withey, deals with methods for the analysis of aluminum. It describes methods for the analysis of alloys of aluminum and copper, also aluminum and zinc, and gives details of a method that was used for the complete analysis of metallic aluminum. This latter method is made use of in the analysis of alloys of aluminum containing magnesium for which purpose it possesses distinct advantages, owing to the fact that large quantities of the alloy may be used in the analysis.

In this method use is made of the fact that tartaric acid is capable of preventing the precipitation of aluminum by ammonium sulphide, while at the same time zinc and nickel are quantitatively precipitated. Manganese is only partially precipitated. The filtrate left after the removal of the sulphides produced by sulphuretted hydrogen in acid solution, and by ammonium sulphide in alkaline tartrate solution is acidified and concentrated. The solution filtered from sulphur is made ammoniacal and the magnesium precipitated with sodium phosphate. The precipitate is redissolved. The precipitate is next dissolved in dilute nitric acid and any manganese, which is usually present, determined by a colorimetric method and calculated into the equivalent weight of manganese pyrophosphate which is then deducted from the magnesium pyrophosphate obtained. The manganese is separately determined in another sample.

The paper contains analyses of solutions containing aluminum and known amounts of iron, zinc, magnesium, and nickel, from 0.25 to 1.0 per cent. The results obtained indicate that the method is very reliable.

The figures obtained in the analysis of an alloy of a well known type are also in excellent agreement with those made by a standard method.

The method recommended for the analysis of the alloys of aluminum and zinc consists in adding to the solution an excess of caustic soda. The hydroxides first precipitated are thus dissolved and on passing sulphuretted hydrogen the zinc is precipitated. The precipitate is dissolved and the zinc, after the removal of traces of aluminum, is determined as phosphate.

To obtain a perfect separation certain precautions are necessary, which are fully discussed in the text.

The FORVM

USE OF TWO GEAR RATIOS IMPORTANT ELEMENT IN TESTS—BATTERIES FREQUENTLY OF TOO SMALL CAPACITY—DISPLACEMENT, GEAR RATIO AND FUEL CONSUMPTION

Using Two Gear Ratios for Official Tests

By E. H. Delling

Chief Engineer The Mercer Automobile Co.

I WAS very much interested in the speed and acceleration tests which were made on Sheepshead Bay Speedway with a Hudson stock car and, therefore, procured a copy of the report of the A. A. A., under whose supervision these trials were made. To my greatest surprise I glean from this report that two different gear ratios were used in the respective trials, namely a 4.454 to 1 gear ratio for the acceleration test, and a 3.5 to 1 ratio for the speed test. This most important fact, however, is not revealed in any of the advertisements published by the Hudson Motor Car Co., and the public is, thus, misled into the belief that any individual Hudson stock car can duplicate the performances in question. If the Hudson company desires to use for advertising purposes the acceleration that was obtained with a 4.454 gear ratio, it should also have ascertained—and stated in its advertisements—the maximum speed which its cars are capable of doing with said gear, and further give the acceleration of its cars with a 3½ to 1 ratio. In view of the fact that the Hudson company states in all its advertisements that the tests in question were made under A. A. A. supervision, I am of the opinion that the A. A. A. should compel said company to mention all facts pertaining to these trials, and not lend its name to mislead the public into a belief which gives the Hudson Motor Car Co. an undue advantage.

Facts About No-Differential Trucks

By Arthur M. Laycock

Chief Engineer Sheldon Axle & Spring Co.

THE idea of operating without a differential is not new. It has been successfully used on racing cars for a good many years, but in the commercial field, it has not been used to any great extent, particularly in the heavier sizes.

The following advantages of this type of drive must be particularly interesting to truck users at this time:

First—Positive pull on two wheels.
Second—Greater tire mileage.
Third—Less wear and tear.
Fourth—Gasoline economy.
Fifth—Dependability.
Sixth—Simplicity.
Seventh—Weight.
Eighth—Price.

Positive Pull on Two Wheels

The positive pull on two wheels can only be appreciated by the truck user himself. Nothing is more exasperating than getting in a mudhole with one wheel only and that wheel begins to spin while the other is on perfectly good ground. In order to get traction, chains are run around the tires, which in a good many instances only digs the hole deeper until finally jacks and planking have to be used in order to get the truck out. If the positive drive is on both wheels, the one wheel on good ground will invariably pull the truck through a very bad place, and this construction absolutely prevents any spinning of the wheels when starting under load.

It is a well known fact in Europe at the present time that the conventional differential on the Army Service Corps trucks will be a thing of the past. Some form of positive drive or locked differential will be called for on the various subsidy specifications. We prophesy that a little cross country work in Mexico with the United States Army Service Corps will bring about the same thing.

Greater Tire Mileage

One has only to imagine a truck operating under shell fire and extremely muddy roads and the truck becoming mired when questions of greater mileage, less wear and tear, gasoline economy, etc., are of infinitesimal value as compared to the truck getting from one place to another positively, but when the greater tire mileage, wear and tear and gasoline economy are even questionable, one really cannot see any serious objection to cutting out the differential. The conditions with the average business man are just as vital and important and almost analogous to trucks operating under war conditions.

Quite a few of our best racing cars have been equipped with solid rear axle, the claim being made that the action of the spinning of the wheel when in the air is very much more detrimental to the tires than the little slippage on rounding a corner on the racetrack. Similar conditions exist when running a solid tire in heavy truck service over rough cobblestones. Any close observer driving behind a truck under these conditions will invariably be able to see under the tires without any difficulty whatever. At the moment these wheels are in the air they must of necessity accelerate and come down on the road at a different speed from which they left, grinding off the rubber to a much greater extent than when rounding corners with a blank differential where the slippage is uniformly distributed throughout the entire periphery of the tire.

In truck service, with the limited experience we have had with the blank differential as compared to any other, it is noticeable that the temperature rise in the tires is very much less when rounding corners under severe loadings with the solid axle than the spinning action of the wheel in a mudhole with the regular differential.

The tire wear, of course, is largely a question of heat units. It is quite a common sight to see a heavy truck in difficulties with the tires smoking from the spinning action of the wheel on soft ground.

There is certainly less wear and tear with the blank differential on engine and all running gear when one wheel partially leaves the ground, due to the irregularities of the road aforementioned.

This variance is felt throughout the whole chassis, from the engine clear back to the rear axle, and in a good many instances sets up a frightful vibration, and makes it most disagreeable to negotiate cobblestone roads particularly when light in the rear. The results obtained from the blank differential as compared to the regular one in this respect are most pronounced. Riding on a truck with a solid differential the load is rarely taken off both wheels at once. When one wheel leaves the ground, the full torque is absorbed in the other wheel remaining on the ground, holding the engine down and preventing racing to a very, very marked extent.

Differential Like Steamboat

The regular differential reminds one of a steamer. Every time the propeller lifts out of the water the engine races and sets up such a vibration that in a good many instances you wonder whether the ship is going to hold together or not. Imagine what a call there would be by marine constructors for something which would absolutely prevent the propeller shaft racing. This is certainly analogous to the truck situation at the present time with the exception that the motor truck can now prevent racing, with its attendant wear and tear on all the parts affected by eliminating the differential.

Every time the propeller leaves the water on a steamer and beats the air, it is just like throwing so much coal overboard. The wheel need not leave the ground actually, but the pressure can be relieved to such an extent due to oscillation of the spring over irregular road surfaces that the wheel begins to spin and the tractive effort instead of being used for the propulsion of the truck is simply using the gasoline for no purpose. This is quite pronounced on heavy vehicles where the wide track is used. One wheel is tracking on good ground all the time while the other is slipping in soft mud. There is not a single truck designer of repute who has not been in serious difficulties at some time or other under these conditions. The writer is well aware that the tractive resistance might be double, due to the condition of the road surfaces, but on top of this, the loss due to the spinning differential is certainly quite pronounced.

Under the above conditions, it is common for engineers to consider the radiator too small — the engine not large enough—or the gear reduction wrong, when in a good many instances the differential is directly responsible, operating on extremely muddy roads with a very heavy gasoline consumption at the best, and sooner or later a solid axle will be called for more extensively on account of gasoline economy, if nothing else.

Dependability Increased

With the elimination of the differential, broken gears, differential spiders freezing fast, broken cases, etc., are a thing of the past, but one has to be extremely careful with the size of drive shafts, as the stress in these members is doubled and must be amply taken care of. The particular advantage of using semi-floating axles under these extreme conditions lies in the fact that the outer ends must of necessity be made very liberal in size due to the combined bending and torsion, and it is a comparatively easy matter to increase the inner ends of the drive shafts. If this be done there is absolutely no question of broken drive shafts and the whole axle becomes thoroughly dependable.

For example, in one of our axles where we would ordinarily use a shaft 1¾ in. across the flat of the hexagon end of the shaft where it fits our differential, we step this up to 1⅞ in., all of which change it was possible for us to make with no other complication whatever than to increase the size of the drive shaft. It was not necessary to make any change in the center of the axle construction other than to provide the "locked" differential with a broached hole 1⅞ in. instead of 1¾ in., and it was possible to do this without any change of parts whatever.

This means that a man who might have an axle in service with a conventional differential and wants to eliminate the troubles as a result of the use of a conventional differential, will simply change his drive shafts, take out his conventional differential, put in our "locked" differential and the job is finished.

Cutting out the differential ring gear and pinions with the spiders has reduced this design to its simplest possible form. Every one of these parts are going to wear with their attendant backlash. The elimination of backlash alone is almost sufficient justification for the design, but the simplicity of the construction will appeal to every one.

One of the objections at the present time to the live axle type of drive is the unsprung weight at the center of the housing. This, of course, is in the worst possible place and the more the center can be lightened the sections throughout the axle can be considerably reduced.

There is also a distinct gain in the oil capacity as compared to the full type of differential. The outside dimension of the axle housing remains the same. The space taken in the ordinary construction with gears will allow of that much more oil being carried, which is a consideration when operating under severe conditions.

Price Reduced

It is evident at a glance to the layman that there is considerable reduction in price to be made in this construction over any form of drive known at the present time, and we prophesy that this alone will give it the increased popularity it richly deserves.

Summarizing, after considering all the various points, it is well not to become too enthusiastic, as the introduction of a blank differential on the face of it is so drastic that one must of necessity move with extreme caution. The time taken in rounding a corner is only a fraction of 1 per cent of the straightaway running, and if a truck is continuously operating around a city block (eight blocks to the mile), it figures around 4 to 5 per cent of the straightaway time, but with average wheelbase and tread, and strong driveshafts, the positive pull on two wheels, greater tire mileage, less wear and tear, gasoline economy, and the extreme dependability with simplicity, weight and price in its favor, we prophesy quite a following of the blank differential.

Car Storage Batteries Are Often Too Small

By Walter LeGare

IT IS with a great deal of interest that I have been reading articles in the leading automobile publications on Magneto vs. Battery ignition, both pro and con, and while I do not lay claim to being an authority on the points involved, the article by N. J. Hart in The Automobile for March 9 compels attention, and in my modest way I beg to submit a few points along this same line.

We have to admit the present-day magneto will give a spark that is better for starting under adverse conditions than a battery system. The only talking point against the magneto is the extra initial cost, and this applies to cheap cars only; and the man who buys such a car does not expect equipment that one would get on a medium or high-priced car.

The magneto costs very little to maintain and keep in perfect condition. I estimate that the average magneto will not cost in excess of $2 a year for repairs, while the battery alone will cost not under $4.50 a year and in most cases $6 to $8 repair each year and be worthless after about two years' service, whereas a magneto will be in prime condition after two years' service, and a few dollars will place it in excellent condition and, in fact, make it as good as new.

In my argument I am not considering the attention the two systems should have but only the attention the average owner gives his car—we all know the average car receives very poor attention.

Regarding that part of Mr. Hart's article on voltage drop, I have found that in the case of a battery which is only three-quarters charged, the actual drop is more than he states with the batteries generally used. I know of only one manufacturer, the Cadillac Motor Car Co., who uses a battery that is large enough to crank the motor and give current for ignition in excess of what is needed. The average manufacturer places a very small capacity battery on their cars; they really are large enough for ignition only and should never be used for starting.

I have made a study and specialty of battery repairing, not because the battery is better than the magneto but because I can make more money repairing batteries than I can repairing magnetos.

Another, and a main point against the battery is its inability to give off high discharge rates after it has seen about a year's service. This I attribute to the fact that the positive plates will become corroded by sulphate just like rust will cover a piece of iron or steel. This is also true of the negative plates but not so noticeable.

Do you know of a battery ignition system that uses a multi-point spark plug? Practically all magneto manufacturers recommend multi-point plugs, the reason for this being that in the battery system they have a job getting a spark across a single gap; so why should they assume the extra trouble of trying to bridge two or three gaps? This is no job for the present-day magneto.

Displacement, Gear Ratio and Consumption

By F. I. Anderson

I HAVE just read, with pleasure and profit, the comment on page 509, THE AUTOMOBILE, by W. P. D., on my question on page 422 on the subject, "Piston Displacement per Mile Measures Consumption."

He states that my error in figuring mileage positively from piston displacement and gear ratio, lies in assuming that one gallon of gasoline, 70 deg. Baume, gives 25 cu. ft. of gas. W. P. D. asserts that one gallon of gasoline, 61 deg. Baume, at 60 deg. Fahr., gives approximately 240 cu. ft. of vapor, or nearly ten times as much as I assume.

I took my figures for this assumption from an article on Motor Fuels, in *Scientific American* Supplement of Dec. 11, 1915, by Prof. Vivian B. Lewes, F. I. C., F. C. S. Professor Lewes gives the following table on the volume of vapor from gasoline hydro-carbons:

	Specific Gravity	Boiling Point	Cubic. Ft. Vapor	
			Gallon	Pound
Pentane	0.626	37.6 deg. C.	31.2	4.9
Hexane	0.664	69 deg. C.	27.7	4.1
Heptane	0.700	98 deg. C.	25.7	3.7
Octane	0.719	118 deg. C.	22.6	3.1
Nonane	0.741	136 deg. C.	20.8	2.9

Doctors seem to disagree on this rather vital point. I sincerely hope that W. P. D., with his 240 cu. ft., is right, as the price of gas is still going up.

Which is right?

If, at high speeds of modern engines, 80 per cent of the gasoline drawn into the cylinders actually goes through raw and is wasted, then there is something radically wrong with the trend of engineering design in the last year or two.

Past the Maximum Efficiency Point

The modern motor attains its highest gas efficiency at between 1000 and 1200 r.p.m. At that speed, the ultimate proportion of the present-day low-grade gas is utilized.

Yet we find engineers working their motors up to 4000 r.p.m. Cars with such motors are on the market not as racing cars—where economy counts for little—but as boulevard cars. If, as seems to be the case, gas efficiency decreases almost in direct proportion to speed above a very modest point, what is the argument in favor of the modern high-speed motor?

The stock answer is that the American driver hates to shift gears. But behind this is the truth that the transmission on the average American car is the weakest point in the mechanism, so the engineers give the driver great ability on high; and the result is that the owner of a modern six or eight or twelve-cylinder motor never learns to shift properly at the rare times when it is necessary. Develop the archaic gearbox, instead of trying to blind us to its imperfections by the device of high engine speed. When someone comes along with an efficient transmission for moderate-priced cars, then the American driver will come back to gear-shifting, with his European brother; that will automatically solve the fuel problem, in a measure at least, by bringing us back to an engine that runs at economical speeds, instead of one that wastes 80 per cent of our gasoline in the exhaust.

A Gas-Electric Ideal

A gas-electric drive, that will govern within 5 per cent, like the modern isolated gasoline-electric light plant, will solve the problem. Then the gas engine can run at its most economical speed, and the dynamo transmission will automatically adjust itself to the load, and we won't have to carry a 100 per cent surplusage of inefficient power.

Vim Adds Model Designed for Postal Delivery Service

PHILADELPHIA, PA., April 15—The Vim Motor Truck Co., this city, has added a mail delivery car to its line of seven standard units. The new vehicle is called the model M and sells for $800. Some time ago the Vim company received an order from the United States Government for a mail carrier to be built according to strict specifications, and the demand which sprang up for these cars resulted in the adoption of model M as a regular model. The body has full screens all around, with doors at front and rear. There is a passenger step at the back for the use of the mail carrier and other equipment is up to Government specifications. The body, which is mounted on the standard Vim four-cylinder chassis, is designed especially to meet the requirements of post offices, mail contractors, rural free delivery routes, etc.

The new model M Vim mail delivery car listing at $800

The Rostrum

Knurling Helped Undersize Pistons

EDITOR THE AUTOMOBILE:—In making up some new aluminum alloy pistons cast in chill the machining department made the clearances a trifle too large, and as these 4-in. pistons were for special show cars and afterwards demonstrated, it was necessary that action of some kind be taken as no more castings were available immediately.

The superintendent of this plant conceived the idea of knurling these pistons and this was accordingly done with a coarse knurl running over the skirt of the piston three times and bringing the diameter of these pistons from 0.009 in. under size up to 0.003 in. under cylinder bore.

Pistons were placed in motors and run 5 hr. under full load in shop and never picked up, and when removed were in perfect condition, the depressions caused by the knurl holding oil perfectly.

You will understand that for this size piston 0.003 in. is very little clearance.

Indianapolis, Ind. W. S. R.

Calculating Motor Cylinder Displacement

Editor THE AUTOMOBILE:—Kindly tell me how to find the cubic inch displacement of any motor if the bore, stroke, and number of cylinders only are given?

2—How can I tell by the r.p.m. of a motor what horsepower it will develop?

3—What are the rules and regulations for amateur racing, for the driver and the car?

New York City. G. K.

—The rule to find the piston displacement is to follow this equation: bore × bore × 3.1416 × stroke × number of cylinders = piston displacement.

2—You cannot tell from that data.

3—Copy of the racing rules can be secured from the Contest Board of the American Automobile Assn., 437 Fifth Avenue, New York City.

Thin Mixture as Overheating Cause

Editor THE AUTOMOBIE:—I am a subscriber to your magazine, and I always read your columns with interest. In almost every number I pick up I see some mention by a subscriber of overheating troubles, and the old fallacy repeated that a rich mixture is what causes overheating. Now I beg to submit that it is an absolute physical impossibility to overheat an engine with a rich mixture, whereas a very thin mixture will cause a great excess of heat. If those who are having trouble could be advised to enrich their mixture instead of making it leaner, which only aggravates their condition, many overheating annoyances would disappear.

In case any reader is inclined to disagree with me, and entertains the belief that a rich mixture really does cause overheating, I should like to ask him to explain the following occurrences which have happened to me personally at various times in the past.

Once in 1907 in Boston one of my customers drove his car to my office with the complaint that the engine was missing. On investigating, I found that it was missing from a too rich mixture and I thinned it down and he drove the car home. In the morning he telephoned me that he could not start his engine, and on going out to his house I found that I had thinned the mixture so far that the engine did not start when cranked. I corrected the difficulty and asked him if he had experienced any other trouble. He said that while driving home the night before, which was only three miles, his engine boiled for the first time since he had had the car. Here was a case where this man's mixture had been excessively rich, so rich that it missed, and yet no overheating was caused, and yet when thinned down (and not to an excessively thin point either, for it did not pop into the carbureter) it boiled for the first time since he had owned the car.

Another time in New Bedford in 1908 a man complained to me that his engine boiled continuously and he said that every mechanic in town had tried to correct the trouble by making his mixture thinner, but it only boiled the worse. In five minutes I had his carbureter adjusted correctly so that during the two days I was in New Bedford he was unable to make his motor heat, though he tried driving at top speed for many miles in the hot sun. To correct his trouble I had enriched his mixture very considerably.

Another time in 1910 in the winter I started from Pontiac for Detroit with a car which had just been overhauled. I knew that the radiator was full, for I examined all the tanks before starting, and yet, before I had gone a mile the water was boiling furiously, even though the temperature was well below freezing. I stopped the car, refilled the radiator, enriched the mixture considerably and resumed the drive, and never once did the engine heat, even though I was driving in low speed and wallowing through deep drifts of snow for the greater part of the 25 miles.

Last summer in India, while driving a six-cylinder car between Lucknow and Cawnpur, the engine overheated in the first few miles. I instructed my companion to enrich the mixture, which he did, and although I maintained a much higher speed for the rest of the distance, which is 50 miles, there was no further sign of overheating.

I could cite many other instances similar to the above, which have come under my own personal observation. Now I should like to ask you simply as a matter of logic, if it is a rich mixture that overheats the motor, how do you explain these occurrences?

Detroit, Mich. F. R. PENDLETON.

Information on Schebler Carbureter

Editor THE AUTOMOBILE:—Will you kindly give a description of the Schebler carbureter used on the Studebaker four, 1916? In the instruction book it gives the reverse adjustments from those made by the sales agency's shop men. Would it be possible to use a leaner mixture if both hood and radiator were covered during cold weather, using a standard hood and radiator cover?

Philadelphia, Pa. O. S. W.

—To adjust carbureter turn air valve cap *A*, Fig. 1, clockwise or to the right until it stops, then turn to the left or anticlockwise one complete turn. To start engine open throttle about one-eighth or one quarter way. When motor is started let it run until engine is warmed, then turn air valve cap *A* to left or anti-clockwise until engine hits perfectly. Advance spark three-quarters way on quadrant; if engine back fires on quick acceleration turn adjustment screw *F* up, which increases tension on air valve spring, until acceleration is satisfactory.

Turning air valve cap *A* to right or clockwise lifts needle *E* out of gasoline nozzle and makes rich mixture for starting. As motor warms up, move control lever gradually back toward Air or Lean to obtain best running conditions until motor has reached normal temperature. When this temperature is reached, control lever should be at Air or Lean.

A Special Valve-Seating Tool

Editor THE AUTOMOBILE:—Herewith sketch, Fig. 2, of a valve-seating tool which helped us out of a rather difficult job. We could have put this job in a lathe, but it would have taken more time. The sketch represents a cage-in-head type motor and the tool with which the work was performed. In removing the cage it was found that it had been driven so tightly in the head that the motor could be raised from the chassis by lifting by the cage only, therefore in removing same the seat at point *C* referring to sketch was jammed so that it had to be machined smooth again. The writer used an old valve and stem as per sketch, machined it down at point *D* to a running fit at *E*, then cut it out at point *F* with hacksaw, used a set chisel at point *A*, forcing the metal down as at point *B*, then case-hardening same ground to a cutting edge, the edge *B* being about 0.010 lower than face *G*. The facing operation at point *C* in the cylinder was accomplished in about 5 min. in a 20-in. drill press, making an A-1 job in about 30 min. The 30 min. time included making the tool also.

Des Moines, Iowa. S. E .H.

Peerless Six Developed 110-120 Hp.

Editor THE AUTOMOBILE:—What is the power curve of the 60-6 Peerless later models?

2—What is a fair speed to expect from this car in good order with touring body?

3—Has the Benz concern turned out more than one machine, termed Blitzen Benz?

4—What is the bore and stroke of the Blitzen Benz which attained speed of 147 m.p.h.? I have talked with a man who now owns a Blitzen Benz, and he claims to have driven it 157 m.p.h. He says the bore is 6½ in., stroke 9 in. and that this car is the one that holds world's record. I understand from your magazine that cylinder dimensions were 7 5/16 in. by 8 in. He says this is not the car that raced the Sunbeam twelve last fall, and that the latter car was capable of only 120 m.p.h.

5—Can you give particulars as to how the Stutz works double ignition from Bosch single high-tension magneto? I understand that some such arrangement is being used by them owing to lack of Bosch double ignition magnetos.

Milton, Mass. A. D. H.

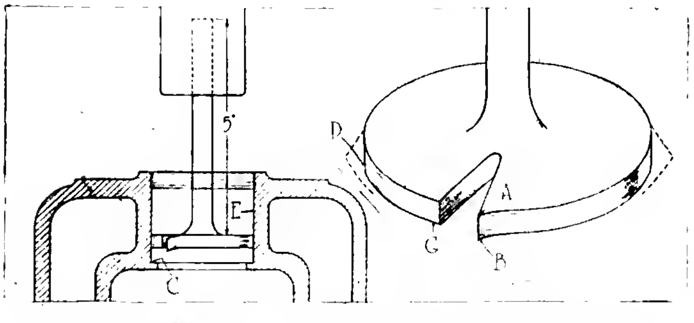


Fig. 2—Valve-seating tool developed by a subscriber and its application in a difficult job on a motor

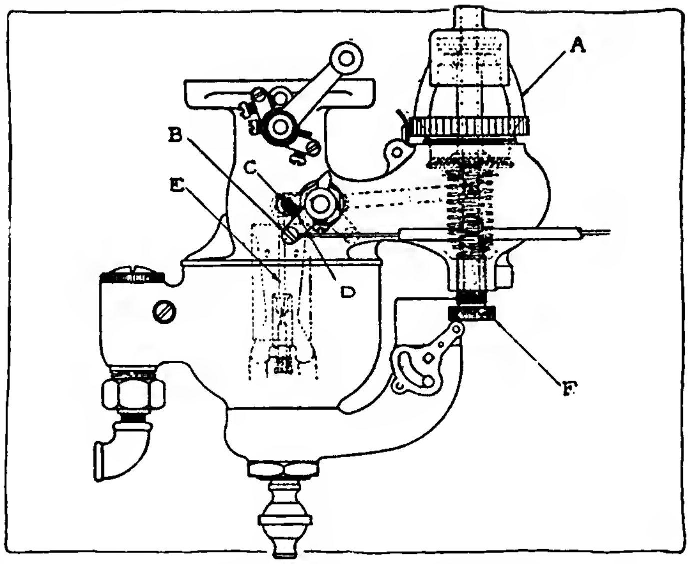

Fig. 1—Adjustment diagram of Schebler carbureter used on 1916 Studebaker four-cylinder model

—The Peerless company states that the old Peerless model 6-60 developed too much horsepower for the regular dynamometer and hence tests were carried on with a fan dynamometer to 110 or 120 hp. at 1585 r.p.m. The gear ratio on this car was 2.56 to 1 with 38-in. rear wheels.

2—Car of this model in good order should reach 70 m.p.h.

3—In all, three cars only were built of the Blitzen Benz type, the cylinder dimensions of which are 185 mm. bore and 200 mm. stroke. The world's record of one of these cars, of which two are in America, was established at Daytona Beach, Fla., April 23, 1911, by the late Bob Burman. It was the first car imported of the two here in America that was given the name Blitzen Benz, and was the record-making car.

As far as THE AUTOMOBILE has record now this car is in the hands of E. A. Moross. The other car of this type is now owned by Harry Harkness and was the second one brought to this country. It does not hold any record at the present time. The world's record for the Blitzen Benz was 1 mile in 25.40 sec.

4—Answered under No. 3.

5—This method, while not recommended by the Stutz company, has been used by some of the Stutz owners on account of not being able to secure the two-spark instrument. The method you speak of and which these users have employed is to connect two sets of spark plugs with the single ignition magneto. These might be series plugs or some other adaptation which renders this possible.

Explanation of Engine Cycle

Editor THE AUTOMOBILE:—Please explain the meaning of the word cycle, and its functions in a gasoline motor. Is each stroke a cycle, etc.?

2—Explain the firing and timing of eight- and twelve-cylinder motors.

3—Had the Marmon 32 a four-cylinder motor?

Dunn, N. C. K. F. H.

—The word cycle refers to a complete set of operations bringing the engine back to the point referred to at the beginning. We say the words four cycle, meaning it takes four strokes to complete a cycle of events in the cylinder. The correct manner of expressing this would be four-stroke cycle as each one of the strokes is only the mechanical action necessary in carrying out the cycle of intake, explosion, expansion and exhaust.

2—The timing and firing of all multi-cylinder engines is arranged to accommodate the angles at which the different cranks are set to each other. This must be done in order that the engine will balance. Regardless of how the engine is timed or the firing order each cylinder carries out its independent action as if it were a single-cylinder motor and it does not depend on any other cylinder to assist it in carrying out its cycle. The firing order naturally depends altogether on the valve timing of each cylinder since it is only a matter of exploding the charge which is compressed in the proper cylinder. The firing orders of eights are the same as fours since the action of the eight is just exactly the same as if there were two four-cylinder engines operating on the same crankshaft, which is exactly what holds true mechanically. The same relationship holds true between twelves and sixes.

3—Yes.

Mixing Gasolene and Kerosene

Editor THE AUTOMOBILE:—What is the real objection to mixing gasoline and kerosene as a fuel for motor cars? Of course, I have heard of such use of it now and then but why is it not generally so used especially since the price of gasoline has advanced so rapidly. I have a Chalmers six-cylinder and would you suppose that such a mixture as half and half would work satisfactorily?

Somerville, Mass. C. E. I.

—As a matter of fact unless you are quite fortunate you are using a mixture of kerosene and gasoline as a matter of practice in your car. It is one of the methods used to dispose of the great surplus quantities of kerosene now on hand. The action of the mixture is just what may be expected from a heavy grade of fuel. A mixture of half-and-half in your Chalmers would probably work quite well after the engine had once become warm.

Distributer vs. Magneto Ignition

Editor THE AUTOMOBILE:—What are the advantages of the distributer ignition system over the high tension magneto and also the advantages of the high tension magneto over the distributer ignition system?

2—What is the factory rating of the 1916 Hupmobile?

Niagara Falls, N. Y. P. N. P.

—In answer to your first question, would refer you to the following papers read at the winter meeting of the Society of Automobile Engineers and reported in THE AUTOMOBILE for Jan. 13:

Magneto vs. Battery Ignition by Francis R. Hoyt.
Notes on Battery Ignition by Alex. Churchward.
Battery vs. Magneto Ignition by Frank Conrad.

These give all sides of the battery-magneto question.

2—The brake horsepower of the model N Hupmobile runs as follows: 10 hp. at 400 r.p.m. and 36 hp. at 1700 r.p.m., which is the speed of maximum horsepower. These motors are purposely timed to give maximum horsepower at the speed mentioned.

Vacuum Feed Feasible for Ford

Editor THE AUTOMOBILE:—I have been much interested in your various articles about the advantages of rear tank and vacuum feed.

Would it be feasible or sensible to put this system on a Ford? If so, how can it be done in the simplest manner?

New York City. F. H. H.

—The Stewart vacuum feed can be readily installed on the Ford car, and in fact the Stewart company issues with the vacuum system a book giving directions how this should be done on different models. The method of installing on the Ford sedan is different from that on the Ford touring car but general directions apply. There are three simple things to remember; first, the top of the Stewart vacuum tank must be above the level of gasoline in the main supply reservoir when full, even when car is going down steep grades. Second, the bottom of the vacuum tank must be not less than 3 in. above the carbureter; and third, the Stewart vacuum tank must not be installed over the generator nor above any electrical terminals on which gasoline could possibly leak.

Amateur Wants Race Information

Editor THE AUTOMOBILE:—What does one have to do to enter a twenty-four-hour automobile race? I have never been in a race before.

2—What is the meaning of a stock car race?

3—How old a car may be used?

4—There is to be a twenty-four-hour race some time this year at the Bay track. Where can I find out full particulars and rules in reference to such a race?

Brooklyn, N. Y. MODERN GARAGE.

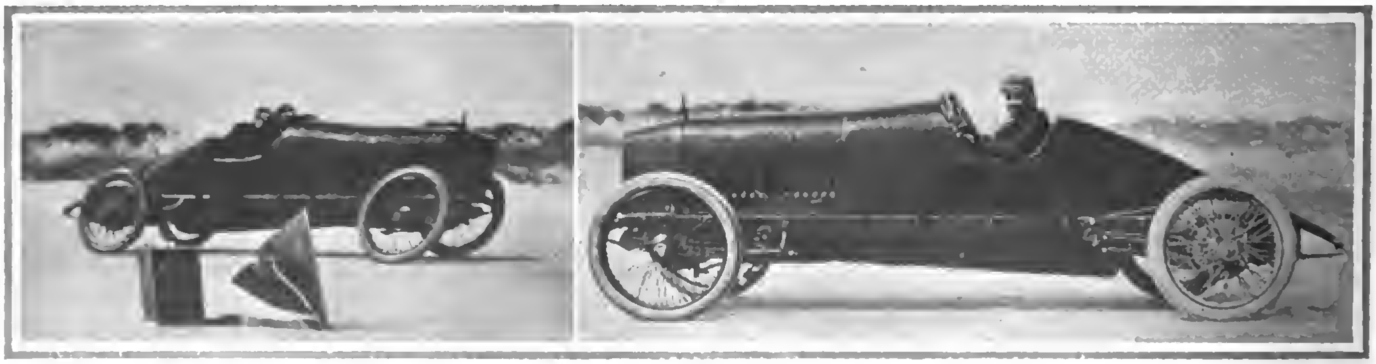
—The qualifications necessary to enter the race is simply that the driver is registered with the American Automobile Assn. and is satisfactory to the A. A. A. officials in charge of that race.

2—A stock car race is one in which the contesting cars have the same specifications as the cars sold by that concern in the open market.

3—The age of the car is immaterial.

4—Full details of all sanctioned events can be secured from the American Automobile Assn., 437 Fifth Avenue, New York City.

The Record-Breaking Hudson Super Six on Ormond-Daytona Beach



Hudson stock Super Six chassis on Ormond-Daytona beach. At the left the car is illustrated traveling at 102.5 m.p.h. and at the right after the tests were completed. On the stock chassis was mounted a special racing type body, the steering column was tilted and a radiator guard added. The chassis was geared 2 11/18 to 1. Valve timing was stock and cast-iron pistons were used, A. A. A. officials checking all specifications for stock classification.

ACCESSORIES

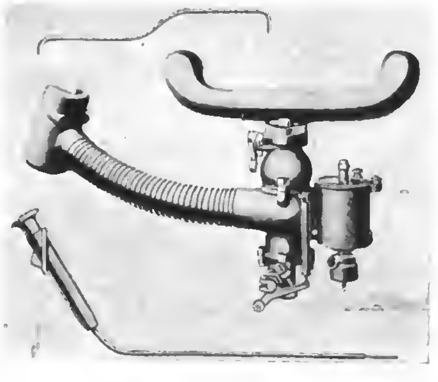
Sunderman Mouse Trap Carbureter

SIMPLE in construction and in adjustment, this carbureter is claimed to feed pure combustible gas from cold kerosene or gasoline to the motor without changing the adjustment, no hot air or water jacket being needed. As shown in the illustration, the rectangular float chamber *F*, fitted with a primer, is adjacent to the mixing chamber, which is simply a square passage. The fuel is admitted to this passage through the jet *J*1 for low speeds and when idling and when the speed is increased the taller jet *J* automatically comes into play so that both jets are operating at once.

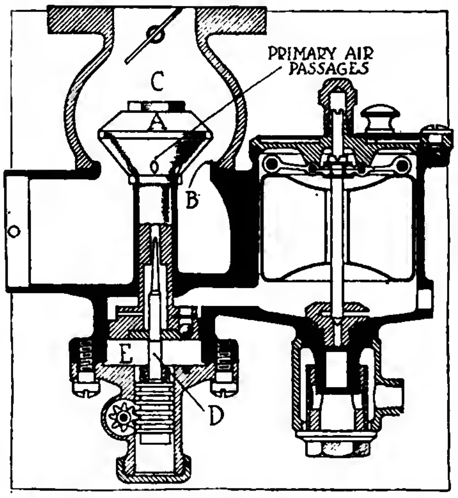
Air is drawn through the valve *V*, which is regulated by the tension on the spring controlled by the adjusting collar *A*. In the illustration the air intake door is shown in the position it assumes when the motor is idling and fuel is being fed through the short jet *J*1 only. As the air rushes into the vacuum behind the intake door it sweeps the globules of fuel from the jets and the resulting vapor is further disintegrated into a homogeneous mixture by passing through the screen *S*, after which it passes the throttle *T* on its way through the manifold to the combustion chamber.

Besides an unusually high degree of fuel economy, the makers claim the carbureter gives great flexibility with consequent minimized gear shifting. The screen *S* prevents backfiring with its attendant dangers, and the elimination of a gasoline adjustment by the use of the regulating jets renders adjustment extremely simple. In fact, the makers state that when the carbureter is once set correctly, further changes will be unnecessary.

The carbureter is made in brass, iron or aluminum alloy, in ¾ in., 1 in., 1⅛ in. and 1¼ in. sizes, under the names of models A, B, F and C, respectively, and as the model Twin F for eight or twelve-cylinder cars. Model F weighs 1¾ lb. in brass or iron and 10 oz. in aluminum alloy, and is 4½ by 2½ by 1⅞ in.—Sunderman Corp., Newburgh, N. Y., maker. J. F. Renfro, Co., Inc., New York City, sole factory distributor.

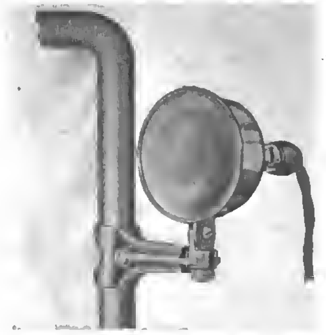


Stewart carbureter for Fords, with manifold



Section through new Stewart carbureter

Fracto anti-glare lens



Culver-Stearns windshield searchlight

Fracto Anti-Glare

In this device half of the frustrum of a cone, formed of glass with specially shaped surfaces, is placed in the lamp under the bulb. The effect of the device is to project all the rays downward when the lamp is first adjusted so that the rays from the top are projected downward before the attachment is put in place. Two points of adjustment are available, one for a diffused short-distance light and the other for projection. No dimming device is employed, the principle employed being the proper collection and distribution of all the light-rays thrown out by the bulb. The device sells for $2.75 per pair.—Fracto Specialty Co., Boston, Mass.

Culver-Stearns Searchlight

This searchlight is of the windshield type, adjustable so that it can be turned in any direction for sign-reading and so forth. Though only 3 in. in diameter it throws a powerful beam of light, having an 8-cp. helical coil tungsten bulb; the makers state that signs can be read at a distance of 200 ft., a focusing device permitting exact adjustment. A switch built into the lamp eliminates the necessity for an extra switch on the dash. The bracket is substantial and clips to the edge of any type of windshield. Price, $2.25—Culver-Stearns Mfg. Co., Worcester, Mass.

Victor Spot Lamps

Made for windshield and foredoor attachment, the Victor spot lamp is equipped with 21-candlepower nitrogen bulb lamps. It can be secured to either of these two parts of the car by means of a bracket with a universal joint that allows the beam of light to be instantly turned in any direction. The swivel joint is of such construction that the friction maintains the position of the light but with sufficient flexibility that it may be easily moved in any direction by means of a handle at the back of the lamp. By the use of this lamp, side roads and passages may be inspected before turning the car and serious accidents thus avoided. The reflector is not a true parabola, but is a special shape which not only throws the parallel beam for a long distance, but also illuminates a wide field. The lamps are valuable in localities where brilliant headlights are prohibited. The price of the lamps of 6½-in. diameter is $7.50.—Victor Auto Parts Co., Cincinnati, Ohio.

Alcohol Solution Tester

Balls of various specific gravities, corresponding with the specific gravities of alcohol-water solutions for different freezing points, constitute this device. For a given solution a test is made, using the proper ball, by drawing off a small quantity of the solution from the radiator dropping the ball into it, and allowing it to remain for a minute, which is long enough to equalize the temperatures. If the ball floats more alcohol is needed; if the ball sinks there is enough. The makers state that the balls contract and expand with temperature changes at the same rate as the solutions in which they are used, so that no

Curtis 1000-lb. canopy top trailer

allowance has to be made. For a quick test the ball may be dropped into the radiator through the cap. Price, 25 cents each.—Liquid Tester Co., Lancaster, Ohio.

Curtis Trailers

The outing trailer is to provide a comfortable portable home to be drawn behind a car. The trailer carries what is in reality a little house with windows and doors in the ends. At the sides are two bunks, which form parts of the side walls when not in use. At night these are let down outwardly and canvas side walls are let down over them, making a snug little room with two beds in it. A fly is provided on each side also. The beds consist of Way sagless springs, 4 by 6 ft., 2 in. and felt mattresses; khaki covers are provided so that the beds when made up can be folded without becoming disarranged. An ice chest and a small oil stove also are furnished. Four adults can sleep on the beds, and for extra persons folding cots can be carried and set up at night under the bunks, which are 3½ ft. from the ground. A ball-and-socket coupling is provided for the attachment of the trailer to the rear of the car. Weight of trailer alone, 500 lb.; equipped for the road, 700 to 750 lb. Price, $250.

The capacity of the Curtis two-wheeled trailer is 1000 lb. The lower priced types have box or stake bodies and steel-tired wheels; more styles are built up to the special model with canopy top and side curtains, wire sides, pneumatic tires and other refinements. A special model is supplied for cradling a canoe or small rowboat. The maker lays stress on the coupling used, which allows for adjustment in all necessary directions and keeps the trailer in its proper place regardless of road conditions. Prices, $47.50 to $137.50.—Curtis Trailer Co., Minneapolis, Minn.

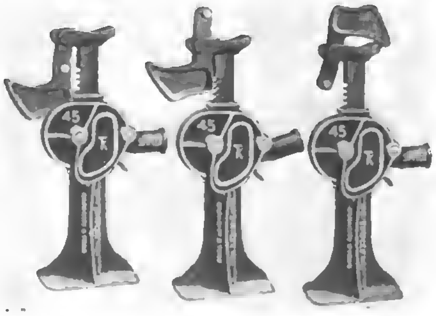
Curtis outing trailer, open for camping and closed for towing by car

Simplex Jacks

The Simplex variable lift jack is of the lever and rack type, and the construction is substantial; its advantage, however, is that on the outer face of the lifting column there are steps on which a lifting foot can be adjusted, giving seven different heights in addition to that of the head. The jack is of heavy malleable iron and the column is of I-beam section. Lifting capacity, 1500 lb.; height closed, 10¼ in.; lift, 6 in.; weight boxed, 9 lb.

The geared jack has a detachable shoe at the head, which is shown in three positions; two of the positions give less than normal height and the third gives more than normal height. When the plain head is to be used the shoe is slipped out of place. The operating pawls on the lever end act on a gear meshing with the rack cut in the lifting column. All working parts are of steel; capacity, 4000 lb.; lift, 8½ in.; available lifting heights, 9, 10½, 11¾ and 13 in.; weight, with steel lever, boxed, 13 lb.—Templeton, Kenly & Co., Chicago, Ill.

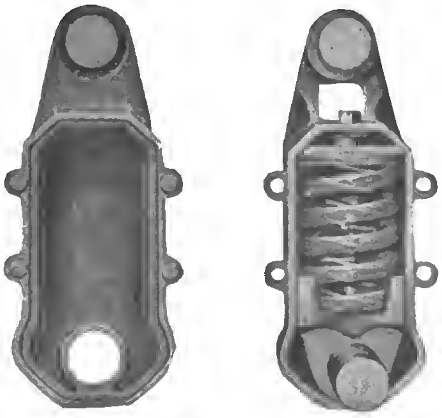
Simplex jack with adjustable foot



Simplex jack with three-position head

Savidge Steering Device

Considerable improvement has been effected in this steering device for Ford cars since it first was put on the market. The principle remains the same, however. A helical spring is carried in a casing which projects backward from the front axle, to which it is bolted; its inner end bears against a stationary cam and the outer end of the casing is attached to the cross-rod of the steering gear. When the cross rod moves in deflecting the steering wheels the casing carrying the spring is moved to one side or the other, and the spring, moving against the stationary cam, is compressed and tends to bring the front wheels back to the straight-ahead position. The object is to take the wobble out of the wheels and to prevent their being turned with dangerous suddenness and sharpness; it also takes up lost motion and absorbs shocks. Attachment is easily effected without machine work or drilling. Price, $4.90.—Meixell Co., Indianapolis, Ind.



Savidge spring steering device

Marvel-Mist Sprayer

The Marvel-Mist cleaning and polishing compound may be used in a sprayer, a light coating being sprayed on the car body and rubbed off with clean cheesecloth. The makers state that it prevents the paint from deteriorating, softens mud and removes oil, grease and road tar and that it produces a high polish on the surface that will not catch dust. A small outfit with cloth sells for $1 while a large one is $1.25. A pint can for refilling the sprayer is listed at 75 cents and the quart size $1, ½ gal. $1.75, 1 gal. $2.75 and 5 gal. garage outfit $12.50.—Marvel-Mist Mfg. Co., Brooklyn, N. Y.

Simon's Dim-A-Glare

Dim-A-Glare is a paste that is applied to the glass, and once it is put on cannot be rubbed or scraped off, it is said. Either the whole or part of the glass will be treated. It sells for 25 cents per tube. —Simons Mfg. Co., Vallejo, Cal.

Accuracy in Design

ON page 711 in this issue of THE AUTOMOBILE attention is drawn to the need for taking proper precautions when adopting Hotchkiss drive. Hotchkiss drive, especially when used for trucks, may easily disturb the brake layout and the article is prompted by the discovery that several engineers have overlooked this fact altogether. The efficiency of an automobile and of a motor truck, as it is gaged by the owner, is made up of multifarious detail. The best machine in the world will not be appreciated if it has just one really weak spot.

It is by overlooking simple things like the relative motions of axles and brake connections that can make all the difference between an entirely excellent vehicle and one that is merely passable; reputations are built up upon care for the minutest details.

This particular case of Hotchkiss drive and brake connections is especially noteworthy, because there are many engineers who believe that Hotchkiss drive is the correct principle, and if users of trucks find that they are having trouble with brakes they will not stop to reason out why this is. If a man has used trucks with radius rods on which the brakes needed adjustment once a month and finds that a Hotchkiss drive truck needs adjustment once a week he is liable to blame the drive without further thought as to the why and wherefore.

Half an hour on the drafting board may easily save $10,000 worth of sales with details of this kind. Let it always be remembered that adjustment of anything is always noticed if required with frequency, and every adjustment made to a car or truck is reckoned against it by the user.

Designers are often prone to lay out the car in an unloaded condition instead of taking into consideration the position of the driving members and suspension units when under normal conditions of load. The various radii of action caused by oscillation of spring members should be carefully watched especially as regards longitudinal members such as brake connections.

The Constant-Pressure Cycle

A QUESTION which is beginning to make itself heard amidst the clamor caused by high-priced fuel, high-speed engines and multi-cylinders, is that of the possibility of cycles other than the Otto. The constant temperature cycle seems to be rejected with but little consideration, while that of constant pressure is affording considerable food for thought.

So far the constant pressure engine, or variations of it such as the Diesel, has been limited to larger units. Is this because the subject has never been vigorously attacked by automobile engineers but only by those who are more used to larger plants? It opens up an avenue of speculation which may or may not lead to a revision of many existing ideas as regards engine design.

It seems that the entire difficulty centers around the use of parts which will be light and at the same time able to sustain the high pressures necessary to admit burning fuel against compression pressures much higher than those possible in Otto cycle motors. With the high compressions the air alone must be compressed and the fuel admitted at the time of combustion and admitted successive in small quantities which will give the series of lesser impulses due to burning as compared to the single violent shock of explosion.

Low Thermal Efficiency

Mean effective pressures will have to be kept high by a maintenance of high pressure throughout the burning period, even though the theoretically constant pressure may not exactly be reached. In the Otto cycle mean effective pressure depends on having the maximum pressure as close to the beginning of the explosion stroke as possible and with the small throttle opening used in touring at speeds of 15 to 20 m.p.h., these pressures fall off more rapidly than the resulting decrease in fuel justifies. In other words, very low thermal efficiency results.

If the constant-pressure engine can be developed to give high efficiency at reduced throttle or at lower car speeds, something will have been accomplished that will be of the utmost value in the event of expensive fuels. The whole series of questions left open by the industry's pioneers may again present themselves to our engineers for solution in the light of latter-day developments.

400 Attend Detroit S. A. E. Meeting—Hear Papers by Vincent and Smith

Motors of the Air and Interpreting the Public to the Engineer Are Subjects of Two Papers of Wide Interest —Section Closes Record Year—New Officers Elected

DETROIT, MICH., April 17—To-night's regular monthly meeting of the Detroit section of the Society of Automobile Engineers was attended by about 400 members of the section and guests, who listened to two clever talks by men in widely varying fields of the automobile industry. J. G. Vincent, vice-president of engineering, Packard Motor Car Co., spoke on Motors of the Air, and Paul Smith, sales head, Chalmers Motor Co., dealt with the subject of Interpreting the Public to the Engineer.

This session marked the closing of the most successful year in the history of the local section, and the new officers who were elected for the ensuing twelve months are D. McCall White, chief engineer, Cadillac Motor Car Co., chairman; O. E. Hunt, assistant chief engineer, Packard Motor Car Co., vice-chairman; W. C. Rands, general manager, Rands Mfg. Co., treasurer; B. G. Koether, general sales manager, Hyatt Roller Bearing Co., secretary; and K. W. Zimmerschied, chief metallurgist, General Motors Co., member of the national nominating committee.

The treasurer's report for the fiscal year just closed shows a cash balance of $1,496.53, as compared with $409.11 at the end of the previous year. Membership has now exceeded the 500 mark, and in every way the section's future seems very rosy. Retiring Chairman G. W. Dunham made an appeal for a permanent home for the section, and W. H. Conant, the present secretary reviewed the progress of the year and indicated the surprising growth of the section.

Motors of the Air

Mr. Vincent showed from his talk that he has been a close student of aeroplane development since the war started, and indicated how general interest has been aroused in aeronautics due to the striking service and reliability of the aircraft in the war.

In designing their war plane engines the Germans put it up to their automobile engineers, with the result that the German machines were developed with high efficiency engines built along automobile lines, the Mercedes type being the best example. The parts are light and reliable.

In France the matter was left to the aircraft engineers, and it is therefore natural that there should be various types of French designs with the strongest tendency toward the rotary-cylinder, air-cooled type. These have great power per pound of weight, but they have proved less desirable for long flights, for when enough oil and gasoline are carried to allow them to run for long periods, the machines become heavier than the light types of automobile motors. Hence the French soon saw the advantage of the automobile type engine with fixed cylinders and developed such.

Of course, the type of fixed cylinder engine depends upon the work required. The six-cylinder is good for moderate-sized machines, but as the planes are increased in dimensions and more is asked of them in the way of carrying ammunition and passengers, the cry is steadily for more power. This has caused the development of the twelve-cylinder, V-type, as well as the eight. There is also a movement for eighteen-cylinder engines, the cylinders arranged in three sets of six around the shaft. This arrangement, however, results in too wide an engine and also makes very complicated connecting-rod lower end construction. The eight has the same objection of being too wide, since the aim is to make the wind-resisting area as little as possible. The twelve, therefore, seems to be the best answer, according to Mr. Vincent, who said further that for large planes nothing less than twelve cylinders will endure.

Another important consideration upon which Mr. Vincent touched is the matter of propeller drive—whether it should be connected directly to the crankshaft or geared down. If it is directly connected, the minimum speed has to be 1400 r.p.m., which is high. It is best to drive it as low as 900 r.p.m. sometimes. with the average speed 1200. Due to inequalities of the air through which the propeller passes, and unevenness of the weight of the wood of the blades, heavy strains are imposed upon the shaft and its mountings, and these have to be allowed for.

The Packard engineer also favors overhead valves with overhead camshafts, since the shafts in this position allow a clear mounting for the carbureters and exhaust pipes. The carbureters logically go in the V and the exhausts on the outside, this arrangement also permitting the placing of the spark plugs on the inside of the V, so that oil will drip off them, and they will be away from the hot exhaust pipes, preventing pre-ignition.

Straight cylinders seem best, and cast-iron types can be made light, reliable and cheap, although aluminum with cast-iron liners are very advantageous. Undoubtedly, Vincent said, steel cylinders are the best possible construction, although they are expensive and hard to make by Americans. The Mercedes utilizes steel cylinders. Everything considered, the aluminum cylinder will probably dominate due to its weight.

Interpreting the Public

Mr. Smith believes that the engineers should be busier refining the essentials of the cars they already have than to be springing new things constantly. It is easier to sell what the public wants than to have to push something by dint of expensive advertising and strenuous sales methods—something about which little is generally known.

The three essentials to-day are more conveniences, better looks and more accessories.

He commended the firm that builds up samples of what it believes it will turn out for the season and then ships samples to widely separated dealers and distributors for their criticism and suggestions even before it is released to the production department.

The following shows Mr. Smith's idea of the relative importance of the five most important factors in the various price divisions. These are given in the order of their importance.

$2,500 and up—Motor types—6, 8 and 12

Cincinnati Lamp Concerns Merge—Capital $2,000,000

CINCINNATI, OHIO, April 14—The Corcoran Lamp Co., the Victor Lamp Co., and the Victor Auto Parts Co., all of this city, representing the Corcoran interests, have been purchased by a local syndicate. The consolidation plan is for a $2,000,000 corporation with $1,500,000 of common stock and $500,000 of preferred stock. The common is to be offered at 70 and the preferred at par.

Present indications are the withdrawal of the Corcoran family from all connection with the company. T. J. Corcoran owns the Corcoran Lamp Co.; W. J. and E. B. Corcoran own the Victor Lamp Co., and J. L. and H. R. Corcoran own the Victor Auto Parts Co.

Martine Resolution Completed

Senate Adopts Preamble to Resolution Calling for Gasoline Trust Probe

WASHINGTON, D. C., April 17—Another step in the gasoline probe was the adoption to-day by the Senate of a preamble to the resolution by Senator Martine, directing the attorney general to investigate and report whether any law is being violated by the present situation in the oil and gasoline industry. The adoption of the preamble completes action on the resolution. The preamble attacks the Standard Oil Co. This action was taken after brief debate in which Senator Martine announced the aggravated conditions in the gasoline industry.

Ohio Standard Oil May Declare 100 Per Cent Stock Dividend

NEW YORK CITY, April 18—The Standard Oil Co. of Ohio probably will declare a stock dividend of 100 per cent. There will be a special meeting May 25 to vote on a proposal which will increase the stock from $3,500,000 to $7,000,000. If the plan goes through this will be the seventeenth distribution of stock among the former subsidiaries of the Standard Oil Co. of New Jersey since the company was separated into its parts. Cash dividends paid during the first quarter of this year have been the largest of any quarter since the dissolution of the Standard Oil Co., except the initial quarter of 1913.

Four Sizes of Hall Trucks

DETROIT, MICH., April 17—The Lewis-Hall Iron Works is now producing four models of commercial vehicles as follows: Two-ton, worm-drive chassis, $2,000; 3½-ton, double side chain chassis, $2,800; 3½-ton, worm-drive chassis, $2,800; 5-ton double side chain chassis, $3,400. The company has appointed Kuehn & Metz, 1926 Broadway, its New York representative, and plans to locate distributing agencies on the Pacific Coast.

Four Cylinders Subject of Joint Meeting

NEW YORK CITY, April 19—A joint meeting of the Metropolitan Sections of the Society of Automobile Engineers and the American Society of Mechanical Engineers will be held in the auditorium of the Engineering Societies Building, April 20. The subject of the meeting will be four-cylinder engines and papers have been prepared by F. E. Watts, chief engineer of the Hupp Motor Car Co., and F. R. Porter, president of the Finley Robertson Porter Co., and formerly chief engineer of the Mercer Motor Car Co.

Over 6500 invitations have been sent out to this meeting, to members of the above organizations and to the Institute of Electrical Engineers and the Aeronautical Society. The meeting will be preceded by an informal dinner.

Continental Motor Co. to Issue $1,000,000 Notes

DETROIT, MICH., April 14.—The Continental Motor Co. is to issue $1,000,000 in 5 per cent notes to be retired in five years. The money is to be used in connection with further enlarging the plant and also for the further financing of the concern for the next few years.

246 Reservations for S. A. E. Trip

DETROIT, MICH., April 15—Two hundred and forty-six reservations for the 1916 summer cruise of the Society of Automobile Engineers have been made on Ss. Noronic, which carries the party from Detroit, June 12, on its four-day trip. At the present rate at which reservations are being made the capacity of the boat will be well taxed by May 1, the date on which the first allotment of staterooms will be made.

Those who have signified their willingness to date to present papers and their subjects are:

C. F. Kettering, Dayton Engineering Laboratories Co.—Future Scientific Development of the Automobile.

H. L. Horning, Waukesha Motor Co.—Motors for Trucks and Tractors.

Arthur B. Brown, designer of Brown carbureter, and Herbert Chase, A. C. A. chief engineer—Constant Pressure Internal Combustion Engines.

W. R. McCulla, Packard Motor Car Co.—Mechanical Transport Under War Conditions.

Howard Coffin, Hudson Motor Car Co. and member of Naval Consulting Board—Preparedness.

J. E. Hale, Goodyear Tire & Rubber Co.—Straight-Side vs. Clincher Type Tires.

C. H. Eason, Hyatt Roller Bearing Co.—Engines for Farm Tractors.

H. D. Church, Packard Motor Car Co.—Motor Trucks.

E. A. Nelson, mechanical engineer—Pressed Steel Construction in Automobiles.

Maxwell Sends Longwell to Orient

DETROIT, April 13—The Mawell Motor Co. is sending W. T. Longwell, its special representative, on an extended business investigation trip to the Orient. Leaving this country April 22, Mr. Longwell will visit Japan, China, Java, Sumatra, India and Ceylon. If the war should end by next February, Mr. Longwell will then continue his investigation through Egypt and then through Europe, expecting to return to Detroit in April, 1917.

Newlin Maxwell Supervisor

DETROIT, MICH., April 17—Howard Newlin, former traffic manager of the Pennsylvania Steel Co., has been appointed supervisor of traffic and transporation for the Maxwell Motor Co. here.

Industry To Aid War College

Railroad Officials and Automobile Men Study Transportation Preparedness

WASHINGTON, D. C., April 17—Military preparedness received a decided impetus to-day when an important conference between representatives of the automobile industry and railroad interests and members of the War College division of the Chief of Staff of the army took place at the War College. The conference, which was of a preliminary character and which was not open to the public, will be followed by meetings of a like nature during the next few months. Alfred Reeves, general manager of the National Automobile Chamber of Commerce, is reported to have informed the army officers of the work that has already been started in the way of compiling information as to the number of privately owned motor trucks throughout the country. Coker F. Clarkson, general manager of the Society of Automobile Engineers, and Russell Huff also are reported to have given the army officers valuable information that will be of aid in working out the transportation problem in case of emergencies.

Others who participated in the conference were Howard Coffin, S. D. Waldron, Henry Souther, George C. Diehl, A. G. Batchelder, S. A. Miles, John M. Wilson, B. Sweet, Fairfax Harrison, president Southern Railway, W. G. Beseler, president Jersey Central Railroad, and R. H. Aishton, vice-president, Chicago & Northwestern.

The conference was presided over by General Macomb and the other army officers present were Colonel Treat, Colonel Kennedy, Lieutenant-Colonel Johnston, Lieutenant-Colonel Cameron, Lieutenant-Colonel Martin, Major Jones, Major Connor, Major Lochridge, Major Moses, Major Pierce, Major Van Deman, Major Palmer, Captain Kerth and Lieutenant-Colonel Howell.

171,977 New York Registrations

ALBANY, N. Y., April 15—Registrations in this State to date amount to 171,977, as compared with 142,576 last year. Receipts amounted to $1,477,363, as against $1,194,439 last year. In the New York City zone this year's registration is running more than 18,000 over the first two and a half months of 1915.

Krake Studebaker Div. Traffic Mgr.

DETROIT, MICH., April 17 — H. G. Krake, who was manager of the traffic bureau of the St. Joseph, Mo., Commercial Club, has become division traffic manager for the Studebaker Corp.

New Mitchell Cars Are Longer

Wheelbase Increased 2 In.—Passenger Space Increased —Prices $75 Higher

RACINE, WIS., April 15—Announcements have been made of the new Mitchell line and show that for next season a considerably refined car as compared to the Six of Sixteen will be put on the market. Mechanically, the only changes are increase in the dimensions of parts made necessary by a 2-in. increase in wheelbase to 127 in.

Accessibility Is Improved

The principal refinements are in the nature of increased passenger space and a beautified exterior appearance. Along with these improvements there has been a price increase of $75, making the five- and three-passenger cars $1,325 and the seven-passenger $1,360. The five-passenger touring car and the seven are exact in every particular except for the disappearing auxiliary seats which may be added to the five at any time at an additional cost of $35.

The mechanical changes have increased accessibility in some degree. The single-unit starting system which was used on the former model has been replaced by Westinghouse two-unit operating through a Bendix gear for the starting motor and eliminating the silent chain which was a part of the starter generator drive. The engine-driven tire pump has been raised to a more accessible position and is now mounted immediately behind the fan and driven by a gear from the fanshaft. The motor design has been changed but little although the cylinder casting has been altered to allow the waterjacket space to extend further down the side, giving a greater reserve of waterjacket area.

Underslung Springs Continued

Now that the wheelbase has been increased 2 in. it has a total of 127 and this has been met by lengthening the cantilever springs 2 in. The number of leaves in the springs has also been increased and the underslung mounting maintained. The principal specifications include a 3½ by 5 motor of L-head design with the cylinders cast in a single block and in unit with the crankcase. The gearbox provides three speeds and the equipment is unusually complete. An example of this is in the glove compartment in the instrument board and the tonneau light in the back of the forward seat.

Borderland Tire Mfg. Co. Formed

LAS CRUCES, N. M., April 13—The Borderland Tire Mfg. Co. has been formed in this city to manufacture automobile tires and tubes. Its capital is $150,000. The officers are as follows: President, W. B. Mandeville of the Union Bank; vice-president and manager, J. T. Ward of Denver; secretary, J. O. Miller of the First National Bank; treasurer, F. W. Campbell of the Bowman Bank and Trust Co. The directors are G. H. Totten, J. T. Ward, J. L. Burnside, Gustave Manasse, J. O. Miller, W. B. Mandeville and F. W. Campbell.

Winton Prices Raised $200

CLEVELAND, OHIO, April 15—The Winton Co., this city, will on May 1 raise the price on the 33 Winton Six $200. The increase, which is 8¾ per cent, will bring the prices up to the following:

Five-passenger touring	$2,485
Seven-passenger touring	2,535
Six-passenger touring	2,635
Four-passenger touring	2,485
Roadster	2,485
Sedan	3,700
Limousine three-quarters	3,450
Limousine, fore-door	3,700
Limousine-landaulet	3,700
Coupe	3,400
Coupelet	2,800
Chassis only	2,200

McFarlan Increases Prices $210—To Discontinue Series T

CONNERSVILLE, IND., April 16—The McFarlan Motor Co., this city, will discontinue the manufacture of the series T roadster and touring car, selling at $2,830 and $2,680. On and after May 1, the McFarlan touring car will be built in series X only. All models under this series will be increased in price $210. The touring car will sell at $3,200 as will the roadster. The sedan will receive the same increase in price and will sell at $4,210. Two limousines, one a seven-passenger, and the other a six-passenger, will sell at $4,410 and $4,210, respectively. A seven-passenger berline has also received this $210 increase, and will sell at $4,510.

Canadian Chalmers Price Unchanged

WINDSOR, ONT., April 15—For the present the price of the Chalmers Six-30 will not be changed in Canada and will remain $1,475 for the touring car and roadster and $1,090 for the cabriolet, duty paid f.o.b. Windsor. This cancels this company's former announcement of the price increase on the Six-30 as affecting Canada. Through its foresight in establishing itself in Canada this company is able at least for the time being to sell cars in Canada without increasing the price. This is in line with the recent decision of the Chalmers company to build Chalmers cars in Canada and is one of the first advantages offered Canadian motorists because of this plan. The price of the Chalmers Six-40 remains at $1,950 f.o.b Windsor.

Will Manufacture Ben Hur

Racers To Be Stock Chassis of Series for Sale on Regular Market

CHICAGO, ILL., April 15—The Ben Hur cars which are being built to represent the Chicago speedway during the 1916 racing season, will be the first models of a series which will be produced for the regular market. While of course they cannot be advertised as such, it is stated that these cars will be stock models so far as the chassis and engine are concerned; that is, the regular production of the factory will be the same in design and manufacture as the cars which will make their début on the tracks this summer.

David F. Reed, president of the Speedway park association, while admitting that leading members of the association were interested in backing a team of racing cars to represent Chicago, states that these cars will not be owned by the Speedway park association proper or campaigned by them. It has been decided to campaign the team under the title of the Ben Hur Racing Assn. which is organized under the charter as not for profit. No dividends will be declared; the initial capital being subscribed by fifty or 100 members of the Speedway park association.

Any returns in the form of prize money, etc., accruing to the Ben Hur racing association will remain in the treasury of the association for the purpose only of research work and development of motors and cars.

According to Mr. Reed, the Ben Hur racing association will not build a special or individual motor for the sake of winning a prize or for commercial publicity, but any motor used in any one of its racing cars must be identical with that offered in the standard passenger car. It is the expectation to have the team ready for its initial bow at the Indianapolis Memorial Day races.

Beecroft to Study Car Market in South America

NEW YORK CITY, April 19—With the object of investigating the automobile selling field in South America for cars, trucks and tractors, David Beecroft, directing editor of THE AUTOMOBILE, sails on April 29 for an extended business trip in Brazil, Uruguay, Argentina and Chile. Mr. Beecroft goes as a member of the Latin-America Return Visit Committee, which goes at the invitation of the Government to investigate into and report on various lines of industry.

The possibilities of the South American field have been under investigation by several American makers for some years, but it is only since the present European war that the matter has received increased attention, and since then the large home consumption has held back the export business to that country.

South America is a land of wonderful distances and naturally a place well suited for power vehicles of all kinds. One country—namely, Brazil—is larger than the entire United States. The great farming country of Argentina is larger than all of the United States east of the Mississippi River. Chile on the map of South America looks like a small strip of country, yet it is longer than from New York to San Francisco.

A Consumer Market

South America offers many chances as a consumer market for motor vehicles. In Argentina the farmers till large areas and have plenty of money to buy trucks and cars. The lack of roads has hampered the movement. The entire country is as level as a table, and in that sense is ideal for motor transport; but it lacks stone to build roads, and up to the present has not seriously undertaken any progressive road policy.

Throughout South America are many fruitful fields for motor transportation. Such industries as coffee, wine, sugar, cotton, rice, lumber, agriculture, mining, etc., will require motor trucks in great quantities as soon as the road movement gets under way. At present there are many trucks in use, but the European governments have done most of the pioneering work. The city of Rio de Janeiro, Brazil, has for many years been a great truck city. The streets are well paved, as are practically all large cities in South America. Italy and France have had a large hold on the Rio truck trade.

K. & S. Tire Enters Field

GUELPH, ONT., April 14—The K. & S. Canadian Tire Co., Ltd., which introduced the Kelly-Springfield tire into Canada, is now manufacturing at its Guelph factory K. & S. tires, which are guaranteed for 7000 miles on Ford cars and 6000 miles on other cars.

Autocar Adds 85,000 Sq. Ft.

ARDMORE, PA., April 14—The Autocar Company, this city, is to erect another factory on Greenfield Avenue, directly oposite the present road testing plant. This new building will have 85,000 sq. ft. of floorspace and will be devoted entirely to the manufacture and painting of Autocar bodies and the final assembly of body and chassis. It will be two stories high, with a main building, two L extensions, a boiler house and blacksmith shop. The building will be divided into zones, each one a complete plant in itself.

Car to Have Beijer Transmission

Hydraulic Device to Be Feature of New Car—To License Others

STEVENS POINT, WIS., April 13—The Beijer Hydraulic Transmission Co., organized in the spring of 1915 at Stevens Point, Wis., by Arthur Beijer, a Swedish engineer, will complete the first model of car employing the Beijer patented transmission about May 1, and after road tests and further experimentation will build the car for the market and license other manufacturers on a royalty basis.

The Beijer transmission has been built into a 50-hp. touring car at the Stevens Point Garage Co.'s plant. The new form of transmission operates on the same principle as the hydraulic jack. A three-cylinder rotary pump is attached to the flywheel of the motor and pumps columns of oil through pipes to motors on each wheel of the car, front and rear. Thus a form of four-wheel drive is attained. The device makes it possible to eliminate clutch, gearbox, universal joints, differential and other expensive parts of the present-day car.

The new system is under the observation of engineers of note in all parts of the country, as well as the government. The same principle is adaptable to the system of control of turrets on battleships and coast defenses and any type of transmission.

Mr. Beijer is an expert on transmissions and has experimented with the hydraulic transmission for many years.

To Make Harroun Kerosene Carbureter in Pittsburgh

PITTSBURGH, PA., April 13—The Kerosene Carbureter Co., this city, has secured the patent and other papers necessary for manufacturing carbureters using kerosene instead of gasoline.

The carbureter manufactured by this company is the invention of Ray Harroun, formerly chief engineer of the Maxwell Motor Co., and now manufacturing aero motors.

Thomas Auto Truck Co. Formed in New York City

NEW YORK CITY, April 14—The Thomas Auto Truck Co. has been formed to build trucks in this city at 639-641 West Fifty-first Street. The line will consist of a ¾, 1, 1½, and 2-ton chassis, and complete bodies and also a line of taxicabs.

The personnel of the company is as follows: C. K. Thomas, president and founder, was for three years previous vice-president and general manager of the Federal Motor Truck Co., of New York. Cloyd Marshall, the secretary and treasurer, was formerly with C. W. Hunt Co., this city. W. S. Thomas, a director, has been prominent in engineering work for a number of years, and was formerly with J. M. Guffey & Co., Pittsburgh, Pa. O. S. Platt, another director, is the owner of the Platt Pattern and Machine Works, Bridgeport, Conn. P. F. Donohue, also a director, is general advertising expert and treasurer of Tammany Hall. G. E. Whitney, M. E., of Bridgeport, Conn., is acting in the capacity of advisory engineer. M. D. Herron, the sales manager, formerly occupied the same position with the Federal Motor Truck Co., this city. W. A. Jones, the chief engineer, has been identified in a mechanical way with the automobile industry for fourteen years. He has been associated with Amplex, Packard and Fiat.

$3,865,000 Record Business for Chalmers in March

DETROIT, MICH., April 17—The Chalmers Motor Co. reports that during the twenty-seven working days of March the value of cars shipped was $3,865,000, indicating the greatest year's business in the history of the concern. On March 31, there were $300,000 worth of Chalmers machines shipped, the record day since the formation of the company. Although new sales and production records have been established in the past three months, Sales Manager Paul Smith says that Chalmers entered the month of April with $8,400,000 worth of orders on its books. Chalmers dealer representation has also rapidly increased, more than 1000 cities and towns in the United States now claiming a dealer for this make of car.

Chalmers Gets Canadian Plant

FORD, ONT., April 15—The Chalmers Motor Co. of Canada, Ltd., which was recently organized with a capital stock of $1,000,000 has leased for a period of five years the factory of the Tate Electric Car Co., and will thus be able to start manufacturing here in Canada within a few weeks.

Duesenberg Motor in New Plant

CHICAGO, ILL., April 17—The Duesenberg Motor Co. moved to its new plant at 2259 Oakdale Avenue, this city, on April 15. The new factory gives the company greatly increased facilities, as compared with its St. Paul plant.

Pullman May Expand Plant

YORK, PA., April 13—The Pullman Motor Car Co, this city, is contemplating building a new plant on a 40-acre tract at Grantley Station. The matter will be presented before a meeting of the board of directors to be held in the near future.

The present quarters are inadequate. The company is very busy at the present time. The past month's output was 900 cars, and it is expected that next month's production will number 1000.

If it is decided to build a new plant, it will be started at once. The old plant will be gradually transferred to the new one, and in about a year, it is believed, the entire Pullman establishment will be located at Grantley.

Willard Builds 1,000,000 Batteries

CLEVELAND, OHIO, April 14—On Saturday, April 8, the total production of automobile lighting and starting batteries by the Willard Storage Battery Co., this city, reached the total of 1,000,000. Production in the company's new plant has increased rapidly during the past year, while over 725 Willard service stations are in operation in all parts of the country. The company reports that its plan of giving free inspection once a month to any car owner, regardless of the make of battery he used, has worked out very successfully.

Hupp Production Gains 69%

DETROIT, MICH., April 15—According to Lee Anderson, commercial manager of the Hupp Motor Car Corp., March was the biggest business month in the concern's history. Production was 69 per cent larger than in March, 1915. During the first three months of 1916 business was 70 per cent ahead of what it was during the first quarter of 1915. Prospects for a continued increase of business are reported by the Hupmobile dealers and distributors.

Pathfinder Reports Big Gain

INDIANAPOLIS, IND., April 15—The Pathfinder Co., this city, reports that sales are now running 100 per cent ahead of production, which is now at the rate of 200 per cent over the same period in 1915. The number of cars shipped since Jan. 1 increased 400 per cent in January, 270 per cent in February and 226 per cent in March over the corresponding periods of 1915.

New Era Spring Gets Plant

DETROIT, MICH., April 15—The New Era Spring & Specialty Co. has acquired the plant of the National Shock Absorber Co., Grand Rapids, Mich., which had been making shock absorbers and bumpers for the New Era company. The offices of the company will remain in Detroit.

Columbia Axle Adds 75 Per Cent

Production Increased 100 Per Cent—200 Men Added to Force

CLEVELAND, OHIO, April 15—The plant of the Columbia Axle Co., this city, has recently added 75 per cent more floorspace and with the new equipment installed the production of axles immediately jumped 100 per cent over the former capacity.

A feature of the new factory building is a sound-proof testing room. Specially constructed walls shut out all sound from this room. The floors and testing racks are of concrete with very solid foundations. Each axle before it receives the final O. K. is tested in this room under the supervision of trained inspectors. The axle is connected to an electric motor and the slightest noise is instantly detected and corrected before the axle is shipped.

Two hundred new men have been added to the factory force. The Columbia company manufactures both front and rear axles for passenger cars and supplies Cole, King, National, Monarch, Daniels, Davis, Auburn and others.

Crow Business Gains 100 Per Cent Over 1915

SOUTH BEND, IND., April 17—Automobiles reaching a total valuation of $155,700 were built and shipped by the Crow Motor Car Co., of Elkhart, Ind., during the month of March. This represents a 100 per cent increase in business over the same period last year, and places the Crow company among the leaders of Indiana automobile manufacturers in point of production. By the end of the year a company official estimates that fully 3000 cars will have been built and sold by the firm. The Crow company has at present 241 people on its payroll. Since Nov. 1, 1915, the company has expended $40,000 on buildings and factory extensions and another new building 60 ft. wide and 100 ft. long and two stories in height is to be built soon.

Spicer to Increase Capacity

PLAINFIELD, N. J., April 14—The Spicer Mfg. Co. is at present busier than ever before and is finding its capacity taxed to the utmost in order to keep pace with the demands of automobile manufacturers. The present output exceeds 500,000 universal joints per year and this will be increased to 65,000 a month as soon as new machinery is obtained. A large amount of new plant has been on order for months past and deliveries are expected very shortly. The bulk of the Spicer business is done with six sizes of joint, though there are small variations within each size, to take care of different methods of attachment required for different transmissions and axles. C. W. Spicer reports that axle and gearbox makers are rapidly adopting the S. A. E. standard tapers for their shafts, and that the variations in design are thus being cut down greatly; the special patterns are mostly for chassis of older design.

Republic Truck to Expand

ALMA, MICH., April 15—The Republic Motor Truck Co., will erect an addition, 60 by 500 ft., to its plant, thus increasing the total floorspace by 30,000 sq. ft. The working force, which is now about 700 men, will be greatly increased, as will production, which is now at the rate of 30 trucks a day.

Saxon Ships 1086 Cars First Nine Days of April

DETROIT, MICH., April 17—For the first nine working days of April, the Saxon Motor Corp. shipped 1086 cars, making an average of 120 per day. As the record month so far was March with 2604 shipped, it seems more than likely that this record will fall before the April total, which would be over 3000 cars if the present rate continues during the entire month. In January, 1556 Saxons were shipped, and 2231 in the following month.

Fire Fails To Stop Silvex

NEW YORK CITY, April 17—Despite a fire which considerably damaged the factory of the Silvex company, there has been no interruption in the company's business. Arrangements have been completed for the use of a neighboring building and there will be no delay in deliveries. When final arrangements are completed manufacturing facilities will be considerably increased.

Two New Members for M. and A. M.

NEW YORK CITY, April 15—The Detroit Gear & Machine Co., Detroit, Mich., maker of transmissions, clutches and transmission gears, and the G. Piel Co., Long Island City, maker of Long horns and muffler cut-outs, have become members of the Motor and Accessory Manufacturers, this city.

To Make Accessories Invented by Buick

JACKSON, MICH., April 13—The rights to manufacture a number of automobile parts and accessories invented by David E. Buick, have been secured by a corporation, soon to be announced, which will begin manufacturing them here. A new carbureter is to be one of the first things to be placed on the market.

February Exports Show Gain of 138.7 Per Cent Over February, 1915

7714 Motor Vehicles Shipped Abroad in That Month —Total Comprised 5651 Passenger Cars Valued at $4,063,429 and 2063 Trucks Worth $6,170,367

WASHINGTON, D. C., April 15—There was a large increase in the exports of automobiles and parts in February last, as compared with the same month of last year. According to figures compiled by the Department of Commerce, the exports in February last were as follows: Commercial cars, 2063, valued at $6,170,367; passenger cars, 5651, valued at $4,063,429; parts, not including tires and engines $2,173,409. For the month of February, 1915, the exports were 1002 commercial cars, valued at $3,022,482; passenger cars, 2230, valued at $1,785,330; parts, not including engines and tires, $564,976.

A Huge Gain

For the eight months' period ended February, 1916, the increase in exports was even greater than during the month's period. During February last, the exports of commercial cars reached the number of 14,467 machines, valued at $38,729,721, while the exports of passenger cars reached a total of 33,256 cars, valued at $25,534,507. The exports of parts, not including engines and tires, were valued at $14,965,360.

The exports for the same period of 1915 look insignificant in comparison with the above figures, the shipments of commercial cars amounting to only 4974 machines, valued at $14,011,924, while the exports of passenger cars totaled 9134 cars, valued at $7,593,429. The value of the parts exports, not including engines and tires, was $3,354,222.

The warring countries in Europe are largely responsible for the large gains that have been made in the automobile export trade. Russia is branching out as a buyer of American machines, 335 of them, valued at $1,514,729, having been shipped there in February last, while during the eight months' period of 1916, the shipments reached a total of 4568 vehicles, the value of which was $14,338,776. Russia did not figure in the export tables last year.

Naturally, the United Kingdom continues to head the list of countries importing American cars. The figures show that in February last 1169 cars, valued at $1,763,079 were shipped there while during the eight months' period the number was 14,740 and the value $20,377,746. This is a big gain over the figures for the same periods of last year, when 1183 cars, valued at $1,688,313, were exported in February and 4631 cars, valued at $6,447,015, during the eight months ended February.

France, too, continues to receive large shipments of American cars, 1027, valued at $2,804,931, being exported there in February, 1916, as against 412, valued at $1,389,599, shipped in February a year ago. For the eight months' period the exports rose from 2436 cars, valued at $6,407,087, in 1915, to 4199 cars, valued at $10,798,226, in 1916.

16 Cars to Germany

There were no shipments of cars to Germany in February last or during the eight months' period of this year, but during the eight months of 1915 there were sixteen cars, valued at $17,364, exported to that country. Italy is purchasing few American cars, only twenty-three, valued at $18,558, being shipped there in February last, as against sixteen, valued at $11,390, in February a year ago, while during the eight months' period the shipments rose from forty-two cars, valued at $35,112, in 1915, to 207 cars, valued at $146,144, in 1916. Little Denmark, which is just beginning to figure in the export tables, took twenty-seven cars, valued at $18,468, in February, while during the eight months' period of this year the number was 469 and the value $314,905. Other European countries imported 281 cars from this country in February last, the value being $301,082, as against 131 cars, valued at $406,368, in February a year ago, while during the eight months' period the exports amounted to 832 cars, valued at $2,300,646, in 1915, and 940 cars, valued at $975,010, in 1916.

Canada Still Gains

A big increase is noted in the shipments to Canada, 947 cars, valued at $593,492, being shipped there in February last, as against 349 cars, valued at $345,733, exported during the same month of last year. The figures for the eight months' period are even more impressive, no less than 4287 cars, valued at $3,033,808, being shipped across the northern border during the eight months of this year, as against 1727 cars, valued at $2,236,426, exported during the corresponding period of last year.

The West Indies and Bermuda are becoming good customers for American cars and this is a market apparently worth cultivating. Five hundred and thirty-eight cars, valued at $366,188, were exported there in February last, this

Exports of Automobiles, Trucks and Parts for February and 8 Previous Months

	February				Eight months ending February			
	1915		1916		1915		1916

Asia and other Oceania	131	197,433	1,564	497,523	814	1,443,677	3,291	867,727
Other Countries	159	145,526	348	187,386	427	349,567	2,272	1,605,933
Total	3,232	$4,807,812	7,714	$10,233,796	14,108	$21,605,353	47,723	$64,264,228

being a considerable gain over the figures for the same month of last year, which were 183 cars, valued at $98,630. The gain during the eight months' period was much greater, the exports increasing from 651 cars, valued at $439,642, in 1915, to 2708 cars, valued at $1,712,084, in 1916.

Heretofore it has been customary to group all the exports to South America under one head. The increase in the shipments to those countries has justified the Department in giving separate enumeration to the various countries, and it is interesting to note that while the combined exports in February a year ago were only 132 cars, valued at $66,767, Argentina alone in February last imported 380 cars, valued at $214,325. Again, during the eight months' period the combined exports to South America amounted to 603 cars, valued at $337,452, while Argentina during the same period of this year imported 2635 cars, valued at $1,199,860. Shipments to other European countries during the eight months of this year were as follows: Brazil, 144 cars, valued at $89,521; Chile, 540 cars, valued at $373,389; Venezuela, 301 cars, valued at $198,185; other South American countries, 332 cars, valued at $190,070.

East Indies Buy Many Cars

The British East Indies are also looming up large as buyers of American cars, 230 of them, valued at $170,158, having been shipped there in February last, while during the eight months of this year the number was 1859 and the value $1,400,401. British Oceania took 598 American cars in February last, the value being $597,661, while during the eight months' period the number was 4005 and the value $3,403,917. Other Asia and Oceania figured in the export trade to the extent of 1564 cars, valued at $497,523, in February last, while the shipments during the eight months of this year reached a total of 3291 cars, valued at $867,727.

The detailed figures, by countries, for comparative periods, appear in the accompanying tabulation.

S. F. Bowser Honored

FORT WAYNE, IND., April 15—S. F. Bowser, head of the Bowser Oil Tank and Pump Co. of Fort Wayne has been elected president of the Erie & Michigan Deep Waterways Assn.

Prof. Morton Joins Ambu Maker

CHICAGO, ILL., April 13—Professor Morton of the Armour Institute has joined the engineering staff of the American Bureau of Engineering, which at the present time is manufacturing a device for detecting and locating trouble in the electric starting and lighting systems of automobiles, called the Ambu Electric Trouble Shooter.

Dept. of Justice To Investigate?

May Undertake Gasoline Price Probe Independent of Trade Commission's Action

WASHINGTON, D. C., April 14—With Congress in receipt of the preliminary report of the Federal Trade Commission on the gasoline situation, as set forth in last week's issue of THE AUTOMOBILE, there is a persistent rumor afloat in Washington that the Department of Justice is preparing to institute an investigation of the subject apart from the investigation being made by the trade commission. Color is given this rumor by the action of Attorney General Gregory in declining to give the Senate information sought in the Kenyon resolution regarding the results of the investigation of the working of the supreme court's Standard Oil decree. The attorney general maintains that it would not be compatible with the public interest to give out the desired information.

The belief that the Department of Justice is going to delve further into the gasoline situation is further strengthened by the fact that department officials recently have been in frequent consultation with Charles B. Morrison of Chicago, who took part in prosecuting the dissolution suit against the Standard Oil Co., and is said to have conducted investigations since the dissolution of the trust, on behalf of the department, to determine whether the so-called subsidiaries have violated the anti-trust law since the decree was entered. The department's investigations are said to have disclosed that the so-called Standard Oil companies are not competing and that the stock ownership of the companies has not materially altered. Inasmuch as the decree permitted an unchanged ownership, present officials of the department have confined their efforts largely to determining whether any new violations of law were involved by the company.

A. C. A. May Test Water Fuel

FARMINGDALE, N. Y., April 18—Louis Enricht, of this town, who announced a few days ago that he had discovered a chemical which when mixed with water gives a fuel superior to gasoline, states that he has been experimenting for three years on chemicals which when added to water would produce a fuel and about three months ago discovered the compound which would produce the desired result. Up to within a few days ago his experiments have been performed upon his own three cars and those of neighboring garages. He then announced his discovery and made demonstrations to all who called until visitors became so frequent that it was impossible to satisfy them all. He has now decided that he will either sell the secret to the United States Government to dispose of as it wishes or to the automobile industry.

In explaining his compound to a representative of THE AUTOMOBILE, Mr. Enricht stated that the preparation could be made in either powdered or liquid form. In the form in which he used it it was prepared in a liquid solution, of which 4 oz. is enough to treat 5 gal. of water. The chemical, he states, remains in solution with the water in the tank until the water reaches the carbureter, at which time it is separated into hydrogen gas and oxygen. The hydrogen is used for combustion and the oxygen combines with the chemicals introduced. He also says that it is a peerless carbon remover and has more power than gasoline. It can be used in any needle valve carbureter, according to Mr. Enricht, but on a jet carbureter requires a larger nozzle. The cost figues at 1½ cents per gallon of mixture. He intends making a private test at the Automobile Club of America, but claims to be afraid of analysis of his fuel, which he says is simple.

Chemists and fuel experts have received the story of the new fuel with much reservation, pointing out that the energy necessary for the dissociation of water is as great as that secured by the recombination of the gases. They state that they know of no chemical which could possibly produce any such effect as described.

Motorzine—Another Gasoline Substitute

ST. LOUIS, MO., April 15—Motorzine, a substance invented by W. H. Stevens of St. Louis, to supply a cheaper substitute for gasoline, has been given exhaustive tests during which it is stated that an average of 27 m.p.g. was made. When mixed with crude oil or coal oil, the new fuel clarifies it at once, and the heavier oil does not carbonize, according to reports. The inventor claims it will be possible to make it for about 3 or 4 cents a gallon in 1,000,000 gal. lots.

E. V. A. A. To Standardize Lamps

CHICAGO, ILL., April 17—Suggestions on the question of standardizing lamps for electric vehicles were sought at a meeting of the Chicago section of the Electric Vehicle Assn. to-day, the information so obtained to be used by the standardization committee in preparing recommendations soon to be submitted. W. F. Bauer, chairman of the committee, explained several points which are in debate and must be disposed of to accomplish the committee's purpose. The standardization of charging devices will be undertaken at a later date.

N. E. Feels Freight Embargo

Increased Rates a Result of Freight Car Shortage—Some Cars Expressed

BOSTON, MASS., April 15—Increased freight rates for the buyers of automobiles is the latest thing that some of the purchasers of cars in New England face now and have been facing for a few weeks. The freight embargo presented a new angle when some of the Boston dealers were told that the railroads would not route their machines through to Boston and other New England cities direct.

They were told that New York and Albany would be the limit because of the need of cars, and also to insure, probably, that the freight cars would not be held too long in New England. Some of the dealers had to accept the inevitable and route their cars to Albany or New York. At those points the machines had to be transferred from the Western lines to cars of the New York, New Haven and Hartford, Boston & Maine and Boston & Albany railroads.

That necessitated hiring men there to make the shift. In some cases fenders had to be taken off to get the cars into smaller freight cars that had no end doors. When the machines reached Boston there was the work of putting the cars together again. On some of the machines the freight charges have represented about $20 more. Some of the dealers did not feel like adding this to the cost and so they cut it in two, standing half of it themselves. Others paid the entire excess freight over the normal. The dealers do not like to talk about it because they feel prospective buyers will be scared away. The cars that come on the gondola flat cars provided with canvas covers and frames are costing some of the dealers a little more, in some cases the cost of the covers being charged to them, but when they are returned they are allowed a rebate. In a few instances buyers have agreed to pay express charges to get cars quickly, but they are very few.

Stover Mfg. & Engine Co. To Be Capitalized at $3,000,000

FREEPORT, ILL., April 15—The Stover Engine Works and the Stover Mfg. Co., this city, will be merged into a new corporation to be known as the Stover Mfg. & Engine Co. The new corporation will be capitalized at $3,000,000.

This concern will manufacture the Stover tractor, the first model of which was turned out the latter part of March. This company expects to turn out about 100 of these tractors this year. One of the features of this tractor, is the use of cross cleated wheels in the rear. When the tractor is used in sod or stubble plowing, extra spurs are furnished, twenty-four to each wheel, which contribute to the footing of each wheel. The four-cylinder motor is rated at 40 hp. A Bennett carbureter and air cleaner is part of the equipment.

May Lower Freight Rates from Milwaukee to South

MILWAUKEE, WIS., April 15—Material reductions in the freight rates on pressed steel frames and other automobile parts from Milwaukee to southern points are in prospect as the result of the appeal of the Dorris Motor Car Co., St. Louis, Mo., to the Interstate Commerce Commission. The A. O. Smith Co., Milwaukee, Wis., recently shipped 202 automobile gear frame side bars, loose, weighing 23,000 lb., from North Milwaukee to St. Louis. The first class rate of 49.3 cents per 100 lb. was charged. The commission held the rate to be unreasonable and changed the rate to third class, amounting to 31.5 cents per 100 lb. Future shipments will take that rate.

American Rubber & Tire Co. Organization Completed

AKRON, OHIO, April 15.—The American Rubber & Tire Co. has been organized here and has purchased and succeeded to the business of the American Tire & Rubber Co. The new company is composed of experienced rubber men and the officers are: Fred. H. Snyder, president; Chas. Dietz, vice-president; Geo. W. Kratsch, secretary and treasurer; Henry L. Houk, general manager and assistant treasurer, and J. W. Rock, factory manager.

A two-story addition to the plant is in course of construction, and the company is making a complete line of tires and accessories, including American Indian red tubes, 5-min.-cure vulcanizing cement, repair materials and accessories.

McEvoy Heads American Top

JACKSON, MICH., April 13—The American Top Co. has been reorganized and J. A. McEvoy, of New York, has become president and general manager, while G. H. Quennard, who was president, has sold out his interest and retired from the company. E. G. Odette, who was secretary, treasurer and general manager, has also withdrawn from the company.

Anti-Friction Lubricant Co. Formed

ST. JOSEPH, MICH., April 12—The Anti-Friction Lubricant Co. has been formed with a capital stock of $20,000 to make all kinds of lubricants. A factory has been secured.

Steamers Relieve Freight Tie-Up

Situation Somewhat Improved to Points in Ohio—Otherwise Unchanged

DETROIT, MICH., April 17—With the opening up of navigation on the Great Lakes, the freight car situation will be relieved to some extent. Steamers of the Detroit and Cleveland Navigation Co. have been operating daily between this city and Cleveland now for one week, and there is a great traffic in cars to that city. Thus the distribution to Ohio points from Cleveland is now practically independent of the rail lines. The same will be true of cars for Buffalo and adjacent points when the boats begin operating from Detroit to Buffalo. The regular schedules to Buffalo will probably go into effect within two weeks.

There seems little change in the freight car situation this week so far as the automobile shippers are concerned. It may be that there is a slightly easier feeling, but even if a greater number of freight cars are available due to the lifting of embargoes by some of the eastern roads, the steadily increasing output of the factories quickly absorbs the greater supply of freight cars so that there is practically as great a shortage as ever, when the number of cars needed is considered. Makers are still shipping large numbers of machines on flats and gondolas with tarpaulins and board superstructures over them.

A meeting of the traffic managers of the various factories was held at the Board of Commerce here on April 13, and the present status of the situation was discussed at length. One factor which works against an adequate supply of the right kind of cars is the misuse of the automobile equipment by southern rail lines and shippers who are in the habit of appropriating the automobile cars for other lines of shipping. It is hoped to relieve this situation by conference with officials of these roads by a sub-committee appointed at the meeting of April 13. This conference will be held at the meeting on April 20 in Atlanta, Ga., of the Southern Assn. of Car Service Officers.

Demurrage Rates Higher

By a regular campaign among their dealers a great many of the manufacturers are seeking to prevent tie-up of cars at their destinations due to the tardiness of some dealers in unloading the automobiles. This is having a very good result generally. Although the demurrage rate was increased on April 1 to $2 a day after five days, the railroads are seeking to have a temporary rate of $5 per day to prevent holding cars.

Mexican Oil Fields Are Active

Tampico Exports Heavier—Two Plants May Adopt Rittman Process

TAMPICO, MEX., April 14—The flurry of excitement that was caused a few weeks ago by the invasion of Mexico by the American punitive expedition is subsiding and oil development operations are being resumed in the different fields situated adjacent to Tampico. Many of the American drillers who gathered in Tampico immediately after the Villa raid upon Columbus, N. M., have returned to their work. Oil exportations, both through this port and Tuxpam, are heavier than for several months. This is due largely to the additions that have been made to the different fleets of oil tank steamers. The refineries here are running full time. It is reported that the Rittman process of manufacturing gasoline will be installed by the Pierce Oil Corp. and the Eagle Petroleum Company in their Mexico refineries. It is claimed that experiments show that this process is specially suited for obtaining much larger quantities of gasoline from Mexican crude oil than is now to be had under the existing distillation method. The refinery of the Pierce Oil Corp. at Tampico will be equipped with fifty Rittman stills, and the plant of the Eagle Petroleum Company with twenty-five Rittman stills, it is stated here on reliable authority.

Many Mexican Concerns

One of the interesting features of the oil development situation in this region is the large number of native Mexican companies that have recently entered the industry. While for the most part these new concerns have comparatively small capital, they promise to become quite a factor in oil production here.

International Profits $661,118.98

NEW YORK CITY, April 15—Profits of $661,118.98 were made by the International Motor Co., this city, in the fiscal year ending Dec. 31, 1915, equaling 18.3 per cent on the $3,600,000 preferred stock. The gross earnings from operations for 1915 were $1,390,073.72, while the selling, administration and general expenses amounted to $728,954.74. The company's deficit balance of $3,118,197.73 on Jan. 1, 1915, has been reduced to $2,457,078.75.

Rubber Goods Elects Directors

JERSEY CITY, N. J., April 13—At the annual meeting here to-day of the stockholders of the Rubber Goods Mfg. Co., the retiring directors, with the exception of C. A. Hunter, were re-elected. The board now stands at ten instead of eleven, as follows: W. S. Ballou, N. F. Brady, S. P. Colt, F. W. Eddy, J. B. Ford, Ernest Hopkinson, Lester Leland, R. B. Price, H. E. Sawyer and E. S. Williams.

Edward V. Hartford, Inc., New Name

JERSEY CITY, N. J., April 13—The Hartford Suspension Co., this city, will change its name to Edward V. Hartford, Inc. This will not mean any change in the personnel or ownership of the company.

Rubber Lower—Copper Higher

NEW YORK CITY, April 18—A further recession in rubber and another increase in copper prices occurred last week. Upriver Para has dropped to 73 cents a pound, while Ceylon First Latex is now quoting at 83. Electrolytic and lake copper added ¾ cent more to its price this week, closing yesterday at 29½. Aluminum, antimony and lead declined. Aluminum closed yesterday at a lowering of 1 cent at 58; antimony dropped 2 cents to 41½; and lead closed at $7.75 per 100 lb. at a loss of 13 cents.

Though gasoline prices in this city remained unchanged last week, the situation according to oil men is still serious and a further rise is predicted. Stocks are said to be practically exhausted and the demand is far in excess of the supply. A factor adding to the tension in this market is the fact that great quantities of kerosene and other refinery products are piling up, and storage tanks throughout the country are well filled with the kerosene which has been refined from crude oil in the manufacture of gasoline. The problem of refining sufficient gasoline to meet the demand is not the only one the refiners have to face. Recent supply and demand statistics show that there are approximately 80,000 more barrels of crude oil consumed each day than are produced.

Hydraulic Pressed Steel Declares 50 Per Cent Stock Dividend

CLEVELAND, OHIO, April 15—The capital stock of the Hydraulic Pressed Steel Co., this city, has been increased from $1,000,000 to $1,500,000 and a special stock dividend of 50 per cent has been declared. The dividend will be payable to shareholders of record as of April 20.

It is stated that over 60 per cent of the outstanding stock has been optioned by Vice-President J. H. Foster at $540 a share on the $1,000,000 basis and $360 a share on the $1,500,000 basis. If the option is exercised, shareholders will be entitled to turn in their stock at the $540 figures.

An eastern syndicate has been formed to take over control of the company, provided present plans go through. It is understood that it is proposed to merge the company with an unnamed steel company with plants in the Pittsburgh district.

Dividends Declared

Packard Motor Car Co.; 1¾ per cent on common, payable May 1 to holders of record April 15.

Duplex Truck 10 Per Cent Dividend

CHARLOTTE, MICH., April 11—The Duplex Power Car Co., which makes the Duplex trucks, has declared a dividend of 10 per cent. The company's business is growing constantly and it is expected that enlargements will soon be made.

Last Dividend for Grabowsky Creditors

DETROIT, MICH., April 15—A final dividend of 2.6 per cent, equivalent to about $10,700, is being mailed by the Security Trust Co., trustee, to the creditors of the defunct Grabowsky Power Wagon Co. It brings up the total distributed to the creditors to about $174,900. All told, 61 per cent has been paid to creditors.

R-C-H to Pay Final Dividend

DETROIT, MICH., April 15.—A final dividend of about 7½ per cent is to be mailed soon to the creditors of the bankrupt R-C-H Corp. for which the Security Trust Co. has been trustee. The amount involved is about $37,000 and will bring up the total paid to secured claims to

$194,000 and to $211,000 on unsecured claims, since November, 1913. The concern failed in October, 1912. All told about 65 per cent of the approved claims of those creditors who extended credit will have been paid, while about 12½ per cent will have been paid to those who did not sign the extension agreement. The debts of the R-C-H Corp. totaled $1,800,000.

Toledo Machine and Tool Capital Now $3,000,000

Toledo, Ohio, April 13—The capital stock of the Toledo Machine and Tool Co. has been reduced from $6,000,000 to $3,000,000. This is $1,800,000 more than the original capitalization which was $1,200,000, prior to Dec. 22, last. It was then increased to $6,000,000 when eastern capital became interested in the plant.

Saginaw Company Capital Is $100,000

Saginaw, Mich., April 13.—The Saginaw Motor Car Co., with a capital stock of $100,000, has been organized and will make the Yale eight, to sell at $1,285. The officers of the company are: John A. Cimmerer, president; J. Will Grant, vice-president; W. C. Wiechmann, secretary; Harry E. Oppenheimer, treasurer; L. J. Lampcke, general manager and engineer.

Standard Co. Has $1,000,000 Capital

Dover, Del., April 13—The Standard Car Construction Co., with a capital of $1,000,000, has been formed to manufacture automobiles and trucks. The incorporators are all from Philadelphia and include F. R. Hansell, G. H. B. Martin, and S. C. Seymour.

Tire Securities Are Strong

Goodyear, Firestone, Miller Rubber and Portage Show Large Gains

New York City, April 18—Much strength was shown by the tire issues last week and as a result a majority of the issues closed on Saturday with large gains. Tire issues were very buoyant while the others were dull. Goodyear, Firestone and Miller Rubber, chalked up gains ranging from 30 to 35 points, while Portage Rubber rose 5 points. The strength of these and other tire stocks is said to be due to a certain extent to the large automobile production this year with the consequent demand for tires and the fact that the price of crude rubber has had another decline.

Automobile issues were less in demand last week with a consequent drop in prices. General Motors featured the decline with a 20-point drop on its common; Chalmers went down 9 points; Chevrolet after a 21-point rise the previous week, dropped 6 points; Studebaker dropped 3 points, Maxwell common ⅝ points, the first preferred ½ point, and the second preferred 2⅜ points; and Willys-Overland dropped 2 points.

Maxwell is being purchased by professionals on a rumor that the common stock is to get a 10 per cent dividend soon and the second preferred 6 per cent. All the back dividends have been disposed of by the recent distribution of 14¼ per cent in non-interest bearing warrants.

Apropos of the increased demand in tire issues this week, reports of large earnings by the tire companies have no doubt been the cause of much activity in these stocks. It is stated that earnings by the Ajax Rubber Co. this year are running far in excess of any previous year, and earnings of between $800,000 and $1,000,000 are being predicted. This company will increase its production to three times its present capacity.

Auburn Ignition Increases Capital

Auburn, N. Y., April 15—The Auburn Ignition Mfg. Co., Inc., this city, manufacturer of spark plugs, valve lifters, etc., has increased its capital from $25,000 to $60,000, in order to secure more efficient manufacturing facilities and working capital. The management of the company will continue with S. M. Kitchen, general manager; C. A. Frank, production manager; and H. G. Kitchen, sales manager.

Chelsea Screw Co. Reorganized

Chelsea, Mich., April 11—The Chelsea Screw Co. has been reorganized. Its capital stock is now $50,000 instead of $18,000. A new large addition is to be put up and a number of automobile parts are to be produced.

To Boom N. E. by Abolishing Motor Law Restrictions

Boston, Mass., April 15—If the plans now under way here are brought to a head, and there is no reason to doubt their success, many thousands of dollars will be spent to boom New England which will result in drawing thousands of motorists to the section. At a meet-

ing here, there were 200 men representing the six States who agreed that the time had come to advertise their locality properly, and the master minds said that at least $250,000 and if need be $500,000 will be spent annually for the next five years to tell the glories of New England.

One of the first things that the organization will be asked to do is to wipe out all the existing provisions in the present motor laws which place restrictions upon motorists as it is recognized that there are now some bad sections in them.

Parrott Tractor Specifications Announced

JACKSON, MICH., April 15.—The specifications of the Parrott tractor which is being made by the Parrott Tractor Co., have been announced. The power plant will be a four-cylinder bloc motor, 3¼ by 4¼; carbureter, Schebler; ignition, Dixie; storage battery, Willard; roller bearings, Hyatt; radiator, Candler; wheels, Hayes; tires, Kelly-Springfield dual block tires; a two-unit starter and lighting system. Wheels of different width will be furnished according to the special work the tractor is destined to perform. It is planned to make 3000 tractors within the next twelve months.

Beeman Garden Tractor in Minneapolis

MINNEAPOLIS, MINN., April 17—Another concern is to join the large local colony of tractor factories. The Beeman Garden Tractor Co. has been incorporated by E. R. Beeman, P. J. Lyons, A. G. Furber, P. H. Knoll and R. C. Brewsaugh. It will make a gasoline-driven garden cultivator, operated on foot. Beeman, manager of the Monitor Drill branch of the Moline Plow Co., and P. J. Lyons, president of the Bull Tractor Co., are the inventors.

Can't Cover Road With Tar

BOSTON, MASS., April 15. — Governor McCall has signed the bill put in by the Automobile Legal Assn. and passed by the Legislature prohibiting contractors on roads from spreading oil and tar across the entire width of a highway at a time.

To Dim Headlights at Portland

PORTLAND, ME., April 15—The city council is framing an ordinance to prevent the use of glaring headlights within the city limits, and also to prohibit the use of muffler cut-outs.

To Continue Dealers' Contest Assn.

NEW YORK CITY, April 19—The Motor Dealers' Association Contest Assn. has voted against dissolution.

The former officers were re-elected as follows: W. C. Poertner, president; Emanuel Lascaris, first vice-president; E. E. McShane, second vice-president; J. C. Nichols, treasurer, and E. F. Korbel, secretary.

Canada Buys 22,070 New Cars

Registrations Show Good Record for Past Year—17,570 Are Fords

OTTAWA, ONT., April 15—Recent statistics show that of all automobiles licensed in the nine provinces of the Dominion of Canada during the past year the Ford car was chosen in a proportion of four times to one of all other makes combined. There were 22,070 cars sold in Canada in these twelve months. Of this number 17,570 were Fords, leaving a balance of 4500 cars of other makes. The number of Fords in the Dominion will be increased by nearly 40,000 by Aug. 1, 1916.

Several of the dealers report their sales up to date this season to be treble what they were at the same time last year, but hardly expect that this exceptional increase will be maintained throughout the season. They all agree, however, that 1000 cars will be well within the mark.

At an average of $1,000 each this means an investment of a million dolares in cars in the district of which Ottawa is the center.

Out of 8616 licensed automobiles in Manitoba for 1915 there were 3452 Fords, 1004 McLaughlin-Buicks and 622 Overlands. In Saskatchewan, there are 3514 Fords, 742 McLaughlin-Buicks and 304 Overlands. In Alberta 5586 cars bear license plates; of this number there are 2695 Fords, 583 McLaughlin-Buicks and 312 Overlands.

To Enforce Boston Laws

BOSTON, MASS., April 15—Police Commissioner O'Meara has sent word to the automobile people and garages that he has instructed the police to see that some of the motor laws that have not been enforced are lived up to from now on. One of the laws relates to allowing cars to stand on streets unattended for various periods, and without the motors shut off. The other law relates to smoking in garages.

Technically, Law Bars Non-Resident Motorists from Bay State

BOSTON, MASS., April 15—According to W. A. Thibodeau, general counsel for the Automobile Legal Assn. of Boston, and an authority on motor laws, it is illegal for the residents of any other State, New Jersey excepted, to enter Massachusetts without registering despite the fact that there is a reciprocity law on the statute books. In fact it is because of the reciprocity law that non-residents are legally not entitled to enter, and as a matter of fact, although Mr. Thibodeau does not say so outright, every non-resident who last year entered the State, except New Jersey motorists, did not do so legally. He calls attention to the fact that the blame for this is due to the Massachusetts Highway Commission. And also that it is not a serious matter, for no new legislation is needed, merely a meeting of the commission and a promulgation stating what States grant reciprocity and the length of time their motorists may stay in the Bay State.

Owners' Licensing Bill Passes Assembly

ALBANY, N. Y., April 19.—The Cromwell-Kelly bill, compelling owners who operate their cars in New York City to obtain licenses similar to a chauffeur's, passed the Assembly last night. It is expected that it will pass the Senate tomorrow. The license fee is $1 for the first year and 25 cents for renewal.

Brown Bill Passes N. Y. Senate

ALBANY, N. Y., April 13—Half of the automobile registration fees in New York State will go to the municipality in which they are paid, according to the Brown automobile registration bill which passed the Senate yesterday. This year New York State will spend $16,000,000 for roads upstate, and 68 per cent of it will have to be paid by New York City. About $10,000,000 is to be spent for new roads, $4,000,000 for highway maintenance and $2,000,000 for State aid.

To Lessen N. Y. Light Glare

ALBANY, N. Y., April 13—The Hewitt resolution seeking a legislative investigation to provide means to lessen the glare of automobile lights was adopted to-day by the Senate. The desired appropriation of $5,000 for expenses was cut to $4,000.

Tibbitts 19 Years with Goodrich

AKRON, OHIO, April 17—E. C. Tibbitts is celebrating the nineteenth anniversary of his appointment as advertising manager for the B. F. Goodrich Co. Tibbitts is the only advertising manager the Goodrich company has ever had.

Detroit Radiator to Sell Starter

DETROIT, MICH., April 14—The Detroit Radiator and Specialty Co., this city has taken over the sales of the B-B mechanical starter, formerly handled by the Detroit Auto Accessory Co. The Detroit Radiator and Specialty Co., is also marketing the More Speed gears for Ford cars.

O'Donnell Wins Ascot Derby

His Duesenberg Averages 65.4 M.P.H. in 150-Mile Speedway Race

ASCOT SPEEDWAY, LOS ANGELES, CAL., April 15—*Special Telegram*—Eddie O'Donnell, in the Duesenberg won the 150-mile Ascot Motor Derby to-day, repeating his victory of Corona and ending his western racing engagements. His time was 2:17.09, or at an average speed of 65.4 m.p.h. Pullen, in a Mercer, was second in 2:17.27 4/5; Hughes, in the Omar, was third in 2:18.24 1/5; Waterman in a Gandy Special was running in fourth place when flagged; Tahis, in the Grant Special, was flagged when the crowd overran the course; Joe Thomas, in a Mercer, went out with a cracked cylinder in the fifth lap and Lou Gandy, in a Gandy Special, broke his oil line in the fiftieth lap. Lloyd, in an Oakland Special, stripped his timing gear at the start. R. C. Durant, who was to have driven the Cyclone, and Tetzlaff, who was to have driven the Durant Special, failed to appear.

Wheeler Resigns as Twin City Speedway President

INDIANAPOLIS, IND., April 13.—Frank H. Wheeler of Indianapolis has resigned as president of the Twin City Motor Speedway Assn. H. E. L. Habighorst of St. Paul, vice-president, will be temporary head. Meyers & Gates, attorneys of Indianapolis, have begun civil action against Mr. Wheeler in the Ramsey County District Court for $24,334.50 attorneys' fees in connection with settlement of the Speedway's financial troubles last year. Mr. Wheeler said regarding the speedway that he is through with it.

Patterson Makes Fast Time

CHICAGO, ILL., April 10—E. C. Patterson, driving a Cadillac, made the best time yesterday in the trials at Speedway park for the non-professional drivers' race to be held May 20. Patterson averaged 74½ m.p.h. for ten laps, or 20 miles. Seven other entrants in the event were giving their cars workouts and making speeds in the neighborhood of 73 and 74 m.p.h. The cars out included Mercers, Cadillacs and Packards.

Sinsabaugh on Contest Board

NEW YORK CITY, April 15—C. G. Sinsabaugh, editor of *Motor*, has been appointed a member of the contest board of the American Automobile Assn. Another addition is A. G. Waddell, of California. Mr. Sinsabaugh served two terms as chairman of the contest committee of the Chicago Automobile Club.

The A. A. A. contest board consists of the following members: Richard Kennerdell, chairman; R. W. Smith, Colorado; C. I. Ryan, Georgia; David Beecroft, New York; F. A. Croselmire, New Jersey; F. G. Webb, New York; Clifford Ireland, Illinois; H. W. Knights, Massachusetts; P. D. Folwell, Pennsylvania; R. W. Carr, Texas; F. M. Fretwell, Washington; C. G. Sinsabaugh, New York, and A. G. Waddell, California.

Coatalen a Sheepshead Entry

NEW YORK CITY, April 19—The Sheepshead Bay Motor Speedway Corp. has received by cable the entry of Louis Coatalen in a Sunbeam for the opening races at Sheepshead Bay May 13.

A. E. Wood, who has been driving Stutz cars, on the Pacific Coast, is returning to the East for the Sheepshead opening and it is probable that he will appear at the wheel of one of Harry Harkness' Delage team.

Sheepshead Speedway Moves Offices

NEW YORK CITY, April 8—The Sheepshead Bay Motor Speedway Corp. to-day moved its offices from 17 Battery Place to the second floor of the Eley Bldg., Forty-ninth Street and Broadway. The sale of tickets for the opening meet on May 13, will begin April 24, the McBride ticket agency handling the sale in New York City and Abraham & Straus in Brooklyn. Reservations of sections will be made for any automobile clubs which desire them.

Birmingham Speedway Started

BIRMINGHAM, ALA., April 14—The formal breaking of ground for the new speedway to be built in this city by the Birmingham Motor Speedway Co. will take place to-morrow.

Atwater Kent Ignition on Hupmobile

PHILADELPHIA, PA., April 15—The Atwater Kent Mfg. Works, this city, reports that the Hupp Motor Car Co., Detroit, Mich., has renewed its contract for Atwater Kent ignition on its 1917 cars.

Splitdorf Equipment for Lawson

NEWARK, N. J., April 17—The Splitdorf Electrical Co., this city, has contracted to supply the Lawson Mfg. Co. with Dixie 40 magnetos, spark plugs, high-tension switch and cables and electric lighting and starting outfits for the Lawson 1-ton truck.

Willys-Knight Adopts Adco

MILWAUKEE, WIS., April 15—The Willys-Knight 1916 series will use Adco coil spring shock absorbers, made by the Auto Device Mfg. Co., this city, as standard equipment.

Milwaukee Display a Success

Showroom Exhibition Sales Are Double Those Made at Indoor Show

MILWAUKEE, WIS., April 15.—A cumulative effort to stimulate retail car buying at the very opening of spring and the touring season best sums up any description of the second annual Dealers' Showroom Automobile Display conducted under the auspices of the Milwaukee Automobile Dealers, Inc., on April 11, 12 and 13. All Milwaukee and the territory for 50 miles around, served by interurban lines from Milwaukee, went motor shopping. While no actual figures of sales are available, dealers declare the display to have been a greater success than the first one, lasting but two days, in April, 1915. There were many visitors, of course, who were only sightseers, but compared with an indoor motor show, the showroom display sales record is better by two to one.

Prospects made at the Auditorium show of the M. A. D. in the middle of January were turned into purchasers at the three-day show this week. A better brand of weather could not have been served than that of the first day.

Each showroom was uniformly decorated, simply but elegantly, with Alabama smilax, palms, potted plants and cut flowers. The M. A. D. looked after the decorations. Some dealers augmented the scheme, and in the case of Harry Newman, Inc., Chalmers agent, a great deal of money was expended for auxiliary decorations on exterior and interior.

Chicago Used-Car Show Postponed

CHICAGO, ILL., April 15—The used car show, which was planned for this spring by the Chicago Automobile Trade Assn., has been postponed for probably one year. On account of the shortness of time after approval was given by the National Automobile Chamber of Commerce it was thought that it would be unwise to attempt to stage the show in May of this year.

100 Cars at Danville Show

DANVILLE, ILL., April 15—The first automobile show by the dealers of Danville and eastern Illinois, was held in the Chambers Building on April 12, 13 and 14. One hundred cars were on exhibition, together with a complete line of accessories.

Fifty Cars at Seattle Show

SEATTLE, WASH., April 14—With fifty representative cars on display, Seattle's third annual automobile show was held in the Arena, and proved a stellar attraction for hundreds of automobilists and prospective car owners from the Pacific Northwest. Many of the visitors came from nearby Canadian cities and Portland, as well as from cities in the State.

The first automobile that ever traveled the streets of Seattle was ranged alongside one of the very latest models.

The steady increase in the price of lumber in the Northwest, coupled with the boom in shipping and other large business interests generally mean a big increase in business for the Seattle dealers, who will profit from the show.

Velie Buyers in Special Train

MOLINE, ILL., April 15—The Velie Co. chartered a special train from Iowa City, Iowa, Saturday, April 15, met 150 guests with a band at Davenport, Iowa, and escorted them via automobile to the Velie plant for a tour of inspection. A dinner was served for the guests at the Manufacturers' hotel in Moline and following the purchase of thirty new cars the owners drove back to Iowa City, taking with them the remainder of the party. In addition to the sale of the thirty cars the company shipped forty-two other cars on the same day.

Chevrolet Salesmen in Annual Meeting

NEW YORK CITY, April 14—The annual meeting of the Chevrolet Salesmen's Assn. was held at the factory of the Chevrolet Motor Co., West Fifty-seventh Street and Eleventh Avenue, this city, Friday April 7. The following officers were re-elected: Honorary president, W. C. Durant; honorary vice-president, W. C. Sills; president, W. A. Sellon; vice-president, H. Lauterbach; treasurer, M. C. Reeves; secretary, W. J. Owens.

Nation-Wide Tire Show This Week

NEW YORK CITY, April 17—During the week beginning to-day the concerns selling the United States Rubber Co.'s line of "balanced" tires will have special exhibitions and a corps of experts to explain exactly what "balanced" means and how the balance between fabric, carcass and rubber tread adds to the life of the tire.

Micatite Is New Pittsfield Plug

NEW YORK CITY, April 14—The name Micatite has been selected as the winner of the $25 in gold offered by the Pittsfield Spark Coil Co., Pittsfield, Mass., for its new spark plug, which incorporates in its construction gas and air tight features. The name was suggested by F. L. Brown, 9400 Edmunds Avenue, Cleveland, Ohio. Over 5000 names were submitted.

Studebaker Tests Owners' Cars

To Teach Methods of Increasing Economy—Corrects Owners' Faults in Driving

DETROIT, MICH., April 17—In order to convince owners that they could operate their cars with greater gasoline economy if they would but handle them more intelligently, the Studebaker Corp. has recently carried on a number of tests in all sections of the country among owners of Studebaker cars. The idea has been worked out not with the thought of making tests primarily, but mainly to show owners how to get the greatest possible mileage per gallon.

In actual operation, the Studebaker plan has been carried out in somewhat the following manner: An expert calling upon an owner who is not getting maximum mileage, first disconnects the regular gasoline supply and attaches an auxiliary tank containing 1 gal. The owner then takes the wheel and drives a few miles, the expert at his side making mental notes the while. At the end of this run, the amount of gasoline used is measured.

The expert from the factory then relieves the owner at the wheel. Before starting out he adjusts the carbureter, and any other things that may need adjusting, in order to obtain greatest economy in operation. The expert then drives the car and drives it properly, explaining the owner's faults to him as they go along.

Reports indicate that in most instances the owner did not have the carbureter adjusted to best advantage. In other cases he might have had a tendency to leave the motor running while away from the car for a considerable length of time. In still other instances his fault might be in speeding up the motor and slipping the clutch when a shift of gears would have been the logical thing to do. Possibly spark plugs might have influenced the economy. At any rate, the factory expert is doing some great missionary work, and the Studebaker Corp. likes the idea immensely.

Movies for Traffic Safety

DENVER, COL., April 14—A plan to promote traffic safety in Denver by means of motion pictures is being worked out by Commissioner of Safety Alexander Nisbet. He intends to prepare a special film showing how the most common accidents are caused, illustrating the purpose of the most important traffic rules, showing the right and wrong way for both vehicles and pedestrians to deal with the main features of traffic conditions and requirements, and to furnish this film to all the moving picture theaters in the city. This method of spreading traffic knowledge is planned as an addition to a campaign of education now being conducted by the Department of Safety through printed rules and suggestions and through explanations given personally by traffic officers where occasion demands. There were 272 arrests of motorists during the month of March for violating traffic laws, and Commissioner Nisbet is seeking to remove causes for arrest by educating the public to work together for law observance and proper carefulness in general.

New York Eisemann Station in New Hands

NEW YORK CITY, April 13—The magneto service station in this city of the Eisemann Magneto Co. has been discontinued, the Auto Electric Service Co. taking over the stock, machines, etc. The latter company will continue at the same address, 245 West Fifty-fifth Street, and will act as service station for New York City proper, also Long Island City, Bronx, and Westchester and Rockland counties in New York State, and Bergen, Hudson, Essex and Union counties in New Jersey. The owners of the Auto Electric Service Co. are Henry Berlinghof, for the past three years service manager of the Eisemann Magneto Co., and George Strasser, for the past ten years foreman of the Eisemann repair department. W. B. Clowes succeeds Mr. Berlinghof as service manager at the company's plant in Brooklyn.

Johnson Detroit Gibney Manager

DETROIT, MICH., April 17—Following the resignation of Detroit branch manager H. L. Winter of the Gibney Tire & Rubber Co., O. S. Johnson has been appointed to manage the Gibney interests here. Mr. Johnson was formerly a district manager for the United States Tire Co.

Gramm-Bernstein in New York

NEW YORK CITY, April 14—The Gramm Worm-Drive Motor Truck Co. has leased 1204 sq. ft. of floorspace in the new Brokaw Building, in the Times Square district here, to act as eastern branch of the Gramm-Bernstein Co., Lima, Ohio.

Hess Is Firestone Cleveland Mgr.

CLEVELAND, OHIO, April 15—J. D. Hess, Jr., for three years a salesman in the Detroit branch of the Firestone Tire & Rubber Co., has been promoted to the management of the Cleveland office of the company.

Factory Miscellany

Canadian Regal to Build—The Canadian Regal Motors, Ltd., East Toronto, Ont., will build a factory costing approximately $18,000.

Acme Rrbber to Build—The Acme Rubber Co., Brampton, Ont., is contemplating building a plant at an estimated cost of $30,000.

Houk to Build—The Houk Mfg. Co., Buffalo, N. Y., is completing plans for an addition at Elmwood Avenue and the New York Central Railroad.

Sparks-Withington to Build—The Sparks-Withington Co., Jackson, Mich., has completed plans for a new plant the same size as its present factory.

To Manufacture Tires—C. C. Coddington, Charlotte, N. C., and others, are interested in the establishment of a corporation capitalized at $500,000 for the manufacture of automobile tires.

Buys Lexington Co. Plant—The Waller Mfg. Co., furniture manufacturer, Lexington, Ky., has purchased the former Lexington Automobile Co.'s plant.

Prudden's New Plant—The W. K. Prudden Co., Lansing, Mich., has awarded the contract for its new factory, 70 by 685 ft., three stories, to cost approximately $100,000.

Hupp in Canada—The Hupp Motor Car Corp. has been granted permission to carry on a manufacturing business in Ontario with a capital stock of $100,000.

Kleiber Truck's New Assembling Plant—The Kleiber Truck Co., San Francisco, Cal., has plans for a new motor truck assembling plant to be built at Fosom and Eleventh Streets, that city.

Kainer Adds—The Kainer Mfg. Co., Chicago, Ill., maker of automobile parts and pumps, has moved to 761 West Mather Street, where a brass foundry has been added to its facilities.

Dayton Body Co. Formed—The Dayton Body Co., Dayton, Ohio, has been formed with $100,000 capital to manufacture automobile bodies. A factory will be constructed, 64 by 384 ft., four stories, of brick. J. D. Art is general manager.

Aluminum Goods to Double Size—The Aluminum Goods Mfg. Co., Manitowoc, Wis., has broken ground for a new shop addition, to be five stories high, 85 by 350 ft. in size, and contain the executive offices. It will require about five months' time to complete the building. The capacity of the plant will thereby be doubled.

Kero Carbureter Formed—The Kero Carbureter Co. has been formed with a capital of $15,000 by Milwaukee interests to manufacture fuel vaporizing devices for internal combustion engines. The incorporators are R. N. Van Doren, J. J. McJeskey and W. G. Gehrs.

Goodyear Issues Tire Repairing Manual—The Goodyear Tire & Rubber Co., Akron, Ohio, has issued the new Goodyear Manual of Tire Repairing. It is primarily a manual discussing the material, equipment and methods of application, necessary to the complete success of the tire repairman. The manual is illustrated.

Spoke and Wheel Factory Enlarges—The Bimel Spoke & Wheel Co., Portland, Ind., is extending its plant by the addition of six large kilns for the final seasoning of spokes and felloes. This will provide sufficient capacity for a daily production of 400 sets of pleasure car wheels and fifty to 100 sets of truck wheels.

The Automobile Calendar

April 24-29.......Bangor, Me., Show.

Nov.............Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

The Week in

the Industry

Jandorf Opens Accessory Shop—The Jandorf Automobile Co., New York City, has made another extension to its business by opening a new tire and accessory store at 1761 Broadway. In addition to the other Broadway quarter at 1759, this company occupies a building at 303 West Fifty-ninth Street with its body department. The factory and service shops are located at 239 West Fifty-sixth Street.

Pittsburgh Apperson in New Hands—The Apperson branch in Pittsburgh, Pa., has been sold to the E. A. Myers Co., 5977 Center Avenue. This company has at present under construction a new building at the corner of Louisa Street, Penant way and Girts way. It is 61 by 110 ft., five stories and fireproof. The company will move into it about June 1.

Philadelphia Packard Making Changes—Extensive changes are being made by the Packard Motor Car Co., Philadelphia, to its branches in the East. In Bethlehem a new showroom and service station, 55 by 100 ft., and one-story high, is being erected at Linden and Spruce Streets; a one-story building, 50 by 100 ft., is being erected at the corner of Mulberry and New Streets, Lancaster. Changes are also being made in Harrisburg, Wilmington and Reading. A showroom is building at Front and Market Streets, Harrisburg; a service station and showroom, 35 by 100 ft., at Ninth and Tatnall Streets, Wilmington, Del., and a service station in Reading for motor trucks exclusively.

N. Y. Timken Offices Moved—Beginning May 1, the New York offices of the Timken-Detroit Axle Co. and the Timken Roller Bearing Co. will be moved to room 713, United States Rubber Bldg. G. L. Bitting will remain in charge as eastern representative of the companies.

Takes Over B-B's Starter Sale—The Detroit Radiator & Specialty Co., Detroit, Mich., which handles the More Speed gears for Ford, has taken over the sales of the B-B starter, formerly handled by the Detroit Auto Specialty Co.

Twin City News—P. Knight, 1608 Crystal Lake Avenue, Minneapolis, will erect a one-story concrete block garage at 4101-3 Bryant Avenue S.

A. Barth, 537 Rice Street, St. Paul, has opened an automobile top and trimming shop. known as the St. Paul Auto Top Works.

L. M. Hick, St. Paul, will erect a story garage and storerooms at Sixth and Exchange Streets to cost $17,000.

Trade Happenings

Macrae Heads Windsor Saxon—K. W. Macrae has been appointed manager of the Saxon branch in Windsor, Ont.

Spray Joins Timken—J. W. Spray is now connected with the sales force of the Timken Roller Bearing Co., Canton, Ohio. He was until recently sales representative in the Middle West of the Diamond Chain Co., Indianapolis, Ind.

Smith Leaves Winnipeg Maxwell—S. Smith of the Maxwell Motor Co., Winnipeg, Man., has severed his connection with that company to take a position with the head office of the company in Detroit.

Geary Joins McGraw Tire—F. S. Geary, formerly with the Kelly-Springfield Tire Co., New York City, has joined the McGraw Tire & Rubber Co., East Palestine, Ohio, as manager of its Newark branch, succeeding W. P. Fraley.

Sleght Heads Toronto Overland—F. J. Sleght, formerly manager of the Elyria factory of the Willys-Overland Co., has been appointed general manager of the Toronto, Ont., plant of that company.

Seaman Joins Knight Tire—L. I. Seaman, formerly associated with the Ajax Rubber Co., has joined the Knight Tire and Rubber Co. of N. Y., New York City, in the capacity of district representative in the western and northern portions of New York State.

Boston Trade Items—H. G. White, well known in oil circles, has joined the Pennsylvania Rubber Co., as New England traveling representative.

A. H. Allen, for the past seven years identified with the Packard factory at Detroit, is now assistant salesmanager for Alvan T. Fuller, the Packard dealer.

Homer Goodrich, who took on the Enger in Boston some months ago, has retired from the agency, and W. B. Fletcher is now president, with S. L. Bickford, treasurer, of the reorganized company.

Denver Men in New Roles—H. G. Peters, formerly treasurer of the Boss Rubber Co., Denver, is now president of the Peters-Tucker-Hay Rubber Co., 1513 Cheyenne Place.

E. A. Johnson, formerly traveling salesman for the United States Tire Co. and later with the Knight-Campbell Music Co., Denver, is now sales manager for the Hupp Motor Sales Co., 1260 Broadway, Colorado and Wyoming distributors for the Hupmobile and Locomobile.

E. M. Tucker, formerly store manager for the Quick Service Tire Co., Denver, is secretary-treasurer of the new Peters-Tucker-Hay Rubber Co., 1513 Cheyenne Place.

H. P. Federspiel, formerly with the Ford and Maxwell branches in Denver, is manager of the Colorado Motor Car Co., 1520 Broadway, Cole, Saxon and Reo distributor for Colorado and Wyoming.

R. E. Hay, formerly with the Boss Rubber Co., Denver, is vice-president of the Peters-Tucker-Hay Rubber Co., 1513 Cheyenne Place.

Washington Trade Items—The Auto Appliance Co. has opened in Tacoma with R. W. Cady, president, and associated with him are H. C. Lemagie and C. F. Powell. This firm handles the Federal and Goodyear tires and a well-selected line of accessories.

The H. L. Olive Co., Spokane, distributor of Overland machines, announces plans for the construction of a large addition to its home, which when completed will give it a floor space of 36,750 sq. ft.

C. C. Fagan has been appointed manager of the Pierce-Arrow service station in Portland, Ore.

The H. L. Mann Motor Co., Portland, Ore., has acquired the Oregon State agency of the Mercer, which he will handle in addition to the Haynes line.

Columbus News Items—The Broad-Oak Automobile Co., located at 622 Oak Street with a branch at 170 North Fourth Street, which has handled the Chalmers in central Ohio since that car has been on the market, has given up the agency and taken the Chandler in fourteen counties in central Ohio. The Chalmers agency in Columbus will be handled by a branch of the Fischer Auto & Service Co. of Cincinnati. The Columbus branch is located at 137 East Gay Street. A. G. Fischer will be the Columbus manager.

D. W. Short has been appointed Columbus representative of the Ohio-Metz-Elcar Co. of Cleveland, the Ohio representative of the Metz and Elcar. Columbus headquarters have been opened at 211 North Fourth Street.

The G-M Service & Specialty Co. has moved from its former location, 275 North Fourth Street, to 179 East Naghten Street.

E. T. Paul, who has been doing a tire repair business at 123 Parsons Avenue, has added a full line of automobile accessories.

O. G. Roberts & Co., 933 East Gay

Street, which has handled the Overland in central Ohio territory for about eight years, has given up the agency to become effective some time previous to July 1.

California Items—A. W. Maxwell, formerly manager of the Studebaker Corp.'s interests in Arizona, has been appointed manager of the newly organized Studebaker commercial car branch in southern California, with headquarters at Los Angeles. The new Arizona manager is R. Robinson, formerly of Los Angeles.

Col. C. L. Hewes, formerly manager of the Oakland, Cal., Pacific Kissel Kar branch, has been appointed manager of the Kissel interests in Los Angeles. Colonel Hewes has been connected with the motor car industry in Oakland and San Francisco for many years and is well known throughout California. O. B. Henderson, former manager of the Los Angeles house and vice-president of the Pacific Kissel Kar branch, has retired from active work in the industry.

Mountain Retail—The Peters-Tucker-Hay Rubber Co., a new $10,000 concern, has opened an agency for Knight and Blackstone tires at 1513 Cheyenne Place, Denver, and also a filling station in connection.

The Headington Auto Co., 1636 Broadway, Denver, Metz, Enger and H. A. Lozier distributor for Colorado and Wyoming, has been appointed official service station for the Master carburetor.

M. M. Rubner, Rawling, Wyo., Cadillac, Chalmers and Hupmobile dealer, has moved from Cedar Street, at the edge of town, to a more central location at 412 Lincoln Highway, where he has larger quarters for garage and salesroom.

The L. E. Kelton Motor Car Co., 1616 Broadway, Denver, Haynes distributor for Colorado and Wyoming, has secured the distributing agency for the Patterson for the same territory.

Mulnix & Rarie, 35 East Colfax Avenue, Denver, Grant and Pathfinder distributors for Colorado and Wyoming, have secured the agency for the Little Giant truck for the same territory.

The Maines-Hough Motor Co., 439 Broadway, Denver, Chevrolet, Monroe and Mitchell distributor for Colorado and Wyoming, has opened a branch salesroom in a more central location, at 17 East Colfax Avenue, with William R. Beattie in charge.

A. L. Davis, Arvada, Col., Chevrolet dealer, is putting up a $15,000 building at Wadsworth Avenue and Grandview for salesroom, garage and extra offices. It will be 40 by 140 ft., of steel, concrete and brick construction, with two stories and a fireproof basement. The top floor will be rented for office use. The building will be finished the middle of April.

Wisconsin Trade Items.—F. J. Chlupp, for ten years associated with the Burroughs Adding Machine Co., has taken the position of manager of the Motor Car Sales Co., 136 Mason Street, Milwaukee, a large territory distributor of the Marmon and Oakland. The company is occupying temporary quarters and will soon move into its new garage and service station on Milwaukee Street, near Mason Street.

The Rice Lake Motor Car Co., Rice Lake, Wis., has taken occupancy of its new garage and repairshop, which, being 66 by 132 ft. in size, is one of the largest buildings devoted to garage purposes in any small city of Wisconsin.

The Olson-Pauly Automobile Co., Manitowoc, Wis., has taken the Wisconsin State agency for the Ross 8 and will appoint agents in Milwaukee and other parts of the territory.

The Kern-Hughes Co., 955 Thirtieth Street, Milwaukee, has taken the State agency for Wisconsin of the Troy motor truck trailer. The Milwaukee Gas Light Co. has purchased a 5-ton trailer, one of the largest in use in Milwaukee.

The Hay Motor Sales Co., organized recently at Stevens Point, Wis., has been appointed district representative of the Elgin Motor Car Corp. A salesroom has been established in the Mansur Building on Strongs Avenue, and service station will be provided as soon as possible.

The J. J. Dougherty Co., 803 Grand Avenue, Milwaukee, accessories and supplies, has established a branch warehouse and salesroom at 398 Kenilworth Place, opposite the new branch plant of the Ford Motor Co. The concern specializes in material for Ford owners.

The Stutz Motor Co. of Milwaukee, headed by E. J. Weller, has been organized to handle the State agency for the Stutz in Wisconsin. Headquarters have been established at 115 Sycamore Street.

W. G. Schultz, for six years associated with the Reeke-Osmond Motor Car Co., Milwaukee, representing the Jeffery, has resigned to resume a connection as special traveling representative of the Thomas B. Jeffery Co., Kenosha, Wis. Mr. Schultz was with the Jeffery company before being transferred to the Milwaukee agency.

The Hilgendorf Hardware Co., 303 Third Street, Milwaukee, has taken the district agency for the Champion, the State agency for which is held by J. E. Murray, Wausau, Wis.

The Burd Piston Ring Sales Co., 424 Jefferson Street, Milwaukee, has moved its offices and warehouse to 813 Grand Avenue. The company represents the Burd product in Wisconsin and upper Michigan. P. C. Christman is general manager.

The Opsato Motor Plow Co., organized at Eau Claire, Wis., in the spring of 1915 to manufacture a gas plow and general utility farm tractor, has been reorganized as the Eau Claire Mfg. Co., and is now ready to begin a large production. The company has completed its plant and installed the equipment. Officers have been elected as follows: President, R. B. Gillette; vice-president, J. P. Norrish; secretary and chief engineer, M. S. Opsato; treasurer, Charles Keller.

The Mechanical Appliance Co., 123-133 Stewart Street, Milwaukee, a large manufacturer of electric motors, generators and similar devices, is so rushed with orders that it has been found necessary to build a new shop, to be 30 by 130 ft. in size.

The Lemke Electric Co., 509-513 Cedar Street, Milwaukee, has been appointed official service and supply station for the Bijur Motor Lighting Co. The Lemke company is also official station for the Bosch, Simms and Mea magneto companies, Splitdorf Electrical Co., Rushmore Dynamo Works and Gray & Davis, Inc., and acts as official distributors for Wisconsin and northern Michigan.

The Ros-Wel Co., 112 Miller Building, Milwaukee, motor car specialties, is now marketing a new anti-freezing solution, trademarked "Uneeda." A large production is being undertaken in preparation for the coming cold weather season.

The big Arcadia Building, 615-625 Wells Street, Milwaukee, scene of some of the most important pugilistic bouts fought in this country in the last twelve years, is about to give way to the march of progress and will be rebuilt into a garage, which will be one of the largest in the Northwest in point of ground floor space. The big structure was originally known as the Hippodrome and was erected at a cost of $100,000. Frank Mulkern, Milwaukee's millionaire newsboy and taxi operator, has held the building under lease for several years and is behind the project to transform it into a large downtown garage such as Milwaukee has long needed. In this building was held the first motor show in Milwaukee, the Milwaukee Automobile Club having promoted the first exhibition in March, 1908, before the now largest exposition building in Milwaukee, namely, the Auditorium, was completed.

The Badger Auto Body Co., Milwaukee, the incorporation of which was recently noted, is establishing a large shop at Lisbon Avenue and the Milwaukee road tracks, and will devote its efforts exclusively to the production of delivery bodies for automobiles, specializing in styles adapted to Ford chassis.

The Wadhams Oil Co., 215 National Avenue, Milwaukee, one of the largest distributors of oils, greases and motor fuels in the Middle West, will add another filling station to the list of stations in the city of Milwaukee. Plans have been prepared for a fireproof tank house, offices and drive at Ivanhoe Place and Prospect Avenue, one of the most prominent corners in the elite residence district of the east side of Milwaukee.

The Hoppe-Hatter Motor Co., 539 Broadway, Milwaukee, agent for the Buick and State agent for the R. & L.-Baker electric and Owen magnetic, will move about June 15 to new and larger quarters now being erected for the firm on Milwaukee Street, just north of Oneida Street, in the heart of the east side motor district of Milwaukee. The building will be 50 by 120 ft. in size and contain a large service station. The present quarters of the Hoppe-Hatter company will be used by the Bartles-Maguire Oil Co., which has shared the big structure with the Buick agent for several years.

The Jefferson Automobile Co., Jefferson, Wis., district agent for the Ford, Buick and Oakland, is building an addition which will provide space for one of the largest and most completely equipped repairshops in any small city of Wisconsin.

Streator Co. Making Truck Bodies—The Alliance Manufacturing Co., Streator, Ill., which for many years was engaged in the construction of wagons and buggies, has gradually adjusted its business to changed conditions and is now devoting its attention largely to commercial truck bodies. As this business has reached a large scale, it has been decided to add hearses. The Alliance company will manufacture the bodies and the Barley company, also of Streator, will furnish the chassis. The "waste" or by-product of the Alliance company is being utilized in making wagon boxes for Montgomery & Ward of Chicago, the latter firm placing more orders than the Alliance plant can provide for.

Iowa Trade Items—J. F. Ochsner of Fort Madison, Iowa, has become agent for the Oakland.

The R. M. Tharp Auto Co., Waterloo, Iowa, is erecting a modern fireproof garage building and will take possession June 1. The firm handles the Jackson, Hupmobile and Allen cars.

The Hoover Auto Co., Oskaloosa, Iowa, has leased an adjacent building as an auxiliary garage. It will be used to store new cars.

J. S. Benson of Iowa City, Iowa, is to erect an automobile service station at Lynn and College Streets.

W. O. Campbell has purchased the Altmeyer Co. agency at Cedar Rapids. He will continue to handle the Studebaker.

H. F. Bierkamp and H. H. Horn have opened a garage at Milton, Iowa. A full line of accessories will be carried. William Broders has established a vulcanizing and tire repairing shop at Durant.

Jack Altmeyer of Cedar Rapids has been appointed general agent of the Dodge Bros. Co., for twelve counties. Headquarters will be in Waterloo.

The Iowa Motor Truck Co., Ottumwa, is working overtime manufacturing truck frames and assembling. The trucks are being manufactured at the plant of the American Mining Tool Co. The company reports many orders on the books.

W. W. Maish has resigned as assistant cashier of the Citizens National Bank, Des Moines, and has bought an interest in the States Auto & Supply Co., of which he will be secretary and treasurer.

Dubuque has been established as a distributing point for the Cadillac in Dubuque County and adjacent territory. W. L. Wallace will be resident manager and will establish a Cadillac service station.

Joseph A. Eisele of Davenport has bought out the Union Motor Co. of that city and has made a contract for the handling of the Chevrolet in this territory. He will also conduct a complete garage and repair establishment.

The Mercantile Warehouse Company of Waterloo has secured an admirable garage site on Commercial Street, near the Russell-Lamson Hotel, and plans the erection there of a new and up-to-date garage, 40 by 140 ft. One of the oldest residences in the city, built in 1850, will be torn down to make way for the new garage.

A new branch of the Studebaker Corp. is to be established immediately in Des Moines. It will supply parts to Studebaker owners and dealers in Iowa and adjacent territory in other States. The local branch will be in charge of J. A. Haskell, formerly assistant manager of the Studebaker branch at Cleveland, Ohio. A $100,000 stock will be handled here, a force of fifteen men employed, and 5000 cars handled annually through this branch. A new building is to be erected to house the new branch. G. L. Willman, Studebaker sales manager, is here to help start the branch. He says Iowa should have twice as many cars.

Louisville Items—J. J. Pontius of Cincinnati has been appointed sales manager of the Oldsmobile Sales Co., 931 South Third Street, Louisville, Ky.

The Paige Motor Sales Co., 725 Third Street, agent for the Marion and Grant, has been appointed Haynes distributor in this territory.

The J. P. Hudson's Sons Co., 1046 East Main Street, well known to Louisville people and farmers of practically every county in Kentucky and southern Indiana as horse and mule dealers for the last twenty years, has acquired the agency for the Lippard-Stewart motor trucks, and would take in part payment for commercial vehicles horses, mules, wagons and harness. Being prepared to find a quick market for them, the Hudson firm then will sell the animals through its regular channels.

Adamson Vulcanizer to Add—The Adamson Mfg. Co., East Palestine, Ohio, is starting work on an addition to its plant to be 50 by 150 ft. and three stories high, total 22,500 sq. ft. of floor space. The new building will be of brick and glass construction, and will be used for increased production of Adamson vulcanizers and new patented devices. Work will be rushed so that the new plant can be occupied some time in June.

Piston Ring Co. Formed—The plant of the Piston Ring Co., Muskegon, Mich., will be doubled and the production, which is now at the rate of 27,000 piston ring castings a day, is to be increased to 50,000 or more a day. One addition to the plant will be a building 52 by 112 ft., while another addition will consist of a building, 119 by 112 ft. At least $75,000 will be expended for additions.

Shakespeare Carbureter to Enlarge Plant—William Shakespeare, who manufacturers the Shakespeare carbureter, will enlarge his factory in Kalamazoo, Mich., and is making provisions to enable a production of 20,000 carbureters, beginning next July.

Beechler Succeeds Goldie—R. G. Beechler, who was chief engineer of the metal products branch of the Timken-Detroit Axle Co., Detroit, Mich., has been appointed works manager, succeeding R. J. Goldie, who resigned.

Auto Body Takes Over Brewing Co.—The Lansing Brewing Co. has been taken over by the Auto Body Co., Lansing, Mich. Negotiations have been pending for some time, but it is said that the brewing company's stockholders did not wish to close up their business until indications were such that the State wide prohibition movement seems certain to make it very difficult for many breweries to keep on doing business in Michigan.

Warehouses for Automobiles—The Mason City Mfg. & Warehouse Co. has taken possession of the Colby plant at Mason City, Iowa, and expects soon to open an automobile warehouse for distribution purposes. The buildings are fireproof. An inclosed chute will lead to the railroad tracks. This will enable dealers in northwestern Iowa and southern Minnesota to buy their cars in larger numbers and will insure prompt deliveries to customers.

Spalding Lansing Foundry Mgr.—F. D. Spalding, Lansing, Mich., has been appointed manager of the Lansing Foundry Co. He was formerly assistant sales manager of the New-Way Motor Co.

Minor in Charge at Frisco—H. W. Minor has been put in charge of the San Francisco office of the American Bureau of Engineering and will push the sale of Ambu Electric Trouble Shooter in that territory. His address is 17 Powell Street.

The Automobile

The Case for the Four

Resume of Situation and Ideas of Two Engineers Who Present Four-Cylinder Side of the Matter—Possibilities of Well-Defined Field for Each Type and Displacement

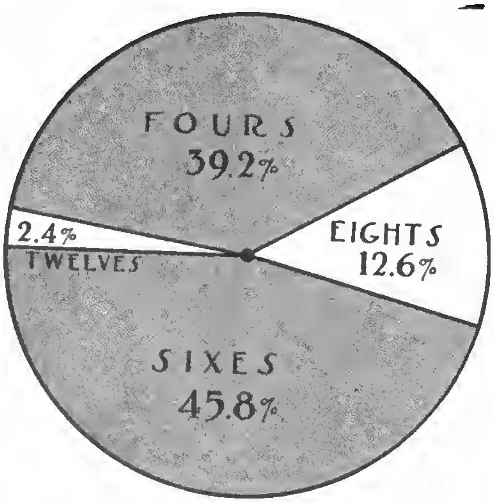
By J. Edward Schipper

FOUR-CYLINDER manufacturers as a body have been placed in the position of a defendant in the courtroom. The plaintiff, in the form of manufacturers of six-, eight- and twelve-cylinder engines, has stated his case and presented his arguments. The defendant must have an opportunity to answer before the case goes to the jury, which is in this case of considerably more than twelve men since it consists of the entire automobile-buying public. The judge who charges the jury and passes upon the points of law in this trial of fours vs. multis is the body of engineers which passes upon the technicalities involved.

In a way it is almost a foregone conclusion that the jury will disagree in this case. That this is true can be seen from the fact that the jurors themselves are largely guilty of prejudice, favoritism or some other quality which would render them ineligible to serve. This partiality on the part of the jury is evidenced by the fact that its various members are riding about in cars in which the cylinder numbers vary between four and three times that number.

In opening a legal case in order to secure the greatest possible dispatch it is customary for both sides to concede points upon which they are agreed. This avoids the necessity for arguing upon facts on which there is no difference of opinion. There are several of these facts that are agreed upon by both the fours and the multis and before the defendants' case is reviewed these facts should be noted.

There is no such thing as the ideal car. On the contrary, there is a different ideal for every set of requirements. It is this condition that stimulates automobile manufacture and renders it possible that there be such a large variety of makes and models. It is also this possibility which renders it permissible or even possible to make cars having a varying number of cylinders. The point, however, to be made by the defendants of the four-cylinder motor, is whether or not fours are suitable for every class of work or whether they have a well-defined field which embraces a greater part of the possible requirements of the motoring public with the other part open to builders of sixes, eights and twelves.



Standing of the cylinders by models listed for the 1916 season

This condition of varying requirements is one of the conceded points. The others are largely along the lines of what individual owners demand in their cars. Taking the average owner, he is found to be the possessor of a five-passenger touring car of which he demands the following qualifications:

1—*Flexibility*—From 5 to 50 m.p.h. on high gear without choking the motor and with smooth application of power.

2—*Acceleration*—The ability to make a quick getaway from a standing start or to increase rapidly from one speed to another on both the high, low and intermediate gears.

3—*Comfort*—Absence of vibration and jolting due to the motor or to road inequality.

4—*Power*—Ability to climb hills, to pull through heavy roads and to travel under adverse conditions on high gear.

5—*Economy*—To be light on tires and to consume relatively small quantities of fuel and oil in consideration of the distance traveled.

All these qualities are demanded by the average owner. They are not, however, demanded by every owner. The possessor of a closed car which is to be driven about the city streets

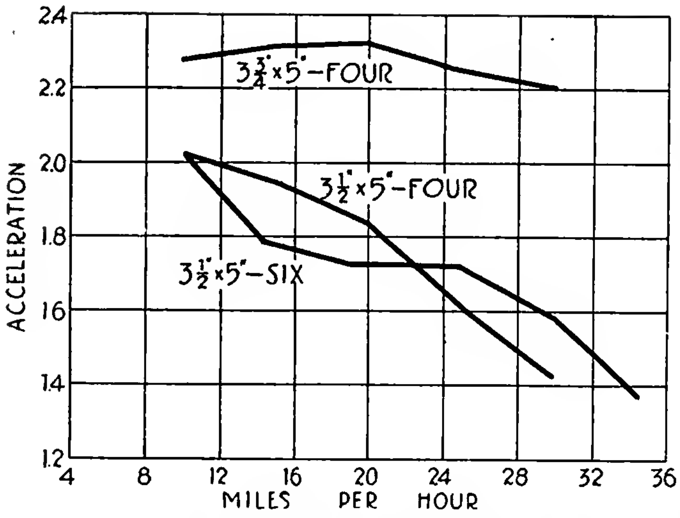


Fig. 1—Curve of acceleration on 3½ by 5 six-cylinder motor
Fig. 2—Curve of acceleration on 3½ by 5 four-cylinder motor
Fig. 3—Acceleration curve on a 3¾ by 5 four-cylinder motor

may insist that his driver never go above 20 m.p.h. On the other hand the college youth in his raceabout who has an indulgent father to pay the tire bills may scorn anything less than breakneck speed. The average owner, though, will ask for the five qualities above outlined, and if the four-cylinder can answer these better than any other type of car it will have gone a long way toward successfully defending its position.

At a joint meeting of the Metropolitan sections of the Society of Automobile Engineers and the American Society of Mechanical Engineers held in New York on the evening of April 20, two prominent engineers presented papers giving the four-cylinder side of the matter. It will be interesting to first study the broad view of the cylinder proposition and then to note what these engineers say in answer to the claims of the multi-cylinder manufacturers who have been classed as the plaintiff in this case.

The concessions have been made and each side is agreed largely as to what is demanded by the average car user. To go further into the matter than this brings the argument directly into the field of dispute, and directly into the part of the question which the jury, the buying public, must decide; for, after all, the public creates demand as rapidly as the engineer creates improvements.

Four-Cylinder Engine Is Simple

It must be conceded that the four-cylinder engine is simpler than engines having more cylinders and, if all the advantages included in the latter can be given by four, there would be no advantage in using a greater number. Again, if the advantages to be secured were only theoretical but did not work out in practice, the four would be still more desirable from the standpoint of simplicity. Therefore in studying the matter of cylinders it must be remembered that engines having more than four cylinders must show an advantage over the four in some practical respect before they are justified.

It would also be of value if it were possible to divide the entire range of automobile activity into a number of fields and then to state exactly what type of engine is most suited for that given field. There is no doubt but that a large number of automobile purchasers buy cars which are not economically the best for their purposes. They are carried away by some detail which appeals to their fancy, causing them to buy a car which is, to say the least, not adapted to their uses. It does not take 66 hp., for instance, to operate a town car over asphalt pavements with no hills at an average speed of 12 m.p.h.

As far as power is concerned, it is not necessary to go very much above 300 cu. in. to secure it. This is shown by the performance of racing cars on the speedways during the past year. On the other hand with large displacements per cylinder the stress on individual connecting-rod and main bearings is greater, and, where it becomes necessary to carry a fairly heavy car over hilly country and rough roads at high speeds, the question is one which is open to considerable doubt.

Better Acceleration on Four?

As regards the matter of acceleration, it will be noted in one of the following papers that the author claims better results for the four than for engines of more cylinders, basing his claims upon the showing of accelerometer curves and explaining them by the difficulties of carburetion in multi-cylinder engines where the gas stream is divided into a number of sub-streams running in different directions, as compared to the four where the intake stream lines are comparatively simple. Overlapping intake valve opening has been the subject of considerable engineering discussion and has had much to do with intake manifold design and also has been one of the factors in the cylinder debate. As an important consideration in acceleration and one of the reasons why the four can be made to perform as well as the multi-cylinder engine, it opens an interesting line of thought. This is particularly so because it attacks the multi-cylinder engine on one of the particular points where supremacy is claimed.

Greater Thermal Efficiency

The claim of higher theoretical thermal efficiency for the four than for the multi-cylinder engines is hardly discussed, although it is advanced by one of the engineers who presented papers on this subject. It would be possible to go back to the one-cylinder engine and show that it has a higher inherent thermal efficiency than the four. The statements regarding increased complications in multi-cylinder engines are also met in the same way, and this again brings us into the field where the jury composed of automobile-buying citizens must decide.

Piston displacement per cylinder is a theory of action which, like a blanket, may be spread to cover the ideas advanced by all parties, but it is not satisfactory as a complete answer to all those concerned. If it were true, then well-defined fields for each number of cylinders would be created by simply arranging logical divisions in piston displacements. The trouble is that the fields of the present motors overlap to a very large degree, leaving certain areas of debatable ground where the battle rages with marked and continuous severity.

The summing up of the four-cylinder case by two engineers who have clung to this type of design through all the attacks made by the promoters of cars having a greater number, is of interest, and it is particularly worthy of note to find that in many instances the attack is made on the very points in which the multi-cylinder engine has claimed superiority.

Automobile Applications of Four-Cylinder Motors

Paper Read Before the Metropolitan Section of the S.A.E. in Joint Meeting with the A.S.M.E.

By F. E. Watts*

THE considerations which determine the motive power for passenger automobiles differ in many respects from those which govern the selection of prime movers for any other purpose.

In the older applications of power, the problem was usually reducible to a dollars and cents basis: given such factors as work required, location, possible fuel supplies, etc.

The automobile power problem is not so definite.

During the past year numerous excellent papers have been read dealing with the technique of modern types of automobile motors. Torque variations, unbalanced forces, periodic vibrations, etc., have been called to our attention repeatedly in these papers. Most of this matter is not new; it may be found in the admirable works of Dalby, Clerk, Guldner, Lucke, Marchis and Sharpe, most of which have been available for ten years past and which are, I am afraid, lying covered with dust on our shelves.

It seems to me that much of the matter which has been presented is not pertinent, because little attention has been given as to the effect which the forces described have upon the passengers.

In this paper, therefore, I will consider briefly the applications of motors to automobiles, and will try to show why the four-cylinder motor is used on the majority of the motor cars produced to-day.

As practically all commercial vehicles, both freight and passenger, have four-cylinder motors, I will confine the discussion to pleasure automobiles.

To still further simplify the question, I will consider only the present types of four-cycle poppet valve motors.

The question to be considered then is: What is an automobile motor required to do? In other words: What is its job?

Experience gained in the building of some 50,000 cars, which are now running in all parts of the world, has convinced me that the majority of automobile owners expect their cars to perform about as follows:

To run steadily and pleasingly on high from 5 to 50 miles an hour over smooth roads.

To carry them over the rougher roads as fast as they can ride with any degree of comfort.

To pull through deep sand, mud or snow easily and without overheating.

To climb any ordinary hill where there are traveled roads, on high.

To get away from a standstill about as quickly as their neighbors' cars.

To do all these things as cheaply as possible, and without skilled care and constant attention.

Naturally the motor's part in securing this performance is important, but I think that anyone will grant that the average automobile owner is not greatly interested in the construction or performance of his motor except as it affects the performance, durability and maintenance cost of his car.

Let us consider these three factors in the order mentioned.

Performance

The horsepower required to give the performance just outlined depends of course quite largely upon the loaded weight of the car. This in turn depends upon the passenger capacity and the comfort desired.

In a practical way it is generally understood that the comfort of the passengers is increased as the ratio of sprung to unsprung weight is increased, and as the ratio of sprung weight to each passenger's weight is increased. I have never seen any mathematical proof of this proposition, but with equal quality of design and workmanship I think it is the general experience.

On this basis we may divide cars carrying from five to seven passengers roughly into three classes: First, cars of toleration, having a shipping weight of less than 1800 lb. Second, cars of comfort, having a shipping weight of from 1800 to 3000 lb. Third, cars of luxury, with a shipping weight of more than 3000 lb. There are, of course, notable exceptions to this classification. All cars of the first class manufactured in quantity have four-cylinder motors, and there appears to be little doubt but that they will continue to use this type.

It is in the second class that the controversy as to the proper type of motor to use is most active at the present time. Cars of the second class include quite a range of vehicle sizes. As the horsepower required varies with the loaded weight we find motors in cars of this class which vary from a little more than 20 hp. to a maximum of somewhat more than 50 hp. Most of the motors are included in the range between 25 and 40 hp.

However, the horsepower of a motor is not always an indication of its availability for automobile use. Often the maximum torque and the range of this torque are the determining factors. The maximum torque of the motors which I have just mentioned will usually run between 1250 and 2000 pound-inches. I say that the maximum horsepower does not always decide the availability of the motor for use in ordinary pleasure cars for the reason that the speed of these cars should be limited to from 55 to 60 m.p.h., and if the maximum horsepower of a motor is obtained at such a high

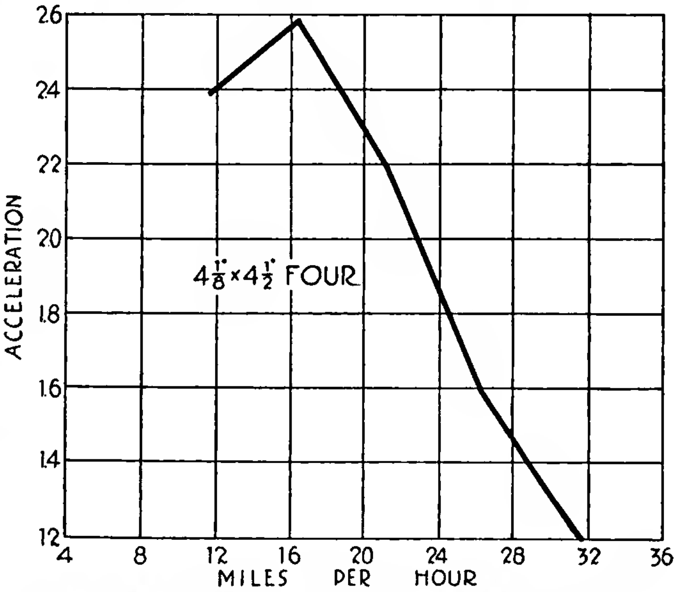

Fig. 4—Curve of acceleration plotted for 4⅛ by 4½ four-cylinder

---

*Chief Engineer Hupp Motor Car Corp., Detroit, Mich.

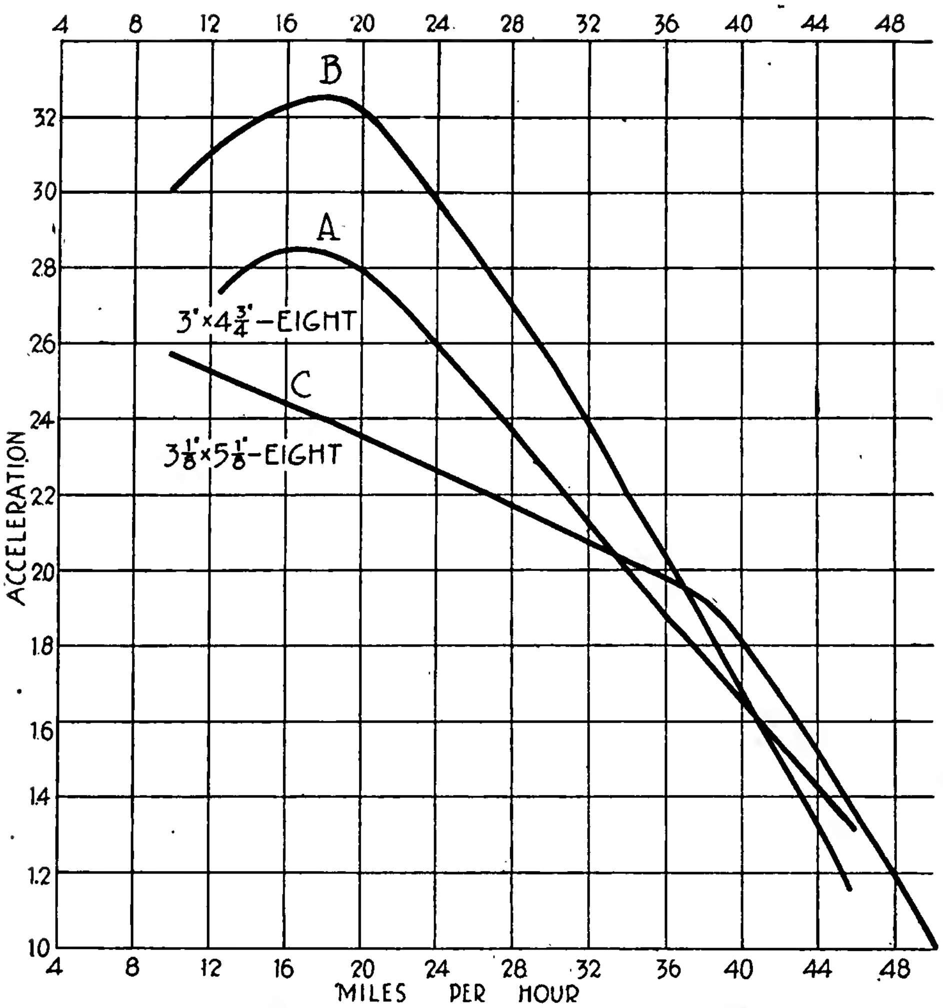

Fig. 6—Comparative curves of acceleration on two eights and a four

number of revolutions that it will not be usable at this car speed with a practical rear axle ratio, it is not of any practical value.

Acceleration Ability Increased

At the present time the horsepower required is quite often determined by the acceleration demanded. Within the last year there has been a tendency to greatly increase the ability for acceleration in motor cars. This has been due partly to the advent of eight- and twelve-cylinder cars, and to rather extravagant claims of salesmen as to the ability of these cars. I believe it is also partly due to the increasing congestion of traffic in our large cities and upon our principal highways, or to other traffic conditions which make a quick get-away very desirable.

It may be desirable in this connection to show some curves taken with the Wimperis accelerometer.

Fig. 1 shows the acceleration curve of a very popular six-cylinder car, 1915 model. You will note that the acceleration at 10 m.p.h. is slightly over 2. This car was considered very satisfactory at the time it was built and was sold in large quantities.

Figs. 2, 3 and 4 show acceleration curves of well-known and popular makes of four-cylinder cars, also 1915 models. These show accelerations which, while slightly greater than the six-cylinder mentioned are very closely comparable with it.

Fig. 5 shows the acceleration curve of a well-known eight-cylinder European car, which was built especially for city work. The acceleration of this car is noticeably low, but it must be remembered that it is the custom abroad to change gears much more frequently than in this country, and this car was fitted with a transmission having four forward speeds.

Fig. 6 shows a comparison of three more recent cars. Cars *A* and *C* have eight-cylinder motors and car *B* has a four-cylinder motor. I believe that the acceleration of car *B* at ordinary driving speeds is about as great as is obtained with any stock car fitted with standard gear ratio, at the present time.

Fig. 7 is a test of the same car as *B* in Fig. 6, but in this test the second speed gear was engaged. The rear axle ratio, however, was 4 to 1, whereas with the standard car this ratio is 4.64 to 1.

A considerable experience in acceleration tests of stock models of American cars purchased in the open market leads to the following conclusions: At the present time the best acceleration, and by this I mean the most available for use in traffic conditions, is obtainable from four-cylinder motors. The acceleration of other types of motors at the slower speeds is not usually as quick or as powerful as the acceleration of the four. At speeds of from 15 to 20 m.p.h. and above the different types become very nearly equal, and at speeds of more than 30 m.p.h., motors having a large number of cylinders are better than the four. This is particularly true of six-, eight- and twelve-cylinder motors having single carbureters, which are apt to be rather uncertain in very low speed action when picking up quickly. The result often is that the more cylinders a motor has the more frequently one is required to use the gearshift lever for city driving. I do not believe that this is fundamentally necessary. It is probably due to imperfect carburetion and poor distribution of gas, and will in all probability be remedied.

The next point which should be discussed in comparing the performance of cars with the different numbers of cylinders is the question of smoothness of operation.

Fours Are Greatly Improved

For very rapid acceleration cars having four-cylinder motors are not quite so smooth in action as those in which the power impulses are more frequent. But recent changes in four-cylinder design, the remarkable lightening of reciprocating parts, the more rigid construction of revolving parts, and above all the very much greater rear axle gear ratios, which the use of spiral-bevel gears has made practical, have entirely revolutionized the performance of modern four-cylinder motors as compared to those built even one or two years ago.

At the present time, while the difference between a four and a six, eight or twelve can be detected on rapid acceleration: it can be detected by the average driver only if he is really trying to detect the difference. It is not noticeable to the average driver, unless he is especially looking for it, at any rate of acceleration he will care to pay for. I believe that the desirable limit in acceleration has about been reached, for we have already reached a point where the wear upon tires and the consumption of gasoline is excessive, and I do not believe that the public will long continue to pay for such high activity.

The next point in comparing smoothness of operation is the comparison of low-speed running. In this respect the manufacturer of a modern four-cylinder car having a rear axle gear ratio greater than 4.50 to 1 need have no hesitancy whatever in comparing his product with any car made. Cars having six-, eight- and twelve-cylinder motors will give a better performance at low speeds when the motor is suitably adjusted and carefully tuned for the test, but it is the almost universal experience of car owners that it is difficult to keep the ultra-multicylinder motor tuned to the point where it will give a demonstrating low speed performance. It is only upon the cars whose owners take exceptionally good care of them, or which are driven and cared for by unusually good chauffeurs that the low-speed advantage of many cylinders becomes apparent. A great deal has been written regarding over-lapping power impulses of six-, eight- and twelve-cylinder motors, without taking into consideration the fact that before these impulses are transmitted to the driving mechanism of the car they are absorbed by the flywheel, and that by suitably proportioning the flywheel great smoothness at slow speeds can be obtained with few cylinders.

High-Speed Possibilities

Going from one extreme of the motor performance to the other, let us compare the high-speed possibilities of the different types. It would seem that in this direction motors of a great number of cylinders should be pre-eminent, but up to the present time at least they do not appear to have proven so. Apparently the most efficient high-speed motors made up to the present time are the multi-valve four-cylinder motors having four valves per cylinder placed in the head. I have had no personal experience with motors of this type, and can judge only from published records of track performance. In touring car motors, however, the high-speed possibilities of the four appear to be well beyond all ordinary requirements. Reciprocating parts of touring car motors have decreased in weight remarkably within the past few years. Several years ago I found the reciprocating weights in pounds per square inch of piston area to be about 0.4 lb. At the present time they have been reduced to about 0.2 lb. As the formula for inertia forces due to reciprocating weight is $\frac{F}{a} = .00034\frac{W}{a}N^2r\,(Cos\,\theta + a, Cos\,2\,\theta)$* the inertia forces of the average motor have been reduced 50 per cent for an equal number of revolutions. Internal forces due to speed have been reduced proportionately and the possibilities for high speed are apparent.

Improved lubrication has also done wonders, and quite recently the matter of counterbalancing crankshafts, which practice has long been followed abroad, has been brought forward prominently in this country. Though considerable friction reduction may be possible in complicated forms of crankshafts, such as are used in many of the six- and twelve-cylinder engines, but little is accomplished by applying counterweights to four-cylinder crankshafts for ordinary touring car speeds.

Friction Tests

Friction tests of four-cylinder motors show no marked improvement below 2500 r.p.m. At very high speeds there is a probability that counterweighted crankshafts show up to better advantage, but such high speeds are not encountered in practice on ordinary touring cars.

Fig. 8 shows the relation of car speeds in miles per hour and engine speeds in revolutions per minute with 5-to-1 rear axle ratio and 32-in. tires. At the present time I do not believe it is desirable for large quantity production to go much beyond a 5-to-1 rear axle ratio even with spiral bevel gears. If the ratio is carried beyond this point, either the diameter of the driving gear must be increased so that the road clearance is reduced below what is desirable, or the size of the pinion becomes so small and the unit pressure on the teeth so high that it is difficult to obtain adequate lubrication of the teeth. This means rapid wear in districts where the cars are subject to hard service, as they are in some of our western states, and it also means that an unduly large number of axles must be turned back for re-adjustment, or for lapping of gears. Or the gears must be rejected altogether on account of noise. The only alternative, if the gears are made large, is to increase the diameter of the tires, which partly nullifies the effect of the increased gear ratio.

At the present time worm-driven rear axles are out of the question for large quantity production, as the cutting of successful worms has not yet reached the large quantity production stage. I believe therefore that a well built L-head four-cylinder motor of standard design is still plenty fast enough for touring car work.

It is, however, at medium speeds of running that the question as to whether or not a motor has objectionable vibra-

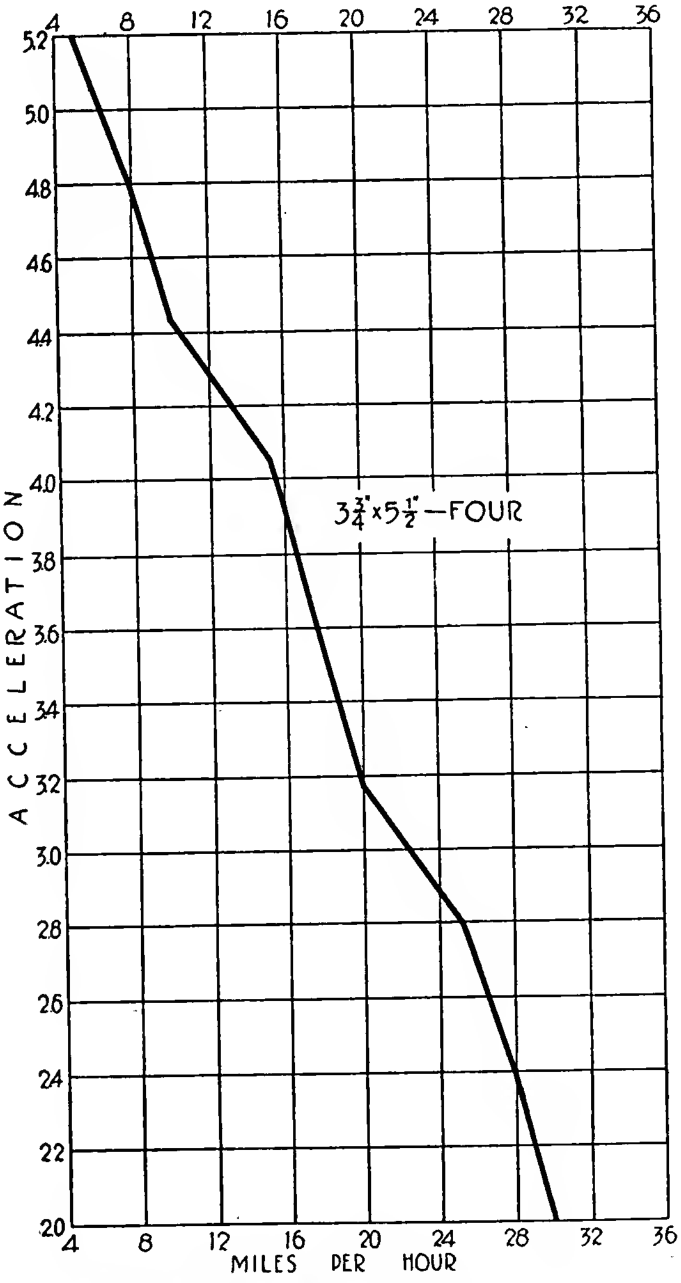

Fig. 7—Second speed gear acceleration curve on a 3¾ by 5½ four

---

*For derivation of formula see "Gas Engine Design," by C. E. Lucke, p. 82.

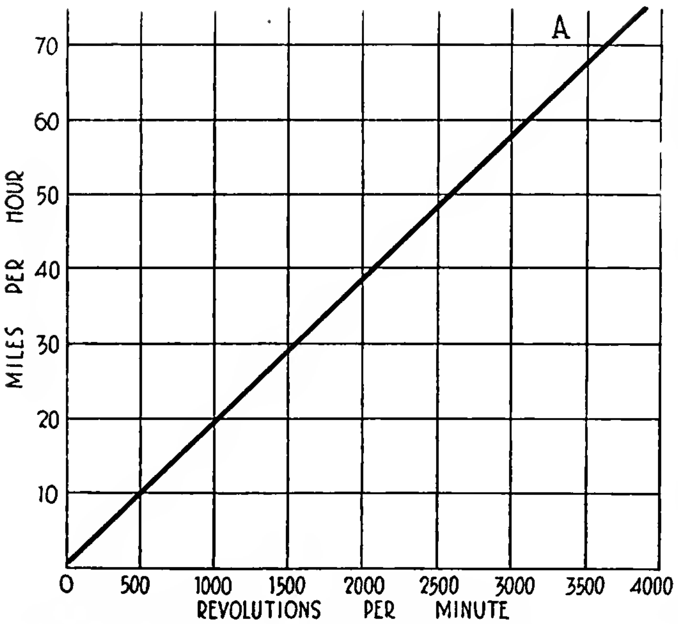

Fig. 8—Curve of m.p.h. against r.p.m. for 32-in. wheel at 5 to 1 ratio

tions becomes most important. Motor car vibrations which affect the passengers' comfort may be divided into two classes: First, those caused by the road surface; second, those caused by the motor. The former are of course the most disagreeable, and unfortunately they are also the least controllable. Vibrations due to the motor are largely controllable by the design of the car. It is, I think, almost universally recognized that the vibrations caused by a well-designed four-cylinder motor with light reciprocating parts are negligible at slow speeds. It is not however generally recognized that it is possible to reduce the vibrations at any speed so that they are comparable to the vibrations at slow speeds. However, the fundamental formula for the vibrations of a four-cylinder motor is: $D = C\frac{rw}{W}$

Where D = Displacement of engine from its normal position.
C = a constant.
r = crank radius.
w = weight of reciprocating parts.
W = total weight of the engine.†

It will be noted that the speed does not enter into this formula. This is due to the fact that while the forces which cause vibrations increase with the motor's speed, the time in which these forces act in a given direction to produce vibration decreases directly with the speed, hence the decrease of the time factor exactly offsets the increase in the force factor, and leaves the tendency for the motor to vibrate exactly the same regardless of speed. This theoretical consideration would be true in practice if all the parts of the motor were perfectly rigid, if it were mounted upon a rigid support, and if the time of vibration of the support did not synchronize with the motor vibrations at any speed. In practice, neither of these assumptions is quite true, but it is possible by making the reciprocating parts light, the crankshaft and other revolving parts rigid, and by suitably proportioning the frame and spring supports, to reduce the vibration of a four-cylinder motor very remarkably. Then, too, the synchronous vibrations are not by any means limited to four-cylinder motors. They are likely to be even worse in six- and twelve-cylinder motors on account of the more complicated forms of their crankshafts. Sixes, eights and twelves are likely to give more trouble from vibrations of the higher periods than are fours, and these vibrations are likely to manifest themselves unexpectedly in parts of the chassis which are distant from the motor. Means of overcoming such high period vibrations are the subject of study at the present time.

It is not fair to compare the running of a modern multi-cylinder motor with an old style four as is so often done. When they are compared with fours of recent design, little difference will be detected.

Durability

The question of durability may be divided into two parts: First, the durability of the motor; second, the durability of the running gear, body, etc.

As to the motor, each part can be made as ample for its work in one type of motor as in another, but the four-cylinder motor should have a longer life than the other types, for it is primarily more accessible and easier to care for, hence it gets the better average attention.

The efficient life of a good motor is much longer than that of the average chassis on American roads. Ordinarily, springs wear out first, then the body, and the other sheet metal parts, then the frame, then the axles, and last of all the motor. The effect of the type of motor on the life of the remainder of the chassis is debatable. The different motor types have not been in use long enough so that we can be sure as yet. We do know that many chassis stresses increase substantially as the square of the car speed, so high speed naturally tends to wear a car out fast. This is the strongest argument for limiting the maximum speed of the car to what I have mentioned. Given equal maximum speeds, road shocks, dirt, and weather effects are the all important factors in chassis wear, so far as I can determine. The slightly greater vibration of a good four-cylinder motor does not seem to be factor enough to be worth considering.

The effect of the greater shocks possible to the driving mechanism from the inertia of the heavier flywheel of a four-cylinder engine can be modified to any extent desired by a suitable clutch design. I believe therefore that a car with four cylinders is as durable as one with more, and that the motor is more durable.

Maintenance Cost

It is an axiom in all mechanical work that the less complicated a machine is, the lower must be its maintenance cost. Now where is this more apparent than in the comparison of the four-cylinder motor with other types? It is more accessible than other types. It has fewer parts in proportion as it has fewer cylinders. Repairs required are not only less frequent than in other types of motors, but they are less costly to make. There are less valves to grind; less cylinders to decarbonize; less spark plugs to clean; less ignition wires to watch for leaks, breaks, short-circuits and static effects; less ignition contacts to synchronize; less work of all sorts to do. Of course this greatly decreases the maintenance cost to the owner, or the time he has to spend in getting his motor in condition if he does the work himself.

As to fuel consumption, the four-cylinder motor is fundamentally superior to other types. In any type of fuel distribution used in motor cars to-day, the division of the gaseous steam decreases efficiency. The single cylinder is the most economical type; and the fuel efficiency decreases as the number of cylinders increases. The public is often misled by certified tests which are made on carefully tuned and adjusted cars, but the result in the hands of the owners is the only thing that will count ultimately. Naturally the rising cost of fuel has caused extravagant statements as to fuel economy, which are made in many advertisements, but unfortunately, for the most part these statements are not borne out in every day practical experience.

---

†For derivation of this formula see: Horseless Age, Vol. 21, p. 513, or "The Balancing of Engines," by Archibald Sharpe.

The designers of ultra-multi-cylinder motors are now busily at work on much smaller motors, utilizing very high compression, and it will be interesting to see what they can do in this direction. This matter of increased compression was tried out about ten years ago, and finally abandoned, but with the increased technical skill available at the present time, and the smaller cylinder sizes, it is possible that something may be accomplished. It is, however, doubtful just how much can be done with our present motor car fuel, for at the present time the gasoline available tends to partake more and more of the nature of kerosene, and does not lend itself exceptionally well to high compression.

Fig. 9 shows a recent test along these lines. The lower curves marked *A* and *B* are compression curves taken from the same motor using two different sets of pistons. The corresponding upper curves show the brake mean effective pressure obtained from the two tests. It will be noted that it takes a considerable increase in compression to get a slight increase in mean effective pressure, particularly at the lower speeds. It was also found that the motor with high compression did not operate as smoothly as the motor with the lower compression. I believe that motors having very high compression, while they may show better fuel economy on the dynamameter and in the hands of careful users, will not prove satisfactory for the use of the general public. Possibly however, other methods of using liquid fuels will solve this problem.

Summary

For cars of the first and second classes I do not believe more than four cylinders are desirable, because in the hands of the average user a modern four-cylinder car will do anything he requires, as pleasantly as any other type, and will do it cheaper. This being so, more than four cylinders are not justified.

In cars of the third class, however, a different condition arises. Here the demand for luxurious appointments and high-speed possibilities make the cost of the motor a much smaller percentage of the total cost of the car. The operating cost also is not so important. And as the weight to be moved is greater, the ultra-multi-cylinder motor has its place. This is its only proper field of automobile application, and I venture to predict that five years from to-day 75 per cent of the money being spent for pleasure cars will go for the purchase of four-cylinder machines.

This is of course a mere matter of opinion. The buying public is the final judge. Their verdict will not depend upon technical arguments but will be based upon practical performance. What it will be is not a question for calculation but rather for the application of common sense.

Internal Combustion Motors

The Four-Cylinder Motor of To-day and Future Possibilities

By F. R. Porter*

TO keep a discussion of the internal combustion motor within the scope of this paper and still have it interesting and instructive seems quite a task. Available data is so varied and conflicting as to the object in view, that it becomes almost worthless for a matter of comparison. From this volume of apparently haphazard experimental data however, we have established a few facts that are now common knowledge, some of which stand out as unconquered points, resulting in hundreds of failures, while others represent confirmation of well-directed research work.

The subject of the Otto cycle motor, like most others of a basic nature, was really beyond the inventor; while he established a point of superiority in motive power, he had no conception of the scope of his subject.

Early experiments soon established limiting factors that controlled the power output of a single cylinder, and made the duplication of units necessary. The apparent possibilities together with the extremely interesting side of the subject produced a demand in advance of the art, resulting in more duplication of units; at the same time attracted the attention of metallurgists and chemists, with the result that the limiting factors assumed new values; some of them, as a result of better material and more appropriate accessories being developed, disappeared almost entirely.

Limiting Factors Are Few

To-day, the limiting factors so far as mechanical ability is concerned are very few and as a rule are well understood. The one that comes nearest to determining the possible power output of a single cylinder is the matter of piston areas.

The extreme heat conditions that pistons are subjected to limit the amount of area exposed to the amount that can be kept down to the proper temperature by heat flow to the cylinder walls. While this factor varies according to the m.e.p., it has been pretty well established at about 16 sq. in., which represents a bore of 4½ in.

Piston speeds are apparently governed by the ability of bearing metal to withstand the inertia forces. While different materials may be employed to decrease these forces, surface friction becomes a considerable factor at very high speeds, so that the practical speed in feet per minute has been established at approximately 3000. Bore to stroke ratio is purely a matter of choice, but is generally accepted as more conducive to thermal efficiency as the ratio increases; two to one, however, seems about the limit.

Compression pressures close to the point of pre-ignition are had almost universally when extreme power output is needed. While the volumetric efficiency controls somewhat the possible ratio of clearance to displacement, five to one is generally accepted, and represents approximately 100 lb. gage.

M.e.p. follows volumetric efficiency almost in direct proportion, the absolute being about 40 per cent above the com-

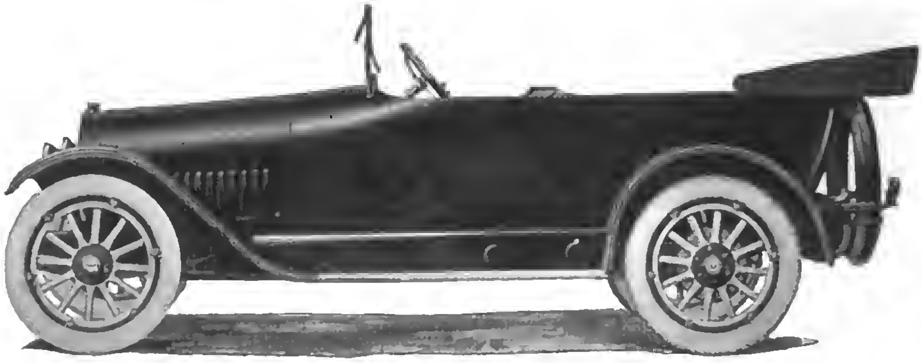
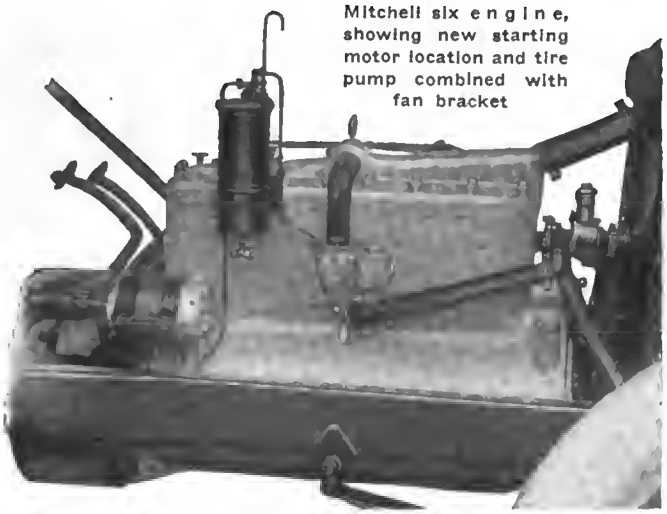
Better Bodies in Mitchell New Six

Lines Improved by the High Radiator—Engine and Chassis Refined

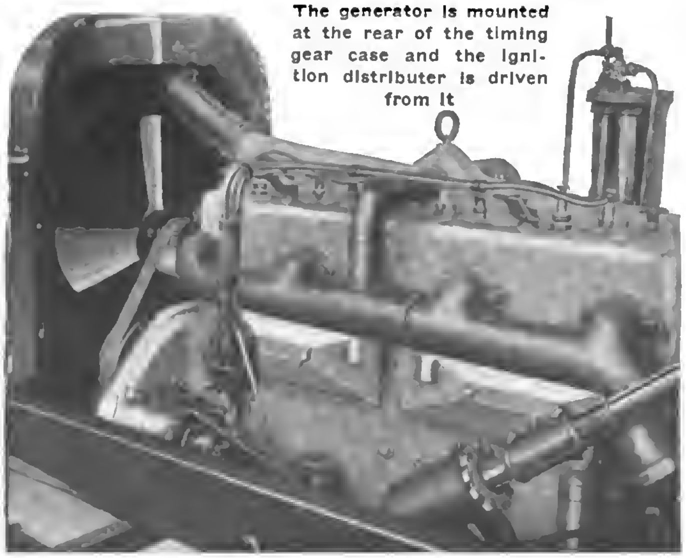


AS announced in THE AUTOMOBILE last week, the new model of the Mitchell Six, built by the Mitchell-Lewis Motor Co., Racine, Wis., is larger, roomier and more attractive in appearance than its predecessor, the Six of '16. The wheelbase has been increased 2 in. to 127 in. by increasing the length of the rear cantilever springs and changing other dimensions to correspond, the waterjacket of the 3½ by 5-in. high-speed block motor has been carried lower on the cylinders, accessibility has been improved and numerous other detail refinements have been made. Some of the most interesting developments, however, are in the body design.

In appearance, the new Mitchells are exponents of the latest in body design, having a high, narrow radiator and smooth, sloping hood, which is well rounded at the top, the rear part having suggestions of boat lines, together with a defined cowl at the back of the front seats. Accompanying the improvement in appearance and increase in the size of the car there has been an increase in price of $75, making the five and three-passenger $1,325 and the seven-passenger $35 additional.



Mitchell six engine, showing new starting motor location and tire pump combined with fan bracket



The generator is mounted at the rear of the timing gear case and the ignition distributer is driven from it

A feature that will be appreciated is that, like some other cars of its class, the five-passenger touring car in every respect is a duplicate of the seven except for the addition of the two spare seats, so that should the purchaser wish to increase the capacity of the five-passenger car he can obtain a seven-passenger in every respect like factory production by the installation of the additional seats which may be obtained later for $35. These seats, by the way, are the disappearing type and fold completely out of sight.

The forward seats, while having no space between them, are divided by a small arm which forms a shoulder rest for both occupants but does not interfere with entrance or exit to the driver's seat. Two little items which indicate the extent to which comfort has been considered are the glove compartment in the instrument board and the tonneau light on the back of the forward seat. Within the instrument board there is fitted a new compartment in which small traveling requisites may be carried and which is locked by the same key that operates the ignition lock. The tonneau light is provided with a push switch which can be operated by the tonneau passenger.

Engine Jacketing Improved

In the design of the block 3½ by 5 in. motor there has been but little alteration. The chief one is the extension of the waterjackets to a very much lower point on the cylinders, giving the engine a more symmetrical appearance as well as providing cooling surface, or water surface for more excessive demands than previously.

The engine is designed to be of the high-speed type and with this end in view special pains have been taken in balancing and lightening the reciprocating parts. The pistons are drilled to decrease weight, and also are provided with piston rings in the two lower grooves, which are made up of four special steel rings, to eliminate loss of compression. The top ring is of the ordinary iron construction. Small holes drilled through the machined oil grooves around the pistons allow the surplus oil to flow back into the crankcase.

The cylinders are L-head, cast in block and integral with the crankcase. This is designed to give rigidity to the motor and reduce vibration. The cylinder head is a one-piece casting, held in place by means of three rows of bolts and a leak-proof fit is assured by the use of a one-piece, copper-asbestos gasket. The cylinder heads can be removed without disturbing any other part of the engine. The crankcase is of the barrel type, the lower half being formed by a light, seamless, steel stamping, which is divided into two compartments, the upper fitted with overflow openings, and troughed for the connecting-rod spoons. The lower compartment comprises the oil reservoir.

The crankshaft has three bearings, and is offset ½ in. from the center of the cylinder. The gears which drive the camshaft, ignition distributer and tire pump are inclosed in a housing which is a part of the crankcase. Gears are lubricated by a separate oil lead and have helical teeth. The lubrication is a combination of circulating and splash, the circulation being maintained by a plunger pump operated by an eccentric on the camshaft. Oil is pumped from the reservoir in the crankcase to the compartments under each connecting-rod, and also to the timing gears in the front. A small quantity of oil is carried to the clutch bearing as well. A unique idea is carried out in the oil indicator. In place of the usual sight feed on the dash, the Mitchell has a plunger type, operated by the oil pressure. This consists of a small rod which protrudes from the dash, proportionately to the pressure of the oil in circulation. In addition to this, an oil level indicator is provided on the crankcase. Push rods and valve stems are supplied with an oil vapor through breather openings into the crankcase.

Fan and Water Pump Combined

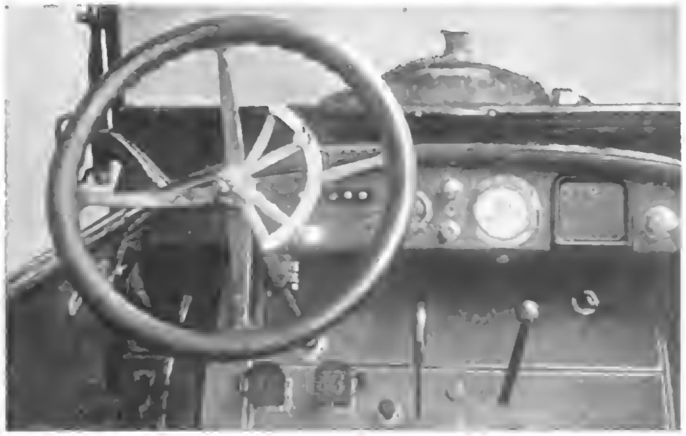
Another unusual bit of design is in the combination of fan and water pump, at the front end of the motor. Instead of mounting it on a lay shaft, the pump, which is a centrifugal type, is mounted on the fan shaft and thus is driven by the fan belt, which is made of endless fabric. Adjustment is provided by a wing nut. This swings the entire fan and pump assembly upwards and thus tightens the belt. The integral fan and pump bracket also forms the outlet for the water pump, thus simplifying the construction to a point where only one hose connection to the pump is necessary. As stated, the waterjackets have been carried down, so that they have extra capacity around the exhaust valve seats.

Ignition is taken care of by a storage battery and an automatic circuit breaker and distributer of the single-unit type, which is driven through a worm gear from the timing gears of the motor. The high-tension wires to the plugs are carried over the engine with special supporting bracket, which prevents chafing and leaking.

Integral Intake Manifold

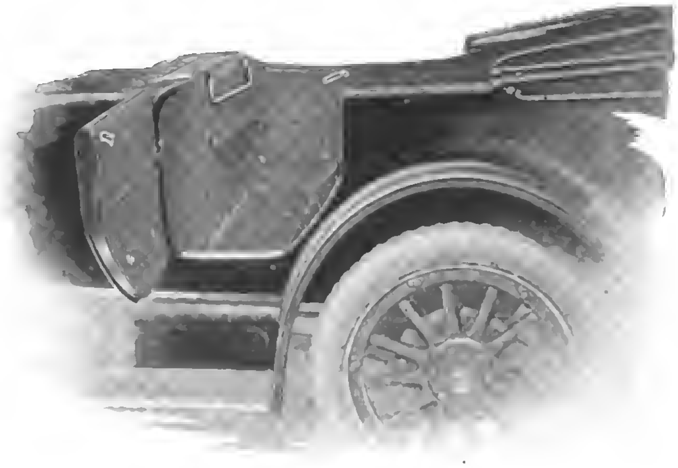
The carbureter is a Rayfield mounted on the right side of the motor. The intake manifold is cast inside of the cylinders, and passes between the middle cylinders from the carbureter on one side to the valves on the other. Fuel is supplied from a tank at the rear by the Stewart vacuum system. Within the flywheel is a cone clutch, which is made up of a stamped-steel spider faced with chrome leather, and having auxiliary springs. Adjustment is provided by three nuts.

Mechanically the alterations have been more in the way of slight changes in the motor which work for increased accessibility. This feature of accessibility is one characterized in the Six of '16 and Mitchell engineers have progressed still further in the new model. To this end the single-unit starting system which was a part of the design in the earlier six has given way to the Westinghouse two-unit system in which the generator and distributer are driven off the same shaft on one side of the engine while the starting motor operates through a Bendix drive to teeth cut on the flywheel. This eliminates the silent chain, which was a part of the starter-generator drive in the previous motor.



A feature of the Mitchell instrument board is the glove compartment

The front view of the new Mitchell six gives an excellent idea of the improved appearance in the body design. Note the high, narrow radiator and sloping lines of the hood



The tonneau door is wide and there is a light in the tonneau cowl

The 2 in. increase in the wheelbase brings this figure up to 127 in. This has been made possible by lengthening the cantilever springs 2 in. Last year these cantilevers were underslung and have been one of the factors in making the Six of '16 an unusually easy riding vehicle. Along with the increase in the length of the springs, the number of leaves have been correspondingly increased.

The engine-driven tire pump has been elevated to a point where it can be gotten at easily and is now mounted immediately behind the fan and driven by a gear on the fan shaft.

Demountable rims, with 34 by 4 tires, anti-skid, on the rear, power tire pump, one-man top and dimming headlights, are among the features of equipment.

Tracing the Why of Carbureter Parts

Cleveland S. A. E. Hear Paper Explaining Functions of Compensating Jets and Air Valves—Diagrams Show Exact Effects of Alterations in Design

By F. H. and F. O. Ball*

THE laboratory used in the investigations here reported contained a gasoline motor and an electrical equipment for loading the motor, also a metering outfit for measuring the gasoline and air used by the carbureter under all conditions. A steam ejector was arranged to be used as another means for drawing air and gasoline through the carbureter. A water column provided the means for observing the suction or head which impelled the flow, thus furnishing the data necessary for plotting curves showing the quantities of gasoline and air discharged at each head.

The Law Governing Flow

Contrary to a somewhat prevalent opinion, the same law governs the flow of air and of gasoline through a fixed orifice and the quantities discharged in both cases vary as the square root of the suction or head. This law does not hold good at extremely high velocities, but throughout the range covered in carbureter practice it may be accepted as approximately correct. It follows, therefore, that in a fixed orifice carbureter, if the flow of gasoline and air begin at a common zero, the ratio of one to the other, at any point, will be the ratio throughout the whole range of working capacity.

In practice it is not desirable to maintain the gasoline level at the overflowing point in the discharge nozzle, therefore the zero of the gasoline curve of flow does not coincide with the zero of the air curve.

Quantity Curves

The foregoing is illustrated in Fig. 1, in which the suction or head is indicated by the scale at the bottom of the chart. The quantities of gasoline are indicated by the scale at the right and the air scale is at the left.

These curves, as drawn in this case, indicated that the capacity of the respective orifices was such that with a suction equal to 20 in. of water, 10 oz. of gasoline were discharged per minute and 100 cu. ft. of air. This ratio has been found to be a strong, clean burning mixture. It corresponds approximately to 12 lb. of air to 1 lb. of gasoline.

Referring again to Fig. 1, it will be noted that the air curve and gasoline curve do not have a common zero and therefore the ratio of gasoline to air, at different points on the curves, is not constant.

Quality Curves

The actual ratio of gasoline to air, under the conditions shown by the quantity curves of Fig. 1, is clearly shown in Fig. 2. Here the horizontal scale is in cubic feet of air per minute and the vertical scale in ounces of gasoline per 100 cu. ft. of air. The right-hand end of the quality curve indicates 10 oz. of gasoline per 100 cu. ft. of air and corresponds with the right-hand end of the quantity curves of Fig. 1 where they coincide. Progressing backward toward zero, the quality curve of Fig. 2 shows the effect of the difference in the zeros of the two quantity curves of Fig. 1.

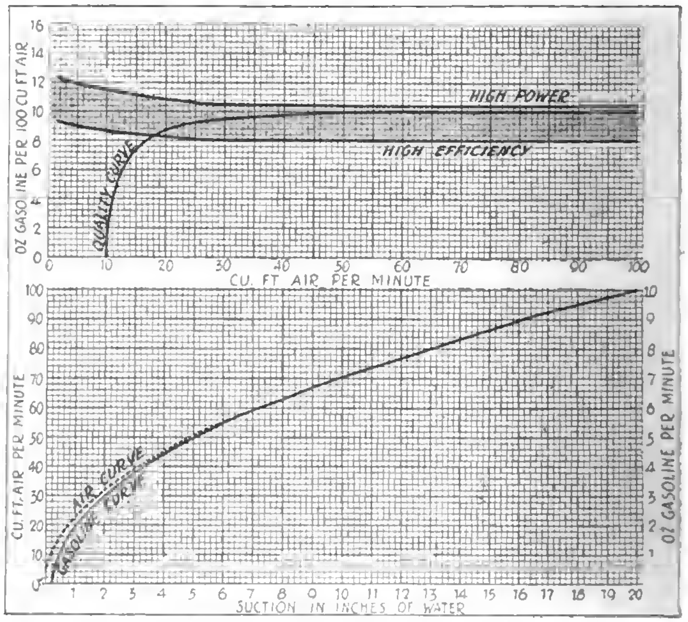
The shaded zone in Fig. 2 covers the range of quality within which it has been found desirable that the quality should be maintained by the carbureter.

The boundaries of this zone may not be universally accepted as the best, but that is a matter of no importance because they are at least approximately the best and the zone is entirely satisfactory as a field in which to plot the characteristic quality diagrams of various types of carbureters for comparison.

Referring to Fig. 2, it will be seen that when less than 18 cu. ft. of air per minute is being drawn through the carbureter, the quality passes outside the desirable zone.

This makes it impossible to enrich small quantities of air. Therefore, the elemental fixed orifice carbureter cannot be used with success, and it becomes necessary to embody in the carbureter some means for augmenting the gasoline supply where it is deficient. Various devices are used for this purpose. Some affect the necessary compensation by acting on the gasoline supply, others act on the air and still others on both.

It is proposed to illustrate and analyze the effect of the most important of these devices, selecting those which have been the most extensively used in high grade instruments. This analysis is made solely for the purpose of showing the effect of the various devices in maintaining a normal quality to a lower minimum quantity than is possible with the elemental fixed orifice carbureter as shown on Fig. 2. In this analysis no attention is paid to the relative maximum capacities nor to any other question relating to the several types of carbureters. These other questions will be considered separately in connection with quality diagrams made by actual carbureters of the several types that are being theoretically analyzed.



Below—Fig. 1, Above—Fig. 2—Curves for elemental carbureter with fixed air and fuel orifices

---

*Penberthy Injector Co.

Figs. 9, 11, 12, 15 and 17 of original paper are omitted as their character is well described in the text.

This carbureter differs from the elemental fixed orifice carbureter in that it is provided with supplemental or compensating devices which increase the supply of gasoline, particularly at that part of the quality diagram where it is most deficient.

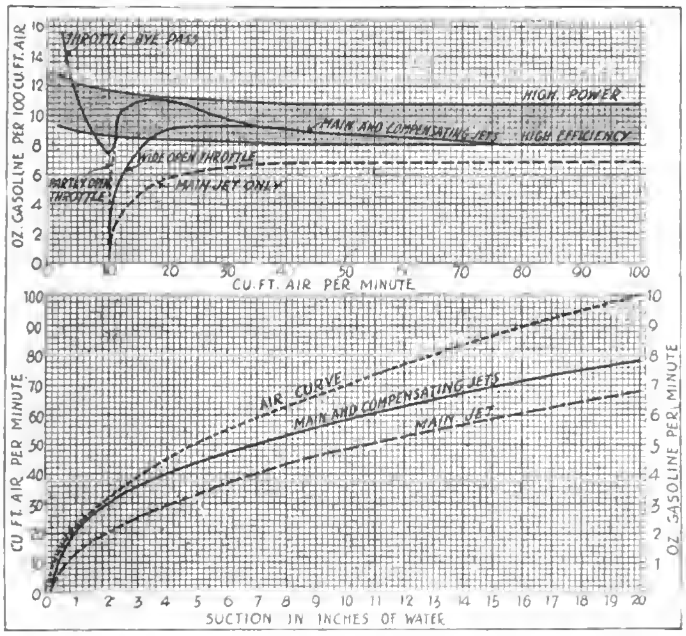
Figs. 3 and 4 illustrate and analyze the effect of these compensating devices. In Fig. 4 the quantities discharged by the main jet under various amounts of suction will be found along the main jet quantity curve.

The quality produced by these quantities is shown on Fig. 3 along the curve marked main jet only. Referring again to Fig. 4, a second supply is drawn from a well open to the atmosphere and supplied with a constant quantity of gasoline from the float chamber by gravity. The total quantities of gasoline from this double supply are indicated by the curve marked Main and Compensating Jets in Fig. 4, and the effect on the quality is indicated in Fig. 3 by the curve marked Main and Compensating Jets. It will be noticed that the quality curve branches and that the two branches marked Partly Open Throttle and Wide Open Throttle come together at a common zero. This will be explained further on.

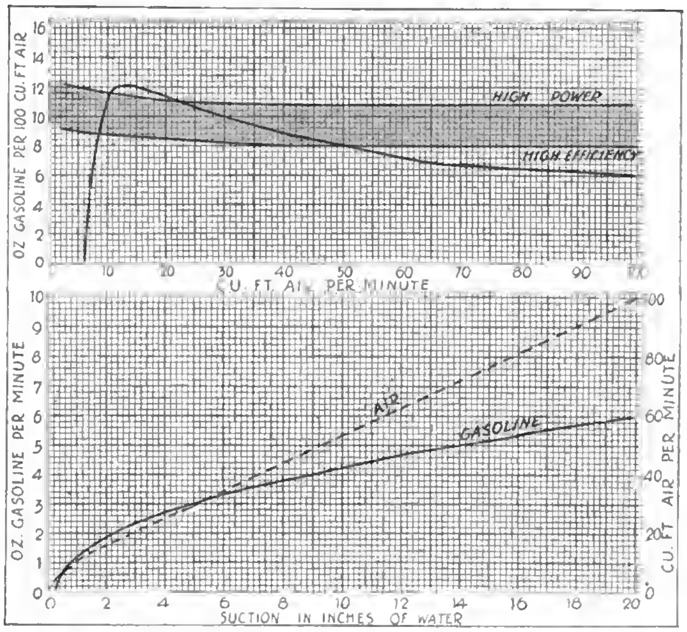
A third supply of gasoline is drawn from the atmospheric gravity well already referred to and discharged at a point on the motor side of the throttle. This is also essentially a constant quantity and its effect on the quality is indicated by the quality curve marked Throttle By-Pass in Fig. 3.

When the throttle is nearly closed the by-pass comes into action and draws gasoline from the gravity well, but when the throttle is wide open and the motor is slowed down by additional load the decreasing suction of the motor permits the atmospheric well to gradually fill with gasoline, thus decreasing the gravity head in the float chamber and causing the quantity discharged into the well to decrease. The effect of this smaller quantity of gasoline drawn from the atmospheric well is shown in Fig. 3 on that part of the quality curve marked Wide Open Throttle. The other branch marked Partly Open Throttle in Fig. 3 indicates the quality when, by progressively closing the throttle, the by-pass comes into action and prevents the level in the atmospheric well from rising. The quantities which produce the branches of the quality curve Main and Compensating Jets, are shown in Fig. 4 by the branches of the quantity curve.

With this arrangement then the carbureter has two distinct quality curves as shown by full lines.



Above—Fig. 3, Below—Fig. 4—Curves for carbureter with fixed orifices and compensating device



Above—Fig. 5, Below—Fig. 6—Analysis of mixture produced by elemental type air valve carbureter

This completes the analysis of this class of carbureters. It is a small class and no further types will be considered.

Air Valve Carbureters

This class of carbureters is much larger than all other classes combined, and the class is represented by a large number of types. Only a few of the most important types will here be considered.

The air valve carbureter will be best understood by first making an analysis of the simplest form, in which all the gasoline is admitted through a fixed orifice and all the air through an air valve closed by a spring.

This is an imaginary type which could not be used with success in practice.

Referring to Fig. 5, it will be seen that the quality does not follow the desirable zone, but crosses it at an angle, thus making a very limited range of capacity through which the mixture would fire.

The analysis of this quality diagram will be found in Fig. 6.

Comparing the quality diagram of Fig. 5 with the diagram of Fig. 2, it is evident that a combination of the two systems of control would make a better quality diagram than either.

This suggests the type of air valve carbureter that will be next considered.

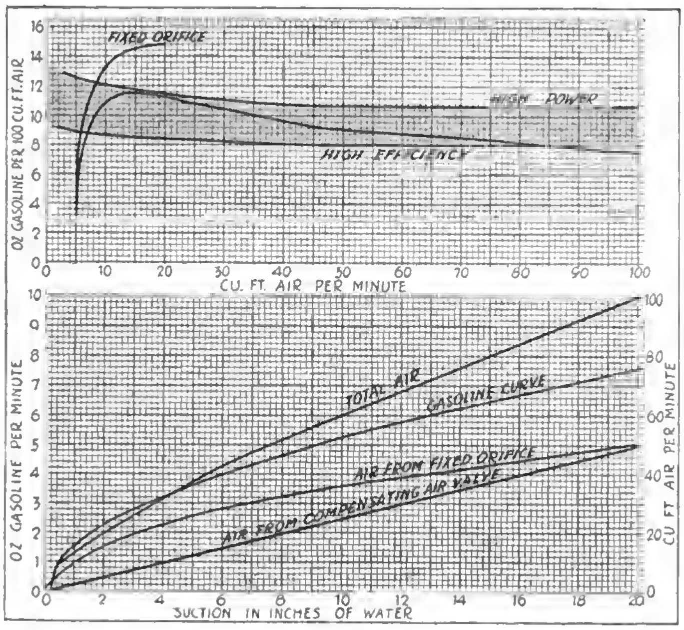
A Simple Carbureter

A carbureter with compensating air valve and fixed orifice is well known in a great variety of forms. The fixed air orifice is often called the strangle tube, or the venturi choke, and ordinarily the gasoline nozzle terminates in this passage. It will be assumed in this case as in the preceding cases, that the gasoline is regulated by a fixed orifice, or, in other words, that the area of the gasoline orifice remains unchanged in the operation of the carbureter.

A second air passage in this type is closed by a spring opposed air valve, which opens as the suction increases.

Referring to Fig. 7, the three dotted curves represent quantities of air passing through the air passages with different degrees of vacuum in the manifold as indicated by the scale at the bottom of the chart.

The lower dotted curve indicates the quantities admitted by the progressively opening air valve. The next dotted line represents the quantities admitted through the fixed air orifice and the third dotted line is the sum of these quantities



Below—Fig. 7, Above—Fig. 8—Carbureter with compensating air valve device

and is therefore the total air. The full line curve indicates the quantities of gasoline admitted through the fixed gasoline orifice.

Referring to Fig. 8, the dotted curve shows what the quality would have been if the air valve had been prevented from opening, and the full line curve indicates the quality when the air valve is free to open in response to increasing suction.

Supplemental Gasoline Jet

Various means have been used to cause a second gasoline jet to come into action before reaching maximum capacity, thus augmenting the supply where it has become deficient.

If this second jet comes into service abruptly as it does in many cases, it causes the quality diagram to make abrupt changes of quality.

This is clearly shown in Fig. 9, which is a diagram actually made by a well-known carbureter of this type. The dotted curve shows what the quality would have been with the first jet only, and the added richness caused by the second jet is shown by the full line curve.

Metering Pin on Air Valve

Fig. 10, shows how the effect sought to be produced with the double jet as shown by Fig. 9, is more perfectly produced by a tapering metering pin attached to the air valve and arranged so that when the aid orifice is increased by opening the air valve, the gasoline orifice is simultaneously increased by withdrawing the tapering pin.

With this device a fluid dashpot attached to the valve seems to be necessary to prevent objectionable reciprocating motion of the metering pin attached to the air valve. These moving parts attached to the air valve prevent a delicacy of action that is desirable when small quantities are being used and the forces acting on the valve are consequently very weak.

To overcome this difficulty and give stability of action it has been found necessary to make the primary fixed air orifice larger than with the simple carbureter, thus making it possible to keep the air valve in contact with the seat until the actuating forces have become of some magnitude. The effect of this is to make it impossible to enrich a small quantity of air. This will be seen by referring to Fig. 10. Under these conditions the closing of the throttle for slow speed reduces the motor speed partly by reducing the quantity of mixture entering the cylinder and partly by the decreasing richness of the mixture. This results in an extremely lean mixture for idling, and slow running, which fires with uncertainty and is very susceptible to the cold.

Throttle Cam Needle Valve

Fig 11 shows a quality diagram made by the best known carbureter of this type and it illustrates the effect produced by this method of control.

It will be seen that each of the several quality curves have the same general characteristic as the curve in Fig. 12.

These several curves in Fig. 11 show that in each case the needle valve remained in one position throughout the curve, which would necessarily mean that the throttle valve also remained in one position and the speed was changed by changing the load.

If the load at each speed is such that the necessary position of the throttle causes the needle valve to supply the amount of fuel required by the air that is being used, then a normal quality of mixture is supplied, but under all other conditions the mixture is either too lean or too rich. To understand this clearly, refer to Fig. 11, and note that when 100 ft. of air was being used by the motor, the quality of the mixture was 10.

Assuming now that the throttle remains wide open, and the speed is reduced by increasing the load (as it would be in climbing a hill) the quality grows steadily richer following the upper curve and the motor presently ceases to fire because of excessive richness. This is a condition that is always found the gasoline orifice is varied by opening and closing the throttle.

Liquid Friction as a Factor

In the analysis of all the types of carbureters that have been considered, the quantities of gasoline flowing through a fixed orifice have been assumed to vary as the square root of the suction or head. The curve representing these quantities is also the curve representing the velocity of a mass in equal increments of time when acted on by a constant

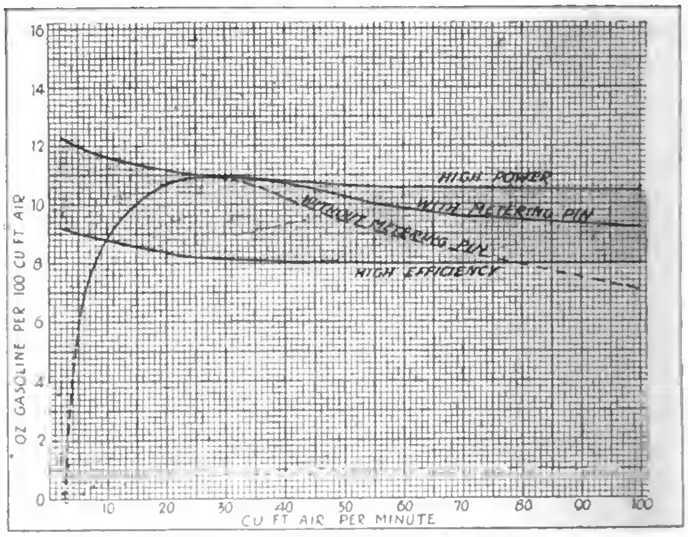


Fig. 10—Carbureter with metering pin attached to air valve

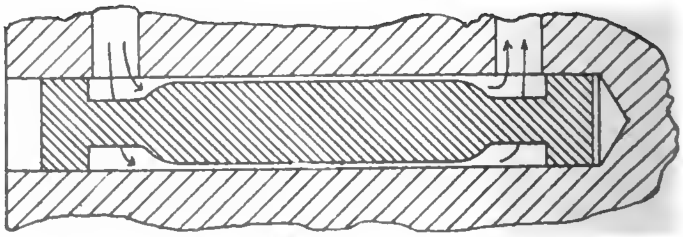

Fig. 13—Device for creating liquid friction and restricting gasoline flow

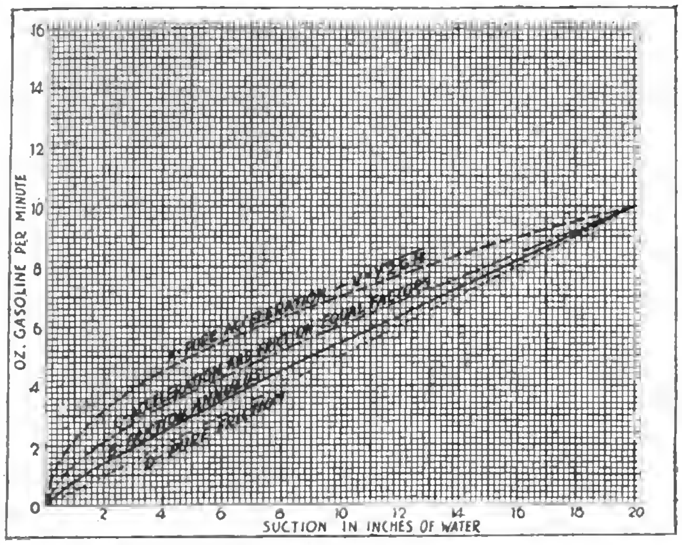

Fig. 14—Curves showing effect of liquid friction attachment

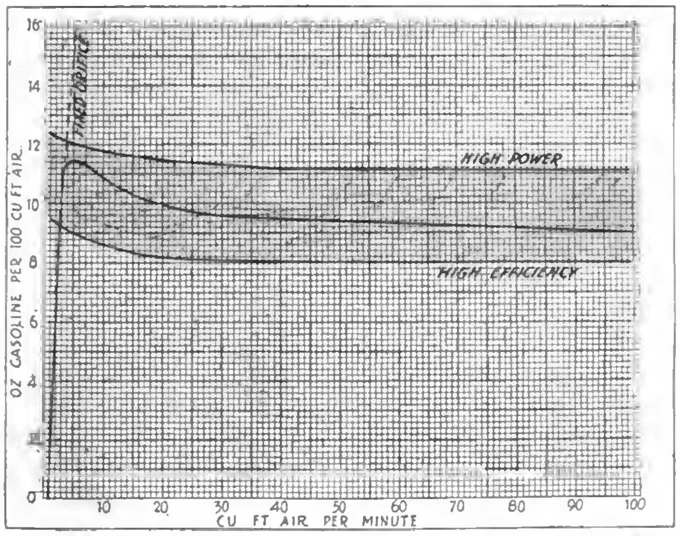

Fig. 16—Curve from air valve carbureter with frictional gasoline damper

force as the force of gravitation, and the law is called the law of acceleration. Because of the foregoing, it is evident that the friction of liquid flowing through an orifice is a negligible quantity, and that the inertia of the liquid which opposes acceleration through the orifice is practically the only factor, and the flow may be called an acceleration flow.

Liquid friction, however, may be so magnified relatively to the inertia of the liquid as to become the dominating factor, in which case the shape of the curve is greatly changed because the resistance of friction is directly as the velocity and not as the square of the velocity.

Fig. 13, represents a device for magnifying liquid friction relatively to the resistance of its inertia. It will be seen that the liquid passes through a very thin annulus of relatively large diameter. This thin liquid tube encounters liquid friction on a large surface, both inside and outside. Because of the high degree of friction thus developed, the cross section area of the annulus must be much larger for a given quantity than would be required with an orifice flow, and this decreases the velocity and consequently the effect of inertia.

The rounded corners of the entrance to the annulus eliminates a resistance called entrance head. Fig. 14, is a graphical illustration of the foregoing. The curve *A* will be recognized as the curve representing the relative quantities discharged by an orifice. The diagonal line connecting the ends of curve *A* represents the quantities that would be discharged if the only resistance to the flow were friction, because in that case the quantities would increase directly as the head. This, of course, is an impossible condition in practice. Curve *B* represents the quantities actually discharged when the flow was resisted by a device such as is shown in Fig. 13.

The dotted curve *C* passes midway between the curve *A* and the diagonal line. All curves between *A* and *C* may be called curves of acceleration flow, because in every case acceleration is the dominating factor, and curves between *C* and the straight line may be called curves of friction flow, because in every case friction is the dominating factor.

Friction Control of Gasoline

Referring to Figs. 5 and 6, it will be noticed that the reason a constant ratio between the gasoline and air cannot be maintained is that the quantities of gasoline discharged by a fixed orifice are found along a curve and the quantities of air discharged by a spring opposed air valve are found along a straight line, or practically so, and a straight line cannot be made to coincide with a curve except at a single point.

Referring now to Fig. 15, it is evident that a gasoline flow represented by curve *B* is much more desirable to use with an air curve represented by a straight line than the gasoline curve *A*.

In Fig. 15, will be found the analysis of a carbureter using friction control of gasoline. This analysis follows the same general plan that was followed on the preceding pages, and the resulting quality diagram will be found in Fig. 16.

Springs without Shackles Possible

Some Experiments Being Made With Different Designs—A New System for Spring Leaf Lubrication

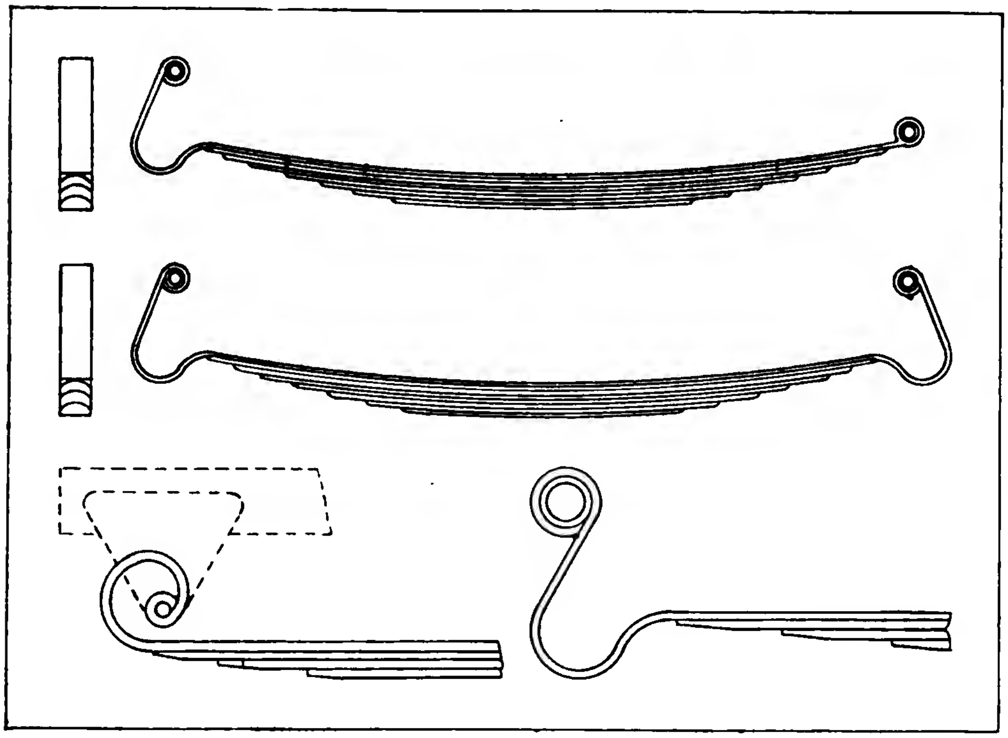
RECOGNIZING that the part of the spring suspension which is the quickest to show wear is the spring shackle, the Sheldon Axle & Spring Co. have been making experiments with several designs of spring in which the shackle is eliminated altogether. The amount of movement on a shackle pin is extremely small, which is the reason why these pins are so difficult to lubricate properly. Since the purpose of the shackle is to allow for the very slight variations in length of a flat spring as it is flexed, the substitution of a secondary spring action to replace the shackle is a natural step, and the Sheldon design consists of a slight alteration to the form of the main spring so that it can compensate for changes in length within itself.

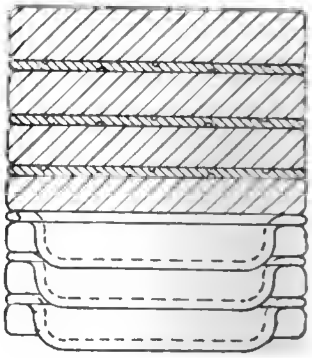
The sketches show several different ways of working out the idea, and the experiments so far are promising in their results. It must be explained, however, that these springs are not yet being used commercially since it is desired to try out the different shapes thoroughly.

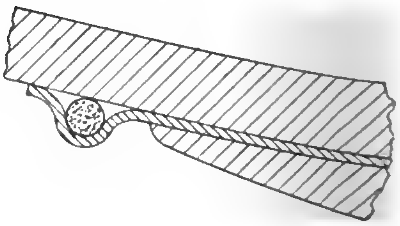
The upper spring in the left group is designed for the rear position where Hotchkiss drive is used; the one immediately beneath is for use with a torque tube design where the spring needs to be free both ends, and the two scrolls at the bottom are alternative designs which are being tried out for durability, side by side.

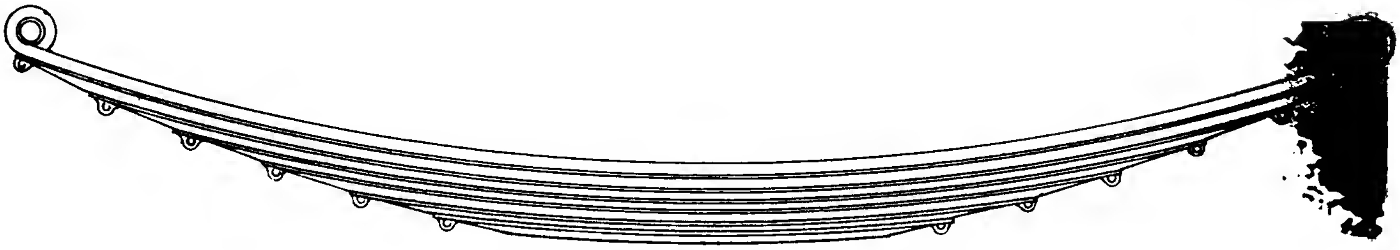
A Lubricating Idea

The large spring at the bottom of the cut, and the two sections on the right side show an idea of A. M. Laycock's for lubricating spring leaves. Between each leaf pair is a piece of thin steel with grooves cut or pressed in it. These spacing strips are extended beyond the ends of the leaves and then rolled into little channels with the ends turned up, and the cup so formed is filled with an absorbent pad. The channel has a hole pierced in one end, the spring being so mounted that this end comes on the outside of the chassis, and it is only a short task to inject a squirt of oil into each cup.







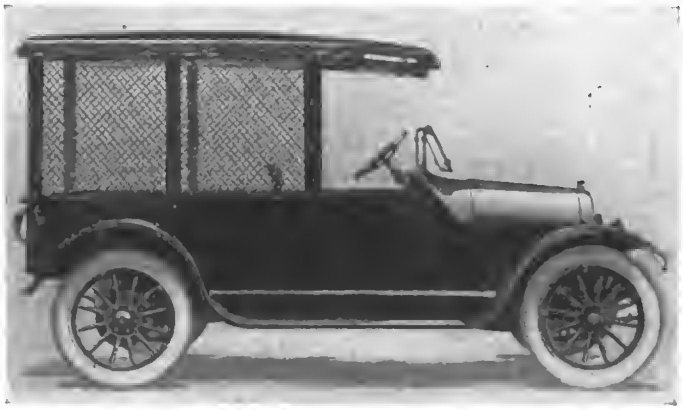


Top Left—Group of scroll end springs designed for use without shackles. Below and Right—Idea for lubricating spring leaves with an oil can.

Overland Adds Light Delivery Model

A NEW delivery car known as model 75 has been brought out by the Willys-Overland Co., Toledo, Ohio. The new car is smaller than the previous Overland delivery vehicle, which had 800 lb. capacity and sold for $695. The new car sells for $595 and has a capacity of 750 lb. It is furnished complete with a screen-sided body and is intended particularly for light fast delivery work. It is mounted on pneumatic tires and is provided with side doors on the cab and complete electrical equipment.

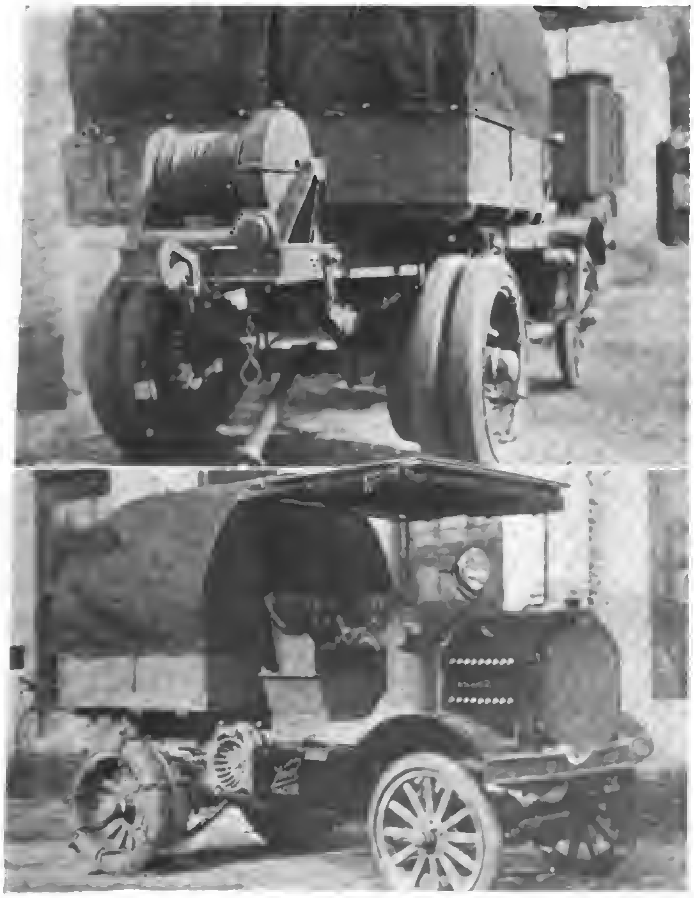
The new motor differs from that employed previously on the Overland commercial wagon. The cylinders are cast in block and the valves are to the right instead of to the left. The previous engine had individual cylinders. Cooling is by thermo-syphon and ignition by the single Splitdorf instrument with hand advance.



The new Overland light delivery car selling at $595

It has a cone clutch, connected with the gearset by a torsion tube inclosing the driveshaft, the gearbox being mounted on the rear axle as in previous Overland models. Torque and propulsive stresses are both taken through the torsion tube. Rear springs are of the cantilever type, three-quarters-elliptic springs being used on the larger model. The steering wheel is to the left and the levers are in the center. The tires are mounted on demountable rims. The standard body is of the piano box type, extending back on a line with the top edge of the cab door and surmounted by a stage top on six uprights. Roller curtains are provided in addition to the screen sides and a tailboard is fitted at the rear with leather retaining straps. The driver's seat extends part way into the body and, unlike the helper's seat, has a folding back to afford access to the load from the front. The helper's seat folds out of the way when not in use.

A New Knox Towing Winch Tractor



Two views of the new Knox towing winch tractor, showing its compact construction. The mounting of the towing winch horizontally across the rear is illustrated above

A NEW towing winch tractor has been placed on the market by the Knox Motor Associates, Springfield, Mass., under the name of model 36. The new machine is a self-contained vehicle practically identical with the model 35 semi-tractor, except that the frame is carried well back of the rear axle and it is mounted on a single set of semi-elliptics instead of the two sets of springs, semi-elliptic and cantilever, used on the older model. The body, which is about 4-ft. long and of about the same width, is placed immediately behind the cab, the winch being placed horizontally across the frame behind it. It is equipped with towing hooks fore and aft, the rear being centrally located and the front consisting of two mounted on each forward corner.

Triangular brackets of substantial section are used for the winch mounting and the drive is by worm from a transverse shaft driven off the gearset. The winch is controlled by a separate clutch. It carries 150 ft. of wire cable, and at 1000 r.p.m. the motor hauls in the cable at 150 ft. per minute. There is a large sprag to anchor the tractor when the winch is in operation. This can be lifted readily when not in use and is pivoted directly to the rear axle to allow the cushioning effect of the springs to come into effect when it is in use.

A heavy coil buffer spring is used in connection with the rear towing hook to cushion the draft. The capacity of the chassis is 4 tons, the body permitting a traction-giving load to be carried and also providing carrying space for road tools, etc., if desired.

Among the uses of the winch may be mentioned wrecking purposes, heavy hoisting, emergency hauling and all-around utility work in pulling through bad stretches of road, etc. The pulling-power of the winch is 20,000 lb. For traction on roads not adapted to rubber tires steel wheels are provided at slightly extra cost. These are interchangeable with the rubber-shod wooden wheels. The hydraulic brake used on the older model tractor is also employed on this. The price of the vehicle is $5,000.

The FORVM

WHEEL WOBBLE CAUSED BY STEERING LINK LAYOUT—THROTTLING BY CHANGING LIFT OF INTAKE VALVE—KEROSENE TROUBLES IN USING GASOLINE—BRAKE-ACTUATING SYSTEM AND REBOUND CHECKS

Steering Link Design Causes Wheel Wobble

By Leon A. Chaminade

THE articles on steering gear layout published in THE AUTOMOBILE for March 23 and April 6, by H. H. Dyke and Theo. D. Stanley respectively, have brought to my attention a correction for the faults of the present steering system, which has not been, to my knowledge, brought forth in the trade papers. Having had many years' experience as a driver of automobiles and being at present a student of machine design, I heartily agree with Mr. Dyke about the advantages of the present arrangements of the front spring, steering link and knuckle steering arm, which cause a bad wobbling of the front wheels while traveling over rough roads.

Mr. Dyke is in error in saying that with any alternative construction, from the present standard arrangement of steering connection from frame to axle, the steering link must run crosswise or partly crosswise of the car. Fig. 1 shows a front spring pivoted at its rear end and shackled at its front end. The steering gear housing is attached to the top of the frame and the steering gear arm projects downward outside the frame, having its lower point on the center line of the front spring pivot pin when the wheels are parallel to the axis of the frame, that is, when the car is traveling in a straight line. Since the axle in its up and down motion travels along the arc *A*, which has its center at *A*, the steering knuckle arm will move along this same arc. In the present standard arrangement this true motion of the steering knuckle arm is interfered with as explained by Mr. Dyke, but with the construction shown in Fig. 1 there is no interference and therefore no wobbling of the front wheels because the front end of the steering link moves along the same arc, *A*, for the steering link and spring are pivoted on the same center line.

The advantages of this construction are that the spring will act as a cushioning buffer between the front axle and frame as in the standard arrangement; that the spring will prevent side sway or lateral movement of the front wheels relative to the frame; and will permit the cushioning movement between the front axle and frame to take place without interference with the proper action of the steering connection. The steering gear arm, and therefore the steering gear housing, will be placed further forward than in the standard arrangement, necessitating more rake to the steering column, which means a more comfortable position of the steering wheel for the driver. There will be much less wear on all steering gear parts. This construction does not bring the steering link crosswise of the car but parallel to it. The disadvantage is that the front axle is pushed by the spring and not pulled by it; but this disadvantage is far more theoretical than practical as shown by the best racing machines and a large percentage of the stock cars built today, on which not only the rear axle but the whole car is pushed by the rear spring. If the rear spring is capable of pushing the whole car satisfactorily why cannot the front spring push the front axle and wheels in a perfectly satisfactory manner?

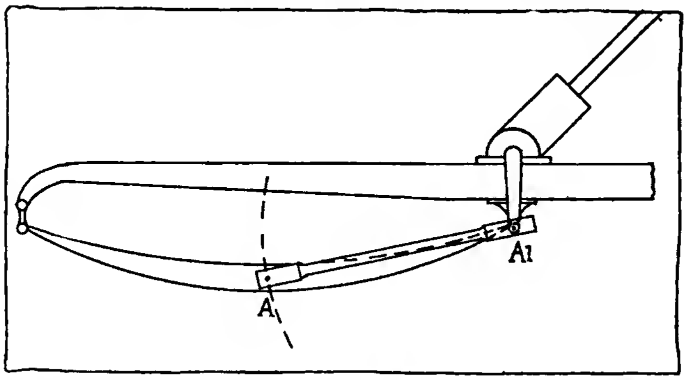


Fig. 1—Action of steering link when front spring is pivoted at its rear end and shackled at the front. This construction is designed to prevent the wheels from wobbling

Throttling by Changing Intake Valve Lift

By C. J. Morrison,

Chief Engineer, Meyer, Morrison & Co., Inc.

THE suggestion in a recent issue of THE AUTOMOBILE that throttling be accomplished by changing the lift of the intake valve is very interesting. It appears, for many reasons, to be a better way of throttling than present methods, but, unfortunately is hard to accomplish on motors having more than two cylinders.

The old one-cylinder Cadillacs used this method of throttling with great success. This motor, in common with other early types, was modeled after the steam engine, and the intake valve was actuated by means of an eccentric on a half time shaft just back of the crankshaft and a connecting-rod similar to the device used on steam engines. The back end of the rod ran on a roller which could be raised and lowered by means of a fulcrum connected to a rod which led to a handle on the steering column. When the fulcrum was in its lowest position, the connecting-rod simply ran back and forth on the roller without lifting the valve. As the fulcrum was raised, the rod opened the valve more and more until the full opening was reached. Of course the rod had considerable travel in order that the valve could seat after being lifted to its greatest opening.

The carbureter on this car was also interesting as its design was entirely different from present practice. Gasoline passed through a needle valve and dropped down onto a fine mesh wire screen which completely filled the air inlet. This screen was funnel shaped and had its point toward the incoming air. As the air passed through the screen it picked up the gasoline vapor and formed a perfect mixture. The stem of the needle valve was attached to a flat circular disk which raised in response to the suction from the engine and permitted gasoline to fall down onto the screen.

This carbureter was not waterjacketed but was practically part of the cylinder head and therefore kept warm. The addition of a stove over the exhaust pipe would undoubtedly enable it to handle present day fuel very efficiently.

Excellent Vaporization

The method of vaporizing the gasoline and mixing with the air was better than in some of the latest designs. When a drop of gasoline fell on the screen it spread out in a thin film which insured that it would vaporize and mix thoroughly with the incoming air.

A few years ago a man who was still driving one of the old Cadillacs was asked what kind of a carbureter it had. He studied for a moment, then said, "Carbureter? What is that? I don't believe my car has one." Although he had driven the car for many years and had taken all the care of it himself, he had never had any reason for discovering the carbureter. There is a lesson in this for some of the designers of the modern car.

Kerosene Troubles Exist in Gasoline Carburetion

By W. P. Deppé

I WISH to call attention to a phase of carbureting so-called cracked gasolines which is beginning to become more apparent every day as the increase of kerosene cuts, perhaps, are being forced into gasolines, to answer the public's cry for more fuel all the time.

In the article on "The Problems of Kerosene," in THE AUTOMOBILE for March 30, quite ably written by A. L. Clayden, chairman of the standardization committee of the S. A. E., he calls attention to some well-known features of difficulty surrounding the use of kerosene in high speed variable speed engines, as compared to the use of gasolines in the same engines.

But he did not mention the fact that kerosene troubles are actually existing to-day in the average gasoline carburetion on practically all automobiles now outstanding with the ordinary designs of carbureters, as they are now generally known. It is the cause of loss of power, difficult starting at times in cold engines, less miles per gallon, even in the smaller engines, and lighter cars, in some sections, with resultant fewer ton miles per gallon of fuel consumed than ever before. This is apparent when one takes the time and trouble to go into details of any average statistics bearing on this subject.

Properties Remain the Same

I refer to the fact that if you crack crudes or kerosenes, by any known method of distillation, into so-called gasolines, which may perhaps show higher Baumé scale readings, and lower boiling point temperatures when in liquid state as such cracked gasolines, in comparison to the same readings in the crudes or the heavier hydrocarbons from which they were cracked, that you do not as yet seem to alter the action of the vapors or gases, in carbureting for internal combustion engines with these so-called cracked gasolines. That is, the vapors and gases seem to require just as high temperatures and heat volumes to hold them in such states as the original oils required for their vapors and gases, when in motors, mixing chambers, manifolds, valve chambers, and within the cylinders during intake stroke, etc.

The vapors of so-called cracked gasolines, and their gases act just like those of kerosene mentioned by Mr. Clayden in the article mentioned, in transit in manifolds, seem just as susceptible to temperature variations due to throttling, expansion, precipitation from gas to vapor and then to liquids, and are just as slow to ignite and with flame propagation seemingly just as slow as the vapors and gases of the heavier hydrocarbons from which these so-called gasolines were cracked by any method I have seen demonstrated either in the laboratory or in the commercial sales of gasolines.

I am glad to say, however, that it is possible now for any automobile engineer to have carburetion methods installed in any good four-cylinder model, with proper designs used for gas producers, distributing manifolds, valve chambers, with correct relation between bore and stroke, and where the highest engine speeds do not require much over 2000 r.p.m. using either gasoline or kerosene.

Either Fuel Can Be Used

In such a unit, it is now possible to operate either on all gasoline, mixtures of gasoline with kerosenes, either mechanically after put into the markets, or through the cracking methods of making gasolines from heavier hydrocarbons, or on all kerosenes, when gas producers and other details are adjusted with heat sufficient to handle all kerosene. There is no perceptible difference in road work, with but very slight variations on brake load in the testing rooms, as between all gasolines, or all kerosenes, with heat sufficient to handle all kerosenes; all on the same fixed meter adjustments. There is a slight loss of power above 2000 r.p.m. and even some brake load losses in power over 1000 r.p.m., but these are not apparent on the road tests, because these gas producers on the road tests work as designed. That is, they average up the variables met with on the road, but some of which are fixed in dynamometer tests, and too much heat develops on the brake tests, in some respects, but which are leveled out in road work, as cars are used in ordinary daily routine.

There is no apparent difference in the throttling flexibility as between so-called gasolines of to-day and all kerosene, as such things are now furnished to the average user, because for the reason given above, there is really no difference in the action of vapors and gases of so-called cracked gasolines and all kerosenes, after being carbureted. The only thing one must guard against is to avoid fractional distillation or gas dissociation in carbureting with such high temperatures as are required in handling all kerosenes.

Thinks Four Is Ultimate Engine

In my opinion, from a purely gas production standpoint, I should say that the four-cylinder engine, L-head type, is the ultimate engine, because of the time elements, the actions of vapors and gases of present day oil fuels however distilled from crudes, or however vaporized or gasified, when carbureted. Because of the fact that as I understand it no two intake valves are open at once in a four, and there are two in a six, and more in engines with more than six cylinders, which bring about temperature drops, as outlined by Mr. Clayden in his article on kerosene carburetion. You cannot permit the splitting of the mixture charge to two cylinders at once, without setting up some of the disadvantages mentioned by Mr. Clayden in this article.

With gas producers furnishing a more or less dry gas rather than vapor mixtures at all times, even under the action of throttling, from the lightning-like governor throttle in four-cylinder, vertical tractor engines, to the more leisurely throttling complications from working through several miles of Fifth Avenue traffic at the time of greatest congestion, a four with the same crankshaft finish and balance, as has been developed in most good sixes, etc., will be just as velvety, with not as much vibration as with six or more cylinders, will have swifter getaway, better traction in snow, mud, sand, and on long hills, in the gasolines now coming into play, which the gentlemen of the S. A. E. must plan to treat as kerosene vapors and gases must be handled, if there is to be that greater development of the internal combustion engine which the past development of that form of prime motive power would indicate is possible.

L-Head Feature Important

As one who knows little else but gas production from oils, I should say that it is not a question of mechanical merit, or refinement, as between engines with four cylinders, or more cylinders, but it is in fact a question of the engine which can be carbureted with the oils now here, and worse coming, and which must run in fact on kerosene vapors and gases, whether you feed them cracked gasolines, or all kerosene. Any man who has spent enough time on carbureting kerosenes and their gases and vapors to find out just how little he really knows about the oil fuels will certainly suggest that the fours from now on be given very careful consideration, and particularly the L-head type, because of the fact that the exhaust gases pass out next to the intake ports in that form of engine.

Brake-Actuating Mechanism and Rebound Checks

By Marius C. Krarup

IN the article by A. L. Clayden last week on brake action with the so-called Hotchkiss drive, through the rear springs as driving-struts, two things strike me as remarkable: It is perfectly clear and it offers a remedy. Furthermore, this remedy is applicable also in those cases where the fault is already remedied in part through the use of nearly straight springs and other provisions tending to equalize the distance from brake pedal to brake cam for all positions of the axle.

To illustrate how your article strikes through, I may mention a few of the ideas to which it seems to loan new strength. One lies close to the surface, relating to rebound checks. As you point out, if there is a dangerous discrepancy between the curve of the axle movement under shock action and the curve described by the end of the brake pull rod, this discrepancy will be most pronounced at the extremes of the movements, at the highest and at the lowest possible positions of the axle. The shorter the arcs can be made without interfering with the springing, the more accurately can they be made to correspond If the lower or rebound end of the arcs is cut out, a little can be added at the upper end, in favor of greater flexibility in the semi-elliptic leaf springs, and it seems to be generally admitted that greater flexibility is desirable in truck springs, if it can be managed. As brakes are particularly liable to be applied sharply immediately after a severe shock—even though a second earlier would have been better—and about simultaneously with the rebound, your article, it seems, demonstrates an advantage in properly designed rebound checks, in the matter of safeguarding the brake action, to which attention has not been called before.

Whether the equalizer shaft can always be located so as to have the action correct without introducing a new and additional element in the linkage, with corresponding accentuation of wear and frequent need of re-adjustment, or other complications, is perhaps another question, to be decided only by a careful examination of the layout in each case. At all events, an important point to which only the foremost designers have paid much attention in the past, has been brought clearly into the foreground for the information of all. All must now look to have the last section in the brake rod linkage act from the most suitable center, even if the drive is not taken through the springs.

From such material most practical progress has been forged. It comes not only through the direct adoption of the suggested remedy but also by shaping and strengthening the conception of other methods by which the shortcoming may be obviated. Thus the superficial idea, if it is correct and practical, really strikes toward the root of things with admirable efficiency—if you will permit me this bit of philosophic observation—reaching all who are interested in things as they are, and not only those pioneers whose mental chronometers show the time of day to a second while their ambitions are two to ten years ahead of the calendar.

Avoidance of Wear

A much more radical thought is suggested, however; radical in the sense of going to the root of things. It is understood that the greatest danger of failing brake action comes through the need of adjustment of the linkage. We should have an actuating mechanism that does not wear or is not affected by wear, so far as the brake action resulting from a given pedal movement is concerned.

Tracing the wear back to its source, we find that most of it is due to the resistance. During the act of turning the cam the progressive resistance of the cam is transmitted to every working joint. We should therefore have an operating mechanism that does not share in the work done by the brakes while they are being turned on. The cam is retroactive. But even if it were worked through an irreversible worm, the linkage would still support the work of tightening the brakes and the conception of a mechanism which works without any notable resistance is more attractive. The electric brake is in this class. The hydraulic brake can be designed on this plan. The compressed-air brake likewise. And it is not out of all question to have a mechanical friction brake so actuated, even if it is not of the centrifugal type which probably never can be resurrected. We can, for example, easily imagine a pin being pushed into a hydraulic device within the brake drum, to set certain valves and causing the device to be actuated with greater or lesser resistance according to the depth to which the pin is inserted, or causing the hydraulic device to operate, by means of the rotation of the wheel, ordinary brake shoes in the drum. I have no doubt that, in cars with electric equipment, electric brakes will be in use long after the pedal-shaft-crank-rod-crank-rod-equalizer-crank-rod-crank-shaft-cam-retractor-spring mechanism has gone to the discard. And with regard to the other types of brake which may be operated without notable resistance or wear in the actuating mechanism, the designing and perfecting of them probably only awaits the demand.

Your article will do a great deal, I should judge, to bring such a demand to a focus both among the public and the manufacturers, having laid before us so clearly the most radical shortcoming in the existing system.

I should like to dwell on the clear and unmistakable language in which your subject is set forth, as to my mind there is the most intimate relation between lucid diction and engineering progress, but, as your space is limited and the subject a separate one, even if it is suggested in this connection, I shall bring this up some other time.

One more word about rebound checks, however, as they were referred to above only as an aid in obtaining reliable brake action. Their chief mission is of course to secure comfort with flexible vehicle springs and protect the latter, but it may not be amiss to mention another purpose, which they always serve in some degree and could be made to serve more fully. I refer to their value for obviating the vibration of axles which are heavy at the middle and for which now an adjustable brace rod is commonly provided. This brace rod with its dangers of maladjustment and fractures could well be spared if suitable rebound checks were applied. Frequently two straps are used, each about midway between the differential housing and the wheel, but they are necessarily adjusted to light load (so as not to make the springing hard for that condition) and protect neither the axle nor the springs sufficiently when severe shocks are received under full load. If, on the other hand, a more efficient rebound check were applied at the middle of the axle, such practice would be economical, and the axle vibration would be fully obviated. And, in the case of one-wheel shocks, probably as much checking effect for the rebound of the springs as is necessary can be obtained on this plan, provided the checking device is robust enough and of the required design. The requirements in this respect, at least for all trucks and omnibuses, are simply, it seems, that the rebound check shall have an action accommodating itself perfectly to load variations, so that the checking may always be entirely completed when the spring has returned, after a shock, to its original position of equilibrium under whatever static load it happens to carry at any given time—and not always to the same position. If there is not room for a practical development in this direction it would be interesting to know why not, and I take it that your Forum is the place for just such questions and their answers.

Differential Increases Difficulties for Dump Trucks

By L. G. Bartlett,

Chief Engineer, Old Reliable Motor Truck Co.

THE writer was very much interested in the article by A. Ludlow Clayden in last week's issue of THE AUTOMOBILE respecting the experiments which are being carried on by various engineers respecting the possibility of eliminating the differential from commercial vehicles, and gladly gives you his experience with heavy dump trucks, which had approximately 8½ tons paying load.

The chassis and body, with hoist complete, weighed 12,500 lb., and the wheelbase was 150 in., with dual 40 by 7-in. tires in rear and 36 by 6-in. singles in front, with chassis and body distribution of 55 per cent in rear, and 45 per cent in front, while the paying load distribution is approximately 85 per cent in rear, and 15 per cent in front. This load distribution may seem excessively heavy in rear, but the writer has checked a number of jobs where the distribution has shown an excess of 100 per cent, the overhang having been tolerated in order to provide the required dumping angle, and also eliminate body and hoist strains.

With the abovementioned loading conditions, and with the very short wheelbase which the American type of truck allows, we found that it was entirely impossible, with the differential locked, to make anything like the short turns which we had been able to accomplish, and moreover, were quite surprised to find that when the streets were sufficiently wet and slippery, to allow a differentiating action to take place, the result was that the much greater traction of the rear wheels would force the front wheels to proceed in direct line with them, regardless of the manipulation of the steering gear. This would invariably occur in alleys, or in places where there was considerable soft earth, or loose material, and was of decided disadvantage to the particular truck in question, because the short wheelbase made abrupt turning easily accomplished, and reduced running time very materially on short hauls, and in tight places. On slower turns, there was a decided increase in the power required, but steering was not seriously affected.

The writer is pleased at this time to extend to you his hearty congratulations on the original work, and open forum which your articles are making possible in THE AUTOMOBILE, and no doubt expresses the feelings of many, that you are keeping us in closer touch with one another's difficulties and achievements, and materially assisting in the production of more economical and serviceable transportation.

Troublesome Differential's Days Are Numbered

By E. C. Shumard,

Engineer, United States Motor Truck Co.

IN reference to A. L. Clayden's article on locked differential, the writer has given this proposition considerable thought for a number of years, and will soon be testing out a Sheldon worm axle without differential.

There have been devised numerous contrivances for the purpose of locking together an ordinary differential to be used when one drive wheel encounters a slippery place. As a rule, they have not been altogether successful, because of complication and the human equation. The writer has observed many times that such locks have been connected and after the truck had been freed from the slippery position, the lock had been completely forgotten, and truck had proceeded on its way. It was evident that if this could be done frequently without damage or without even knowing of the condition, the differential was not a necessity.

Without data from actual tests, the writer is of the opinion that greater damage is done to the tires by their contact with the road under accelerated speed after bouncing over an obstruction and causing the wheel to leave the ground than could occur from the necessary slipping in making turns with both drive wheels keyed to a single bar.

Further, the fact that one wheel must spin when it leaves the ground or comes in contact with a slippery spot, and nearly always is stopped, suddenly, throws severe strains on differential and other parts, as well as the tires.

It has been generally believed that more power will be required in making turns without the differential. However, this argument is questionable because the increase in gear ratio through the differential is considerable, and also calls for more power when making short turns.

The writer believes that the troublesome differential's days are numbered.

Trucks Do Not Need Differentials

By J. G. Paine,

Detroit Commercial Car Co.

WE note with interest the article relative to the elimination of the differential from trucks. We have not carried out any experiments along this line, but it has long been our opinion that this move is not only desirable but is practical as well. In theory it may not line up just as we would so desire, but in our judgment for truck use, especially the slower-moving trucks, the absence of the differential would never be noticed, even in turning the shortest radius, but there would be a very distinct advantage where a truck had one driving wheel in a hole with no bottom on one side and the solid pavement on the other.

The writer has seen this condition many times this spring.

We hope to see discussions on this subject from manufacturers who have actually made experiments.

Differential Will Be Simplified

By A. C. Wollensak,

Chief Engineer Sterling Motor Truck Co.

WE have read with interest the article by A. L. Clayden relating to elimination of the differential, and also the article by Mr. Laycock and the editorial.

We are sure that great strides will be made in this direction in the near future. We do not know whether the differential will be entirely eliminated, but we do believe that it will be considerably simplified.

The History of the American Automobile Industry—27

Further Petroleum Developments—Its Use for Medicinal Purposes—Drake's First Well in 1859—Petroleum Ignored and Wasted—Later It Begins to Influence Inventors

By David Beecroft

IN spite of repeated forcing of her bountiful petroleum upon a blind and unwilling generation, Mother Nature was unable to make a people who thought they were progressive accept the wealth she was so anxious to give. Occasionally, some man with more ambition than his neighbors would bottle a little of it and sell it for medicinal purposes at 50 cents per half pint or would send a few bottles to the coast cities, recommending it for everything from cattle cures to cancers, in the hope of introducing it and getting a market started. The total used in this way was but trifling, however. The oils needed by civilization were secured largely from the sperm whale and from the products of the farms. Yet, with this natural supply neglected, we find a considerable industry growing up in artificial oil extracted at considerable expense from certain coals and shales.

In 1846, an illuminating oil made from a coal secured in Albert County, New Brunswick, Canada, was put on the United States market. Camphene distilled from turpentine was used for lighting, although considered quite dangerous because of its easy inflammability.

In 1850, the making of paraffin oil from coal, peat and shales had grown to such an extent as to be considered a financial success and the next ten years showed a very considerable development of these artificial products. Even the paraffin candle was produced, although it could not have competed with the tallow candle had it not been a by-product. Some idea of the progress since that date is expressed by the fact that the Standard Oil Co.'s candle output a couple of years ago in this age of acetylene, electricity and gas was 300,000,000.

1859—Drake's First Well

The Moses who had vision enough to lead out of this period was E. L. Drake, who, in 1859, went from the East to Oil Creek and drilled the first well near Titusville, his object being to secure oil. This started the movement toward the now great petroleum industry and the manufacture of artificial oil from coal ceased in 1860. The names of the earlier products, however, remained with us and were largely applied to the later natural ones. The next ten years were largely development ones. Wells producing oil rapidly increased and many attempts to use the newly recognized product were made in many different lines. Lighting by kerosene lamps became quickly the common and accepted form and absorbed the major portion of the oil output. The gasolines were thrown away as being both useless and dangerous, while the heavier portions were used principally as lubricating oils and found a considerable market in spite of prejudice against the new thing and in favor of animal lubrication.

The Waste of Gasoline

A peculiar manifestation of this period was numerous attempts to make gas for illumination from the kerosene by the application of heat and by the use of complicated mechanical constructions, while the gasolines, ready and willing to convert themselves into gas by the mere mixing with air, were ignored and thrown away. The only explanation possible seems to be that the experimenters were working with the material at hand and did not know of the waste by-product. This condition of affairs is found so often and in so many lines that it would seem a wise government should establish a public information bureau to which an experimenter might apply for the facts of benefit to himself and humanity in general without any additional expense.

Gasoline Influences Inventors

With this development of the oil industry in 1860, we can now understand why the internal combustion engine began to attract attention and crowd its predecessors to the rear just as the air engine or combined air and steam engine or steam and smoke engine had been promising to crowd the original steam engine. Kerosene, being available in practically every market, was naturally the fuel used. The internal combustion engine had been pretty well made known to the American public by Dr. Alfred Drake of Philadelphia, who, beginning his experiments in 1837, had exhibited his engine with hot-tube ignition at the Crystal Palace, New York, in 1855, which engine is said to have been "precisely like Lenoir's, which was brought out in Paris in 1860-2 and often claimed to be the first of this type. Ericsson's hot-air experiments on a large scale propelling an ocean-going steamer and his exploitation of same had done much to direct public attention toward air and gas engines. Five air engine patents were granted to him between 1851 and 1860 and about forty hot-air engine patents were issued in the next twelve years, a very large number when the total patent issue is considered. George B. Brayton was building air and gas engines in 1864 and it is believed had taken up the work as early as 1857, although his first patent seems not to have been issued until 1872.

A Bubbling Type Carbureter

The patents of that period show a bubbling type carbureter by Ashcroft in which a float rested on the surface of the liquid while air admitted below the float followed a scroll or a spiral passage in the bottom of the float for a considerable length and so had much time to be saturated with the vapor of the liquid. This device was used by De Dion and other foreign makers thirty-five years later. A patent to Richardson & Pond in 1867 shows air sprayed in fine streams into and rising through the liquid for the same purpose.

That the gas engines of those days were troubled with carbon, was undoubtedly truer than to-day when carbureters are better, and Wiegand in 1864 mentions in his patent a liquid put into the cylinder, "to carry off the carbon" and improve the ignition. American publications described in 1865 the engine of Hugon as an improvement on the Lenoir and a method of obtaining an inflammable vapor by passing air through naphtha, petroleum or other volatile liquids invented by Wenham, both the above being foreigners. Lenoir cards were published in the *Scientific American* in 1866 and in the same year benzine vapor was suggested for the "newly introduced gas engines."

The next year, 1867, there appeared several articles on the use for petroleum for fuel and the activity in this line is indicated by the term mania.

In 1869 Maxim and Radley patented a carbureter in which the air was passed through heating and vaporizing chambers, this being the H. S. Maxim, who afterward built the light and powerful aeronautic engines which were so interesting to the earlier automobile workers.

In 1870 we find liquid fuel advocated for steam engines and petroleum gas from their own well, probably natural gas, in use at the Erie Water Works.

In 1873 Sloper patented a portable gas machine which was fitted with concentric partitions packed with picked cotton and excelsior through which the air could be drawn and absorb the vapor from these wick-like substances which rested in the petroleum liquid.

With these mentions, it seems unnecessary to consider further development of the use of petroleum in its relation to the automobile. The Brayton engines which rapidly assumed a commanding position, beginning with the early seventies, introduced the liquid fuel by pumps. The Otto engines, which in the middle eighties began crowding the Brayton from its position, mostly used city gas but where a carbureter was needed, it was of the surface or Sloper type, and this was the kind seen in use by Charles E. Duryea in 1886 when he selected the gasoline engine with its portable gas producer and electric ignition as containing the elements of the successful motor vehicle motor.

Elwood Haynes used, at first, a pump to introduce the liquid fuel and later, a mixing valve which admitted both air and liquid in approximately proper proportions. Duryea, however, never used the gas tank lest fire result and because a fear and criticism of this result would certainly exist, but in his very first machine, begun in 1891, developed a spray device. This was not wholly new with him, however, having been shown in a British patent of 1874 and being simply a modification of the well-known atomizer used for perfumes.

Gasoline at 5 Cents Per Gal.

The production and development of the petroleum industry, although in starting proceeded rather faster than the demands for the product so that the last years of the century found Duryea buying 5 gal. of high-grade gasoline at the corner grocery store in Peoria, Ill., hundreds of miles from an oil well, for an insignificant 25 cents. Kerosene at 3 to 4 cents per gallon in barrel lots delivered was so cheap that he refused to shovel coal and ashes but patented and used a kerosene burning furnace for heating his house. In more recent years the condition has reversed. Gasoline, once thrown away, is now the leader, the demand for kerosene has greatly diminished proportionately, while lubricating oil, particularly of high fire test for superheated steam and for gas engines, has become so necessary that these improved devices could hardly operate without it. So rapidly did these changes take place in the first dozen years of the present century that an old and experienced oil man refused to invest any money whatever in a truck propelled by gasoline because he was certain that gasoline prices would be prohibitive before he could get the truck on the market in paying quantity. The development of new fields greatly relieved the gasoline demand, but the condition would have been critical before this had not a process or processes been discovered for re-assembling the hydrogen and carbon constituents of petroleum so that the heavier grades may now be separated into lighter with a residue of still heavier ones.

Bulletin on Nickel Steels

WASHINGTON, D. C., April 22—The Bureau of Standards Department of Commerce, proposes to issue a series of circulars of information on the proporties of the more interesting or technically important metals and alloys. The first of the series, describing the properties of the non-expansible alloy Invar and other nickel steels, has just been published. The magnetic, electrical, thermal and mechanical properties are given with numerous illustrations, together with statements concerning microstructure, constitution, applications, and sources of supply.

The publication is circular No. 58, entitled Invar and Related Nickel Steels, and copies will be sent free to interested persons upon application.

The Rostrum

Pinion Is Meshed Too Tightly

EDITOR THE AUTOMOBILE:—From the rear axle of my Saxon B roadster, 1915, there comes at low speeds a singing, humming noise which seems more pronounced at lower speeds, but at about 25 m.p.h. it is more or less lost in the other noises. I have packed the universal, the transmission and the rear axle pinion gears, but this has not seemed to have made any difference. The car has but lately come into my possession, so I do not know how long this condition was in developing. Could the small pinion be meshed deeper into the ring gear to overcome this, and if so, what will be the steps necessary? In this model how is this done? Could the gears already be too closely meshed? How can I tell when the adjustment is about correct? The rear wheel has vertical play of about 3/32 in. The right wheel is without play. In this excessive? Could this cause the noise?

Oil leaks out of the valve so that this side of the engine is covered with oil which drips on the mud pan, which in this car supports the engine. Would packing the valve cover plate with felt stop this or do I require new valve guides?

Summit, N. J. H. B. R.

—The pinions can be adjusted by removing the large pipe plug on the top of the transmission case and loosening the set screw on the side of the case. The adjusting nut is then turned in or out. In this case it is believed that the pinion is meshed too tightly with the ring gear, and it should be backed out six or eight notches.

The vertical play in the rear wheel is no doubt caused by worn bearing or axle shaft and to eliminate it it will be necessary to install new parts in place of the worn ones. The vertical play in the wheels would not cause the noise in the axle.

To stop the leak around the valve tappet cover it is only necessary to install new felt washers around the cover.

Correct Temperature for Vulcanization

Editor THE AUTOMOBILE:—What is the right heat a tire should have in order to vulcanize and how long should it be kept to said heat?

Fall River, Mass. J. H.

—This depends whether it is the inner tube or outer tube you are vulcanizing as far as time is concerned. Generally about 15 min. suffices to make an inner tube vulcanization at a temperature of about 145 deg. C. The tire shoe takes a longer time depending on the depth of vulcanization. It would be best to simply follow the directions with your vulcanizing outfit for practical results as this has been worked out to give proper temperatures for the conditions for which it is designed.

Wants More Quality in Cars

Editor THE AUTOMOBILE:—It is about two years now since a craze started for the production of "quantity" cars, in the sense that every American manufacturer seems to be striving to give a big car for little money.

There must be a large number of agents and dealers to whom this trend is unsatisfactory. An overwhelming number of our prospects are men not in a position to afford the enormously increased maintenance ratio consequent upon the use of a car with a long wheelbase having, necessarily, larger tires and increased weight. We point out that a 30 by 3½ tire sells, out here, for $25, a 34 by 4 for $35. Gasoline retails at never less than 60 cents per gallon and oil $1.40. Therefore the one desideratum is economical running cost.

Only the short-wheelbase, light car can give us this and instead of a 112-in. wheelbase, 2500 lb. car retailing, in America, at $750, we need a car of but 102 to 104 in. wheelbase weighing not more than 1750 lb. The selling price of $750 is about right, and as against the greater quantity we could be given more quality.

Trusting that it will not take up too much of your space, below we give a few abridged specifications which we think needful:

Wheelbase	102 in.
Track	56 in.
Tires	30 x 3½
Weight	1750 lb. or less
Cooling	thermo-syphon, large water capacity.
Motor	long-stroke, high-speed type 25 hp.
Carbureter	Zenith or similar type.
Gasoline tank	in dash.
Body	all metal; enamelled; very low streamline.
Speeds	three forward, one reverse
Seats	tilting downwards to rear.

Such a car, if put on the market by one of the big manufacturers, would command an instant clientèle.

For two years we have carefully scanned all your announcements giving details of any new models likely to suit us, until we came to the item wheelbase, our interest then ceasing, for it is invariably given as 110 in. or more.

The Studebaker Corp. put the just right car on the market during 1913, and withdrew it the following year. Why?

We have seen nothing in use of late that will compare with that little car for quality of material and equipment.

A similar size car is needed, but with altered body lines, etc., conforming to more modern ideas.

Beaufort, West, So. Af. J. W. COURTIS, Motor Supply Co.

Storage Battery for Dual Ignition

Editor THE AUTOMOBILE:—Why do we use battery with dual system magneto?

2—Why is spark advanced when cranking on the magneto?

3—Why should a magneto armature run at engine speed on four-cycle, four-cylinder engines?

4—Where is set ignition placed and on what system is it used?

Columbus, Ohio. L. L. S.

—The accompanying diagram, Fig. 2, illustrates the necessity for a storage battery to carry out the scheme of dual ignition. If there were no storage battery you would not have dual ignition, but single instead. Dual ignition employs two sources of current with one set of spark plugs. Hence the battery and the magneto.

2—Spark is advanced to take care of mechanical and electrical lag and to make the explosion occur as nearly as possible to upper dead center. In cranking, if the spark occurs at the point of highest compression ignition is much more certain.

3—The magneto produces two sparks to the revolution and since a four-cylinder, four-cycle engine has two explosions to a revolution it is necessary, in order to have the two sparks, to have the magneto operating at engine speed.

4—Set ignition can be used on any system desired. It simply means that the spark cannot be manually advanced. Generally the spark is set in relation to the speed of the motor so that the explosion will occur as near upper dead center as possible. See Fig. 1.

Noise Probably in Timing Gears

Editor The Automobile:—Since equipping my Stoddard-Dayton 48 with patent piston rings, the motor makes a loud humming and grating noise. The oiling system seems to be working all right. What is the cause of this and what should be done in this case?

Madisonville, Ky. F. D. C.

—It does not seem possible that piston rings can give a humming or grating noise. The indication of a ring which is too tight in the groove is a clicking sound, and it is suggested that you look after your timing gears, etc.

Connecting Accessories on McLaughlin-Buick

Editor The Automobile:—How would I correctly add an automatic cigar lighter made by the Electric Automatic Cigar Lighter Co., New York, and a self-winding clock made by the Hartford Clock Co., to a model D45 McLaughlin-Buick six-cylinder car; also an attachment for a trouble lamp?

Brandon, Man. W. M. C.

—The trouble lamp connection which fits in the instrument lamp socket is already furnished with these cars as a part of their regular equipment. Other devices such as the cigar lighter and the electric clock should be connected to No. 1, 2 or 3 switch terminal, but No. 3 terminal would probably be found to be most convenient. It will also be necessary to provide a ground connection for this lamp.

Information on Model 10 Buick

Editor The Automobile:—What is the fastest time a Buick 10 ever made?

2—What ratio did it have between motor and wheels?

3—What kind of magneto and carbureter?

4—What speed has a stock Buick 10 in good condition?

5—Will I have to get a complete new axle or new pinion and ring gear in order to gear a Buick 10 up?

6—About what will be the cost of same?

7—What is the ordinary ratio for this car?

8—What is the speed of the 1909 or 1910 Simplex, chain-driven, 50 hp.; National 40; Stutz bearcat; Mercer raceabout?

9—How, and to what limit can I speed up a Buick 10?

Norfolk, Va. R. M. P.

—The fastest time ever made by a Buick 10 car is unknown, as there are no official records on this model.

2—The model tens were geared 3 and 3½ to 1 with 32-in. wheels.

3—They were equipped with Remy magnetos and Schebler carbureters.

4—Between 50 and 60 m.p.h.

5—The gear ratio can be changed by inserting new pinion and ring gear only. Any Buick dealer or branch will be able to quote you prices for this material.

6—Given in question 5.

7—This is given in answer No. 2, which is printed above.

8—All the cars you mention when tuned up are good for about 75 m.p.h.

9—About 60 m.p.h.

Friction of Tire on Road

Editor The Automobile:—I am desirous of obtaining certain information relating to the tractive effort or rolling friction co-efficient of solid rubber tires on various road surfaces. That is, what relations exist between tractive effort in pounds at the rim of the driving wheel of a motor truck or other motor vehicle, total load on the wheels, speed of the truck and power of the engine or motor when operating over the various good and bad conditions of streets and roads.

This information is to be used for the theoretical calculation of the power required to drive certain capacity trucks over or through various road conditions at given speeds, employing solid rubber tires.

Columbus, Ohio. L. R. Yeager.

—The following are the accepted figures for co-efficients of road friction for solid rubber tires of the usual compound:

Hard, level asphalt	0.0100
Wood pavement	0.0115
Level macadam	0.0115 to 0.0300
Plank road	0.0090
Cobble stones	0.0175
Good dirt road	0.0110 to 0.0200
Ordinary dirt country road	0.0200
Sand	0.2000

The tractive resistance of average roads against solid rubber tires is generally assumed to be 60 lb. per ton of weight on the wheel. Speed and motor power do not materially affect these figures excepting that there is a certain percentage of slip at high speeds and that too sudden application of power will of course prevent the tires taking hold.

Tire Sizes and Speedometer Gears

Editor The Automobile:—I am using a 37 by 5 tire on a 36 by 4½ rim but did not change the speedometer gears which are for the 36 by 4½ tire. What amount in speed and mileage is my speedometer registering wrong if anything at all? I think my speedometer is registering too slow but would like to know how much.

Allentown, Pa. H. J. G.

—The mileage will err to the amount of 3.1416 in. every revolution of the car wheel. The reading on the speedometer will indicate too little by that amount. At 10 m.p.h. a 37-in.

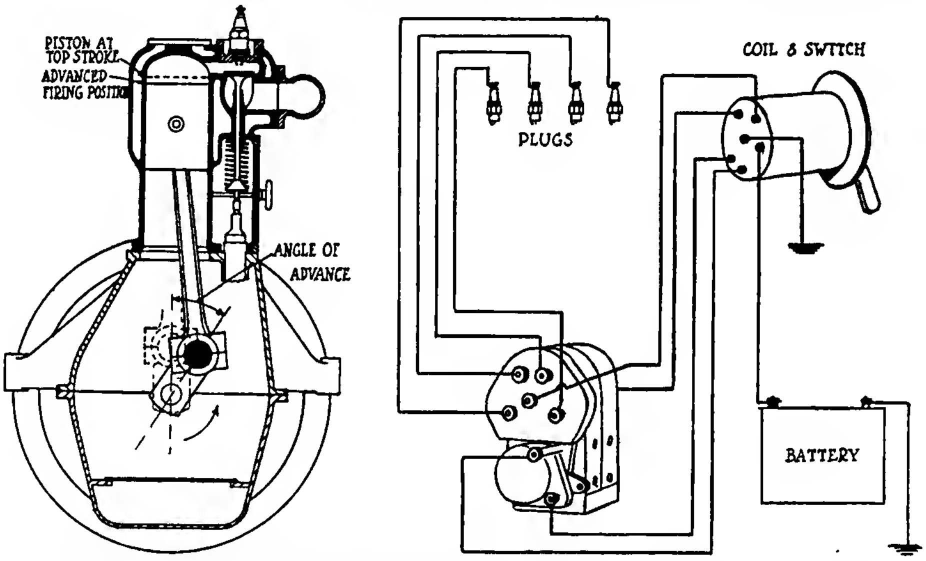

Fig. 1—Left—Top center and advanced firing positions. Fig 2—Right—Wiring diagram of a dual ignition system

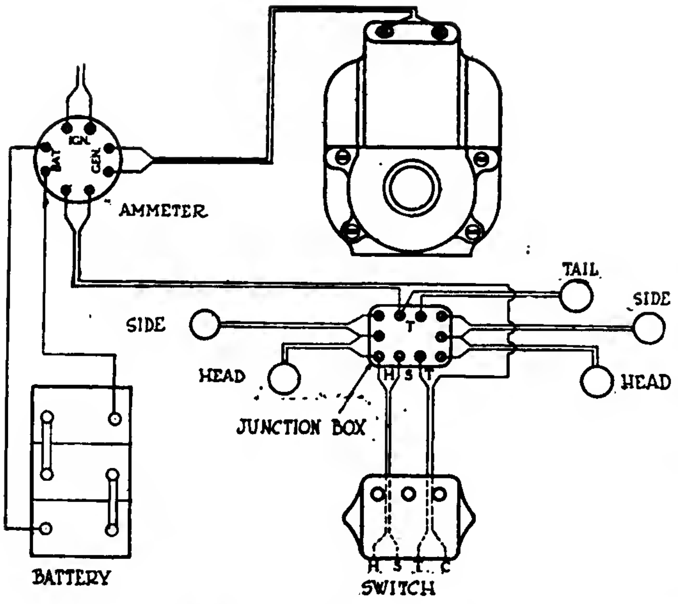

Fig. 3—Wiring diagram of the Remy electric system on the Stutz

wheel is rotating 90.9 times in 1 min. while a 36-in. wheel is rotating 93.4 times. Or to put it another way, if the 37-in. wheel is rotating 100 times in a minute the car will be traveling 11 m.p.h. The 36-in. wheel will have to rotate 102.7 times a minute for the speedometer to indicate 11 m.p.h.

With the conditions above outlined holding true the speed readings on your speedometer and the distance readings will be about 97 per cent of what they should be.

Correct Setting of Fixed Spark

Editor THE AUTOMOBILE:—I saw an article in a recent issue about set spark. It stated the piston should be within ⅛ in. of top on compression stroke when the spark should occur. Is this right? If so, I have been setting mine wrong. My engine has a set spark and the only gas control is a foot accelerator. Now when the throttle is closed for idle running I have my spark occur when the piston is at top dead center on compression stroke. If I change it to occur ⅛ in. before top center will it be all right? What is the best position for the most power obtainable? The markings on the engine are entirely gone so I am depending on your best judgment.

New Durham, N. J. S. A.

—Carry the spark as far ahead as you can without having the engine knock and without having it kick back in starting. The distance in advance of dead center depends on the speed of the motor and on the type of ignition apparatus. This is true because the higher the motor speed the further in advance should be the spark, and the greater the mechanical and electrical lag in the ignition apparatus the further ahead the spark should be set.

Diagram of Remy Electric System

Editor THE AUTOMOBILE:—Please publish a wiring diagram of the Remy starting and lighting system as used on Stutz roadster, starting motor model five, lighting generator model 0.

2—Is this system typical of all Stutz cars?

3—Describe the Bosch waterproof magneto as used on this car.

4—Where can the S. A. E. handbook be obtained, and what is the price of it?

Montreal, Canada. J. W.

—The wiring diagram you request is illustrated in Fig. 3. No diagram of the starter wiring is available as it is simply a two-wire system direct from the battery to the starter with the switch cut in.

2—Yes. This is typical of all Stutz cars.

3—This is a regular stock model Bosch magneto. The magneto model is the Z-R four or six in accordance with whether the car has four or six cylinders. It is very similar to the familiar Bosch DU type magnetos except that it is provided with a waterproof cover.

4—The handbook can be secured from the Society of Automobile Engineers, 29 West Thirty-ninth Street, New York City. The price for the two volumes is $7.

Wants Definition of Torque

Editor THE AUTOMOBILE:—Kindly define and explain the word torque as applied to automobiles.

Rochester, N. Y. J. D. M.

—The word torque is a definite one and means the same whether referred to automobiles or any other piece of mechanism. It is the force which tends to produce rotation or torsion and is measured tangentially by multiplying the force by the radius about the axis of rotation. That is, the torque in a given shaft would be equal to the power applied to the shaft times the distance of the tangential point of application from the axis of the shaft.

A Plea for Amateur Racing

Editor THE AUTOMOBILE:—In these days, when automobile racing, after some bad years, is so rapidly regaining its interest and popularity with the public, it seems strange that some serious effort is not being made to build up the amateur side of the sport. The publicity for the manufacturers, to be gained from stock, or even special, cars raced by nonprofessionals is tremendous, and furthermore it would be cheap, which can hardly be said for factory teams. From the standpoint of the promoter, a larger and more interested crowd than at any, except the very greatest, professional races would be assured from the friends of, and club and city "rooters" for, the various amateurs. Also, the prizes, as an inducement for entering, would not have to be so large. The potential purchasing power of the amateur and his friends is, also, by no means to be neglected.

There seem to be two particular reasons why promoters are averse to running an event of this class, the first being that they believe there are no eligibles, under the definition of the A. A. A., who would dare to race, and the second that, even if there were, their lack of skill would render them a menace to each other and the spectators, as well.

In regard to the first reason, the cause is to be found in the fact that no attempt is ever made to canvass the owners of fast cars who have the time and money for sport. Secondly, if some publicity was given the idea in the press, a surprising number of additional prospects would come forward, once the actual conditions of the contest were explained to them, and they were assured of meeting a class of cars and drivers of the same general ability as their own.

In regard to the second reason, the simple fact that a man is willing to receive money for racing is no reason that it should at once endow him with a superior competency to that of the man who is not. If experience was a requirement for drivers' certificates, the situation might be different, but this is not the case. There are any number of young men in this country who can, and do, drive fast, and are perfectly competent to handle cars at speed. If given a chance, they should show surprising ability. At any rate, the amateur's car would not be as speedy a proposition as the professionals', and the danger would be proportionally lessened.

It might be a good idea to hold some of the first races on "dangerous" courses, that is to say, those on which sharp turns and rough surfaces would keep down the speed to a point where a wreck would, probably, not be serious, and where the ability of the men could be better observed than on a perfectly banked speedway, where the average would be high, and good luck in not blowing a tire at a bad place would count more than good driving.

The writer, recently, tried to interest the management of the Panama-California Exposition in holding, in connection with the race of March 25, an amateur event. The course exactly met the above requirements, Burman's winning speed, in a Peugeot, being only a little better than 50 miles. Spectators were amply protected by bales of hay. The Exposition management declined to follow the suggestion, for the reason herewith quoted from their letter.

"The idea . . . would be a valuable special event, but for the fact that the course here is so difficult as to entirely prevent any amateur driving. . . . The condition is not due to the fact that they cannot drive well enough, but rather to the fact that they may become over-enthusiastic and an accident would result."

That over-enthusiasm is a failing by no means confined to the amateur was shown rather clearly, a few days later, in the March 26 *Los Angeles Times'* story of the race.

"On the opening lap, Burman, Tetzlaff and Durant overran the hair-pin turn in front of the Cristobal Cafe, and plowed through an opening in the banked baled hay, running into a jam in the safety zone. . . . In the mix-up the Durant Special lost three spokes out of the left rear wheel and bent the frame in several places. The Milac inherited a battle scar on the rear end of its gas tank." Comment is unnecessary!

Del Mar, Cal. JOHN F. GRAY.

What Makes Electric Current Flow

Editor THE AUTOMOBILE:—What makes current flow? I have read the article entitled, Automobile Electricity in THE AUTOMOBILE for April 6, and I would like to know what it is that makes the current flow through the electric circle.

New York City. D. M. L.

—Electricity travels from the point of higher pressure to that of lower pressure. It travels in measurable quantities and since these quantities have direction of flow and pressure they are capable of performing work. Electrical pressure can be measured by standard units. Water or air pressure is denoted by pounds to the square inch. Electrical pressure is measured by volts. The amount of water flowing through a pipe is calculated in gallons per minute. The quantity of electrical current flowing through a wire is calculated in amperes. Resistance to flow of water through pipes is given by the coefficient of friction and by measuring the obstructions in the pipe. Resistance to electrical flow is measured in ohms.

The amount of current flowing is equivalent to the pressure divided by the resistance or, using the units of measurement just defined, amperes equals volts divided by ohms.

This equation is the basis of practically all electrical calculations. A practical example is in a lamp. If we take a headlamp of 12 cp. and say that it has a resistance of 3 ohms. and that it is intended for a 6-volt circuit it is possible to determine at once how many amperes are necessary to light the lamp. Applying the equation the amount of current is equal to 6 volts divided by 3 ohms or 2 amp.

Taking the simple elementary case mentioned before of a battery, a switch and a lamp, the resistance to the flow in the circuit is encountered in the wire, in the switch and in the lamp. The wire acts for the current the same as the pipe does for water. The smaller the pipe the greater the amount of resistance to flow. The smaller the wire the greater the resistance to the electric current. Poor connections between the wire and the switch would introduce resistance into the line as the current would be compelled to flow through the poorly-made contact at the points of connection. This would utilize some of the pressure that could otherwise be employed in lighting the lamp and the result is that the lamp would be dim. If it takes 6 volts pressure to bring the lamp to the proper degree of brightness and other resistances in the line due to poor connections, etc., weaken the pressure at the lamp until it is down to 4 volts, the lamp instead of lighting brightly will light dimly. If the resistance in the line becomes so great that current cannot flow at all the lamp will go out. When the circuit is broken due to the fracture of a wire, for instance, or the disconnection of a lead the current is interrupted and flow ceases.

If an extremely high-tension circuit were used, or in other words, a circuit in which the pressure or voltage ran up to thousands of volts, a small break in the wire would not be a means of altogether interrupting the current as the pressure would be sufficient for the electrical current to be forced acoss the gap in spite of the resistance of the air. Such an occurrence takes place in the high-tension ignition system where the current circle is completed by the high tension spark caused by the current jumping across the gaps between the electrodes in the spark plug.

Using Camphor Gum in Fuel

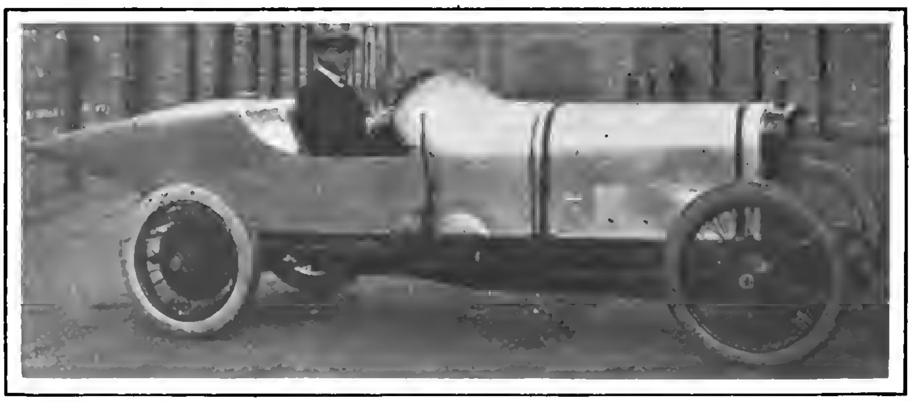
Editor THE AUTOMOBILE:—What advantage is gained in adding camphor gum to gasoline for fuel? I am told to mix 2 oz. camphor gum to 10 gal. gasoline to improve mileage from 10 to 15 per cent. Does it improve the mileage and does it affect the cylinders to add ether to the gasoline?

Cleveland, Ohio. A. D. S.

—THE AUTOMOBILE does not recommend the use of camphor gum in fuel.

New Sunbeam for Sheepshead Bay Races

AS announced in THE AUTOMOBILE for April 20, Louis Coatalen, of the Sunbeam factory, has cabled to the management of the Sheepshead Bay Motor Speedway Corp. the entry in a new Sunbeam racer of Joseph Christiaens at the Sheepshead Bay opening scheduled for May 13. The car is a 1916 model, it is stated, which has never raced before, but, according to reports from Brooklands, it has developed a speed of 116 m.p.h. Christiaens and the car have already reached this country. The illustration shows Louis Coatalen at the wheel of the new racer.



Trailers in Many Sizes

Miami Line of Vehicles Specially Designed for Automobile Work Range from 800-lb. to Four-Wheel 1250-lb.

IT very frequently becomes necessary in depot, bus and taxi work to carry large pieces of luggage along with the passengers. Where a small trunk is all that is necessary it can be readily put up on the driver's seat and will not interfere greatly with his movements. On the other hand, there are a large number of instances where the passenger would like to have several large pieces of baggage delivered at the same time that he is. To handle work of this kind the Miami Trailer Co., of Troy, Miami County, Ohio, has brought out a line of trailers designed and built especially for automobile speeds.

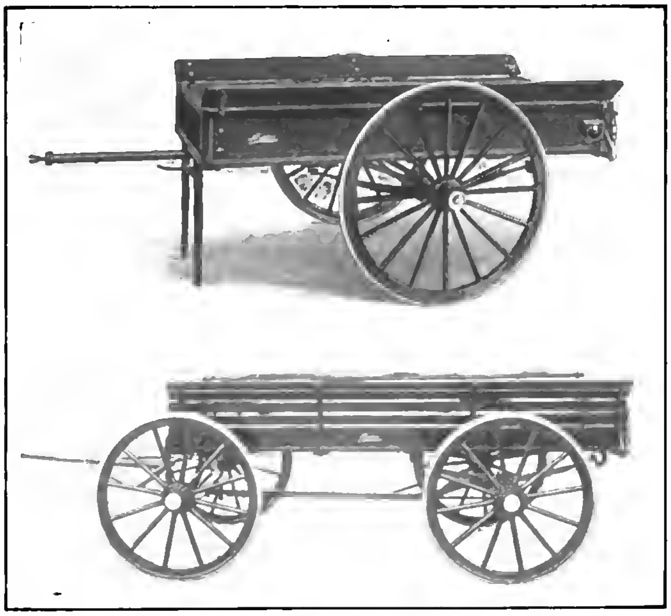
The present line comprises five models of different capacities and sizes, all of which are capable of being fastened behind passenger cars by means of a special shock-absorbing drawbar arrangement. The fundamental features of these trailers are centered about the fact that they can readily be attached to a passenger car and are capable of traveling at the speeds ordinarily used with vehicles of this type.

Attached to Chassis

Attachment of the trailer is made to the chassis or sprung part of the car and not to the unsprung axle. Thus there is no tendency on the part of the trailer to increase the proportionate unsprung weight. The axles and bearings used in the construction of the trailers are of the same grade as those used in automobiles and in the case of the four-wheel trailers they are designed to follow or trail perfectly with the automobile.

Wide Range of Sizes

In size the trailers range from a two-wheel 800-lb. vehicle to a four-wheel type with a carrying capacity of 1250 lb. The weights of the trailers in themselves range from 290 lb. up to 500 lb. The models are known as 1, 1A, 2, 3 and 4.



Above—Model 3 Miami trailer with 9-in. panel body
Below—Model 2, which has an 8-in. flareboard and is of solid oak lined with steel

Standard automobile axles and bearings are used in the construction of Miami trailers

Models 1 and 2 each have a carrying capacity of over 1200 lb., the rating of No. 1 being 1250 and No. 2, 1230. No. 1A is a modification of No. 1 with pneumatic tires 30 by 3 in. in size in place of the solid tires used on No. 1. The technical specifications of these little trailers of over 1200 lb. capacity show them to have 1¼-in. Timken axles equipped with Timken roller bearings. They have regulation artillery wheels, 32-in. in diameter both front and rear, except on the vehicles which take the 30 by 3-in. tires. Specially designed, short-turn gears to assist in proper tracking are employed and the spring mounting is semi-elliptic with 1½ by 38-in. front and rear springs, the front having six leaves and the rear five.

Standard Tread Dimension

The tread of these trailers is 56-in. standard and the height from the ground to the bed is 26-in. The shock-absorbing drawbar previously mentioned is employed and the wheelbase is 70 in. For body equipment the No. 1 design has a 10-in. panel type, 96 by 38 in. in interior dimensions with a 6-in. flare board. There is a drop end gate with chain.

Body No. 2 has the same internal dimensions with an 8-in. flareboard and is of solid oak, steel lined. The finish is black, striped and varnished and an electric tail light is provided to conform with traffic ordinances.

Model No. 3 is a two-wheel vehicle having 1¼-in. axles and solid rubber tires. The body in this case is a 9-in. panel type with interior dimensions 78 by 38 and a 5-in. flareboard. Its carrying capacity is 1000 lb.

Model No. 4, the smallest type, has a 1⅛-in. coach axle with plain taper bearings. The wheels are 32-in. artillery type with 1¼-in. solid tires. Semi-elliptic springs of 1½-in. width and five leaves are used. The tread is standard 56-in. and the body 78 by 38 in. with 8-in. panel and 5-in. flareboard. The weight of this little vehicle is 290 lb.

Bodies for Special Purposes

For special purposes the Miami company will make bodies to order, but for all ordinary work the line described should apply. These small trailers should be particularly useful in carying baggage from the small hotel to the railroad depot. An ordinary size car is generally sufficient to meet the requirements of passenger traffic, but for baggage work the local express company or some other vehicle must often be relied upon. The upkeep of a small trailer of this kind is very low and the parts of which it is composed are as substantial as those on the small automobile. In fact, they are exactly similar to automobile parts.

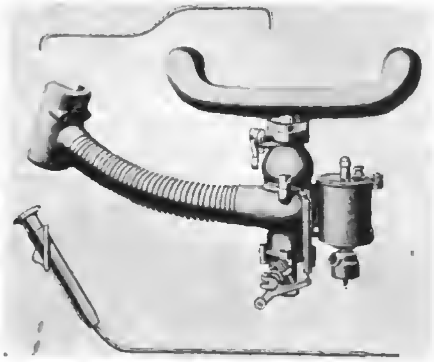
ACCESSORIES

Stewart Carbureter for Fords

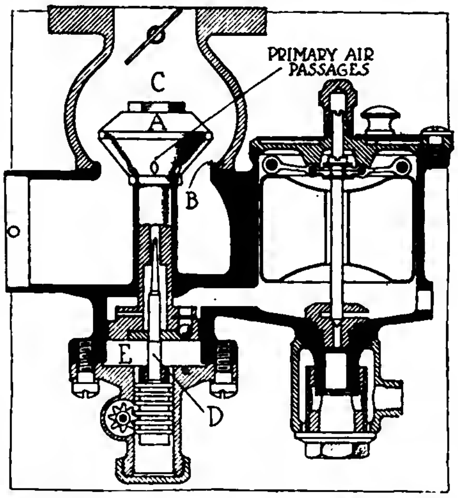
A SPECIAL carbureter for Ford cars has been added to the Stewart line. This instrument works on the same metering-pin principle as the other Stewart instruments, but is designed for the needs of the Ford engine. Besides the carbureter itself, a manifold, hot air connections, dash adjustment and all fittings are included in the outfit as retailed at $15.

The principle of the Stewart carbureter may best be understood from the sectional view. The metering valve *A* rests upon the seat *B* when the engine is not running, but as the engine begins to rotate, the suction raises the valve from the seat, drawing in air around it from the air intake. This suction also draws gasoline up within the valve stem, this mixing with the incoming air in the chamber *C*. The Stewart has but one adjustment, that being for the amount of gasoline. The air is a fixed amount, it being simply necessary to regulate the amount of gasoline admitted. This is controlled by the tapered metering pin *D*, and the adjustment is made when the engine is running at idling speed. By turning the adjusting screw either to the right or left, the position of the metering pin is raised or lowered, thereby allowing a greater or less supply of fuel to be drawn up into the mixing chamber. When the right proportion has been determined at low speed, it is evident that as the speed of the engine increases, the metering valve *A* raises higher from its seat and away from the metering pin *D*. This allows a greater supply of both gasoline and air to be admitted in the right proportions as predetermined when designing the instrument.

In the Ford type of Stewart carbureter the float bowl is furnished in either one of two positions. Some Fords are specially equipped with a high-tension magneto, in which case it will be necessary to have the bowl at right angles to the air port or between the carbureter body and the hood base of the car. Where there is no high-tension magneto installation, the float bowl is placed at 180 deg. to the air port, or forward of the carbureter body.—Detroit Lubricator Co., Detroit, Mich.



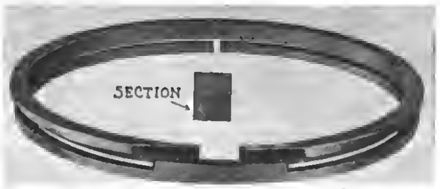
Stewart carbureter for Fords, with manifold mounting indicated



Section through new Stewart carbureter

Du Bois Piston Ring

The Du Bois is a two-piece concentric ring. One section is the full width of the piston groove and is of L-shaped cross section, while the other is smaller and fits into the angle of the larger part. The splits come at diametrically opposite points; the width of the large ring is such that it seals the split in the small one, while the latter has a projecting part to seal the split in the wide ring. The makers claim particularly that the ring produces a good vacuum in the cylinder, so that the full charge is drawn in at each intake stroke.—Du Bois Machine Shop, Inc., Albany, N. Y.



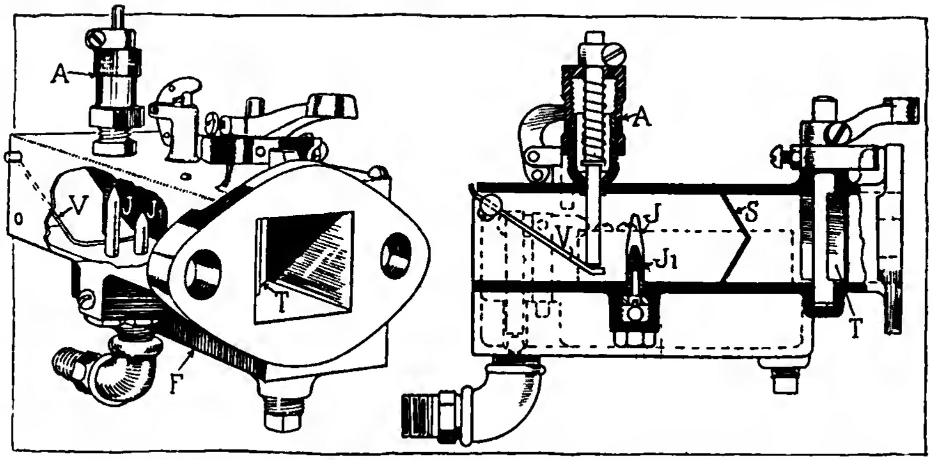
Du Bois two-piece piston ring

Sunderman Mouse Trap Carbureter

Simple in construction and in adjustment, this carbureter is claimed to feed pure combustible gas from cold kerosene or gasoline to the motor without changing the adjustment, no hot air or water jacket being needed. As shown in the illustration, the rectangular float chamber *F*, fitted with a primer, is adjacent to the mixing chamber, which is simply a square passage. The fuel is admitted to this passage through the jet *J*1 for low speeds and when idling and when the speed is increased the taller jet *J* automatically comes into play so that both jets are operating at once.

Air is drawn through the valve *V*, which is regulated by the tension on the spring controlled by the adjusting collar *A*. In the illustration the air intake door is shown in the position it assumes when the motor is idling and fuel is being fed through the short jet *J*1 only. As the air rushes into the vacuum behind the intake door it sweeps the globules of fuel from the jets and the resulting vapor is further disintegrated into a homogeneous mixture by passing through the screen *S*, after which it passes the throttle *T* on its way through the manifold to the combustion chamber.

Besides an unusually high degree of fuel economy, the makers claim the carbureter gives great flexibility with consequent minimized gear shifting. The screen *S* prevents backfiring with its attendant dangers, and the elimination of a gasoline adjustment by the use of the regulating jets renders adjustment extremely simple. In fact, the makers state that when the carbureter is once set correctly, fur-



Sunderman Mouse Trap carbureter, showing the two jets, the safety screen preventing backfiring and the simple adjustment of the air inlet valve ther changes will be entirely unnecessary.

The carbureter is made in brass, iron or aluminum alloy, in ¾ in., 1 in., 1⅛ in. and 1¼ in. sizes, under the names of models *A*, *B*, *F* and *C*, respectively, and as the model Twin *F* for eight or twelve-cylinder cars. Model *F* weighs 1¾ lb. in brass or iron and 10 oz. in aluminum alloy, and is 4½ by 2½ by 1⅞ in.—Sunderman Corp., Newburgh, N. Y., maker. J. F. Renfro Co., Inc., New York City, sole factory distributor.

Eclipse Piston Ring

The Eclipse ring is composed of two rings, one of which is an eccentric L ring and the other flat and concentric. The eccentric ring, which is designed to secure an even pressure at all points around the cylinder, is held tight at the joint by the concentric ring so that it conforms exactly to the cylinder diameter. A straight cut in the eccentric ring prevents compression turning the outside ring around on the eccentric ring so that pins are unnecessary and weak spots are eliminated. The entire ring can float around inside the piston, without impairing compression. Eclipse rings are made of gray iron and are guaranteed to fit in any diameter and width. A feature of this ring's construction is that it prevents leaks of gas and oil and lengthens the life of unground cylinders.—Hope Machine Co., manufacturer; Edwin T. Craven Co., Philadelphia, Pa., sole distributor.

Bell Air Valves

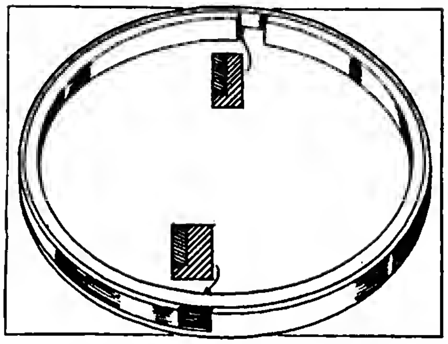
The Evertite valve is made in ¼, ⅜ and ½-in. sizes; the enlarged stem end and the peculiar corrugations make it practically impossible for the hose to be blown off. The Premier combination consists of an Evertite valve combined with a tire gage. The Automatic Electric not only registers air pressure, but also automatically controls the current for the electric pump motor; with this valve the makers state that a storage tank can be dispensed with and there is no pressure on the hose except when a tire is being inflated. Prices, Premier, $3; Automatic Electric, $8.50; Evertite, $1.—Bell Brass Mfg. Co., 205 White Building, Seattle, Wash.

Spee-Dee Hand Cleaner

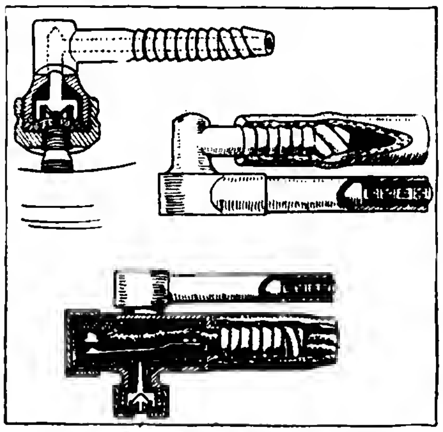
The Spee-Dee cleaner is a solvent for grease and when applied to the hands it takes up all dirt, leaving the hands clean when wiped off. It is used without water. The maker states that it does not injure the skin in the least. The emulsion can be mixed with water and used to clean oily motor parts. Spee-Dee sells for 15 cents per can.—States Chemical Co., Chicago, Ill.

Economy Manifold

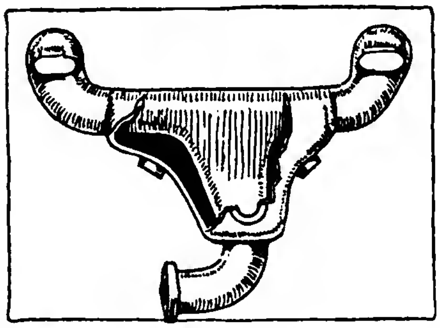
The Economy special intake manifold has a jacket through which part of the exhaust gas is passed, heating the intake and the vapor which passes through it and bringing the mixture to a more completely combustible state. The maker states that carbon deposits are reduced and gasoline consumption lessened by the use of this appliance. There are no adjustments and no loose parts. Manifolds will fit any Ford from 1909 to date. Price, $6 attached.—Economy Manifold Co., Syracuse, N. Y.



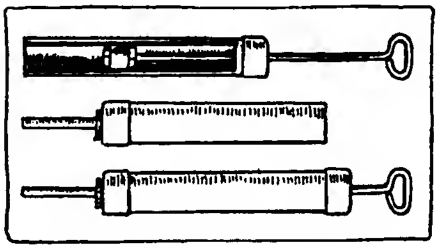
Eclipse piston ring, showing section



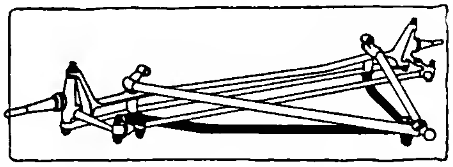
Three types of Bell air valves



Economy exhaust-jacketed manifold



Puritan easy-loading grease gun



Standard radius rod support for Fords

Puritan Grease Gun

The Puritan grease gun is ingeniously filled. There is an inner tube which can be withdrawn when the plunger is drawn up as far as it will go; the tube is filled with grease and inserted in the gun and expelled in the usual way. The tube can be inserted in one position only, so that it cannot be put in wrong. The gun sells for $1.50.—Puritan Mfg. Co., Bridgeport, Conn.

Standard Radius Rod Support

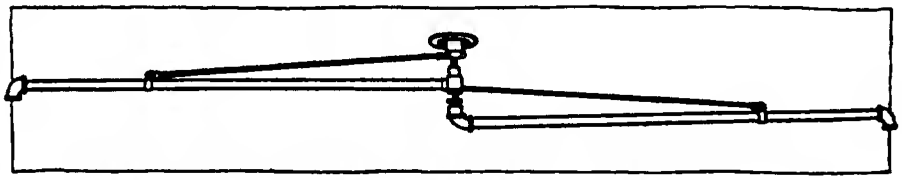
In this device steel tubing radius rods are installed on the Ford car in the same position as the regular radius rods, except that they attach below the front axle instead of above it. They are held by the spring hanger bolts on the axle and in the rear at the ball-and-socket joint just in front of the magneto casing. The object is to stiffen up the front axle system and incidentally to steady the steering of the car. Price $1.50.—Standard Auto Accessory Co., Leipsic, Ohio.

Raban Revolving Washer

Washers are made in several different styles but the general features claimed for all of them are simplicity and a method of support which removes all strain from the working parts. The Leader, which lists at $17, is provided with an inside valve which is said to prevent leakage even when the pressure is abnormal. Price $15 to $35.—W. A. Raban, Port Chester, New York.

Sexton's Castor Motor Oil

Castor oil and vegetable and mineral oils are compounded in such proportions as to form a lubricant said to possess the desirable qualities of pure castor oil without its drawbacks. The lubricant is made suitable for any service by varying the proportions of castor and other oils, and various grades are made that are suitable for various motors, their individual characteristics being taken into consideration. The price is about the same as that of the highest grade mineral lubricating oils.—Sexton Oil Co., Chicago, Ill.



Raban double-ended overhead washer to permit two men to work at once

British Taxation

THE recently issued British order in Council which prohibits the importation of passenger cars, parts and accessories is bound to have a serious effect upon the dealers of the United Kingdom as the latter have lately been depending almost entirely upon American supplies to maintain their business. The prohibition of importation of parts appears likely to work some hardship upon British owners of American cars, though it is to be presumed that the big distributors like the Ford and Overland branches in England carry sufficient spare parts to care for their customers' wants for a fair period.

Following the importation prohibition, however, comes the new taxation imposed by the budget for 1916. This increases the annual license fees which are paid to the national exchequer by 100 per cent on small cars and 200 per cent on larger machines. To give an example, the old taxes which have been in force for some time made the annual tax on a Ford car $30.24 and this is now raised to $90.72. The tax is based upon a horsepower formula exactly similar to the A. L. A. M. and the $90 tax is payable on all four-cylinder cars having a bore over 3 5/32 in. on sixes with a bore exceeding 2 9/16 in. and on eights with a bore over 2 3/16 in.

Nor is the $90 tax the worst, for there are three other stages. Cars rating over 26 hp. are charged $126 per annum, over 33 hp. $156, over 40 hp. $315 and cars over 60 hp. rating $630, the conversions to dollars being in round figures.

It is highly improbable that these motor car taxes will be reduced directly upon the declaration of peace and the removal of the importation prohibition, which latter will almost certainly be discontinued as soon as the Atlantic freight situation eases. This means that for some years to come there will probably be a premium upon cars with a bore of 80 mm. (3 5/32 in.) or under, as this is the limit of bore for fours to come under the $90 tax. The rating of this size of engine is 15.8 hp. and practically every American car exceeds this amount considerably. It means that the quite small, high-speed four is going to be the favorite car for export to Great Britain.

What of the Four?

A YEAR ago when the six versus eight argument was at its height, when the twelve was about to make its bow to the public and cylinders were the main topic of engineering conversation, there were many who expressed the view that all the discussion would serve to draw attention to the advantages of the four. The highly successful meeting of the Metropolitan section of the S. A. E. last week, at which the future of the four was the topic of the evening, proves that interest in the four is reawakening.

It means something more than the swing of the pendulum. Probably it marks the first step in the commencement of the endeavor to reduce the cost of operating an automobile, which appears to be one of the most important problems now facing engineers.

It is agreed that the demand for large, heavy cars will be limited in the future, and that the highly efficient, light machine is the coming type. Such a car may prove to be most easily made with any number of cylinders, but undoubtedly the four shows to better advantage as the total size of the engine is reduced.

There is a very general feeling that a small four with the highest possible class of internal and external finish would command a good price and sell in considerable quantities. It may be either right or wrong, but while it lasts interest in the four will continue.

Comprehending Carburetion

THE paper read in Cleveland by F. H. Ball and F. O. Ball is noteworthy because it shows in a very graphic manner just what are the main problems of successful carburetion. The diagrams showing the action of the various types of instruments enable the essential functions of the different parts that go to carbureter makeup to be clearly grasped, and the effect of altering one part or another to be appreciated.

From the diagrams we see how comparatively difficult it is to hold the mixture curve of a carbureter within the effective zone, giving a mixture neither too rich nor too strong.

Cleveland Meeting Shows Progress In Standardization by S. A. E.

Few New Standards Actually Recommended But Progress Reports of Divisions Indicate Full Program for Summer Meeting—Some Big Things in Hand

CLEVELAND, OHIO, April 21—Laying down the details of the proposed form for fuel economy testing of automobiles provided the highest spot in the meeting of the S. A. E. Standards Committee held at the Statler Hotel to-day. There was a large attendance, some seventy members participating in the discussions, and reports were received from all divisions of the committee. It was made clear that all divisions with but two exceptions, have programs before them which will provide work for the rest of the year; there has never been a time when more important matters were before the Society.

A very noticeable feature of the meeting was the tendency to ask for data of a fundamental nature. In discussing the reports of the divisions there were several demands for purely scientific treatment of the problems; demands that the theory of the subject be considered more fully than current practice in establishing new recommendations.

Tire Standards Division

An important vote was one recommending the Council to appoint a new division of the committee to be called the Tire Standards Division. Hitherto matters relating to solid tires have been handled by the truck division and there has been one division with a special interest in pneumatic tires. It is felt that there is need for a careful analysis of such things as the proper loads and air pressures for tires of different sizes, the comparative durabilty of solid tires of different sections and so forth. The new division would be entrusted with research work along such lines and would endeavor to develop S. A. E. recommendations to which all tire makers could subscribe. It is also thought probable that a standardization of passenger car felloe bands is now possible which would make rims of different type interchangeable, and the examination of this subject would be one of the new division's first tasks.

Seek Ability Formula

The most vigorous discussion of the day took place at the afternoon session, on the presentation of the report of the research division which is given complete on page 790. The report is an amendment of one presented to the January meeting and turned back as insufficiently rigid. The report as now presented was accepted, but only as a progress report, the committee thinking that the recommended test ought to cover acceleration and other things. The research division is thus entrusted with the expansion of the scheme for fuel economy testing into a comprehensive test which will show everything about a car that can be tested.

The discussion was very general, among the speakers being C. T. Myers, Timken-David Brown Co.; Professor Fishleigh, Michigan University; K. W. Zimmerschied, past chairman Standards Committee, and E. E. Sweet, Cadillac Motor Car Co. The possibility of an "ability formula," which has long been an ideal, was the main subject. Engineers in various parts of the world have for years past been trying to find some method of testing which would enable a figure of merit of some kind to be given a car that would include everything, economy, speed, acceleration, weight, etc. Mr. Myers held that it was possible to develop a test which would give satisfactory results and J. Younger, Pierce-Arrow Motor Car Co., drew attention to the close similarity of the theoretical work done by independent investigators. It was finally voted to accept the report as far as it went, but not to recommend its adoption by the Society till the research division had completely examined the ability formula idea and reported to the Standards Committee.

Speedometer Drive Details

The Miscellaneous Division is one that always has a full slate, and the report read by J. G. Utz, chairman of the division, showed that there was much in hand. This also was a progress report, nothing being quite ready for adoption, though several things are near that stage. Mr. Utz explained the proposed speedometer drive connection, which is now being examined by manufacturers. This consists of a socket with a shaft and a flange for attaching to any convenient part of the gearbox. It is proposed that the gearbox maker should provide the original driving gear within the gearset so that the speedometer manufacturer would furnish a standard end to the flexible drive which would fit the standard socket. The nest of gears giving opportunity for variation to suit tire size and gear ratio could be either within the gearbox or outside. It seems certain that this standard will go through without much difficulty, though the design may be altered a good deal. The present idea provides quite a small flange on the gearbox and E. G. Gunn, Premier Motor Corp., suggested that it might be well to make the hole larger, so that the nest of gears could be inserted from outside the gearset and thus accommodate the different ratios required without pulling apart the transmission.

In discussing this drive the error caused by using rear wheel drive for the speedometer was mentioned. Berne Nadall, Stewart-Warner Corp, stated that this did not exceed 1.5 per cent under ordinary circumstances and was no greater than the error caused by variations in tire diameter away from nominal size. E. E. Sweet added that this tire variation was surprisingly great, saying that he had found tires of the same nominal size which varied in circumference as much as 5 in.

Next in the list of this division are recommendations for the depth of piston ring grooves, this following previous work in connection with their width. A formula for determining the width in terms of the piston diameter is

$$G = \sqrt{\frac{.01\,D^2}{8} + .005}$$

and this appears to give very good results, providing a groove which will accommodate nearly all types of ring. This will be ready for acceptance by the Society in June.

A very small detail of substantial importance which the Miscellaneous division is about to standardize is the thread on the top extremity of spark plugs, so that any spark plug nut will fit. Seeing the ease with which these terminal nuts can be lost, this should be a standard much appreciated by the general public.

It was voted that the recommended practice for gearshift gates or lever positions should be given in the data book as follows—left side, reverse forward, low gear back; right side, intermediate forward, high back. This setting is stated to be now used by 82 per cent of makers. Recommendations for four speed positions are to be removed.

C. W. McKinley, Willys-Overland Co., asked that the Miscellaneous division give attention to the length of thread on S. A. E. bolts saying that this was now so short that the usefulness of the standard bolt was greatly curtailed.

Lamp Investigations

The Electrical Equipment division has held two formal and one informal meetings during the past few weeks, the chief work done being the appointment of a sub-committee under the chairmanship of W. E. McKetchnie, Cadillac Motor Car Co., to confer upon lamp standardization; of another committee under chairmanship of F. Conrad, Westinghouse Elect. & Mfg. Co., on generator, starting

Plan $5,000,000 Ford Plant

80 Acres Bought in Newark, N. J.—To Expand Chicago Plant

DETROIT, MICH., April 24—The Ford Motor Co. has acquired 80 acres of land just outside of Newark, N. J., on which it is planned to erect a service station and assembly plant, at a cost of about $5,000,000.

Frank L. Klingensmith, vice-president and treasurer of the Ford company, states that no definite ideas have been formulated beyond the fact that an assembly plant and service station similar to the one at Long Island City is to be erected. The tract is large enough to erect any sort of plants the Ford company may need in the future and the move is more in the nature of a step to meet any later needs of the company in the way of expansion in the Eastern territory. It is pointed out that inasmuch as the tract could be bought at a reasonable figure, it was acquired without any definite idea as to exactly how it would all be utilized. There is a hint that possibly an Eastern unit of the Ford tractor business will find its location on this tract and also that an export factory will be erected.

Coincident with the news that the Ford company had acquired property near New York City, it has also been learned that a plot, 100 by 161 ft. on Michigan Avenue, Chicago, has been acquired. This adjoins the new assembly plant recently completed in that city and will be utilized for enlarging this building when occasion demands. Another lot 75 by 121 ft. has also been acquired in Chicago at the corner of West Madison and Kildare avenues, where a service station may be located.

Murray New Eight

PITTSBURGH, PA., April 25—The Murray Motor Car Co. has been organized here to manufacture the Murray touring car, an eight-cylinder design with seven-passenger accommodation with 127-in. wheelbase for car and roadster types. W. B. Murray, who has been connected with Packard distribution in this city, is president and associated with him are J. W. Pontefract and W. W. Bensel. Fred Berger is chief engineer and Joseph Gardham production manager. A factory has been secured at 3700 Grand Boulevard, and materials have been contracted for.

The car will largely be an assembled one, using a unit power plant composed of an eight-cylinder Herschell-Spillman motor 3¼ by 5, and a Covert gearset. Other parts to be used are Timken axles, Perfection springs, Parish & Bingham frame, Gemmer steering gear and Blood universals. At this time it is not definite what electrical equipment will be used, but it is expected that Westinghouse starting and lighting equipment will be standard. Bosch ignition will be fitted. The price has not been decided upon, but it will be in the zone of $2,000.

Two New Jeffery Trucks

KENOSHA, WIS., April 22—The Thos. B. Jeffery Co. of this city has added two new trucks to its line. One is a 1500-lb. capacity car at $900, which follows along the lines of the four-cylinder passenger car design and the other is a 3000-lb. truck, selling at $1,400 and of heavier construction throughout as compared with the lighter one, but nevertheless of somewhat similar design.

Briscoe Advances Prices

JACKSON, MICH., April 24—The Briscoe Motor Corp., this city, has raised its prices $40 on the 4-24 to $625; $35 to $785 on the 4-38, and $35 to $985 on the eight-cylinder model. The prices went into effect April 15.

Argo Raises Prices $20

JACKSON, MICH., April 24—The Argo Motor Co., Inc., announces that due to the higher cost of materials and improvements in construction of the Argo cars, the price of the touring car has been raised from $435 to $455, and the roadster from $385 to $405, an increase of $20 on each model.

Sears-Cross Lowers Prices

BROOKLYN, N. Y., April 21.—The Sears-Cross Co., this city, on March 25 reduced the prices of its speedometers. Model F-15, for Fords, has been reduced from $12 to $8; model FF-16, also for Fords, has been reduced from $15 to $10, and the F.C.M.B. model has been reduced from $25 to $12.

New Company to Take Over Standard Roller Bearing

PHILADELPHIA, PA., April 21—The reorganization committee of the Standard Roller Bearing Co. has agreed on the tentative plan for refinancing the company which was outlined in THE AUTOMOBILE for Jan. 6, 1916. Under this plan the holders of debenture gold 5's maturing April 2, 1916, convertible gold 6's due March 2, 1918, bills payable and accounts payable are to receive in cash 20 per cent of the principal of their claims, and the balance of the principal of their claims, 80 per cent in second preferred stock, in a new company to be organized to purchase the old company.

Overland Wages Up 4 to 10

17,000 Employees Affected by New Pay Schedule in Effect June 1

TOLEDO, OHIO, April 21—Effective June 1, about 17,000 factory employees of the Willys-Overland Co. will receive an increase in wages ranging from 4 to 10 per cent and a reduced schedule of hours.

The shops of the company will be operated on an 8-hr. basis, the present working time being 50 hr. a week. The company will give 50-hr. pay for 48-hr. work. All the advances are voluntary on the part of the company.

This means that the company's payroll for factory employees, now about $250,000 a week, will be increased to $275,000 a week. It also means an annual distribution of wages amounting in round numbers to $14,300,000.

According to the special factory notice, beginning June 1, all factory employees receiving 25 cents or less per hour will then receive an increase of 10 per cent. Those now receiving over 25 cents and up to and including 30 cents per hour, will receive an increase of 7 per cent. Those now receiving over 30 cents per hour will receive an increase of 4 per cent.

As in the past the company will pay time and one-half for overtime, and double time for Sundays and holidays.

Winton Raises Wages 10 per Cent

CLEVELAND, OHIO, April 22—The announcement is made by the Winton Co. that all of the employees will be given an advance of 10 per cent in wages, effective May 1. In all 1300 men are affected by the increase.

Jordan Plant to Be Completed June 1

CLEVELAND, OHIO, April 21—The first unit of the new Jordan Motor Car Co. plant on East 152d Street, this city, will be completed by June 1 and production of the Jordan car will begin soon after that date.

The first building of the plant group will include 30,000 sq. ft. of floor space and will cost about $50,000.

It is understood that the six-cylinder chassis will contain the one best unit produced by each one of the leading makers among parts producing companies in America.

To Sell Lauth-Juergens Assets

FREMONT, OHIO, April 22—The stockholders of the Lauth-Juergens Motor Truck Co. will meet April 25 to vote on the adoption of an agreement for the sale of the entire property and assets of the company to the H. G. Burford Co.

Packard Makes 116 M. P. H.

Special Car with 300-In. Aeroplane Engine Tried Out on Speedway

NEW YORK CITY, April 26—The 300-cu. in Packard aviation engine is being tried out this week on Sheepshead Bay Speedway, it having been fitted to a specially built chassis of great engineering interest. The 2-mile wood track is not yet dry from the recent rains, so that it has not been possible to make any laps at full speed, as it has been thought unsafe to go to the top of the banking. On complete laps the car has been doing well over 100 m.p.h. and on the straightaways 116 m.p.h. is readily attainable. This is not official timing but is conservative checking with the stopwatch.

The engine has twelve cylinders 2 21/32 by 4½ in., giving just a trifle under 300 cu. in. piston displacement, and the gearing gives a crankshaft speed round about 3000 r.p.m. at 100 m.p.h. There are four valves per cylinder line. For these shafts, there is a gear drive Peugeot fashion, only this is arranged at the flywheel end instead of in front. An especially striking feature is the use of Delco ignition with a storage battery and a small Bijur generator; there is no magneto.

J. G. Vincent, vice-president, and Ralph de Palma have been driving the car in these preliminary trials. It is understood that the car is shortly to return to Detroit for examination and may be back on the speedway in a few weeks.

Steenstrup Sails April 29

DETROIT, MICH., April 24—Peter S. Steenstrup, foreign representative of the Hupp Motor Corp., this city, will leave April 29 for Russia, Italy and other foreign countries in the interest of the Hupp organization. He will establish headquarters in London.

Electric-Vehicle Program Out

NEW YORK CITY, April 26—The first session of The National Electric Light Assn. convention in Chicago devoted to electric vehicle interests will take place May 24, and will include the following program:

Chairman's address by Walter H. Johnson, secretary's report by A. Jackson Marshall, treasurer's report by H. M. Edwards, reports of section activities, and the committee reports as follows:

Membership committee, Joseph D. Israel, chairman; Standardization committee, E. R. Whitney, chairman; Motion Picture Film committee, Carl H. Reed, chairman; Traffic and Good Roads committee, A. H. Manwaring, chairman; Insurance committee, Day Baker, chairman. Appointment of Nominating committee.

The Thursday morning session will be devoted to the following committee reports and papers:

Garage and Rates committee, George B. Foster, chairman; Legislation committee, P. D. Wagoner, chairman; Federal and Municipal Transportation committee, J. H. McGraw, chairman; Industrial Truck Applications, by C. W. Squires, Jr.; Electric Truck Troubles and How to Eliminate Them, by F. E. Whitney; The Relation of Tires to Electric Vehicle Efficiency, by S. V. Norton; Greater Garage Service, by Harry Salvat.

Reports and papers for the last session, Thursday afternoon, are:

Operating Records committee, W. P. Kennedy, chairman; Central Station Cooperation committee, E. S. Mansfield, chairman; Exchange Battery Systems, by P. D. Wagoner; Passenger Vehicle Problems and Activities, by E. P. Chalfant; Central Station Promotion of Electric Vehicle Use, by W. P. Kennedy. Report of Nominating committee.

Goodyear Issues $10,000,000 Preferred—To Increase Output

AKRON, OHIO, April 22—To take care of increased production and factory enlargements, the Goodyear Tire & Rubber Co., this city, has announced the sale of $10,000,000 of new preferred stock. The new facilities will make way for a much greater cord tire production than heretofore. The company has been working day and night for the past year and has been making factory enlargements for some time past to take care of increased business. But these additions have not kept up with the business growth and as a result the company expects to practically double its production facilities within the next ten months. The company has been turning out practically 17,000 tires a day. Within the year its capacity will be 25,000 tires a day.

The new cumulative preferred stock yields 7 per cent. A syndicate of bankers, composed of Kissel, Kinnicutt & Co., of New York City; Borton & Borton of Cleveland, and others, have taken over the stock for sale. The company agrees to set aside each year a sinking fund sufficient in amount to retire the issue at 112 within about twenty-three years and, in addition, to at all times maintain its net quick and total assets at not less than 115 per cent and 200 per cent, respectively, of the preferred stock outstanding. The financial strength of the company is indicated by the fact that the net quick assets, after this sale, amount to 154 per cent on the preferred.

The stockholders of the company will meet May 20 to adjust and increase its capital. The present outstanding issue of preferred amounting to $6,200,000 is to be called for redemption at $120 a share and will be replaced by a new issue of $17,700,000. Common shareholders are to receive a stock dividend of 100 per cent, bringing the outstanding common issue up to $17,500,000. Preferred stockholders will have the alternative of accepting $120 a share cash or the new preferred stock at $105 a share.

Niles Co. To Build Trucks

Railroad Car Maker's Line Will Comprise ¾ to 1-Ton and 2 to 2½-Ton

NILES, OHIO, April 21.—The Niles Car & Mfg. Co., this city, will shortly enter the commercial vehicle field with two models, one designed to carry from ¾ to 1 ton and the other from 2 to 2½ tons.

The two models will be along the same general lines, having the motor under the bonnet, with approximately an 85-per cent live load on the rear axle. The light truck will be equipped with pneumatic tires on demountable rims while the heavy truck will have solid tires.

Both models will be worm driven, the Timken David-Brown worm being employed. The front axle is Timken. On both models standard units will be three-point suspended Continental motor; Borg & Beck dry plate disk clutch; Stromberg carbureter; Fedder's honeycomb radiator; Blood Bros. universal joints with tubular driveshaft; and heavy artillery type wood wheels. Frames are pressed steel with heavy angle and reinforced with cross members and gusset plates. All bodies will be built by the company.

The Niles company, which has been manufacturing interurban electric and other types of passenger railway cars for over 15 years, will operate a large plant in Niles for the manufacture of the trucks. Special machinery is being installed at present.

Service stations will be opened and maintained in all the more important cities where the company's sales will be concentrated. The sales policy will be the direct-to-user plan, no agents or dealers being appointed.

Warner and Patterson Buy Double Lens Company

CHICAGO, ILL., April 26—A. P. Warner, formerly with the Stewart-Warner Speedometer Corp. and E. C. Patterson of *Collier's* have purchased the double Lens Co., making double lens non-glaring headlight glass. The new concern will be called the Warner Lens Co. and the product will be known as Warner Glass lens. In the new concern will be J. H. Cattell, formerly with the *Scientific American*. Warner and Cattell will be the active figures in the concern.

Bruske with Mop Co.

DETROIT, MICH., April 21—Paul Hale Bruske, formerly director of publicity, Maxwell Motor Co., has become advertising manager of the O-SO-EZY Mop. Co., Detroit.

American Plant for Plainfield

Corp. Recently Formed Plans 3000 Five-Passenger Sixes in Year

NEW YORK CITY, April 22—The American Motors Corp., recently formed by Louis Chevrolet and a group of Eastern business men, has practically completed negotiations for the establishment of a plant in Plainfield, N. J. Production is expected to start by the middle of July and the corporation will turn out about 3000 cars the first year.

A five-passenger six-cylinder car selling under $1,000 has been planned as the first model. A Continental 3¼ by 4½-in. motor will be used. Other features include spiral-bevel drive, 122-in. wheelbase, 32 by 4-in. tires, self-starter and electric lighting.

A considerable part of the capital has been paid in. The company is capitalized at $1,250,000 and at the present time has $500,000 preferred and $500,000 common outstanding.

Louis Chevrolet will be chief engineer of the corporation. W. H. Hoople, president of the Interstate Electric Corp.; J. C. Spiers, formerly general manager of the Autocar Co. and factory manager of the Locomobile, Mercer, S.G.V. and Standard Roller Bearing companies, and G. F. Baright, formerly advertising manager of the Prudential Life Insurance Co., Newark, N. J., are backing the company.

Develop Bournonville Rotary Valve Motors for Aeroplanes

NEW YORK CITY, April 26—Bournonville rotary valve motors are now being developed for aeroplane work by the Bournonville Motors Corp., this city. The work has proceeded far enough so that it is expected to have one of the motors on test at the A. C. A. about June 1.

In addition to the New York company, another has been formed in Canada, being incorporated in Toronto for $500,000. The incorporators are William Gilchrist, James Stewart and H. J. Stuart and others, all of Toronto. It is understood that the leading spirit in the Canadian enterprize is Col. J. B. Miller, head of the Polson Iron Works, Toronto. This concern builds the M.F.P. aeroplane.

For the time being, the automobile end of the business is understood to have been shelved and the company is pushing forward as fast as possible its work on the aeroplane motors, owing to the great demand for motors of this type. The motor which has been developed is expected to show from 160 to 180 hp. on the block test as 1600 to 1800 r.p.m.

The Bournonville motor was described in THE AUTOMOBILE for Dec. 24, 1914, on page 1156. It is a balanced rotary valve arrangement in which a single rotary valve is placed over the cylinders. The valve is made in separate pieces to avoid the complications due to longitudinal expansion. The arrangement of gas passage so that the gases act as a carbon sweeper is one of the features of the motor.

Chevrolet Starts Building on $1,000,000 Additions

FLINT, MICH., April 22—The Chevrolet Motor Co. has begun several large additions to its plants here, these to cost between $750,000 and $1,000,000, and when completed it is stated the local Chevrolet organization will have a capacity of 350 cars per day, besides making it possible to turn out 1000 motors and 1000 axles each day, for distribution to the concern's several assembly plants in other sections of the country.

One of the new buildings will be an axle plant measuring 120 by 900 ft., all single story except 284 ft. at the front end, which will be two stories, to provide lunch rooms and other accommodations for the workmen. Another is a warehouse, 150 by 500 ft. and four stories high and additional assembly space is also to be provided in the form of a U-shaped structure with two 750-ft. wings three stories high. These buildings will all be of reinforced concrete factory construction.

As was recently announced, the Chevrolet organization has acquired manufacturing plants at Bay City, Mich., from the National Cycle & Mfg. Co. and the National Motor Truck Co. and this added capacity will be devoted to the making of some 200 motors a day.

Hawkeye Is 1¼-Tonner

SIOUX CITY, IOWA, April 24—The Hawkeye Mfg. & Repair Co., this city, has brought out a 1¼-ton truck designated as model H. the chassis price of which is $1,250. A 36-hp., four-cylinder block-case valve in the head motor is used. This engine is made by the Hawkeye company. Other features are Stewart Warner vacuum feed, Eisemann magneto, three-speed gearset mounted in unit with the motor, multiple disk dry-plate clutch, semi-elliptic springs, etc.

Puritan Buys Keeton Stock

DETROIT, MICH., April 25—The Puritan Machine Co., Detroit, Mich., recently purchased from the defunct Keeton Motors, Ltd., whose factory was located at Brantford, Ont., the stock of parts, blueprints, drawings, jigs, dies and tools, etc., and will continue service to Keeton car owners from the Puritan plant here.

Monroe in Welch Plant

Turns Over Flint Plant to General Motors—Durant Out of Monroe

DETROIT, MICH., April 24—The General Motors Co. has made a deal with the Monroe Motor Co., Flint, Mich., whereby the Monroe company turns over its factory at Flint to the larger organization and takes possession of the plants formerly occupied by the Welch Motor Car Co., Pontiac, Mich., now out of business. The plant at Flint adjoins the Buick factories and prior to its being occupied by the Monroe Motor Co. was used by the Chevrolet Motor Co.

The move seems to have been an advantageous one all around, because it allows the further expansion of the General Motors industrial organization at Flint, besides permitting the Monroe Motor Co. to concentrate its activities in Pontiac, where the Monroe Body Co., from which the Monroe car concern secures its bodies, is also located in Pontiac. It is expected that Monroe will make the move about May 15.

W. C. Durant, prominent figure in General Motors and Chevrolet activities, has severed his connection with the Monroe concern, of which he was formerly vice-president.

United Motor Fuel Corp. Predicts Abundant Gasoline

NEW YORK CITY, April 26—The work of the United Motor Fuel Corp., in the interests of the automobile manufacturers during the last month, point to four conclusions, first, and most important, that the future has in store an abundant supply of motor fuel at prices lower than those prevailing; second, that no process now in common use does all that can be done in the production of gasoline; third, that no process except the Burton is as yet a demonstrated economical commercial success; fourth, that at least two processes now in their infancy will eventually develop into important factors in price reduction.

These deductions, according to the National Automobile Chamber of Commerce, are based on examination of all the well known processes and a number not so well known; of the probable supply of crude oil; of the possibility of using crudes now almost neglected as sources of gasoline supply, and on careful examination of all patents since the issue to C. H. Hall in 1869.

The United Motor Fuel Corp. has been flooded with all sorts of proposals, but is interested in nothing except processes demonstrated and in actual operation.

Iowa Buys 15,000 Cars in 1916

136,500 Registrations — Claim State in Third Place on March 31

DES MOINES, IOWA, April 25—Of the 136,500 cars already registered in Iowa for 1916, 15,000 are new machines, the records show. The oldest car thus far registered for this year is a 1903 Reo, and the next oldest is a 1905 Ford.

Iowa ranked third in the United States on March 31 in the number of automobiles registered for 1916, according to figures compiled by Roy Allen, head of the Iowa Automobile Registration Department. New York was first and California second.

Seven States registered over 100,000 cars in 1915. The number of cars registered in each up to April 1 of this year is shown in the following table:

State	Total, 1915	To April 1, 1916
New York	231,831	154,405
California	163,795	158,423

Stanley Bros. Apply Steam Automobile Engine to Rail Use

NEWTON, MASS., April 22—F. E. & F. O. Stanley, the manufacturers of Stanley steam cars, are the principal figures in the Unit Railway Car Co. of Massachusetts just formed to make their steam motor applicable to railway cars. Those who have seen the new car that the Stanley brothers are building, and know what is planned, say that the passing of the electric trolley with its wires, expensive power stations and the huge steam locomotives with their coal and soot is not an impossibility in the near future. Kerosene will be used as fuel, giving five miles to the gallon.

For a long time the Stanley brothers have been working upon a plan of adapting to railroad and railway purposes the steam automobile engine which they have developed through a long series of years. They have now reached a point where the first car to be built will be ready for a trial trip in a little more than a month. When finished the new car will be given a trial on one of the railroads in New England.

The car will weigh much less than the ordinary railroad or trolley car of similar capacity, and it will cost much less to build.

The car now in process of construction will carry forty-four passengers and it has a baggage compartment and another one for the engineer. It will weigh about 35,000 lb. and will cost about $10,000. The car is adapted to interurban service or use on standard steam roads. It is to have a steel body, air brakes, electric lighting system and the standard railroad equipment required by the Inter State Commerce Commission. In addition to this car designs have been drawn up for a smaller car to carry twenty-six passengers.

Material Prices Steady

NEW YORK CITY, April 25—Market prices last week were steady. With the exception of another 13-cent drop in lead and one of $2.50 in tin, prices were normal. Rubber prices are still being maintained at the low level established two weeks ago. The gasoline situation remains unchanged, no advances and no decreases having occurred. Since Louis Enricht of Farmingdale, L. I., made public the announcement of his new fuel, he has been swamped with reporters and cranks, but nothing further regarding the nature of the product has been divulged, nor have any more tests been permitted by the inventor.

Aluminum, copper, and open-hearth and Bessemer steels were steady and unchanged. Copper reached 29½ cents a pound last week with good sales. The aluminum market is easier with sellers lowering prices.

Oils and lubricants remained steady. Lard oil rose to 98 cents while cottonseed oil saw a 30-cent gain.

Daily Market Reports for the Past Week

Material	Tues.	Wed.	Thur.	Fri.	Sat.	Mon.	Week's Ch'ge

Cleveland S. A. E. Ranks Third

207 Attend Dinner and 250 Hear Carbureter Paper Following

CLEVELAND, OHIO, April 22—The Cleveland Section of the S. A. E. arranged a dinner at the Statler Hotel to mark the conclusion of the Standards Committee meeting held here yesterday, the dinner being followed by the paper on carburetion by F. H. and F. O. Ball, which is reprinted on page 762. A number of members of the Council were present. Mr. Ball read the paper from a small platform at the end of the large hall, the audience sitting at their tables. Before the paper was read a few short speeches were delivered from the chairman's table. Coker F. Clarkson, general manager of the S. A. E., spoke concerning the use of trucks by the United States Government, stating that the army found mechanical transport 30 per cent cheaper than animal. It is his conviction that the S. A. E. will take an important part in helping the military authorities to work out their plans for properly organized systems. Committees from the S. A. E. will be appointed to work with the army and give all the help possible.

J. H. Herron, chairman of the Cleveland section, said that the section had made rapid strides in membership, without much effort beyond that obtainable from an energetic membership committee. C. S. Pelton, secretary of the section, stated that the membership is now 171, being a gain of forty-five in one month. This puts the section third in membership and places it very close to that of the Metropolitan section. On June 24 there will be a field day, for which preparations are well advanced, and details of the entertainment program will be ready shortly.

The next meeting of the section will be on May 19, the paper for that occasion being entitled Efficiency in Automobile Practice, by A. Ludlow Clayden, chairman of the Standards Committee.

353 Reservations for S. A. E. Cruise

DETROIT, April 24.—Reservations have been made to date for 353 S.A.E. members and friends for the summer cruise June 12—16. Treasurer W. H. Conant of the 1916 Meetings Committee reports daily receipts increasing, and it is now certain that the total accommodation of 550 on S.S. Noronic will be taken by June 1, if not earlier. At the present rate the ship will be sold out before that time.

Chairman Geo. H. Dunham had a full

meeting of his 1916 Meetings Committee in this city Saturday, and completed many plans for the cruise. For the benefit of those who want a day's fishing in Georgian Bay a complete outfit of fishing tackle will be carried on the Noronic and sold to members. The boat will stop at Sarnia, Ontario, on the return trip, Friday, June 16, for the convenience of those wanting to catch eastern trains at that point. This also applies to Grand Trunk trains west.

Attendance this year promises to eclipse all former years from the viewpoint of wide representation. Already nearly all of the past presidents have made reservations. The broad gage and high caliber papers that have already been arranged for have had much to do with many of the early decisions to go on the cruise.

In addition to the papers already announced the following have been definitely decided upon: W. H. Allen, Single vs. Dual Tires for Truck Wheels; A. P. Brush, High Speed Motors; Benjamin Liebowitz, Dynamics of Vehicle Suspension; H. L. Horning, Motors for Trucks and Tractors; A. J. Slade, Motor Truck Transport Preparations, and B. D. Bachman, truck subjects.

Dividends Declared

Stewart-Warner Speedometer Co.: quarterly 1¾ per cent on preferred and 1½ per cent on common, both payable May 1 to stock of record April 22.

Splitdorf Electrical Co. will send out checks for an additional 7 per cent on account of dividends in arrears, leaving 12 per cent still unpaid.

Break in Security Prices

Liquidation on Heavy Scale—Recovery on Favorable Report from Germany

NEW YORK CITY, April 25—The effect of unfavorable news or some national crisis on security prices was illustrated last Saturday when a violent break in stocks occurred, accompanied by liquidation on a heavy scale. The unfavorable tenor of Berlin advices at that time and the Mexican crisis overshadowed all other market considerations. One of the largest drops in automobile securities was that of General Motors, which declined 20 points. This stock and others, however, picked up substantially yesterday on intimation that Germany will endeavor to preserve peace with the United States.

Goodyear common was the only issue last week which showed strength. This stock rose to 405, or a gain of 35 points. The previous week it went up 34 points. This stock has been in great demand as a result of the coming stockholders' meeting, where it is said action will be taken on a 100 per cent stock dividend.

Chevrolet, Maxwell, Studebaker and Willys-Overland again dropped. Chevrolet, which declined 6 points the previous week, dropped 7 points on Saturday; Maxwell common, first preferred and second preferred showed net losses of 2⅝, 7⅝ and 4⅜ points; Studebaker common went down 18 points while its preferred dropped 4 points; and Willys-Overland common dropped 18 points after a 2-point drop the preceding week.

Tire issues which featured the market last week with substantial gains were a little lower. Goodrich common went down 3¼ points; Kelly-Springfield common dropped 4½ points; and U. S. Rubber common and preferred declined 2½ and 2 points, respectively.

Detroit quotations were in sympathy with those on the local exchange. Chalmers dropped 9 points; Continental Motor common declined 3 points; General Motors common 10 points and its preferred 3 points. Maxwell common and first preferred were 2 points lower while the second preferred dropped 1½ points. Studebaker common closed at 120, a decline of 14 points.

Hurlburt Increases Capital $300,000 To Add Equipment

NEW YORK CITY, April 21—The need of more factory equipment to take care of its production facilities has caused the Hurlburt Motor Truck Co., this city, to increase its capital $300,000 from $150,000 to $450,000, of which $350,000 will be preferred stock paying dividends semi-annually beginning Oct. 1, 1916 at the rate of 7 per cent per annum. The balance, $100,000, will continue as common stock.

With the new equipment, the company expects to increase its present production materially. Production now ranges from 600 to 1000 cars a year.

Stewart-Warner Retires Preferred

CHICAGO, ILL., April 21—The Stewart-Warner Speedometer Corp., this city, will retire at 110 and accrued dividends the $241,480 preferred stock, which is one-third of the amount outstanding.

Automobile Industry Represents 28% of Capital in Detroit Manufacturing

U. S. Census Statistics for 1914 Show 120 Concerns Making Cars, Trucks, Bodies and Parts, Etc., Produce 40 Per Cent of Value of All Manufactures in That City

DETROIT, MICH., April 12—Some striking facts to indicate what the automobile industry has done for the city of Detroit are to be found in the statement just issued, which gives detailed statistics of the four leading industries of this city; namely, automobiles, copper, brass and bronze, slaughtering and meat packing, and tobacco. This covers the year 1914 and is supplementary to the preliminary report made some months ago, giving results for Detroit of the census of manufacturers for the calendar year of 1914.

That the automobile industry really constitutes a considerably larger proportion of Detroit's industrial wealth than has been supposed, is indicated by the figures which show that the amount invested in the industry here, including parts makers was 28 per cent of the total amount of money invested in all business enterprises of this city for 1914.

Automobiles and parts to a value of $163,588,000 were produced in the year, equal to 40 per cent of the $402,864,000 value of all manufactures. The industry paid for materials $101,259,000 out of $223,527,000 paid by all manufacturing trades, or 45 per cent, and added $62,329,000 to the value of the materials by manufacture.

The present statement shows that $82,561,000 of the total capital of $295,171,000 invested in manufacturing plants in Detroit, was invested in the automobile industry; $9,405,000 in copper, brass and bronze works; $4,121,000 in slaughter houses and meat packing, and $8,505,000 in tobacco works.

Of the city's total of 2030 manufacturing concerns in 1914, 120 were devoted to the automobile industry; forty-one to brass, bronze and copper works; thirteen to slaughtering and meat packing, and 1007 to the manufacture of tobacco, cigars, etc.

Each of thirty-one establishments produced automobiles, trucks or parts to the value of $1,000,000 and over, 30 to the value of $100,000 to $1,000,000 and 32 to the value of $20,000 to $100,000.

Of the 120,977 persons engaged in manufacturing, the automobile plants employed 37,641; brass, bronze and copper works, 4579; slaughter houses and meat packing, 1299, and tobacco concerns, 7832. Of the total number of persons engaged in manufacturing, 31 per cent are engaged in automobile work.

Of the total industry of the city, the automobile industry constitutes 28 per cent; the number of persons engaged in automobile work constitutes 31 per cent of the total number of persons engaged in manufacturing. Salaries in the automobile business are slightly under the average, as shown by the fact that the motor car industry constitutes 34 per cent of the aggregate salaries and wages and 25 per cent of the total paid in salaries, but the wages paid to the automobile workers constitute 37 per cent of the city's total paid in wages in the manufacturing industries.

Cost of material, value of products and value added by manufacture for the four industries appear in the tabulation.

Industry	Cost of Material	Value of Product	Value Added by Manufacture
Automobile	$101,259,000	$163,588,000	$62,329,000
Brass, copper and bronze	10,442,000	15,159,000	4,717,000
Slaughtering and meat packing	18,489,000	20,321,000	1,832,000
Tobacco	7,309,000	17,044,000	9,735,000

Harkness to Try for World's Record in Blitzen Benz

NEW YORK CITY, April 24—H. S. Harkness has bought the Blitzen Benz in which the late Bob Burman established the world's record in 1911 at Daytona, Fla., when he drove 1 mile in 25.4 sec. The car was formerly owned by S. A. Fletcher, an Indianapolis banker. This car will be driven at the Sheepshead Bay Speedway on May 13 in an attempt to lower the present mark made by Burman at Daytona. Though no driver has as yet been selected for the trial, it is stated that Mr. Harkness will in all probability be its pilot.

Premier Racing Motor Develops 140 Hp. at 2900 R.p.m.

INDIANAPOLIS, IND., April 24—The Premier Motor Corp. is building two or three racing cars which will have four-cylinder 3⅝ by 6⅝-in. motors, developing 140 hp. at 2900 r.p.m. Practically the entire steel work is of chrome vanadium steel.

The motor, an overhead-valve type with two intake and two exhaust valves in each cylinder, has its camshafts driven by a train of gears which extend up the front. Each gear is carried on two annular ball bearings. The crankshaft is made from special steel and is carried on four annular ball bearings.

Castor oil is used exclusively and is carried under air pressure from the tank to sight feeds located on the dash from whence it passes through separate leads to each of the crankshaft bearings and to both camshafts, which are hollow. The oil passes through them the full length of the motor and overflows at the front and on the train of gears. The oil which goes to the crankshaft bearings passes through the ball bearings and after it is thrown off by them it is kept in banjo-shaped rings which are fastened to the side of the crankshaft. After the oil gets into these banjo rings it is thrown by centrifugal force and carried into the crankpins where it lubricates the big end of the connecting-rod and then is carried up on the connecting-rod through a small tube to the piston pin.

The rear springs are semi-elliptic, 50-in. long and absorb both the torque and the drive of the car. The front springs are semi-elliptic and are bound with cord for part of their length. Double shock absorbers are attached to each spring. Several different rear axle lever gear sets were tried and the results noted. The final ratio selected was 3 to 1, using a 35-in. tire.

Empire to Try for West-to-East Record

NEW YORK CITY, April 24—An attempt will be made by the Empire Automobile Co., Indianapolis, to break the West-to-East record of 11 days, 5 hr., 25 min. made by E. G. Baker and W. F. Sturm last May in a Stutz. An Empire car will be shipped to San Francisco today from this city in charge of Robert Hammond, who will drive it from that city. He expects to make the trip in ten days. He will be accompanied by M. Smith, a newspaper man.

Racklyft Joins Sunderman Carburetor

NEW YORK CITY, April 21—J. W. Racklyft, former assistant chief engineer of the Northway Motor & Mfg. Co., Detroit, Mich., has been appointed assistant chief engineer of the Sunderman Corp., this city, and will assist Capt. F. R. Sunderman, chief engineer of the company, in conducting tests for Detroit and Middle Western manufacturers.

Plummer Forms Liberty Agency

NEW YORK CITY, April 20.—J. F. Plummer, for sixteen years local manager of the Locomobile Co. of America branch, has organized the Colonial Motors, Ltd., which will handle the Liberty car.

Splitdorf Gets Hupp Export Contract

NEWARK, N. J., April 20—The Splitdorf Electrical Co., this city, has closed a contract with the Hupp Motor Car Corp., Detroit, Mich., for its magneto requirements for 1917 on all cars for export. The Dixie 40 will be used.

21 Sheepshead Bay Entries

Nine Are of Foreign Make—Full List of 32 Expected

New York City, April 25—Twenty-one entries to date have been made for the Sheepshead Bay Speedway races on May 13. The latest entrant is Joseph Christiaens, the Belgian, who drove the six-cylinder Excelsior into sixth place at Indianapolis two years ago. He has just arrived in this city from London and has brought over a new Sunbeam Six.

To date nine foreign entries have been made for the four events on May 13. These events include the Metropolitan Trophy, 150 miles; Queens Cup, 50 miles; Coney Island Cup, 20 miles; and a 10-mile handicap, for non-winners, called the William E. Kemble Cup.

France will be represented by four Delages and three Peugeots, while England will be represented by two Sunbeam sixes.

Cars and drivers entered to date are:

Car	Driver
Erwin Forty	Grover C. Bergdoll
Erwin Forty	Eugene Stecher
Peugeot	Ralph Mulford
Crawford	Billy Chandler
Crawford.	Dave Lewis
Crawford	Unnamed
Duesenberg	Eddie O'Connell
Duesenberg	C. J. Devlin
Maxwell	Pete Henderson
Maxwell	E. C. Rickenbacher
Peugeot	Dario Resta
Peugeot	John Aitken
Delage	Carl Limberg
Delage	Jack Lecain
Delage	Unnamed
Delage	Unnamed
Sunbeam Six	Joseph Christiaens
Sunbeam Six	Aldo Franchi
Mulford Special	W. T. Muller
Olsen	C. W. Thompson
J. J. R. Special	Bert Watson

Resta will race against Aviator De Lloyd Thompson in an exhibition event May 6 and 7.

Three Meets for Tacoma

Tacoma, Wash., April 11—The Tacoma Speedway Assn. has definitely decided on three meets for this season, the dates being Decoration Day, July 4 and Aug. 5. The events for the Decoration Day program include three races of 10, 20 and 30 miles. There will also be an outdoor motor car show and a large parade of cars. The prizes for the day total $500 besides accessory prizes.

A New Kerosene Vaporizer

Ohio Gas Generator Co. Will Manufacture Webber Patent Device

Columbus, Ohio, April 22—The Ohio Gas Generator Co. has been formed here to manufacture a kerosene vaporizing device patented by Theodore Webber, formerly of Buffalo, who has been in this city for the past three years perfecting his invention. This consists of a cylindrical container which is placed around the exhaust pipe of the engine; kerosene is passed through this and the heat of the exhaust vaporizes it so that on being mixed with air the gas is highly explosive. Webber also has an attachment which injects a small quantity of water into the cylinder at each revolution of the engine.

Mr. Webber recently gave a demonstration of his vaporizer attached to a 5-hp. stationary gasoline engine which ran 6 hr. on 3 gal. of kerosene.

S. A. E. Standards Considered in Cleveland

(*Continued from page* 782)

motor and ignition standards; and the collection of data on flexible metallic tubing with a view to early standardization.

A. L. Riker, chairman of the division, reported that the sub-committees were at work. The lamp committee intends to make a scientific investigation of the glare question, to standardize some small parts like lamp glasses, and to take up any other work along this line. The other sub-committee is a joint one, having representatives from the Engine and Transmission division, and it seems probable that the lighting generator will be the first point of attack. The variations in practice are so large that it is obviously going to be a serious undertaking to set up standards which will be suitable to all requirements. Probably a good deal of original work will have to be done, but it is felt that the situation is in a plastic state and ought, therefore, to yield to standardization without great difficulty.

The division made some minor recommendations for the revision of the sheets of the data book dealing with grounded return wires. They also recommended that lamps for three-cell batteries should in future be known as 7-volt bulbs and those for six-cell batteries as 14-volt bulbs; the gage of the metal also to be removed from the bulb base specification. These recommendations, together with the rest of the report were accepted unanimously.

Sheet Steel Next Development

The Iron and Steel division had a progress report which K. W. Zimmerschied, chairman, presented. At present sheet steel has no proper classification, its specification for chemical and physical qualities, the nature of the finish and the gage of metal are somewhat obscured by the use of such names as "fender stock," "panel stock," etc. Mr. Zimmerschied said it was anticipated that the work would occupy a year or two.

It was reported that the division found it impossible to recommend any standard system of coloring for steel bar stock to distinguish the brands. The best color system depends upon the grades carried in stock by a manufacturer. A new steel of 40-50 carbon, 3½ per cent nickel will be recommended as an addition to the S. A. E. steels, this being specially suitable for oil tempered gears. Some alterations in test specimen specifications are being considered.

To Standardize Truck Control

W. P. Kennedy, chairman Truck Standards division, reported that the solid tire questions before his division were still active issues, the question of proper loading for the different sections now being under consideration. The chief work before the division is now the standardization of truck controls so that a driver will be able to change from one to another without any feeling of strangeness. Position of gear lever, location of pedals, of brake lever, etc., will be considered, together with such detail as the direction of throttle lever movement, etc. J. Younger, Pierce-Arrow Motor Car Co., made a strong plea for a fundamental consideration of this subject, urging that the division make experiments to discover what is best, and do not pay too much attention to prevailing practice. This view was well supported by the meeting, and the remark was made that there had already been considerable trouble in the Mexican expedition through drivers having to take over trucks which were strange to them. There has been endless trouble in Europe on this account.

Roller Bearings in Metric Size

The Carbureter Fittings division report was presented by V. R. Heftler, Zenith Carbureter Co. It contained recommendations regarding certain sizes of double outlet carbureters and described the work being done with throttle lever throw and gasoline pipes.

The Ball and Roller Bearings division, presented a sheet of proposed dimensions for metric sizes of taper roller bearings which would interchange with standard sizes of ball bearings, and also reported progress with respect to ball thrust bearings. The taper roller bearing recommendations will be circulated and re-submitted at the June meeting.

Professor Fishleigh, in presenting the report of the Engine and Transmission division announced that progress was being made with revision of the S. A. E. engine test forms and determinations of engine characteristic curves. The division has asked for a number of tests to be made on V belts, and the chairman of the Standards Commttiee, A. Ludlow Clayden announced that he had asked Cornell University to undertake the tests. The mechanical engineering department of the University had expressed its willingness to accept the responsibility.

The Spring, Electric Vehicle, Nomenclature and Chain divisions also presented short progress reports describing the work in hand. Mr. Zimmerschied said that the nomenclature compilation was nearing completion, and it was hoped to finish it before the summer meeting took place.

Fuel Economy Test

Hereunder follow the main provisions of the fuel economy test recommended by the Research division which has been accepted as far as it goes, with instructions to the division to proceed with consideration of an ability formula and an acceleration test:

1—The test shall be conducted on an automobile speedway.

2—The fuel consumption shall be measured at a series of speeds varying from 10 miles to the maximum speed of which the car is capable.

At each speed a distance of 10 miles shall be covered and to eliminate the effects of variable wind resistance two runs must be made at each speed in opposite directions around the speedway. The following table shows the order in which the runs must be made and the speeds at which they must be made together, with the approximate time consumed.

	M.P.H.	Dist.	Time	
			hr.	Min.
1st run	10	10	1	
Reversed direction...	10	10	1	
2nd run	15	10		40
Reversed direction...	15	10		40
3rd run	20	10		30
Reversed direction...	20	10		30
4th run	25	10		24
Reversed direction...	25	10		24
5th run	30	10		20
Reversed direction...	30	10		20
6th run	40	10		15
Reversed direction...	40	10		15
7th run	50	10		12
Reversed direction...	50	10		12
Etc. to limit of speed..				
		140	6	42

3—Fuel shall be fed to the carbureter during the test by gravity and shall be supplied from a special tank mounted so that the vertical distance between the top of the float chamber of the carbureter and the bottom of the fuel chamber is not less than 12 in. There shall be two tanks, preferably mounted side by side. These tanks shall be so connected to the main fuel pipe (by means of two cocks or otherwise), that one tank may be cut in and the other cut out in a fraction of a second. Of these two tanks one is a reserve tank used for maneuvering between test runs and this may be a fixture if so desired. The other tank which will be used during the test must be capable of easy detachment so that it can be weighed and replaced without difficulty. The tank used for the tests must contain sufficient fuel to enable the car to complete its run at the maximum speed on one filling.

4—The method of controlling the fuel shall be as follows: The engine must previously be brought to a condition of normal temperature. The special tank shall have been filled with fuel and weighed carefully. It is suggested that this may readily be done on a carefully calibrated spring balance. The tank shall then be connected so that it can be brought into use by the observer sitting beside the driver. The speed at which the test is to be made shall first be obtained from the reserve tank and the special tank shall be switched in by the observer on crossing the starting line marked on the speedway.

5—The speed during each run must be maintained as constant as possible. The time for each lap is to be checked by the observer and in no case must it deviate from the scheduled time by more than five per cent, plus or minus.

6—On the completion of each stage of the test it shall be repeated in the opposite direction every condition being observed as before.

7—At the conclusion of each stage of the test the special fuel tank shall be removed from its attachment and again carefully weighed. The weight of fuel consumed having been entered, the tank may be refilled and weighed again previous to the commencement of the succeeding stage.

8—The whole of the fuel to be employed during the entire test must be retained in a receptacle from which the observer can take a sample for the purpose of checking the specific gravity whence the quantity of fuel employed during the test may be determined from the weights actually measured.

Note: The object of specifying measurement of the fuel by weight instead of by volume is that the accurate measurement of the weight of the tank can easily be made from time to time as required, whereas the accurate measurement of volume calls for more elaborate apparatus and is much more susceptible to error.

9—The entire cooling system of the automobile must be fully operative during the test both as regards air and water circulation.

10—Coasting or declutching is not to be permitted.

11—The entire test is to be made in the highest gear, this including the final acceleration test.

12—The test is to be run with the car in the condition as indicated on the form, that is with all tanks full and full complement of passengers or corresponding ballast.

13—Oils or greases used in the engine, transmission, rear axle or other parts of the car must be of normal quantity and quality.

14—The car must carry its full standard equipment of parts and accessories, which must be the stock accessories as supplied by the manufacturer in accordance with the A. A. A. definition.

15—The test should be certified by a competent and impartial observer having no financial or commercial interest in the results. This observer shall make affidavit before a notary public regarding results of the test and the latter shall affix his seal to the report.

16—Immediately upon conclusion of the fuel economy tests an acceleration test must be made in accordance with the S. A. E. form. This test must be made with the same carbureter adjustment as that used for the fuel consumption tests.

17—From the commencement of the economy test to the conclusion of the acceleration test there must be no manipulation of any carbureter adjustment or control other than the throttle.

Explanatory Notes and Definitions

Weight of car alone—By this is meant the weight of the car with all oil, fuel and water tanks full, including special equipment necessary for the test and full standard equipment of tools, tires, rims, spare wheels, etc., as supplied with the stock model of the car.

Full complement of passengers consists of one passenger or the equivalent for each seat provided, driver included. The average weight for passengers and driver to be 150 lb. each.

For inclosed bodies all windows and doors to be closed. For touring bodies, top to be up, side curtains not used and rear curtain to be fastened down.

Windshield to be fully erected during test.

The pressure in the tires shall be that recommended by the manufacturer of the tires used, corresponding to the load applied both front and rear.

Information must be furnished in the form of a Baumé gravity reading for the fuel and supplemented wherever possible by a curve showing the results of a distillation and heat value tests. The trade name of the fuel used must be given.

Wind velocity—The fact is emphasized that the test should be run at a time when no appreciable wind exists.

The Four-Cylinder Motor of To-Day

(*Continued from page* 759)

pression pressures, while the brake mean effective varies as the mechanical efficiency, which according to good practice ranges between 20 to 30 per cent above compression pressures.

The matter of power impulse per revolutions, or torque quality, is not as new a subject as the road vehicle as we know it to-day. Many years of steam practice combined with that of the internal combustion motor have established the fact, that so far as working ability is concerned, an impulse stroke every 180 deg., or two per revolution, multiplied by the available number per minute, produces an almost perfect power flow.

How the Motor Works Out

Having outlined the factor values as we know them to-day let us consider a motor using the limits specified which are not extreme by any means.

P representing the m.e.p., we can assume as actual at 120 lb., L representing length of stroke in feet has a value of 0.5, A or area of piston equals 7.06 while N or number of power impulses per minute we have as 6000. Expressed by the usual formula we have $\frac{120 \times 0.5 \times 7.06 \times 6000}{33,000} = 77$ hp., a truly remarkable performance when we consider that such a motor complete should weigh about 400 lb.

This motor applied to the road should be geared about four to one with a third speed reduction of 1.33 to 1; second speed 2 to 1, and first 3 to 1, making the motor to wheel gearing 4-5.33-8 and 12 to 1 respectively, using 34-in. wheels, road speeds from 8 to 65 m.p.h. could be had on direct drive, while third speed would afford a possible range from 4 to 70 m.p.h.

The high m.e.p. obtained would not permit a wide open throttle at very low speeds with any spark advance, as very objectionable and detrimental pounding would result. To safeguard against this abuse a purely mechanical carbureter should be employed, with dimensions such as would prohibit a wide open condition at low engine speeds.

If greater car speeds are desired especially for the heavier type of vehicle, more power is easily had by changing the bore to stroke ratio, and still keep within the limits of our m.e.p. and piston speeds. This would, however, result in a slight loss of thermal efficiency.

Constructional features are matters of individual tastes. To obtain, however, the efficiency outlined, neutral space must be kept to a minimum which excludes practically all valve types other than over head or sliding sleeves. Intake gas speeds should be kept below 12,000 ft. per minute, and reciprocating parts must be extremely light.

The practice outlined is beyond the conventional, but has been demonstrated as easily possible many times. Except for the one extremely low factor, that of the thermal efficiency, it represents an ideal easily obtainable.

In comparison to motors with a greater number of cylinders of the same displacement, the answer lies in the question of thermal efficiency. The heat losses represent practically 60 per cent of the total fuel used, and are about equally divided between the flow to the cooling medium and the exhaust losses. The cooling medium losses are in proportion to the surface exposed, times the heat gradient, since the surface exposed increases rapidly in relation to the displacement as volumes are divided. The heat losses are likewise increased; in addition the mechanical losses, while small increase in exact proportion to the number of cylinders added.

Considering that thermal efficiency is the only point that prohibits perfect realization of the Otto cycle theory, anything that tends to decrease the possibilities should be considered a step backward. The demand, however, for power output beyond the possibilities of a four-cylinder motor as outlined must be met by the use of a greater number of cylinders in proportion to the power needed.

Theory Favors Four Cylinders

Discussion of Four-Cylinder Papers Points to Greater Thermal Efficiency of Four—Higher Mean Effective Pressures Urged at Reduced Throttle Openings

OWING to the presence of a number of members of the Society of Mechanical Engineers and the Aeronautical Society, the discussion on these papers very often went over to stationary and aeronautical practice. Some of the comments from the aeronautical point of view were particularly interesting in showing that the cylinder question is not confined to automobile design.

President Barker of the Aeronautical Society called attention to the fact that in Mr. Watts' paper the ultra-multi-cylinder engine is referred to as the de luxe type. "I wish to call the attention of the assembled engineers," said Mr. Barker, "to the fact that the aeroplane motor must be an ultra-multi-cylinder design. Therefore it is the motor de luxe that should require and should have the particular attention of engineers in its development. There seems to be nothing to criticise in Mr. Watts' paper, but it is necessary to look ahead. The development in the automobile engine has reached a very high point. It has become difficult to criticise. Now there are other worlds to conquer. Entering the aerial field you will find ample material for the wonderful ability and skill which has been developed in the past twenty years in the profound study that has been made of the automobile motor. If you automobile engineers will turn your attention to the aeroplane motor you will find there the full opportunity to develop."

Four Cylinders for Aeroplanes

Hugo Gibson, president of the Coalition Co., took exception to Mr. Barker's contention that the ultra-multi-cylinder engine is necessary for aeronautical purposes. He said:

"Since economy is perhaps the prime necessity in aeroplane engines after power, of course, then necessarily the fewer the cylinders the better for the proposition. So with the greater number of cylinders are you not confusing the advantages of smoothness, absence of vibration, etc., with the necessity for economy and large amount of power from a small amount of weight? These are the real necessities in aeronautical matters, and if that is so then we have nearly gone the limit if Mr. Watts' paper is right: that the limit of any cylinder is 4½ in. in diameter. I disagree with Mr. Watts in this point, however."

E. Favary, president of the Favary Tire & Cushion Co., stated that in listening to the papers one is forced to the conclusion that the four-cylinder engines should be in universal use, but while we all agree that the four-cylinder engine is most efficient and that the engines with a higher number of cylinders are not always attuned where they will show up to advantage, still they are here and they are gaining ground.

Mr. Favary went on to say: "Both papers presented this evening show us that the four-cylinder engine has a much higher thermal efficiency and is, therefore, the engine which should be most extensively used in the future. This is no doubt true, but at the same time we all admit that an engine with a greater number of cylinders has a more uniform torque and a more perfect running balance; it allows driving at low speeds without jerks and obviates the necessity for such frequent gear changes. These points, of course, are most important to the automobile user. All vibrations I believe can better be decreased in engines of a larger number of cylinders than in four-cylinder engines. On account of the increased cost of fuel, and the more extensive uses to which the automobile is adapted, economy plays a most important part, and therefore the greatest field for the future, as Mr. Porter pointed out, is to increase the thermal efficiency.

Heat Losses Enormous

"We all know that the heat losses are enormous. For this reason it is of prime importance to find some means for their reduction. The greater the number of cylinders, the greater the jacket area exposed to the hot gases, and the greater are those losses. For instance, a six-cylinder has approximately 20 per cent more area exposed to the cooling water than a four-cylinder engine, and in practice it means somewhere between 10 per cent more fuel. However, even in a four-cylinder, the losses are enormous, and I want to point out some means which might in the future prove a basis for development.

"Since piston speeds are now practical at 3000 ft. per minute, where some years ago 1000 ft. per minute was considered the limit, I think the combustion chamber could be kept at a much higher temperature without danger of pre-ignition. In other words, on account of the high speed of the engine, ignition would not take place before the charge should be fired, knowing that it does take some time after firing before obtaining the full effect of combustion. For this reason, a much higher temperature might be permissible. At the same time we must remember that oil will carbonize at higher temperatures, which would render its lubricating qualities defective and the running of the engine impractical. A possible field of development might be to provide only the part of the cylinder below the combustion chamber with a water jacket, so as to cool the portion requiring lubrication, while at the same time allowing the combustion chamber to have a higher temperature. If desired, the cylinder head may be bolted to the cylinder by the interposition of asbestos packing or some other non-conductor. To get the best results the piston rings should be lower down on the piston so as to increase the cubic content of the cylinder which can be maintained at a higher temperature. The possibility, perhaps Utopian, of still further reducing the temperature of the combustion chamber wall, might be accomplished by lining it with some material substantially impervious to heat. Of course we must bear in mind the occurrence of pre-ignition, but some means might be found for overcoming this.

Outside Compression Possible

"A higher engine speed, as previously mentioned, would greatly assist to overcome pre-ignition. In order to keep the mixture cool, it might be found advantageous to compress it outside the cylinder, and admit it through large valves into the cylinder, after the piston has completed a portion of the suction stroke. The mixture, at a low temperature, entering the cylinder under compression, requires some time before reaching the temperature of spontaneous ignition.

"Furthermore, by forcing the compressed mixture into the cylinder at a certain position of the suction stroke, the gas will expand, thereby tending to lower the temperature of the mixture. On the compression stroke, of course, the temperature will again be raised. This, with the increased engine speed, may render it possible to have the combustion chamber wall at a very much higher temperature, thereby obtaining an increased thermal efficiency."

J. Edward Schipper, technical editor THE AUTOMOBILE, advanced the idea that the matter might be one of piston displacement per cylinder, saying: "In the matter of cylinders it sometimes seems to come down to almost a point of piston displacement per cylinder. The consideration of what are the best working stresses on main bearings and connecting-rod bearings seems to be an important factor that has a good deal of bearing on the number of cylinders. Taking many of the present-day automobile engines that have worked out satisfactorily, it seems as if a piston displacement of about 70 cu. in. per cylinder seems to hit the nail pretty squarely on the head; and Mr. Watts has in his paper classified cars according to the weight. That seems to bear out this way of looking at it also. That is, the four-cylinder engine running less than 300 cu. in. piston displacement seems to correspond to about 70 cu. in. per cylinder, giving an easy working engine as far as bearing surfaces are concerned and also one in which the advantages of good carburetion obtain.

"For cars in what he calls the luxurious class—and he says there that the multi-cylinder engine might be justified—if we take the piston displacement which would be obtained by using say 70 cu. in. to the cylinder that would probably run it rather high. But nevertheless it seems that the piston displacement per cylinder is the limiting factor, which might be one of the methods of determining the correct number of cylinders to use for any given weight of vehicle."

Porter Closes Discussion

In closing the discussion, Mr. Porter said, in part: "Displacement per cylinder, as suggested by Mr. Schipper, I think, is on the right road, but I think it is a little bit under what is the limit, but it is well within what is necessary. I do not believe that there is any automobile built or any condition of automobiling in the world outside of racing that can need more than 300 cu. in. Because out of such a motor you can get 100 hp. without half trying, and it would work well, and you would never have occasion to use that horsepower. The average automobile does not need it: At something like 40 m.p.h. I think the five-passenger, 2000 to 3000-lb. car, takes about 20 hp. at 50 m.p.h.

"Now when it comes to acceleration, your road wheels govern that. It is the amount of traction you give. You can spin your wheels just as fast as you want to. Not more than 300 cu. in. or about 70 cu. in. per cylinder is absolutely all you want unless you have some other condition. The car I spoke of has more than that; it has 450; and I would not trade it for anything. If I get rid of that I guess I will quit. But it is simply because there seems to be no limit to what it can do. It can go to 100 m.p.h. or go up any hill in the world, accelerate as fast as 2500 r.p.m., but it has a great deal more power than is needed."

Factory Miscellany

Erlin Co. to Build—The Safety Auto Light and Mfg. Co., Erlin, Ohio, will build a plant.

Plant for Piedmont—The Piedmont Motor Co., Lynchburg, Va., contemplates building a plant.

Imperial Motor to Build—The Imperial Motor Co., Ottawa, Ont., will build an addition to its factory. L. H. Roy is manager.

Ford Building for Salt Lake City—The Ford Motor Co., Detroit, is planning the construction of an assemblying plant at Salt Lake City, Utah. The estimated cost is $400,000.

White Springs Tire Plant in Edmond—A tire plant will be equipped by the White Springs Tire Co., Edmond, Okla., recently formed with a capital of $50,000. J. W. White and M. J. O'Connor are interested.

Simplex Starter Adds—The Simplex Starter Co., Anderson, Ind., will make another addition. The new unit will enable the company to turn out 100 additional starters a day, which is double the present capacity.

Canadian Plant for Perfection Tire—The Perfection Tire & Motor Co., Fort Madison, Iowa, has had plans prepared for a Canadian branch plant to be erected at Niagara Falls, Ont., estimated to cost about $300,000.

Mid-Continent Tire Plant in Wichita—The Mid-Continent Tire Mfg. Co. has purchased a site at Thirteenth and Washington Streets, Wichita, Kan., upon which to erect its factory building. The building and equipment will cost $150,000.

To Make Accessories—The C. D. Mfg. Co., Marietta, Ohio, will be incorporated with $100,000 capital by F. A. Caskey and others to manufacture automobile accessories. Temporary factory operations will be carried on in the plant of the Galvin Mfg. Co.

Juno Truck Plant Sold—The former plant of the Juno Motor Truck Co., Juneau, Wis., which has been idle for more than a year, has been turned into a milk condensery. The company was organized about four years ago to take over the business of the Brodesser Motor Truck Co., Milwaukee, but after an existence of about two and a half years retired from business.

Ohio Plant News—The plant of the Elmore Automobile Co., Clyde, has been sold to the Universal Paper Products Co., of Chicago. The deal means the passing of the plant, which was one of the most important in Northern Ohio several years ago.

The plant of the Toledo-Findlay Tire Co., Findlay, which went into the hands of receivers several weeks ago and which has been idle since that time, has been placed in operation by Sheriff Kennedy, who has been placed in charge. A movement is on foot for a reorganization of the concern by the stockholders.

The McIntyre Mfg. Co., Columbus, has started ship motor plows from its plant. The first shipment was made to a point in Nebraska. The output of the company is being gradually increased.

The Automobile Calendar

April 24-29	Bangor, Me., Show.
April 26-May 6	Oakland, Cal., First Annual Pacific Coast Motor Power and Automobile Show, Automobile Industries Assn.
April 29	Fresno, Cal., Road Race, Raisin Classic Trophy Assn.
May 3	N.A.C.C. Monthly Meeting.
May 6	Sioux City, Iowa, Speedway Race, Sioux City Speedway Assn.
May 9-12	Hot Springs, Va., N. A. A. A. J. Meeting.
May 13	New York City, Sheepshead Bay Speedway Race. Metropolitan Trophy, 150 miles; Queens Cup, 50 miles; Coney Island Cup, 20 miles, and Brooklyn handicap for non-winners, 10 miles.
May 13-14	Columbus, Ohio, Track Race, Columbus Driving Park. Cee - Cee - Dee League.
May 14-20	Milwaukee, Wis., Sheridan Road Week to Complete Highway Connecting Milwaukee and Chicago.
May 18	S.A.E. New York Section, May Meeting.
May 20	Chicago Non-Professional Speedway Race, Western Interclub Speedway Park.
May 25	Pennsylvania's Second Good Roads Day.
May 26-27	Del Monte, Cal., Meeting, Three Divisions of National Assn. of Automobile Accessory Jobbers.
May 28-30	Cleveland, Ohio, Track Race, Cee - Cee - Dee League.
May 30	Des Moines, Iowa, Iowa Derby, 20 Miles; Des Moines Special, 10 miles.
May 30	Tacoma, Wash., 10, 20 and 30-Mile Races, Tacoma Speedway Assn.
May 30	Elmira, N. Y., Track Race, Elmira Auto & Motorcycle Racing Assn.
May 30	Indianapolis Speedway 300-Mile Race.
May 30	Minneapolis, Minn., Speedway Race.
June 4	Sheepshead Bay Speedway, 30-Mile Race, American Liberty Day Committee.
June 8	New York City, Orphans' Day Outing at Donnelly's Grove, College Point, L. I. Orphan's Automobile Day Outing Assn.
June 10	Chicago Speedway Race. International 300 - Mile Race, Speedway Park, Speedway Park Assn.
June 12-16	S. A. E. Summer Trip on Great Lakes.
June 16-17	Sheepshead Bay Speedway, 24-Hr. Race, Trade Racing Assn., New York City.
June 20	Galesburg, Ill., Track Race, 100 miles.
June 28	Des Moines, Iowa, Speedway Free-for-all, 300-mile race.
July	LaGrande, Ore., Track Race, LaGrande Motor Club.
July 2-6	Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
July 4	Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4	Tacoma, Wash., Speedway Race, Tacoma Speedway Assn.
July 4	Minneapolis 300-Mile Speedway Race.
July 4	Sioux City Speedway Race.
July 15	Omaha, Neb., Speedway Race.
July 15	North Yakima, Wash., Track Race, Riegel-Hiller Co.
July 17-21	Dallas, Tex., Tractor Demonstration.
July 24-28	Hutchinson, Kan., Tractor Demonstration.
July 31-Aug. 4	St. Louis, Mo., Tractor Demonstration.
Aug. 5	Tacoma Speedway Race, Tacoma Speedway Assn.
Aug. 7-11	Fremont, Neb., Tractor Demonstration.
Aug. 11-12	Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.
Aug. 12	Portland, Ore., Track Race, Riegel-Hiller Co.
Aug. 14-18	Cedar Rapids, Ia., Tractor Demonstration.
Aug. 18-19	Elgin Road Race, Chicago Auto Club.
Aug. 21-25	Bloomington, Ill., Tractor Demonstration.
Aug. 28-Sept. 1	Indiana Tractor Demonstration.
Sept. 2-9	Columbus, Ohio, Fall Show, Ohio State Fair, Columbus Automobile Show Co.
Sept. 4	Des Moines Speedway Invitation Race. Limited to six entries.
Sept. 4	Indianapolis Speedway Race.
Sept. 4-5	Spokane, Wash., Track Race, Inland Auto Assn.
Sept. 4-8	Madison, Wis., Tractor Demonstration.
Sept. 6-7	St. Paul, Minn., Good Roads Congress, Auditorium.
Sept. 11-16	Milwaukee, Wis., Fall Show, Wisconsin State Fair, Milwaukee Automobile Dealers.
Sept. 16	Providence Speedway Race.
Sept. 29	Trenton, N. J., Inter-State Fair. H. P. Murphy, Racing Sec.
Sept. 30	New York City, Sheepshead Bay Speedway Race.
Oct. 7	Philadelphia Speedway Race.
Oct. 7	Omaha Speedway Race.
Oct. 14	Chicago Speedway Race.
Oct. 19	Indianapolis, Ind., Race, Indianapolis Motor Speedway.
Nov	Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

The Week in the Industry

Ohio Trade Happenings—The Vim Motor Sales Co., which has been formed in Columbus to distribute Vim trucks, has established its showrooms and service station in the New Columbus Auto Repair Co. Building at 103 South Front Street.

The Times Square Automobile Co. of New York and Chicago, which has purchased the bankrupt stock of automobile accessories of the Columbus Automobile Supply Co., at Gay and Fourth Streets, Columbus, will open a permanent branch store of this company, under the management of S. E. Brown and W. H. Montague, at 137 South High Street.

Twin City News—The Auto Engine Co., University Avenue and Griggs Street, St. Paul, will take over the space in its plant occupied by the Dussenberg Motor Co. The latter has moved to the Lowe-Victor Building, Chicago. The extra space was needed for increased business.

The Morton Brake Co., 45 Tenth Street S., Minneapolis, has begun the manufacture of the Morton Four-Wheel brake, whose power is applied by foot pedal pressure. The mechanism is simple and saves wear on tires by its use by elimination of tire chains.

Wis. Trade Items—The National Weighing Apparatus Co., 917 Third Street, Milwaukee, has taken new and larger quarters, consisting of the former plant of the Milwaukee Separator Co., at 267-273 Sixth Street. The capacity is thereby doubled. The officers of the company are: President, John Malenscheck; vice-president, John Dobnik; secretary and treasurer, J. L. Malenscheck.

The I. B. Rowell Mfg. Co., Waukesha, which has devoted its attention for many years to the manufacture of farm implements, has taken several large contracts to manufacture automobile devices for patentees who do not desire to establish works of their own. One order is for 60,000 self-starting devices for Ford cars, to sell at $30 each, and another order is for a large production of road surfacers and other light road machinery. Extra help has been engaged and the facilities extended to fill the orders.

The Roebken Garage at Cedarburg has been purchased by the newly organized Boerner Automobile Co., which takes immediate possession. The Boerner company proposed to build a new garage, but the project is indefinitely postponed because of the purchase.

Trade Happenings

Willson Heads Brooklyn Chevrolet—J. H. Willson has been made manager of the Brooklyn Chevrolet branch. Willson comes from the New York City branch.

Krueger Owns Milwaukee Cole Branch—W. H. Krueger, who recently went to Milwaukee to assume charge of the Cole company's distributing branch in that city, has purchased outright the Milwaukee business, and is not connected with the Cole Motor Co. of Chicago, as reported.

Detroit Changes—H. F. Hartman, who has been identified with the service activities of the Studebaker Corp. for the past five years, has just been appointed superintendent of the Detroit Studebaker service station. Previous to his present appointment Mr. Hartman was in charge of service at the Philadelphia branch, and before that supervisor of service for the States of Texas and New Mexico.

L. S. Weeks, formerly factory representative of the Studebaker Corp., has been appointed manager of the Atlanta, Ga., branch, and J. B. Dub, formerly salesman for the Detroit retail branch, has been made manager of the retail department at Atlanta.

Cyril O. Assmus has been appointed export representative in Detroit of the Maxwell Motor Co., succeeding A. S. Stevens, export manager of the company, who will hereafter have his headquarters in New York, and who will shortly leave there for South America.

Goodyear Trade Notes—R. W. Rost, Newark, N. J., salesman, has been promoted to manager of the Goodyear branch at Albany, N. Y., succeeding E. B. Sigerson, recently appointed manager of the Buffalo branch.

J. A. Leathermen, Portland, Ore., salesman, has been promoted to manager of the branch in that city.

L. H. Vaughan, former manager at Utica, N. Y., has been appointed manager of Goodyear's branch at Newark, N. J. He is succeeded at Utica by F. G. Richards, who has been connected with the Newark branch as salesman.

R. S. Herman, formerly a salesman with the Joplin, Mo., branch, has been transferred to Salina, Kan., as manager of the new Goodyear branch there.

Knepper a Factory Rep.—H. H. Knepper has withdrawn from the Knepper-Knight Co., Detroit, and has opened an office at 967 Woodward Avenue, that city, where he will continue to handle the account of the Marshall Ventilated Mattress Co., maker of the Marshall springs for automobile backs and cushions; the Polson Mfg. Co., auxiliary seats, and windshields, and the Lipman Air Appliance Co., maker of air, water and oil pumps. He is also handling the account of the M. J. Whittall Associates, makers of automobile carpets.

The name of the Knepper-Knight Co. has been changed to the Knight Co., the latter company having taken over all the interests that H. H. Knepper had in the former company. The company has the distribution of Soss hinges, Eaco horns, Inland piston rings and Boston gasoline gages.

Cowie Electric in Wichita—The E. S. Cowie Electrical Co., Kansas City, Mo., maker of electrical motor appliances, has acquired a lease on a building in Wichita, Kan., and will establish a branch house there before June 1.

Canadian Trade Items—The Dominion Automobile Co., handling the Hudson and Peerless cars, is installed in its bright and commodious new quarters at 146, 150 Bay Street, Toronto, Ont. A complete service department with a full compliment of parts has been installed.

S. Trusler, Hupp agent for the counties of Essex and Lambton, has formed a new company to be known as the Trusler-Carrick Co. This company has rented a fine showroom at 63 Ouellette Avenue, Windsor, besides show rooms and garage at Sarnia. In addition to the Hupp, the full line of the Gray-Dort Co. will be handled. Mr. Trusler will manage the Windsor business and Mr. Carrick will look after the business in Sarnia.

Northwest News—The Mitchell Motor & Service Co., Seattle, will shortly begin the construction of a new home at East Pine and Summit Avenue. The new Mitchell Building will provide 12,000 sq. ft. of floor space.

Hugh Chalmers, president of the Chalmers Motor Co., spent the past week in Seattle as the guest of J. C. Garner, local Chalmers representative. He was also the guest of the Seattle Ad Club, to whom he gave an intensely interesting and instructive address, which was heard by more than 300 prominent Seattle business men.

G. N. Bussell and A. Goodrick, proprietors of the Glendale Auto Brokerage Co., Tacoma, have taken the Western Washington distribution for the Trailmobile.

Tire Pump

What About You?

Motorists are becoming more and more educated to the conveniences of the Stewart Tire Pump.

They also must better realize what a superior pump it is to all others.

We judge this from the splendid condition of our pump business.

Each week sales increase and letters of satisfaction pour in.

Progressive dealers are taking advantage of this and making money.

Are you?

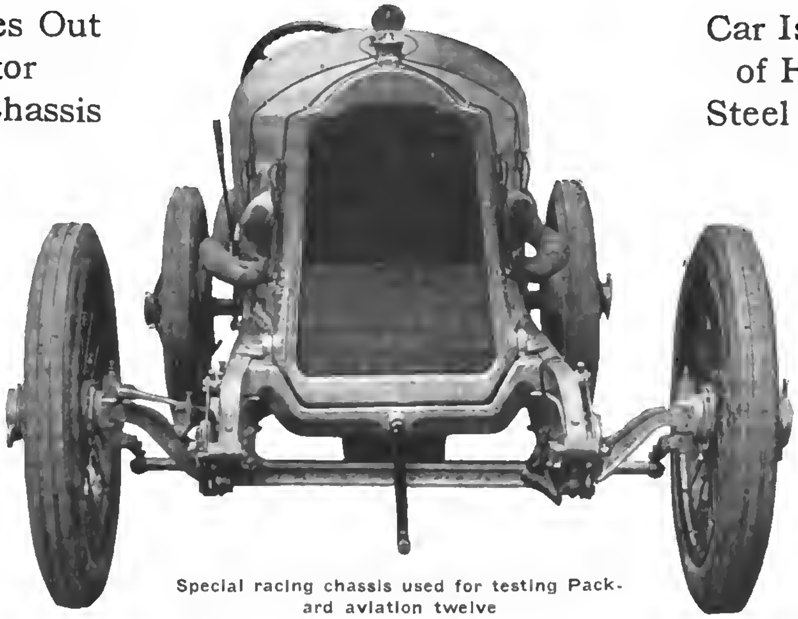
300 Cu. In. Twelve for Aviation

Packard Tries Out New Motor In Special Chassis

Car Is Masterpiece of High Tensile Steel Construction



Special racing chassis used for testing Packard aviation twelve

THAT the Packard Motor Car Co. has for some time been developing a twelve-cylinder aviation engine has been well known, and as was announced last week in THE AUTOMOBILE, the first of these motors is now being tried out for endurance in a special chassis. It is now several years since the Packard engineers began to study and develop high speed engines and the research work which led up to the aviation engine was commenced long before the appearance of the Packard twin six.

J. G. Vincent, engineering vice-president of the Packard company, has several times stated publicly that all their experimental work led them to believe that there were advantages in the twelve-cylinder engine which made it the best type for endurance at high speed. The production of the 3 by 5-in. twin six motor used in the Packard car vindicated many of the theories, since the twelve-cylinder engine showed itself the superior in almost every respect of carefully constructed experimental six-cylinder engines of the same total piston displacement.

Packard Aeroplane Twelve

Piston displacement	300 cu. in.
Bore	2 21/32 in.
Stroke	4½ in.
Normal hp	100 at 2300 r.p.m.
Four valves per cylinder	
Valve diam	1 7/16 in.
Valve lift	0.34 in.
Piston speed at 2300 r.p.m.	1725 ft. per min.
Weight	500 lb.
Ignition	Delco
Lighting and Starting	Delco

Practically as soon as the success of the twin six stock motor was assured designs were started for two other engines intended solely for aviation. One of these was designed to produce about 100 hp. and since this required approximately 300 cu. in. Mr. Vincent decided to limit the displacement to exactly this volume, as it facilitated ready comparison with other types of high-speed motor developed for racing car work. Therefore, the dimensions chosen for the small engine were 2 21/32-in. by 4½-in. and this is the size of engine with which experiments are now being made. The large motor which is under course of construction has a bore and stroke of 4 in. by 6 in., giving approximately 900 cu. in. piston displacement. Both the large and small motor follow the same general lines so the description of the little engine which follows applies in the majority of respects to the large one which will be ready for testing in a short time.

For aviation work regular torque and absence of vibration are very important. The regularity of torque has a value in increasing the efficiency of the propellor while vibration, if present, is destructive to the necessarily somewhat fragile structure of the aeroplane. Light weight is, of course, essential, but it is now customary to consider engine weight inclusive of the fuel, oil and water required. That is to say, it is the weight which must be carried for a flight of several hours' duration which is important and an engine which is economical of fuel and oil can easily be light when weighted together with supplies for a long flight as compared with another engine which is actually lighter so far as the metal part is concerned, but which is more extravagant in operation.

The small Packard aeroplane engine develops its requisite

There is no prettier racing car than the vehicle the Packard company has built to test its aeroplane engine. All the body is detachable in an instant. There is a 40-gal. gasoline tank inside the tail

100 hp. at 2300 r.p.m., and its weight is almost exactly 500 lb. The 100 hp., however, is very considerably less than the total ability of the engine, which will run and show increasing power up to speeds in the neighborhood of 4000 r.p.m. At 3300 r.p.m. the first engine gives 130 hp. The power curve is quite smooth as the motor speed falls off and the engine will run quietly and regularly at 300 to 400 revolutions.

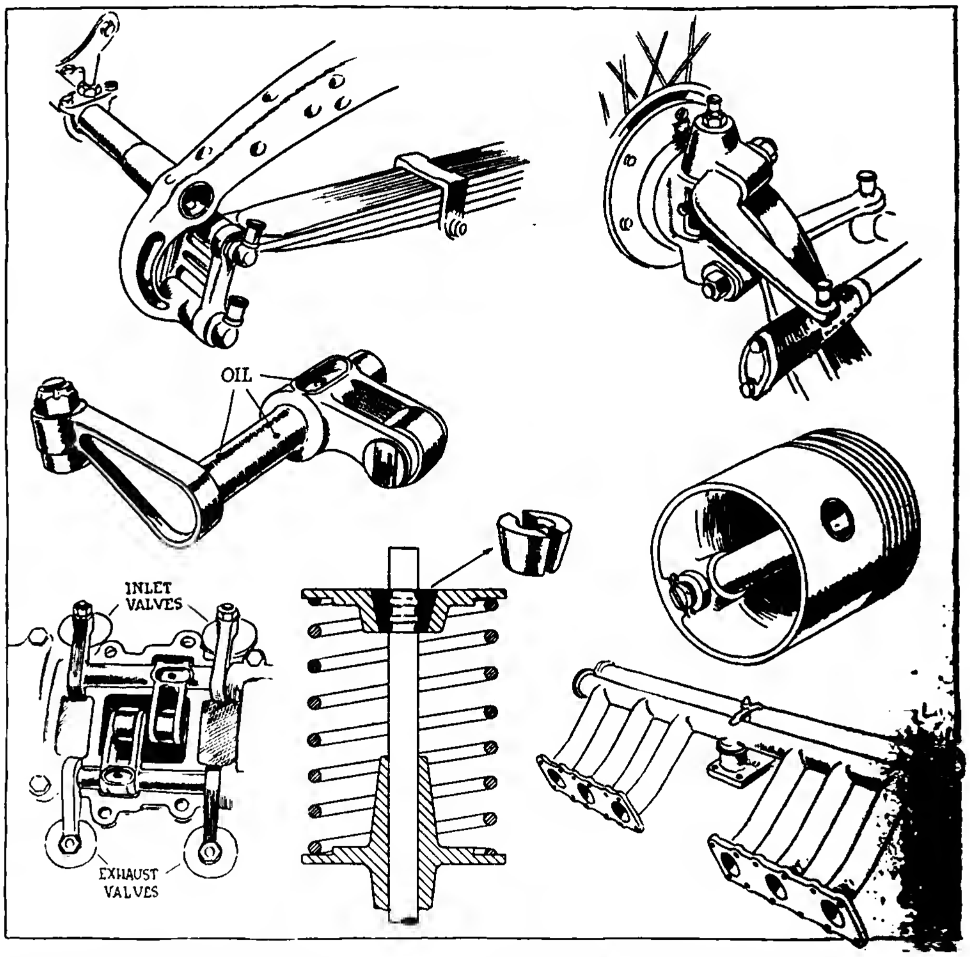
It is now several weeks since the first engine was put on the test block and at first it appeared difficult to find spark plugs which would withstand the very high explosion temperature which is obtained in the cylinders. This trouble has been entirely overcome and the test block failed to show any specific weakness in any part.

This being the case, Mr. Vincent decided to take a leaf out of the book of the Mercedes company and obtain his duration tests by putting the motor in a chassis which would permit it to run at full power for hours on end while exposing it to the shock and other indefinite circumstances that accompany a track test which seem impossible to imitate on the test block. It will be remembered that the Mercedes cars which won the French Grand Prix in 1914 were all fitted with the aeroplane engine which is generally regarded in Europe as being about the best that has yet been constructed. The Packard company has no intention of doing any racing, and it has been necessary to build a special chassis to enable the motor to be tried out properly. For about a week the chassis has been at work at Sheepshead Bay speedway showing lap speeds between 100 and 110 m.p.h. and speeds of 116 m.p.h. on the straightway. This is with a gear ratio giving less than 3000 r.p.m. at 100 m.p.h. No attempt has been made to check the speeds very accurately or to discover the maximum, the bulk of the running being done at about 100 m.p.h., a speed at which the motor is working just a little harder than it would have to work when its speed was held down by the proper size of propeller in an aeroplane.

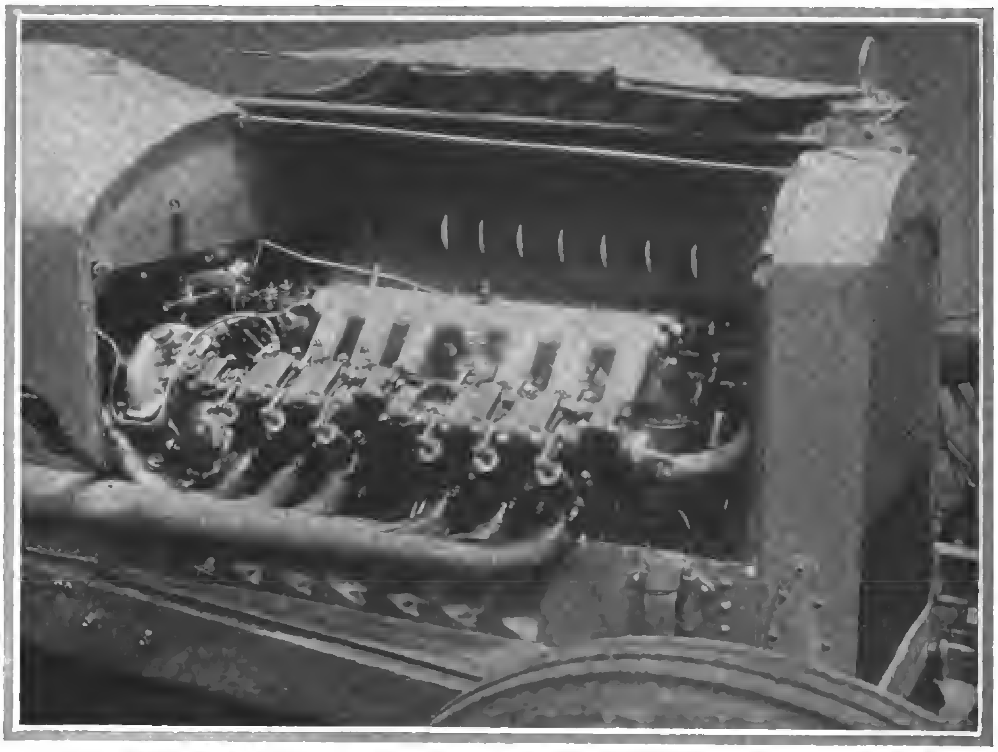
No one can possibly see the car which is being used to test this motor without regretting very greatly that it will not be seen in competition, since it is one of the prettiest racing machines that has ever been made.

In designing the chassis the endeavor has been to render it very highly efficient while making it strong enough to provide absolute safety, the object being to test the motor, and the greatest possible care has been taken to have the chassis perfect.

Coming to the mechanical detail of the engine, its design is based upon that of the stock twin six, but it differs very greatly in detail. Firstly, the cylinders are cast in blocks of three and have four overhead valves apiece. Possibly it is in the operation of these overhead valves that the most striking engineering advance is to be found. There is, of course, an overhead camshaft to each set of cylinders. With a camshaft above the cylinders it has always been troublesome to find means for operating the valves without at the same time losing quantities of oil. If rockers are used there is always a slit in the side of the casing through which the rocker operates and it is impossible to make this oil-tight. If the operation is direct as in the Peugeot or Sunbeam then there must be



Some mechanical details of the latest Packard twelve. The valve rocker in the center is machined from one piece and has a hollow shaft through which the oil flows from the small well at the top. Below is shown the arrangement of the rockers in position over the camshaft. A special form of split conical retainer is used to hold the valve spring seat on the valve stem as shown below in the center. The aluminum inlet manifold is in two halves, clamped together at the center, from which point the carbureter is suspended holes in the bottom of the casing through which the tappets pass to reach the valve stems. In the Packard design this trouble has been overcome by cranking the rockers. The lever which rests on the cam and the lever which touches the valve are at opposite ends of a short shaft. This means that the bearing of the rocker comes between the cam end, which is in an oil box, and the valve end which is outside. The length of the bearing provides a perfect oil seal so that the cam mechanism can be lubricated copiously and yet the valves will remain perfectly clean. This layout can be readily understood by referring to the photograph of the motor.



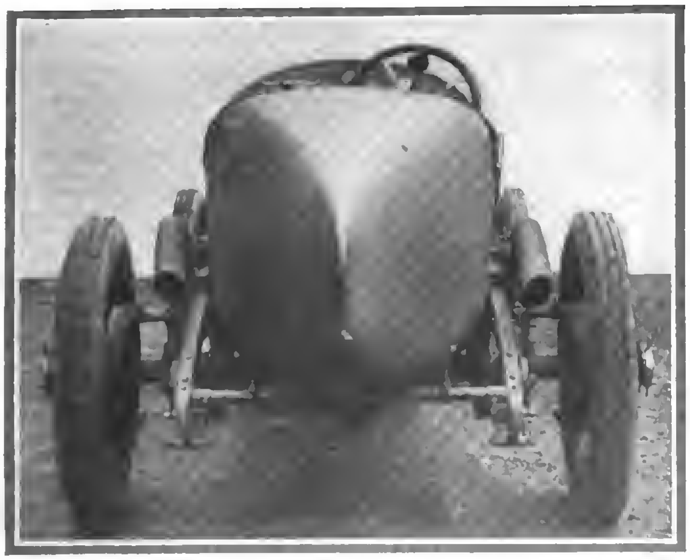
The Packard small size aviation engine fitted in a special chassis for testing it out on speedways. Note the overhead camshafts with the special form of rocker which prevents any loss of oil. Also the Delco ignition distributer and camshaft drive at rear end

Uses Spur Camshaft Drive

Considerable thought was given to the best methods for driving the camshaft, and, by making comparative layouts, it was found that the balance of the advantages favored the use of trains of spur gears. One of the most important advantages is that the parts of the spur gear trains are very simple and there are no thrust bearings required. Spur gears can be cut from very hard material and finished very highly so that there is no error in the timing due to backlash. Actually in this Packard motor when erected it was found that the maximum error in valve timing was 1 deg. on the flywheel which, as any engineer knows, is a remarkable achievement.

For a variety of reasons the rear location is chosen for the spur gears, the crankshaft pinion coming just in front of the flywheel bearing. Owing to the high grade of material the gears are quite narrow, that on the flywheel being only ⅝ in. wide.

For the connecting-rods the stock arrangement has been abandoned and the forked type used instead of the side by side. The reason for this is that the former arrangement is lighter. With an L-head twelve-cylinder engine, if the valves are well proportioned, the length becomes such that there is plenty of room for side-by-side rods. With the overhead valve, four-valve type of cylinder the length is so greatly reduced that there is not even room for forked rods, if the valves are taken as the limiting factor. Thus, having commenced with the valves the engine was lengthened just enough to give proper bearing surface for forked rods. These rods are made from very high tensile steel of I-beam section and are machined all over; an oil tube carries the lubricant to the piston pin.



Tapered tail of special Packard chassis. Note the two exhaust manifolds

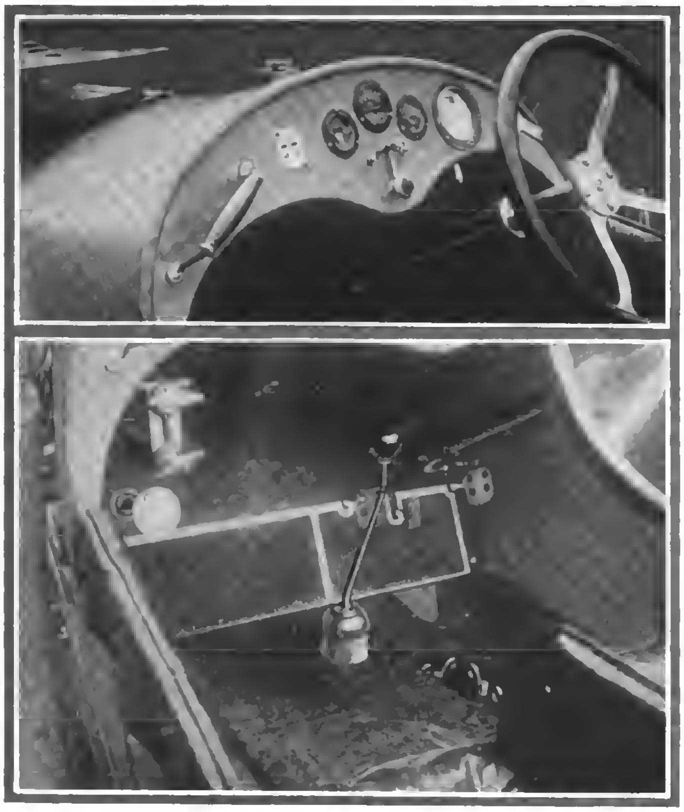
Has Unique Crankshaft

The crankshaft is very unusual as the webs are triangular in end elevation. This design was developed by experiments made to discover the design which would provide the greatest rigidity with the least weight. For both the main bearings, of which there are three, and the crank pins, the diameter is 1⅞ in., but the triangular webs are so strong that the shaft is completely free from whip throughout the whole speed range. It has already been stated that the connecting-rods are very light and this lightness extends to the pistons. These are die-cast aluminum alloy and the whole piston assembly with four rings and piston pin complete weighs 11 oz.

It is when the valves are examined analytically that one of the advantages of the twelve-cylinder construction appears. In these little cylinders, 2 21/32 bore, there is room for four valves 1 7/16 in. in the clear. The angle of seat is 45 deg. and the lift 0.34 in. This gives 1 sq. in. of valve opening for each 17 cu. in. of piston displacement. The 300 cu. in. Mercedes four-cylinder aeroplane engine has the largest valves which can be accommodated, and the valve opening in that engine is 1 sq. in. for each 25 cu. in. displacement.

Another advantage appears when the piston speed is studied since a 4½-in. stroke at the normal running speed of 2300 r.p.m. gives a piston speed of only 1725 ft. per min.

A detail which shows up well in the illustration and yet may appear peculiar, is the design of the intake manifold. This is the result of much experiment and is giving better service than designs which appear to be a theoretical improve-



Above—The dashboard equipment of the Packard is in strong contrast with many cars designed for racing in that it is provided with very few gages. On the right is a revolution indicator, no speedometer being fitted. In the center is an ammeter, on the right a voltmeter, and at the left is the oil gage. The centrally placed lever controls the ignition, a hand advance being superposed; ordinary variations are cared for by the automatic advance within the timer

Below—Although not intended for actual racing, the brake equipment is very complete, to insure safety. This view shows the hand adjusting nuts accessible to the mechanic, and the pressure pumps. As in the view of the cowlboard, the absence of superfluous fittings is very noticeable

ment. Mr. Vincent explains the success of its design as follows:

In an intake the resistance to gas flow comes at the corners or bends and the resistance of the bend is much greater than the resistance in straight pipe. It is thus important that if there be any bends they should all be in the same position relative to the valves served. In this particular manifold the gas rising from the carbureter impinges against the top of the fore and aft pipe, where it spreads, and the distance from each valve to the main header is the same. As a method of demonstrating the accuracy of carburetion and the evenness of charge obtained with this manifold, the fact may be mentioned that when the engine is run without the exhaust manifold the length of the jet of flame from each cylinder is the same. You could hold a straight edge to the tips of the flames and none would overlap it any more than another.

Electric Starting for Air Work

All Packard aviation engines will be supplied with starting and lighting equipment. For this purpose Delco has developed a special small generator design for the high average speed of aeroplane service. This is mounted accessibly between the cylinder blocks. Having the generator and a small battery there seemed no need for any other ignition device than the Delco distributer, which has given such complete satisfaction on the stock twin six. Consequently, one of these is mounted at the rear end of the V. As soon as these engines are ready for delivery, which will be in quite a short time, they will be offered either with the starting and lighting equipment with Delco ignition or without any other electrical equipment but two magnetos. Up to the present the distributer has shown itself well up to the demands made by continued high-speed running.

For cooling, there is a single pump with a double outlet and this is mounted at the front of the crankcase, having its spindle vertical and a bevel gear drive from the front end of the crankshaft; there is no thermostat control. The lubrication system is on the same lines as the stock Packard motor, that is to say, each main bearing of the crankshaft is fed with high pressure oil, which is then taken to the crank pins and passes up to the piston pins. The various auxiliaries are fed independently and the two camshafts are fed from inside.

Has High Compression, Timing Normal

Two other facts about this engine which have a bearing on the power are the compression and the timing. The compression volume is designed to be 17 per cent of the total volume, giving a gage compression of about 110 lb. This high compression pressure is rendered possible by the small size of cylinder and the high thermal conductivity of the pistons, but it has a very destructive action on the spark plugs. The plug, with which all the tests have been made and which appears to be entirely satisfactory, is the Rajah, this being an ordinary stock pattern and not a special model. Mr. Vincent stated that one of these plugs could be heated red hot with a blow torch and then dropped into cold water without any damage to the porcelain.

The timing is quite ordinary:

Inlet opens 5 deg. after top center.
Inlet closes 40 deg. after lower center.
Exhaust opens 47 deg. before lower center.
Exhaust closes 5 deg. after top center.

It will be noticed that the exhaust closes and the inlet opens at the same instant, but there is no overlap.

It is well understood that one of the advantages of four-valve construction is that the smaller valves need but light springs. This is particularly true with the very small parts in the Packard engine since the valves are so light that the spring pressure required is quite small. Actually the pressure of the spring when the valve is fully open is only 52 lb., this falling to 38 lb. when the valve is closed.

Rear Axle Cost $1,000

A few words may be added about the chassis in which this engine is being tested for it is no less remarkable a piece of work in its way. The gearset bolts to the crankcase and the steel flywheel contains a single disk clutch of very light construction. Back of the gearset there is a large and very powerful transmission brake, this being metal-to-metal, as are the rear wheel brakes, all the shoes being cut out from high tensile material so as to obtain great rigidity with minimum weight. The rear axle has a chrome nickel steel housing in two parts split vertically in the center and each half is turned from a solid billet of steel. It is stated that each of these halves cost over $350, bringing the price of the axle to $1,000 or over. The steering gear has been specially designed also and, like the rest of the chassis, is made of the strongest steel that can be obtained.

There is no need to say anything about the shape of the body as this is sufficiently described by the illustrations. Its method of attachment, however, is not so obvious. At the tip of the tail a small socket will be noticeable. This contains a bolt which holds the top part of the body in place. At the front end by the cowl there is a pair of hinge clips. The pins for these form the attachment for the two ends of the rear hood strap. Thus, to remove the body the hood strap is taken off, the two hinge pins unhitched and removed, and the single bolt at the tip of the tail taken out; the body can then be lifted off complete. To give it ample lateral security a steel sill is carried along the top of the frame, the body setting into this, and there are a number of dowel pins along each side.

The chassis altogether represents a distinct advance upon the best work which Europe has so far produced.

24-Hour Record Gained by Hudson

Mulford, Driving Whole Distance, Covers 1819 Miles at Average Speed of 75.8—Old Record Beaten by 238 Miles

Ralph Mulford at the wheel of the Hudson Super Six ready to start on his trial for the twenty-four hour record

SHEEPSHEAD BAY MOTOR SPEEDWAY, May 2—The twenty-four hour record which has stood for nearly eight years has been beaten by Ralph Mulford driving a Hudson Super Six. The new record is a trifle over 1819 miles at an average speed of 75.8 m.p.h. The original record was made by S. F. Edge driving a Napier on the occasion of the opening of Brooklands track in England, June, 1908. Like Mulford, Edge himself drove throughout the entire time, covering 1581 miles, his intention being to better 60 m.p.h. Since this time the twenty-four hour record has stood unattacked.

Mulford's fastest lap was made at 89.4 m.p.h. after covering 1526 miles. He made sixteen stops, of which the longest was 6 min., this being for gasoline and oil and to tighten the grease cups. Throughout the entire distance only one tire was changed; one of the most remarkable features of the run. The tires used were Goodrich Silvertown cords.

Up to the sixteenth hour Mulford had averaged 77 m.p.h. and 10 m.p.g. of gasoline and 150 m.p.g. of oil. His average speed at 500 miles was 77.1; at 900 miles, 77.2; at 682 miles, 77.5; at 1100 miles, 77.04; at 1200 miles, 77.33; at 1000 miles, 76.4.

He had changed mechanicians several times but intended to drive the whole distance himself. The stops made, with the duration of each, were as follows:

First stop on the seventy-first lap or 142nd mile, taking on 13 gal. of gasoline, 1 gal. of oil. Time, 1 min., 21 sec.

Second stop was on the 151st lap where he took on 5 qt. oil, 14 gal. of gasoline and water. He also oiled the shock absorbers. Time, 1 min., 35 sec.

Electric timing device used for Hudson twenty-four hour run

Third stop was on the 226th lap where he snatched a mouthful of food and stocked his car with 12 gal. of gasoline and 1 gal. of oil, also 1 qt. of water. Time, 3 min., 15 sec.

Fourth stop, 302nd lap, gas 13 gal. oil 1 gal. Changed mechanician. Time, 3 min., 8 sec.

Fifth stop, 378th lap, oiled the shock absorber, 12 gal. of gasoline, 7 qt. of oil. Time, 4 min., 2 sec.

Sixth stop, 453rd lap, 13 gal. of gasoline, 5 qt. oil. Food and coffee for driver. Time, 4 min., 4 sec.

Seventh stop, 530th lap, mended bonnet clip. Took on 14 gal. of gasoline, 1 gal. of oil. Time, 4 min., 6 sec.

Eighth stop, 601st lap, 12 gal. of gasoline, 1 gal. of oil. Time, 3 min., 30 sec.

Mulford slowed down on the 622nd lap and stopped on the 623rd lap for a short time because the officials wanted to de-

(*Continued on page* 834)

Electric Transmission Is Indiana S. A. E. Subject

Animated Discussion Follows Presentation of Paper by J. B. Entz Giving Details as Applied to Owen Magnetic Cars—Tests Held on Speedway

INDIANAPOLIS, IND., April 28—The Entz system of electric power transmission as applied to the Owen Magnetic car engaged the attention of the Indiana section of the Society of Automobile Engineers this afternoon and this evening. R. M. Owen and Justus B. Entz turned an Owen Magnetic car over to the research division of the section for a series of tests on the speedway. This was followed by a presentation of a paper in the evening by Mr. Entz before 200 members of the section. This paper was entitled The Electric Transmission on Owen Magnetic Cars and gave in brief the design and operation of this transmission, together with a presentation of its advantages. Inasmuch as the subject matter of the paper was more for the purpose of bringing out discussion and has been published in somewhat slightly different form in previous issues of THE AUTOMOBILE, a brief summary of the paper will be sufficient.

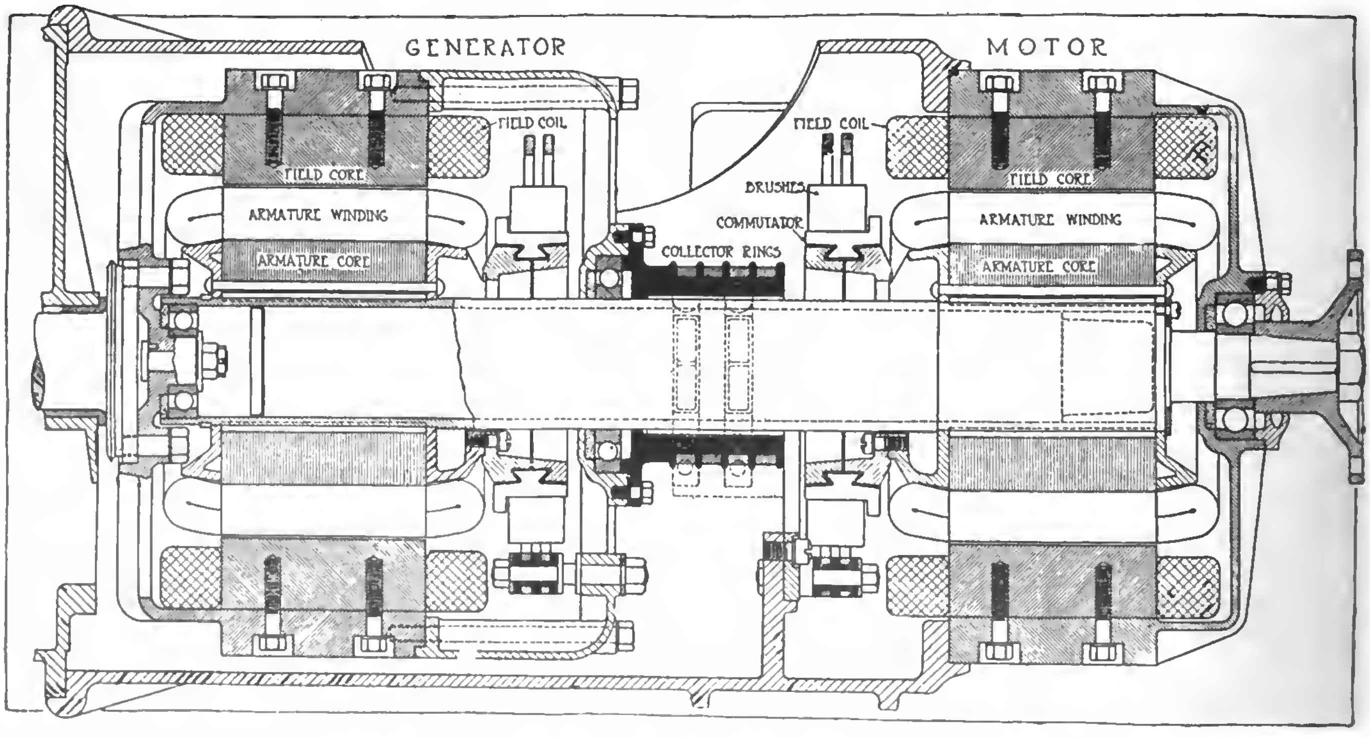
Summary of Paper

In place of the flywheel clutch, gearset, starting and lighting system and their auxiliary parts, two direct current dynamo machines and a drum controller have been substituted. One of the dynamo machines has its field magnet frame directly connected to the engine crankshaft, taking the place of the ordinary flywheel. The armature of this machine is mounted on a large, hollow shaft, which is directly connected to the propeller shaft. This machine is called the clutch generator, as it acts both as a clutch and a generator. The second dynamo machine has its armature mounted on the same hollow shaft as the first, and its field magnets are stationary; it is called the motor, as it is generally used as a motor to help drive the propeller shaft, and boost the effort of the engine as transmitted through the clutch generator, which, like any clutch, can only transmit the engine effort or torque.

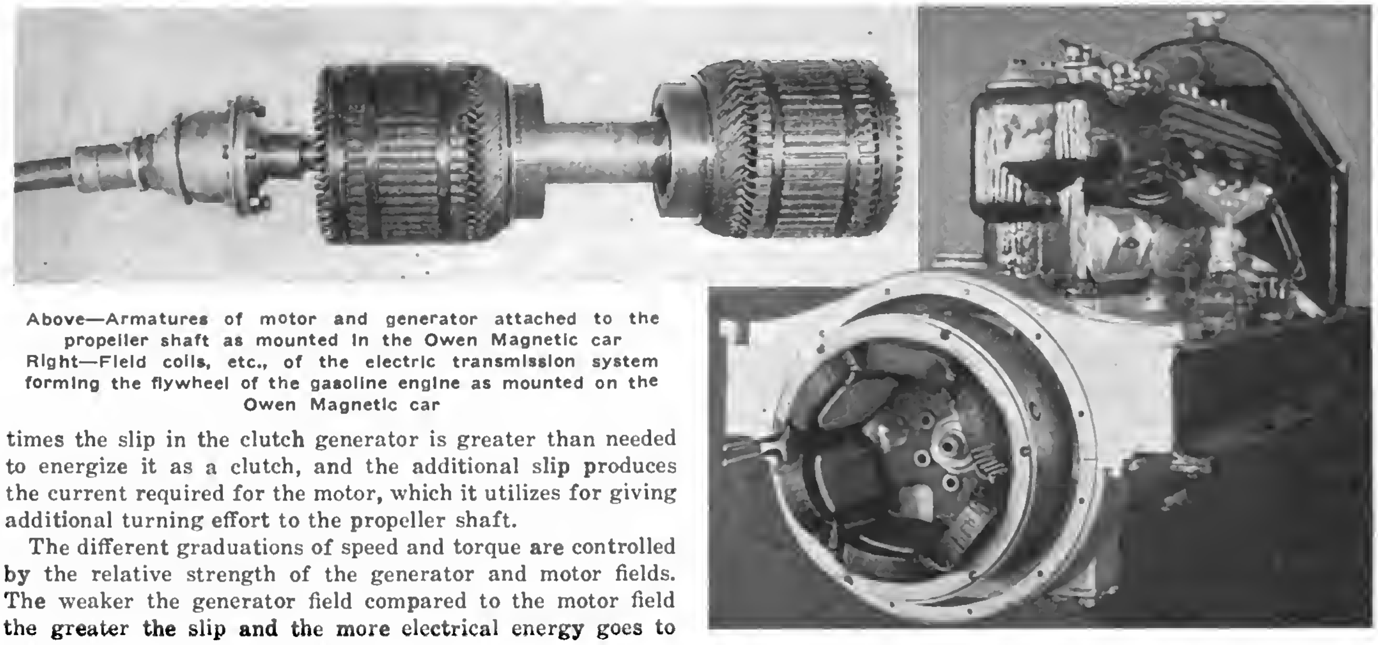
The clutch generator is used as a clutch alone, on the high speed, when it is short circuited upon itself, and a small speed difference between armature and field, or a small slip is necessary to establish the current in its windings which energizes it and causes it to act as a clutch. On the high-speed position the motor plays no part in the transmission of power, but is used as a charging generator for the storage battery, which latter is used for cranking the engine and for the electric lights.

Electric Motor Aids Propulsion

On all other power control positions but the high the motor helps turn the propeller shaft, by taking current from the clutch generator in which circuit it is included. At these



Section through Owen-Entz electric transmission. Generator field cores and coils form the gasoline engine flywheel and the collector rings shown are for the purpose of connecting the field current of the generator to the various circuits. The brushes of the generator revolve with the field. The two armatures are identical and both are keyed to the hollow shaft which is attached to the propeller shaft and has no connection with the gasoline engine



Above—Armatures of motor and generator attached to the propeller shaft as mounted in the Owen Magnetic car
Right—Field coils, etc., of the electric transmission system forming the flywheel of the gasoline engine as mounted on the Owen Magnetic car

times the slip in the clutch generator is greater than needed to energize it as a clutch, and the additional slip produces the current required for the motor, which it utilizes for giving additional turning effort to the propeller shaft.

The different graduations of speed and torque are controlled by the relative strength of the generator and motor fields. The weaker the generator field compared to the motor field the greater the slip and the more electrical energy goes to the motor for producing greater torque.

Besides the positions of power control, there is a neutral position in which the clutching effect is cut out, but the motor is so connected through a resistance as to act as an electric brake, in which case it becomes a generator, taking power to drive it, and so braking the car. This brake is not effective when the speed is highest and is ineffective below 15 m.p.h.; it will hold the car on any mountain grade to 20 m.p.h. without wear of any parts and can be applied with the car going 60 m.p.h. It cannot hold the wheels and there is little danger of skidding, as the braking effort disappears at speeds below 15 m.p.h.

Outside of the simplicity of the system and the fact that it displaces complicated and objectionable parts of the prevailing type of motor car, there are features that appeal to those that drive and ride in a car.

Power Impulses Eliminated

In the first place, all power impulses of the gas engine are eliminated, and the turning effort impressed on the propeller shaft is as uniform and smooth as that from an electric motor; in fact, it is exactly the same. No jars or shocks can be transmitted through the elastic means of transmitting the engine power, as there is no mechanical connection at all between the engine and driving shaft.

In the second place, from the time of starting the car from a standstill until maximum speed is reached and through all the range of power required from level road to the worst hills, the power between the engine and propeller shaft is never disconnected, as is the case where clutch is thrown out, a gear change made and clutch engaged again. This is all controlled by the small lever on top of the steering wheel and allows the car to be manipulated in traffic and on winding, irregular grades in a way to call forth all the power of the engine at just the instant and for just as long as it is needed. The car can be held on a grade by its engine power, the clutch generator slipping and holding with the aid of the electric motor, ready at once to go forward upon opening the throttle or by closing the throttle slightly, the car can be allowed to back, then hold, then forward again, and then up to the maximum speed the grade allows; all without disconnecting the power of the engine from the driving shaft.

Acceleration Is Smooth

From a standstill with the engine idling, the car can be smoothly and rapidly brought up to the speed of traffic in cities, 20 to 25 m.p.h. without a jar or jerk. Acceleration is so smooth as to seem less rapid than it really is, and it is accomplished without any previous speeding up of engine before dropping in of clutch and gear changes made at high engine speed, as is the case when a rapid get-away is made in a geared transmission car.

Another feature is the coasting of the car upon closing the throttle, the principle of operation of the clutch generator being that it will only clutch when the engine is running faster than the driving shaft, so upon closing the throttle the car coasts or drifts perfectly free, with the engine idling. idling.

Discussion of Paper

Chairman F. E. Moskovics, Nordyke & Marmon, opened the discussion by reading a letter from David E. Gallup of the Worcester Polytechnic Institute and chairman Research Division of the Standards Committee of the parent society, asking a number of questions as to the efficiency and torque of the transmission system. In reply, Mr. Entz stated that the efficiency was very high, that the apparatus is similar to a dynamometer in which the losses must be minimum. The only speed difference is that due to the losses and according to tests made by the General Electric Co., the transmission is without loss at the point of maximum torque of the engine. On ordinary level road work the torque required calls for a slippage of about 55 r.p.m. By that is meant that the crankshaft of the engine revolves about 55 r.p.m. faster than does the propeller shaft. At the point of maximum torque, it called for a slippage of 92 r.p.m., but this speed loss is a help at times, as it permits a higher engine speed and thus greater power development when the pull should be greatest. On hills the car does not run more slowly on account of engine slip, but the engine runs more rapidly, thus developing greater horsepower and torque. The principle is the same as slipping the clutch in the conventional type of car with the difference that instead of the energy due to the slip being used up in the form of heat in the clutch which in time will destroy it, the energy thus generated in the electrical transmission by this slippage is used in the motor portion of the electric machine to boost the driving effort.

Up to the point where the engine runs to the speed of maximum torque more power is developed than in the conventional type and the efficiency at 1000 r.p.m. of the engine is 93 per cent.

There can be no loss in friction, the only loss being in speed, and that is not so much a lower car speed as a higher engine speed.

In the matter of economy Mr. Entz stated that parallel tests using cars similar in every respect except the transmission showed better economy of fuel with the electric transmission. This is due chiefly to the saving effected in coasting.

Asked as to a surging effect at certain speeds, Mr. Entz said that this was a matter of expertness of the driver, that because of the complete mechanical disconnection between engine and propeller shaft and the cushioning effect of the magnetic clutch, no inequalities of engine running could be transmitted to the rear axle nor could the road surface cause uneven running. If the car were drifting and the controller handle placed in the wrong place, there might be a slight surging effect.

Asked by R. W. Knowles of the Milburn Wagon Co. as to the amount of added weight and cost in a car equipped with the Entz transmission and also if it were possible to employ an electrical method for reversing instead of the gear reverse employed in the Owen, Mr. Entz stated that electrical reversing mechanism could be employed but the mechanical method gives all the speeds in reverse.

Weight Difference Negligible

As to the difference in weight, there is practically no difference. In some installations the weight has run a little higher for the electric and in others it has run a little lower. The price question is one of quantity production, but the electric system has the advantage of providing directly a method of running in the engine by using the electrical apparatus on the car and shop current also providing a direct dynamometer test. It has been found that the complete apparatus can be assembled in two and a half hours on the bench.

Guy B. Wall, chief engineer of the National Motor Vehicle Co., stated that to adopt the system it would be necessary to give up a thoroughly trustworthy and satisfactory apparatus, the present gear transmission and friction clutch, and suggested that it would be interesting to make some experiments in driving cars under tests such as those performed to-day on the speedway, first with the electrical transmission and then with the gear transmission and friction clutch substituted.

He also thought there was an advantage in the conventional type of drive in being able to use the momentum of the flywheel in getting out of a hole. The effect with the electric transmission would be like using a lead hammer instead of a hard steel hammer. With the same energy applied, the effect would be considerably different.

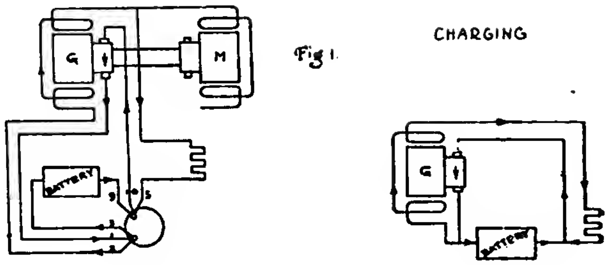
No Changes Made

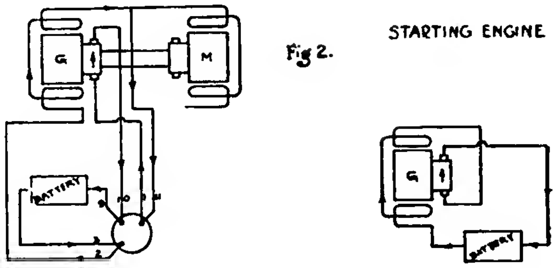
Mr. Wall asked what change had been made in the system during the past two years, to which Mr. Entz replied that there had been no changes in that time.

Asked as to whether the drag of the electric motor was perceptible at high speed, as had been charged against the electrical starting and lighting apparatus, Mr. Entz stated that the drag in charging the battery is considerably less than that of most lighting generators on cars to-day, because the small size of those units prevented their efficiency being high. In regard to pulling out of a hole, Mr. Entz said that the transmission would handle the maximum torque of the engine, which is all any transmission can do, and that the maximum with drawbar pull with the Entz system can be obtained even with the car at a standstill.

A Road Test

George W. Weidely of the Weidely Motors Co. reported on some comparative tests he had made of the Entz transmission, stating that a year ago last September he drove a car from New York to Indianapolis with the conventional gearset transmission and Ray Owen drove another car which was a duplicate in every respect except it had the Entz transmission. In order to make sure that conditions were identical throughout the run, the drivers were interchanged at times, and when one shield went up or down both went up or down, tops were put up and down at the same time, and so on. They covered the 1059 miles in thirty-nine hours, during all but six of which it rained. The geared car weighed 42 lb. less than the electrically equipped car.





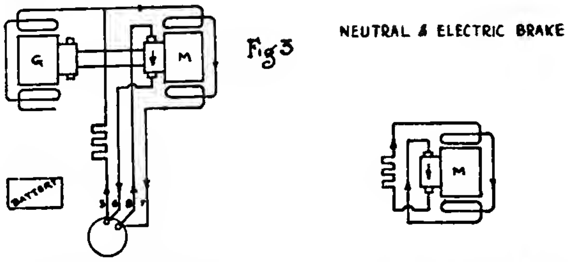


Fig. 1—Connections showing one way of charging the battery with the electric transmission system while the car is standing; this is done from the generator and a much higher rate of charge is possible than would be safe to establish for running conditions. Thus, if the battery is run down it can be brought up in a short time as a high rate of charge is permissible for a battery that has not reached the gassing point and is not warm

Fig. 2—Connections when the clutch generator is being used as an engine starter; in this case the field and armature connections are reversed so as to turn the engine forward, and the starting battery is included in its circuit

Fig. 3—Connections when in neutral position when the clutching effects is cut out but the motor is so connected through a resistance as to act as an electric brake in which case it becomes a generator taking power to drive it and so braking the car. The brake is not effective when the speed is highest and is ineffective below 15 m.p.h. It cannot hold the wheels and there is little danger of skidding as the braking effort disappears below this speed

On level roads there could be noticed no difference in speed capability. On most hills the electrically equipped car could run away from the gear-driven car on account of its ability to change the gear ratio to suit the hill. There was so little difference in the ability on the road that it was not measurable. Both cars obtained a speed of 64 miles an hour. As to fuel economy, Mr. Weidely stated that there was so little difference in the figures of the fuel consumption for the run that had they been interchanged it would be impossible to tell which was which.

R. H. Combs, manager of the Traffic department of the Prest-O-Lite Co., and secretary of the section, asked as to the current and voltage in the system, Mr. Entz replying that the current depended upon the torque and the voltage depended upon the slip and torque.

Asked by Darwin S. Hatch, editor *Motor Age*, as to the possibilities of eliminating slippage completely at high speeds by the introduction of a friction method of clutching by centrifugal or other means, similar to that which has been suggested by another company, Mr. Entz stated that it was his belief that he suggested it originally a good many years ago, in the form of a centrifugally-operated mechanism but found it necessary to discard the system, because with it the smoothness and cushioning effect was lost. He said it was the endeavor to eliminate the possibilities of wear in the transmission, and as proof that the purely electric transmission is free from wear cited the old Columbias which were made in 1907, nine years ago. All turned out are still running and the electrical transmission has never been touched or even oiled.

6TH POSITION

GENERATOR SHORT CIRCUITED MOTOR MADE INTO GENERATOR BY MEANS OF SHUNT FIELD AND IS CHARGING BATTERY

Fig. 4—In the first power control position the generator field is shunted so as to weaken it while the motor field is full strength, being unshunted

Fig. 5—Both fields are unshunted but the motor field is still the stronger, due to its being wound with more turns

Fig. 6—The generator field is unshunted but the motor field is shunted by means of which it is weakened as compared with the generator field, in which case it gives less torque for a given current but also less counter electro-motive force and therefore less slips at the generator

Fig. 7—The motor on this position has a shunt field opposed by a series field in the battery circuit, making it a differential generator with an inherent self-regulating characteristic. On all other power control positions but the high the motor helps turn the propeller shaft by taking current from the clutch generator, being included in this circuit. At these times the slip in the clutch generator is greater than needed to energize it as a clutch and the additional slip produces the current required for the motor which it utilizes for giving additional turning effort to the propeller shaft

Use of Two-Speed Gearset

G. P. Dorris, president of the Dorris Motor Car Co., considered that in the present condition of the automobile industry that the demand was for abnormal power and all high gear work and asked as to the possibility of using the two-speed gearset in conjunction with the electric transmission in order to get flexibility. In reply Mr. Entz stated that they had built some cars with two-speed gearsets of this sort which gave double the number of speed changes possible with the direct drive only.

Suitable for Trucks

R. M. Owen explained that they realized the possibilities of the truck field but up to the present had preferred to develop the passenger car end, although they expect definite data on cost of operation and maintenance in about two months from a number of trucks they have in service.

Tests on Indianapolis Speedway

Preliminary to presenting the paper some tests were made on the Owen Magnetic equipped with the Entz transmission and driven by R. M. Owen, president of the original Owen company. These tests were run on the Indianapolis speedway by the research committee of the Indianapolis section S. A. E., and under Charles P. Grimes of the National company and Chester Ricker of the Stutz company. These tests were made to determine the current required at different speeds and also acceleration and deceleration tests from which the drawbar pull and horsepower used to propel the car were calculated by the following formulæ:

$$F = \frac{5170 \times 10}{t \times 21.95} = \frac{2357}{t}$$

$$Hp. = \frac{FV \text{ mean}}{375}$$

It was shown that at a car speed of 10 m.p.h. the current was 35 amp., at 15 it was 35 amp., and from that speed to 50 m.p.h. increased gradually to 77.5 amp. The drawbar pull was shown to vary from 69.9 at approximately 20 m.p.h. to 109.6 at a speed between 30 and 40. Acceleration figures gave 4.3 sec. from standstill to 10 m.p.h., 3.8 from 10 to 20, 7.1 from 20 to 30, and 11.9 from 30 to 40.

REPORT OF TEST ON OWEN CARS ON INDIANAPOLIS MOTOR SPEEDWAY, APRIL 28

Gear ratio, 3½ to 1.	Barometer 29.39 in. hg., 35-in. wheel.
Weight of empty car, 4540 lb.	Temperature, 64 deg. Fahr.
Weight of loaded car, 5170 lb.	

First Test

Car Speed M.P.H.	Amp.
10	35
15	35
20	45
25	52.5
30	55
40	55
45	60
50	70
55	77.5

Second Test—Deceleration (Neutral)

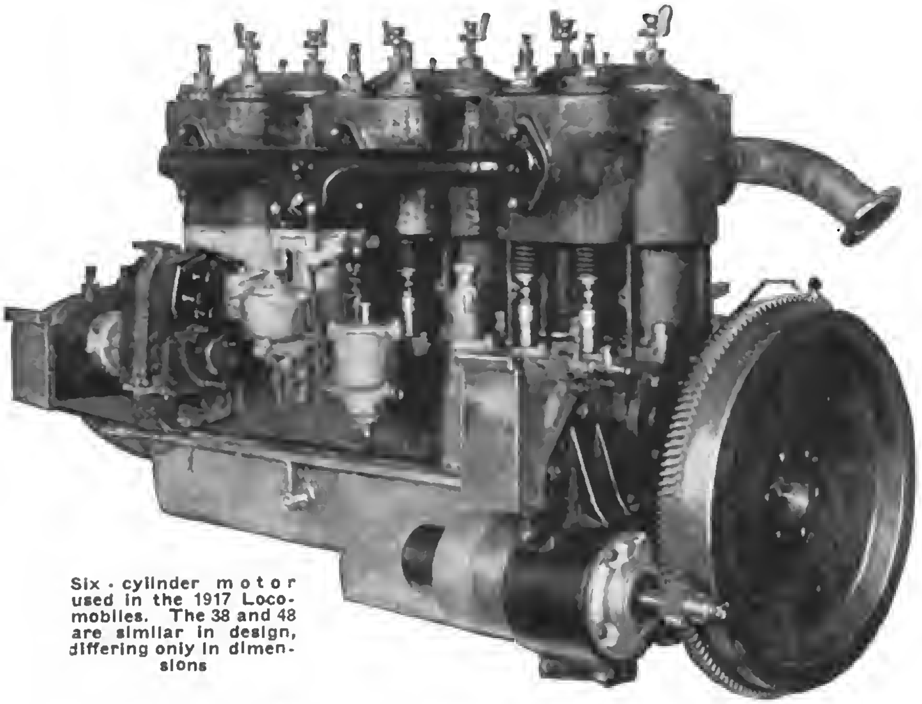
M.P.H.	Mean Time, Sec.	Draw Bar Pull, In.
15-5	25.6	92.0
20-10	31.9	73.8
25-15	33.7	69.9
30-20	27.9	84.3
30-25	21.5	109.6

Third Test—Acceleration

M.P.H.	Mean Time, Sec.	Draw Bar Pull
0-10	4.8	548.0
10-20	3.8	620.0
20-30	7.1	331.9
30-40	11.9	197.8

Locomobiles Improved in Detail

38 and 48 Chassis Continued for 1917—Bodies Are Lower—Starting Motor Re-Designed



Six-cylinder motor used in the 1917 Locomobiles. The 38 and 48 are similar in design, differing only in dimensions

LOCOMOBILE chassis and bodies for 1917 follow much along the lines of the past six years except for detail changes intended to give the final touch of refinement to cars which are designed specifically to be the last word in beauty and luxury. At first sight the two sixes which are now in their seventh and sixth years, seem little changed as compared with a year ago. A detail study, however, shows perhaps sixty alterations which, although none are fundamental, combine to make the Locomobile for the coming season a product improved in many particulars as compared with its predecessor.

New two-stage carbureter made under the Ball patents, which will be a feature of the 1917 Locomobiles

Cars Are Lower

Broadly speaking, Locomobile cars for 1917 are more beautiful in appearance because they are lower. They are more easy-riding due to a re-arrangement of the suspension and they are faster under all sorts of conditions, having better acceleration and a higher maximum speed due to a new carbureter, lighter reciprocating parts and a better balanced motor. Taking the car as a whole in every feature of value to the owner the 1917 Locomobile is a better car than that of 1916, due simply to a greater attention to detail which renders every step in manufacture a matter of painstaking care on the part of each individual workman.

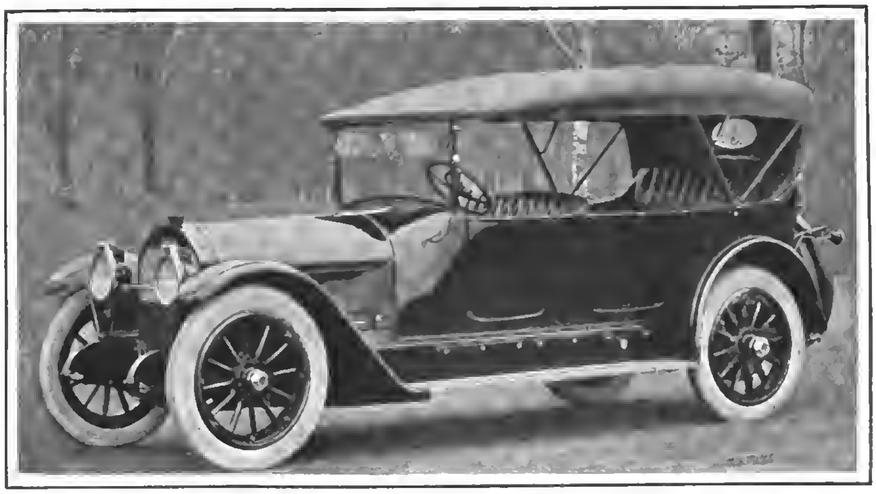
Prices Are Higher

These refinements have been accompanied by a change in price due to the increased cost of material. The seven-passenger on the larger six-cylinder chassis, which will continue to be known as the 48, sells for $5,400. The 38, also a six-cylinder chassis, lists at $4,600 in the seven-passenger size. The other cars listed for 1917 are six-passenger bodies on both the 38 and 48 at the same price as the seven-passenger, a limousine selling for $5,600 on the 38 and $6,500 on the 48, a landaulet at $5,700 on the 38 and $6,600 on the 48 and berlines selling for $5,900 on the 38 and $6,800 on the 48. In addition, there is a four-passenger special car at $4,750 on the 38 chassis. This four-passenger job is a new product and only a limited number will be built.

Mechanically a number of detail refinements will be found throughout the car, although none of them rank as radical. Probably the change having the greatest effect on the car is the re-arrangement of the spring suspension in which the front springs have been increased to 40 in. in length, whereas they were 38 in. They are considerably flatter and are a factor in giving the car a lower appearance. The re-arrangement of the front spring mounting has also had the effect of shortening the wheelbases 1 in. on both the 38 and 48 cars, making the smaller car 139 in. and the larger 142. This shortening of the wheelbase is not perceptible as, owing to the fact that the cars are lower, they give the impression of being longer and

To aid in making the Locomobile lower the front axle sweeps in a continuous curve between the steering knuckles instead of dropping abruptly the shortened wheelbase has not in any way decreased the body space.

Another factor in giving the car a lower appearance is that the front spring supports are lower than they were on the previous models and the front axle is swept in a continuous curve from steering knuckle to steering knuckle instead of having an abrupt drop. To balance the lowering of the front of the car the rear springs have been made very much flatter although of the same dimensions as previously. The lowering of the spring pads on the front axle has totaled 2 in., but, owing to the curve of the axle, no reduction in clearance has been made. Changes in the axle have necessitated other changes in the car particularly in the pivot tie rod which has been flattened out to harmonize with the curve of the front axle. Again, in changing the tie rod it has been necessary to shorten the pivot steering arms. At the rear an additional 2-in. kickup in the frame takes care of the lowering of the rear end of the car.



Locomobile six-cylinder touring car for 1917, showing the new body lines

Body Lines Altered

All the changes above outlined have given a total lowering of the frame of the car of 2 in.; but this is not all that has been done to produce a low appearing design. The body lines themselves have been altered so that the total height of the body has been reduced by about 3 in. These changes have been effected so that the continued line of the bonnet now harmonizes with the lines of the car, considerably flattening out the curvatures at the top of the body.

In carrying out this alteration in lines the shape of the top of the radiator is changed, the curve being flattened to harmonize with changes in bonnet and cowl. The bonnet is altered in size and shape, the width at the rear being increased while the horizontal lines at the side are raised 2 in. to match the change in the radiator and the top curve has been flattened for the same reason. The upper curved surface of the cowl is flattened and the instrument board is brought nearer to the driver. This series of changes has been carried back through the windshield, on which the curve at the lower part is changed to meet the curvature of the cowl and the windshield is now supported by special one-piece forged side braces built up inside the cowl.

Forward compartment of 1917 Locomobile, showing wide door and arrangement of levers to right and left of driver

Probably the most radical changes are in the starting system, of which the motor has been entirely redesigned and is an entirely inclosed unit. In place of the former double reduction of approximately 35 to 1 it now has a reduction of 10 to 1, giving a much lower armature speed. The pull-in switch is placed on the rear end of the armature shaft and is entirely enclosed. It is quieter than the former model and is now located on the left side below instead of the right side above the crankshaft.

An interesting change in connection with the installation of the starting motor is the fact that the teeth on the flywheel ring gear are now cut on a spiral at an angle of 13 deg. instead of being a straight spur gear as heretofore. This gives a silent and more positive engagement, and a quicker and easier disengagement, due to the shape of the tooth tending to push the pinion out of mesh.

The generator is now of the voltage control type and has been reduced to conform to existing 6-volt standards. The voltage of the 1916 generator was seven. Another electrical change is the installation on all models of the dual Eisemann magneto.

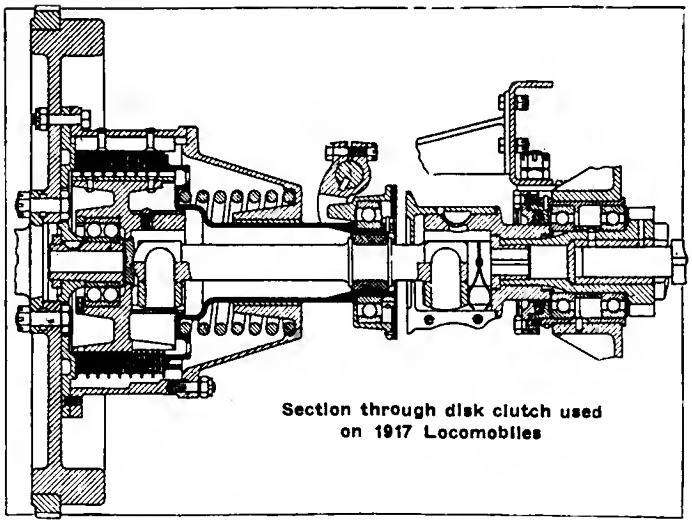
Other mechanical changes are even more of a detail nature than those mentioned. More forgings are used now than a year ago on the small parts. The pedals are now equipped with renewable rubber pads of rectangular shape, the ball bearings on the clutch pinion are enlarged in diameter and spaced farther apart.

Detail body changes are numerous, the bodies have been made stronger by means of special channel construction. There are now curtain compartments in the backs of the front seats which are quite different from those of last year. Instead of the two large pockets there is one large central pocket and two smaller ones on each side. This change is due to the new arrangement in having the auxiliary seats fold into the backs of the front seats.

The carpet used to form the covering for the floor of the tonneau is now Wilton instead of velvet on account of durability. The tonneau light is an entirely new type, being practically flush with the back of the front seats. The step light has also been improved by using a plain instead of a cut lens and the top is lighter in weight and more easily operated.

Chassis Are Similar

Practically exact similarity of design is used for the two Locomobile six-cylinder chassis. They are designated respectively as the N-7 and the R-7. The former has a 4½ by 5½ in. motor and the latter a 4¼ by 5 with maximum horsepower ratings of over 82 and 65 respectively. Wheelbases of the two cars are 142 and 139 in., and with these major differences the two chassis are the same throughout save for a few unimportant and minor details.



Section through disk clutch used on 1917 Locomobiles

Locomobile cylinders are T-head in shape, cast in pairs. The cylinders are of gray iron which has been aged before manufacture. Two rings are used in the pistons with an oil ring at the bottom. This is a change over 1916 when five rings were used. In fact, the whole piston design has been lightened materially, one of the ribs being taken out of the head and the rib around the middle between the piston pin bosses also removed. The inside of the piston is now machined as far as possible, still further reducing the surplus weight and in the weighing process they are checked to 1/16 oz.

Alloy Steel Connecting-Rods

Alloy steel connecting-rods of H section are used. These rods are also lighter as compared to a year ago, this reduction in weight having been accomplished by machining and hand filing. In checking the weights of the connecting-rods they are weighed to within 1/16 oz., and in balancing this work is carried out more carefully and accurately than in previous models as newly-designed special machinery has been introduced for balancing of crankshafts and flywheels.

One of the Locomobile features which has been continued through many years is the government bronze crankcase, which has a tensile strength of 80,000 lb. per sq. in. The oil pan is of cast aluminum and the four arms for the motor support are a part of the bronze casting forming the upper half of the crankcase.

Special chrome-nickel steel is used for the crankshaft and this is carried on seven main bearings. Bearings are all hand-scraped by men who specialize in this type of work. The scraping of the bearings is one of the points of pride of the Locomobile concern. The bearings are accessible by dropping the lower part of the crankcase.

Chrome-nickel steel forgings are used for the crankshafts and the cams are integral with the shaft. The exhaust camshaft is 1 1/16 in. in diameter and the intake ⅞ in. They are each carried by five bronze bearings, and in the hardening of the cams all parts of the camshaft except those to be hardened are copper plated and asbestos-wrapped to resist carbonizing action. The surfaces are rendered glass hard with the inner structure of the cam sufficiently tough to withstand the stresses of valve drive.

The gears for the camshaft are helical and are driven by an alloy steel pinion on the crankshaft. Chrome nickel steel gears are used for the water pump shaft and the magneto shaft.

Tungsten Valves Used

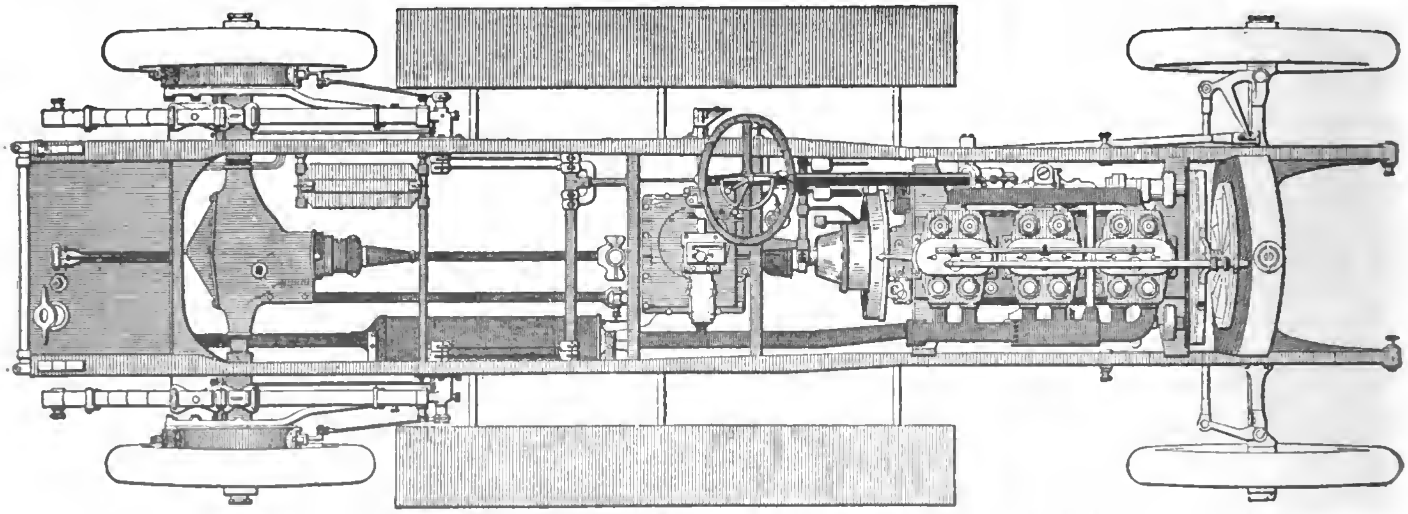
Tungsten valves are employed and these are ground to a true seat at the factory. It is intended with this material that no warpage should take place and the owner will be spared the trouble of frequent grinding. The tappets are also of alloy steel and operate in bronze guides, while the rollers are case hardened and operate on hardened pins. A new feature of the valve action is that in the 1917 cars the spring on the intake valve is just as stiff as that on the exhaust. This prevents the possibility of the riding of the valve at the higher speeds.

Lubrication is by an internal circulating system and is a combination low pressure feed and splash. The oil reservoir is in the aluminum oil pan at the bottom of the crankcase. The capacity of the 48 is 7 qt. and on the 38 it is 6 qt. The gear-type oil pump forces the lubricant up through an external pipe which has two connections. The first of these is to the oil feed pipe in the lower half of the crankcase. This has six outlets which feed the six splash troughs respectively. They are located under each cylinder and are arranged so that the trough wall is higher at the back than in the front so as to give a greater depth of oil in ascending a hill.

The second oil outlet is to the oil feed pipe in the upper part of the crankcase. This has branch pipes which lead to the seven main bearings and at the forward end the pipe is continued into the timing gear housing. The oil pipe allows the excess oil which is not used through the two outlets to go through a by-pass valve and return to the oil sump in the base of the motor. The amount of oil passing through the two main leads varies inversely with the opening of the by-pass valve.

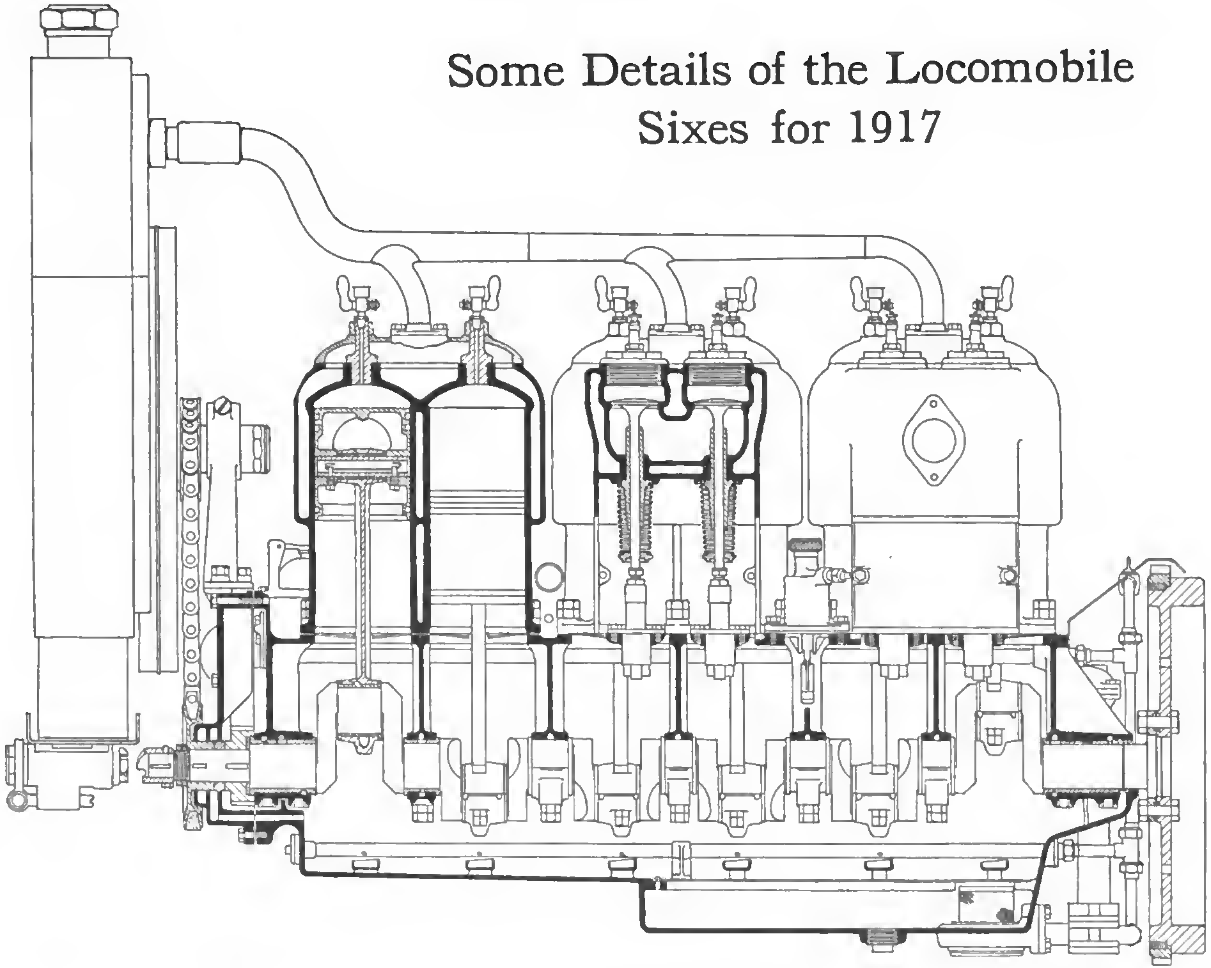
Carbureter, illustrated on page 804, is known as the Locomobile-Ball type, being made under the Ball patents. It is a two-stage type with a low speed jet for ordinary running and

(*Continued on page* 811)

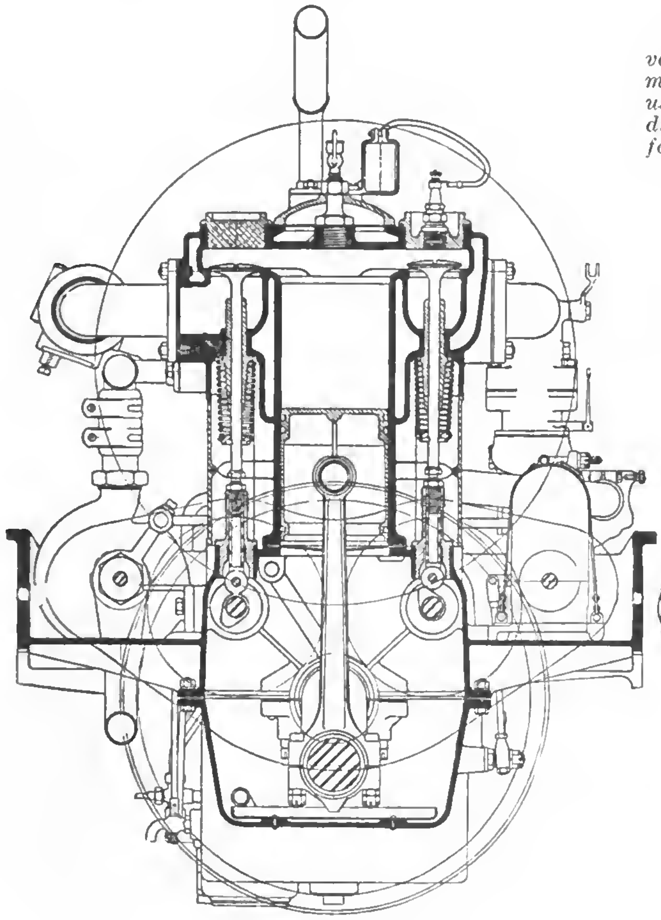


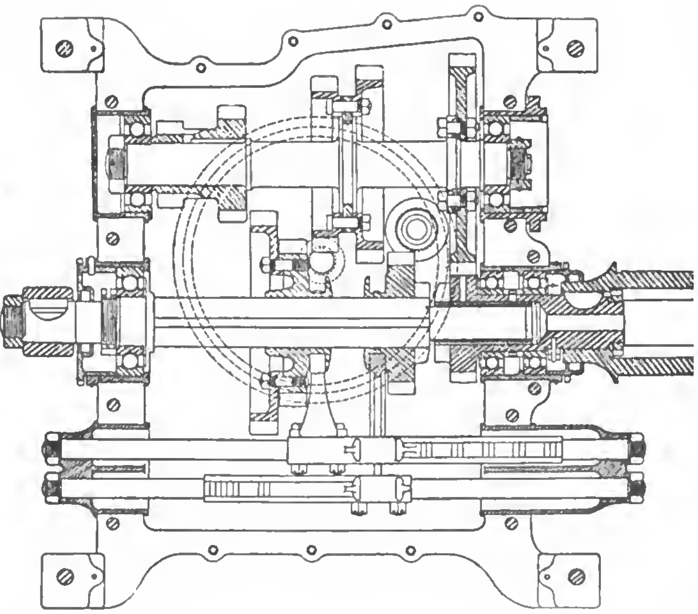
Chassis of 1917 Locomobile. The 38 and 48 are essentially similar in design, the only difference being in the dimensions

Some Details of the Locomobile Sixes for 1917



Herewith are reproduced longitudinal and transverse sections through the Locomobile six-cylinder motor for 1917. The design is similar for the motors used in the 38 and 48 chassis except for differences in dimensions. Below is illustrated a section through the four-speed selective gearbox used on these cars.





Possibilities of Double Expansion Engine

Economical Power Obtainable from Engine Using Full Power of Explosion and Exhausting at Low Pressure

By James Langmuir Napier

AT this moment, when the question of economy of fuel is so general a topic of discussion, anything relating to means for getting the last ounce from the expansion stroke is interesting. In the current issue of our British contemporary, *The Automobile Engineer*, appears the article reprinted hereunder, from the pen of a well known writer on the fundamental theory of the internal combustion engine. Mr. Napier is an engineer of a very wide and varied experience and his views are usually regarded as authoritative. Mr. Napier's article follows:

Effect of Compounding

The possibility of compounding the internal combustion engine is far from a new idea, but the question may appositely be raised at the present time on account of the growing importance of economy in all matters. Theoretical economy is a consideration to be approached with caution, and even practical economy in fuel may be of little value if it should be associated with expensive complication of construction or with a demand for extraordinary accuracy of workmanship, or if the engine of cheap construction and economical in running costs should be found to be of limited application by reason of undue inflexibility of power output. The present article is an attempt to consider whether, keeping all such considerations in view, the compound internal combustion engine may have a practical future or whether it must be relegated to the category of things desirable but inexpedient.

The compound steam engine struggled for existence for more than half a century in opposition to the established "expansive" engine, in which the whole expansion of the steam was effected in one cylinder. Scientific and sham-scientific, practical, and visionary arguments must have been freely used and misused in the discussion, which appears to have been reduced finally to the question of whether expansion conducted in two cylinders, as represented in Fig. 1, could possibly be more economical than similar expansion of an equal original to an equal final volume in a single cylinder, as shown to the same scale by Fig. 2. The logical device known as *petitio principii* was probably frequently in evidence (as it is in the suggested comparison of these two diagrams), and it appears likely that the discussion might have developed into a British institution if progress in boiler-making had not caused its collapse by permitting the use of pressures too high for convenient use in a single cylinder or even in two. Coal economy also, while it might be explained away for purposes of argument as a by-product, became too marked for effective concealment from steam users generally; and even the Admiralty, without any virtuous pretensions to retrenchment and reform, but with an eye to the strategical value of coal endurance, and after prolonged experiment, became convinced of the advantage of the compound engine.

I have made no study of the progress of invention in the matter of the compound internal combustion engine, but I have no doubt that early attempts in this direction failed or were impracticable, owing to following too closely the analogy of the compound steam engine and ignoring the physical differences between the working fluids employed. Thus the diagram, Fig. 1, which represents the theoretical combination of indicator diagrams from the high and low pressure cylinders of a two-cylinder compound engine, assumes the existence of a receiver of infinite capacity between the two cylinders. The steam exhausted from the high pressure cylinder enters the receiver without change of pressure, and the same quantity of steam is subsequently admitted to the low pressure cylinder for further expansion. Obviously it would be possible to maintain such a receiver at a constant temperature in the case of the steam engine, and equally obviously impossible in the case of internal combustion. Apart from other considerations the mere difference of exhaust temperatures imparts an insuperable difference of conditions to the two problems, and is sufficient to negative entirely the admission of any receiver between the cylinders of a practically possible compound internal combustion engine.

In the latter case the conditions of theoretical perfection are not only that there shall be no receiver, but also that there shall be no clearance in the low pressure cylinder; and the compound diagram from both cylinders would thus take the form indicated in Fig. 3, the high pressure cylinder exhausting direct into the low, and the high pressure piston being subject to the back pressure due to the continued expansion of the products of combustion in both cylinders together. The pistons are assumed to be connected to diametrically opposed cranks, and the obliquity of the connecting-rods is neglected. Expansion is supposed to continue to atmospheric pressure.

In the diagram, Fig. 3, the curve of expansion *abc* is continuous, expansion proceeding first in the h.p. cylinder from *a* to *b*, and thereafter in both cylinders combined from *b* to *c*; the volume of the h.p. cylinder decreasing and the l.p. cylinder increasing until the expansion is completed at *c* in a volume consisting of the l.p. cylinder alone plus the clearance in the h.p. cylinder. Exhaust from the l.p. cylinder follows the atmospheric line from *c* to *d*; and, as the cylinder is assumed to have no clearance, the l.p. diagram is completed by the ordinate *bd*.

Since the cylinders are in communication during the exhaust from the h.p. cylinder, the h.p. exhaust curve *be* is similar to the l.p. pressure curve *bc*, and the mean pressures of the areas *bed* and *bcd* can be shown to be equal. Compression takes place only in the h.p. cylinder as indicated by the curve *df*. The curves *be* and *df* intersect at o. As indicated in the diagram, the volume of the h.p. clearance is unity, the total volume of the h.p. cylinder is *n*, and the volume of the l.p. cylinder plus the h.p. clearance is *m*. The areas of the h.p. and l.p. cylinders are, therefore, in the ratio $(n-1)$ to $(m-1)$.

It is clear, of course, that in this diagram the work done in the h.p. cylinder is graphically represented by the area *abof* less the negative area *eod*; or, which is the same thing, by the area *abdf* less the area *bed*, which latter area represents the work done in expelling the exhaust. The relation between the area *bcd*, or any part of it, and the work done in the l.p. cylinder is scarcely equally clear, since the area of that cylinder is proportional to *ec* and not to *dc*. The relation might possibly be taken for granted, but a few words of proof will not be undesirable.

At the beginning of exhaust from the h.p. cylinder let the l.p. crankpin move from the top center so that the l.p. piston descends through a fraction 1/A of the stroke. The h.p. piston will ascend through an equal distance, and the products of combustion will then be contained in a composite volume made up of:

(1) The h.p. clearance = 1.

(2) Part of the h.p. displacement $= (n-1)\left(1-\frac{1}{A}\right)$.

(3) Part of the l.p. displacement $= \frac{(m-1)}{A}$

the whole volume being

$$1+(n-1)\left(\frac{A-1}{A}\right)+\left(\frac{m-1}{A}\right)$$
$$= \frac{A+(nA-n-A+1)+(m-1)}{A}$$
$$= \frac{nA+(m-n)}{A}$$
$$= n+\frac{m-n}{A}$$

Let $dh = \frac{m-n}{A}$ then the pressure indicated by the ordinate from h to the expansion curve bc is the pressure at the fraction 1/A of the outward stroke of the l.p. piston. But since $dc = (m-n)$ and 1/A is any fraction, it is apparent that the visible mean pressure of the area bcd is the true mean pressure on the l.p. piston; and the work done in the l.p. cylinder is represented by the area $bcd \times \frac{ec}{dc}$ or by the area bcd plus the area bed.

But the work done in the h.p. cylinder has been seen to be represented by the area $abdf$ less the area bed; therefore the whole work done in both cylinders is represented by the area $abdf$, together with the area bcd, being the whole shaded area in Fig. 4. The first question, therefore, to be decided in connection with a possible compound engine is the efficiency represented by such a diagram in comparison with that of a single cylinder under equal conditions.

Fig. 5 is practically the same diagram as Fig. 4, but drawn to scale in this instance and with some approximation to actual conditions. The compression pressure has been slightly exaggerated in order to simplify calculation, both compression and expansion curves being represented by the equation, $PV^{4/3} = C$. The volume of the h.p. clearance being unity, the total volume of the h.p. cylinder is assumed to be 4, and the ultimate volume of expansion 11.3; the ratio between the displacements of the h.p. and l.p. pistons is thus 3/10.3, the l.p. cylinder being assumed to have no clearance. In the statements which follow R represents the ratio between the absolute explosion and compression pressures; p is 14.7, the atmospheric pressure; and n is the compression ratio, or number of expansions, referred to the h.p. cylinder only, and thus representing in this instance the constant number 4. The shaded areas represent the result of assuming $R = 3$, corresponding to the combustion of a moderately rich mixture. The upper and lower dotted expansion curves correspond to $R = 4$ and $R = 2$, or a very rich and very weak mixture respectively.

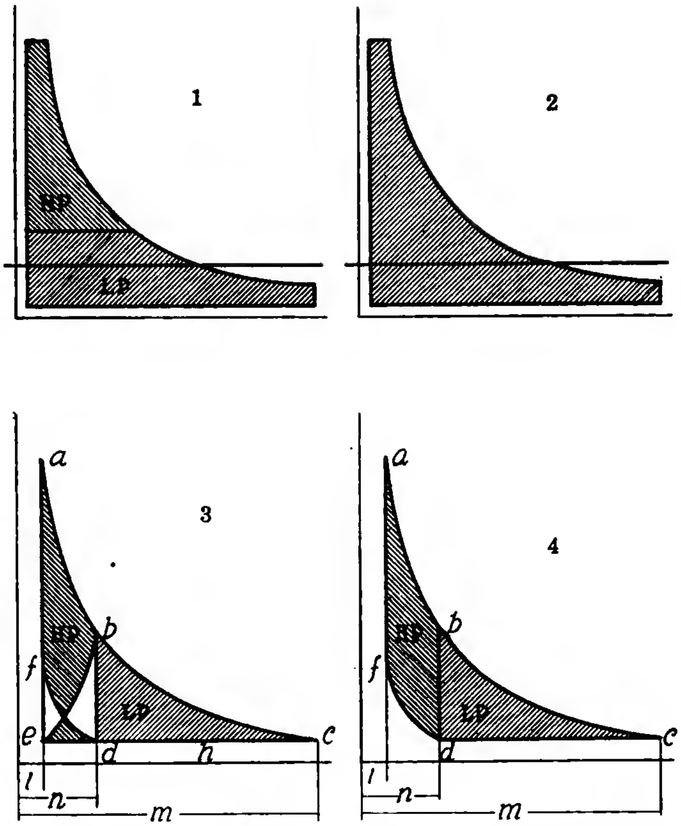
In the case where $R = 2$ the expansion curve cuts the atmospheric line at 6.7 volumes, corresponding to a fraction of the stroke equal to 2.7/7.3. If the l.p. cylinder had the full dimensions assumed it would become useless after this point in the stroke, and in the case where $R = 3$ the same condition will be seen to arise at 9.1 volumes, corresponding to a fraction of the stroke equal to 5.1/7.3. The full volume of the cylinder assumed in the diagram is utilized only in the case where $R = 4$.

The area of the h.p. portions of this diagram—that is, the area to the left of Vol. 4—may be found from the formula:

h.p. area $= 3pn\,(R-1)\;(n^{1/3}-1)$ ...... (1)

and the l.p. area (that is the positive area to the right of Vol. 4, bounded above by the expansion curve and beneath by the atmospheric line) from the formula:

l.p. area $= pn\,(3R-4R^{3/4}+1)$ ...... (2)



Figs. 1-4—Indicator diagrams from theoretical compound engines

and a comparison of these areas shows the maximum increase of power to be expected from compounding. The appropriate figures for different values of R are given in the following table, together with mean pressures calculated from the formulæ:

h.p. mean pressure

$$= \frac{3pn\,(R-1)\;(n^{1/3}-1)}{n-1} \qquad \text{......} \quad (3)$$

l.p. mean pressure

$$= \frac{p\,(3R-4R^{3/4}+1)}{R^{3/4}-1} \qquad \text{......} \quad (4)$$

In equation (3) the mean pressure is the pressure calculated from Fig. 5 as if the h.p. cylinder were the only cylinder, and without deduction for the back pressure due to the presence of the l.p. cylinder. In equation (4) the l.p. mean pressure is arrived at by dividing the l.p. area as already defined by its length along the atmospheric line in each case.

It will be noticed that l.p. mean pressure is independent of n, and it may be deduced from this that in a compound engine the relative increase of power and economy should be greater when the compression ratio in the h.p. cylinder is low. This is actually the case; but, while with $n = 2$ and $R = 4$ the maximum increase of power and economy due to the addition of a second cylinder would amount to approximately 60 per cent, the resulting power and efficiency would still be absolutely less than that of a single cylinder where $n = 4$. Compounding, at the best, is only a substitute for high compression, and it is, therefore, of little interest to consider its effect in conjunction with compression lower than that which is easily attainable in practice.

TABLE I.

R.	n.	Maximum Additional Power, Per Cent	H.P. Mean Pressure	L.P. Mean Pressure	Limit of Expansion Volumes
2	4	15.4	34.57	5.86	6.728
3	4	25.0	69.15	10.16	9.116
4	4	31.8	103.72	13.53	11.316

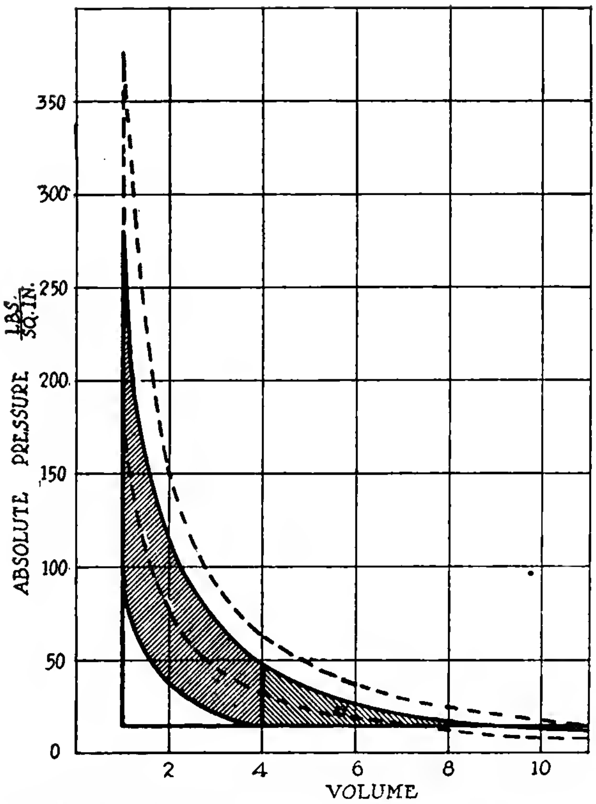


Fig. 5—Same diagram as Fig. 4 but drawn to scale and with actual working conditions considered

An increase of power approaching 25 per cent without additional cost of fuel is worth having if it is real and if it does not involve an extravagant capital outlay. I have therefore prepared Fig. 6 as an indication of probably the simplest type of engine capable of embodying the compound principle. It is to be understood, of course, that this figure is in no sense even an elementary design, but merely a skeleton diagram illustrating some features of a possible general arrangement, and serving at the same time as an indication of the difficulties that will be encountered in any serious attempt at practical design.

The engine suggested in Fig. 6 has three cylinders, two high pressure, with one low pressure between them. All the cranks are in the same plane, the l.p. crank being opposed to both h.p. cranks. Each h.p. cylinder exhausts into the l.p. cylinder, but on different strokes; thus the left-hand h.p. piston as shown may be imagined to be beginning the exhaust stroke while the right-hand piston is about to compress its charge. There is thus an impulse at each half revolution, the h.p. impulses being separated by an interval of one revolution, and each being followed, at an interval of half a revolution, by a relatively feeble l.p. impulse. The balance of such an engine presents no difficulty; and, if the power of each h.p. cylinder is augmented by 25 per cent, the whole arrangement represents roughly the power of two and a half cylinders for the capital cost and maintenance charges of three, but with the fuel cost of two, always remembering that with anything much less than a full load the capital cost and maintenance charges remain, while the fuel economy tends toward disappearance.

The exhaust from the l.p. cylinder (not indicated in Fig. 6) can be easily arranged, but it is apparent that considerable difficulty will be experienced in designing the valves and passages between the high and low pressure cylinders, and I anticipate that some arrangement of sliding valves, such as sleeve valves, might be found essential. The difficulty arises in connection with clearance in the l.p. cylinder, which must be reduced to the utmost limit of parsimony if any reasonable approach to the maximum additional power indicated in the table is expected. It may be advisable to show graphically the pernicious effect of l.p. clearance, and to form some estimate of what actual, as distinguished from maximum, additional power may be attained.

Fig. 7 is an enlarged reproduction of part of Fig. 5, the expansion curve *abg* being that due to $R = 4$, represented by the upper dotted line in Fig. 5 and cutting the atmospheric line at 11.3 volumes. The line *ad* is the ordinate at Vol. 4, forming the boundary of the h.p. diagram.

For the purpose of estimating the minimum clearance in a small l.p. cylinder I assume that the area of the piston is 24 sq. in. and its stroke 4½ in., making the volume 108 cu. in. Practically there must be some clearance between the piston and the cylinder head, and this may be estimated at $24 \times 1/16 = 1.5$ cu. in. Assuming a sleeve valve, the clearance due to two ports may be taken at $2 \times 6 \times ¼ = 3$ cu. in., while an allowance of 0.9 cu. in. should be sufficient for clearance due to the exhaust valve if that is placed in the cylinder head. The sum of these amounts is 5.4 cu. in., or 5 per cent of the cylinder volume; and that amount is accordingly represented in Fig. 7 by the length *ae*, which is 5 per cent of the length originally assumed to represent the volume of the l.p. cylinder. If expansion is still to proceed along the line *abg*, this amount of 5 per cent is taken from the original volume of the cylinder, and the volume displaced by the piston is no longer proportional to *dg*, but to *hg*.

The l.p. cylinder having clearance must have compression, and the exhaust valve is accordingly closed at the distance *ch* before the end of the stroke *gh*, so that the pressure at the end of the stroke may be $he = ad$. The compression ratio on the figures assumed being nearly 3, the gas available for further expansion at the beginning of h.p. exhaust is that which at atmospheric pressure originally occupied 4 volumes in the h.p. cylinder and 1½ volumes in the l.p. cylinder, and which now occupies 4½ volumes. If the temperature of compression of the l.p. cylinder were equal to the terminal temperature of the h.p. cylinder, that gas would expand as indicated by the line *ef;* but as their relative temperatures will be something like 1000 deg. and 500 deg., the pressure of the mixture will drop to a point which happens to coincide so nearly with the point *b* in the expansion curve that they may be considered for present purposes to be indentical. The effective added power is thus represented by the area *bcg*, and the power lost due to 5 per cent clearance in the l.p. cylinder is represented by the area *abcd*.

The area *abcd* is 36 per cent of the area *agd*, and it follows, therefore, that unless clearance in the l.p. cylinder can be reduced to a figure materially less than 5 per cent of its total volume the previous table must be supplemented as follows:

TABLE II.

R.	n.	Probable Effective Additional Power, Per Cent	L. P. Probable Effective Mean Pressure
2	4	9.85	4.00
3	4	16.00	7.00
4	4	20.35	9.50

These figures are less imposing than those previously given, but they are subject to no discount, and may even be considered capable of improvement, as, for instance, by increasing the stroke, which would correspondingly diminish the

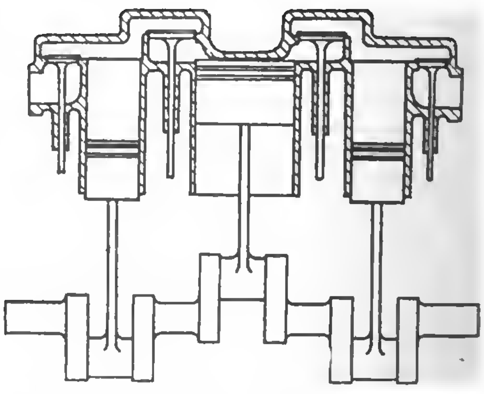

Fig. 6—Section through a simple type of engine embodying the compound principle

percentage of clearance. A relatively long stroke would also be desirable for motor car purposes, since it is practically certain that until motor cars become ordinary acquisitions of the governing classes a low pressure cylinder would be liable to be taxed as if it were subject to explosion pressure.

It seems doubtful, even omitting consideration of extra taxation, whether a compound engine would appeal to the private motorist, who is not commonly exigent in the matter of miles per gallon. Some few scientific enthusiasts would respond promptly, but the great majority would look coldly on a probable increase from 25 m.p.g. to 29 m.p.g., which corresponds to 16 per cent additional efficiency, and which would mean a saving of 5½ gal. per 1000 miles with a premium on gear changing. With an engine large enough for top gear runs, the l.p. cylinder would too often be acting as a glorified silencer. The circumstances are radically different in the case of motor omnibuses and lorries, normally under heavy load, doing at the outside 8 m.p.g., and running perhaps 24,000 miles a year. The saving in such a case might be expected to amount to 17¼ gal. per 1000 miles, or fully 400 gal. a year per vehicle. The question of whether any, and how much, capital charges should be debited against this saving would depend upon the type of engine scrapped and the type of engine adopted. The substitution for a worn out four-cylinder engine of a three-cylinder compound with somewhat larger h.p. cylinders should not increase the cost of renewal.

It should be noted, in conclusion, that the lost area *abcd* of Fig. 7 is due, not only to cylinder clearance, but also to the inevitable external cooling of the cylinder during the l.p. exhaust stroke. If there were no clearance the temperature of that portion of the exhaust remaining in the l.p. cylinder would be of no importance since it would have no volume. If, on the other hand, there were no loss by cooling, expansion in the l.p. cylinder would follow the line *ef* as already described, and the lost area *abcd* would be balanced by the gain of mean pressure.

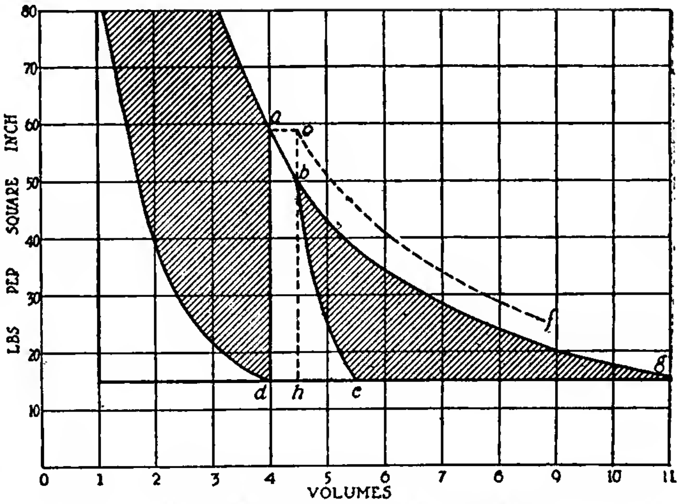

Fig. 7—An enlarged reproduction of part of the expansion curve shown in Fig. 5

The deduction from maximum efficiency, as recorded in Table II, is based on an ample allowance for water-cooling as in the case of an ordinary h.p. cylinder, but since the l.p. cylinder is subject to no higher temperature than the h.p. terminal temperature, it would appear that a very moderate degree of air-cooling should suffice for the low pressure cylinder, and that moderation in this matter should conduce to the general efficiency and to improved l.p. mean pressure. It would be unwise to expect material increase in the maximum additional efficiency, as stated in Table I, from such a modification, since the gas expanding in the l.p. cylinder remains in communication with the water-cooled h.p. cylinder. During l.p. exhaust that communication naturally ceases, and it may therefore be assumed that Table II represents the least favorable results.

Locomobiles Improved in Detail for 1917

(*Continued from page* 807)

a high speed jet for wide open throttle. When this jet comes into action an additional air valve is also opened, giving practically an entire secondary carbureter. The carbureter is not waterjacketed but is provided with a hot air attachment. An adjustment on the steering column actuates a metering screw which determines the amount of fuel entering the low speed jet.

A special design of Westinghouse electric lighting and starting system is used on the Locomobile. The generator is a 6-volt unit located on the right side of the motor behind the water pump. It is regulated automatically by a differential field winding and the field winding is made of special wire which as the generator becomes warm the resistance increases tapering down the output. Single wire system is used.

The starting motor is series wound and is capable of turning the 38 over at about 125 r.p.m. and the 48 at about 115 r.p.m. This is fast enough to start on the magneto. Starting motor engagement is effected magnetically. In the magnet pinion shift is a powerful electro-magnet having a pull-in coil. This becomes magnetized and acts to engage the starting pinion. The engine is first turned over slowly and then rapidly picks up speed and cranks the engine. When the engine commences to fire and speed up the voltage of the generator builds up and the starting motor circuit is opened automatically.

The clutch is a disk type with steel disks, but between each pair of disks is a floating ring of fabric. The gearbox is connected to the clutch by a universal. The gearset is a four-speed selective type contained in a manganese bronze case bolted to the frame at four points. The entire upper half is a light weight cast aluminum housing which can be quickly removed. The gear ratios are first 15.4 to 1; second, 7.39 to 1; third, 5.38 to 1; fourth, direct, 3.85 to 1; reverse, 21.75 to 1.

Power is transmitted from the gearbox to the rear axle by a chrome-nickel steel propeller shaft having a ball bearing full universal at the gearbox end and a block and pin type of universal at the rear end. The rear axle is floating, the housing consisting of a hollow steel casting into which seamless steel tubes are forced under heavy pressure. A truss rod is passed under the housing and anchored at the outer end. The frame of chrome-nickel steel is of pressed steel channels with 6-in. side members of chrome-nickel steel. The members are hot-riveted together and all the holes are drilled in ream.

In equipment Locomobiles are particularly complete. The bodies are of sheet aluminum, beaten into shape and fastened to a wooden frame. The instrument panel is located in the hood and the same panel is used on all 1917 models. It is held to the front cowl frame by two bolts at each side. Besides the liberal equipment of tonneau, cowl and step lights and other requisites of a luxurious car, Locomobiles are fitted with power tire pumps which are capable of pumping up a 37 by 5 tire to 90 lb. in about 4½ min. with the engine running at 1200 r.p.m.

The top is a one-man type which this year has been made very simple to operate. A handle is conveniently fastened to one of the bows and the top can be raised by one hand.

Tracing the Why of Carbureter Parts*

Part II

Comparisons of Carbureters in Regard to Range of Capacity Through Which They Supply a Normal Quality of Mixture—Atomizing, Pick-Up, Fuel Efficiency—Two-Stage Carbureter

By F. H. and F. O. Ball

THE preceding instalment was devoted to an analysis of theoretical diagrams from several types of carbureters. It is now proposed to investigate the diagrams actually produced by these instruments, which will be found in Figs. 9, 10, 11, 12, 17, 18 and 19, all published last week.

Comparisons of Quality Diagrams

Comparisons will first be made between these several types regarding uniformity of quality. The several diagrams referred to speak for themselves regarding this feature. Each type of carbureter produces its own characteristic diagram, which cannot be greatly modified by changes of adjustment, as the peculiarities are inherent. In most cases the carbureters had been adjusted by the manufacturer for test purposes.

It is, of course, understood that a desirable diagram is one that runs parallel to the zone of best quality.

Working Range

One of the most important comparisons of carbureters is in regard to the range of capacity through which they furnish a normal quality of mixture. For the purpose of making this comparison, a uniform standard has been adopted in which the maximum in every case is determined by measuring the quantity of air the carbureter will deliver with a manifold vacuum equal to 30 in. of water, and the minimum is located at the point where the quality passes out of the quality zone.

With this basis of comparison, it matters not what the nominal size of the carbureter may be nor whether all the carbureters to be compared are of the same size.

In this case, however, all the carbureters used were of the same nominal size and therefore the quality diagrams may be plotted on charts having the same scale of capacity.

The differences of maximum capacity shown by the different types means little or nothing unless considered in connection with the minimum capacity because a carbureter with limited working range may be made to show large capacity by making great sacrifices of good performance at slow speed.

A clearer idea of the effect of large capacity may be obtained by taking a practical example. The carbureters used in these investigations were all of the 1¼-in. size, which is the size ordinarily used on motors having a piston displacement of 275 to 300 cu. in. Motors of this size, when supplied with a normal quality of mixture, require from 3 to 4 cu. ft. of air per minute when idling or driving a car at its slowest speed on high gear.

Looking over the several diagrams, it is evident that in most cases the idling and slow running must be done with a much larger quantity than 4 ft. per minute, and that the slow speed is partly due to the very lean quality of the mixture.

This is not a desirable condition because the running of the motor is weak and uncertain and is more susceptible to changes of temperature than when a normal quality is used.

Before leaving the subject of working range, attention is called to the showing made by the several diagrams under consideration.

The smallest range is 1 to 11 in Fig. 10, and the largest, 1 to 47 in Figs. 18 and 19.

The explanation of the large range of Fig. 18, will be found in Fig. 15. It will be seen that because the gasoline curve and air curve are so nearly parallel a very small primary fixed orifice may be used and the quality diagram therefore maintains a normal quality to a very small minimum. In view of the remarkable showing made by this friction control type, it is unfortunate that fluctuations in the temperature of the gasoline should change the quantity flowing through the annulus to an extent that makes it undesirable.

Atomizing

The question as to the most practical maximum in each case is not decided wholly with regard to the quality for idling and slow running, but the question of atomizing at slow motor speeds must also be considered.

When it is remembered that the atomizing energy of an air stream varies as the square of its velocity, it is evident that large capacity and the low air velocity that accompanies it inevitably means very little atomizing energy when small quantities are being used. It therefore becomes necessary to keep in mind the desirability of good atomizing.

Pick-up

The question of pick-up must also be considered in determining the most practical compromise in the matter of capacity. It is, of course, possible to obtain good pick-up by reducing the capacity to a point where the atomizing energy

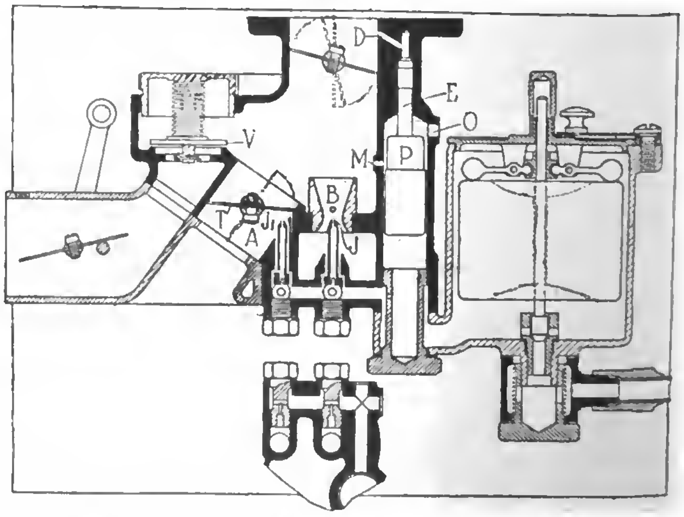

Fig. 20—Carbureter actuated by fluctuations of the vacuum in the manifold and discharging a predetermined quantity of gasoline whenever the throttle is suddenly opened at slow speed

---

*Paper presented before the Cleveland section of the S. A. E.

is so high that no pick-up device is necessary. This is done by some manufacturers, but with the better grade of instruments, some kind of pick-up device is incorporated in the structure. Quite a variety of such devices are in use. The one most commonly found in carbureters is the liquid dashpot attached to the air valve. This device prevents a rapid movement of the valve and consequently when the throttle is suddenly opened, there is a lack of air and also an increase of gasoline until the valve has opened to its normal position.

Fig. 20 represents a very good device which is actuated by fluctuations of the vacuum in the manifold, and discharges a predetermined quantity of gasoline whenever the throttle is suddenly opened at slow speed. This device consists of the plunger *P*, having an extension, *E*, on its upper end, which acts as a piston to move the plunger under the influence of the fluctuations of the manifold vacuum communicated to the piston through the passage, *D*. The plunger is fitted loosely in a cylindrical chamber having a restricted passage at the bottom communicating with the float chamber so that the level of gasoline in the plunger chamber is maintained at the float chamber level. The plunger chamber has an atmospheric opening, *O*, and a passage, *M*, to the mixing chamber.

The operation is as follows: When the throttle is nearly closed, the vacuum in the manifold lifts the plunger to the position shown, and the space below the plunger fills with gasoline. The device is now ready for action. A sudden opening of the throttle breaks the vacuum in the manifold, which releases the plunger and it drops by gravity, causing the gasoline to pass up to the space above the plunger, where it is swept into the mixing chamber by the air entering through the passages, *O* and *M*. This operation is repeated as often as the throttle is suddenly opened from a nearly closed position.

Two-Stage Carbureter

Many of the difficulties that have been shown to be inherent in the several types of carbureters described on the preceding pages may be minimized by dividing the carbureter into two stages. This type is illustrated in Fig. 20, in which *B* is the primary fixed orifice for air, and *J* is the gasoline jet located as usual in this passage. A spring-opposed valve *V* controls the flow of air through the valve passage to the mixing chamber.

These parts, when connected to a gasoline supply and an outlet to a motor, constitute a simple air valve carbureter such as has been described and analyzed on the preceding pages, and this simple carbureter is called the primary stage of the instrument.

Associated with this in the structure is the air passage, *A*, containing the gasoline jet *J1*.

These parts, when in action, constitute an elemental fixed orifice carbureter, such as has already been fully described. This fixed orifice carbureter is the second stage and its capacity is generally somewhat more than half the total capacity. Normally, this second stage is closed by the butterfly valve, *T*, and held closed by a spring. A connection to the throttle is so arranged that when the throttle is nearly open, the final full opening throws the valve *T* wide open, thereby more than doubling the capacity of the carbureter.

Without going extensively into a consideration of this type, a few features may be briefly noted.

Obviously the working range of a two-stage instrument should be greater than a single stage because it is the summing up of the ranges of both stages.

The atomizing of the primary stage must necessarily be high, even when the total capacity of the instrument is very great because the dividing of a carbureter into two equal stages makes the atomizing energy of the primary stage four times as great as with the full capacity. This high atomizing facilitates the pick-up to such an extent that it is fairly good practice to make the capacity of the primary stage so small that no pick-up device is necessary. All things considered, however, it is better to divide the two stages more evenly and incorporate a pick-up device.

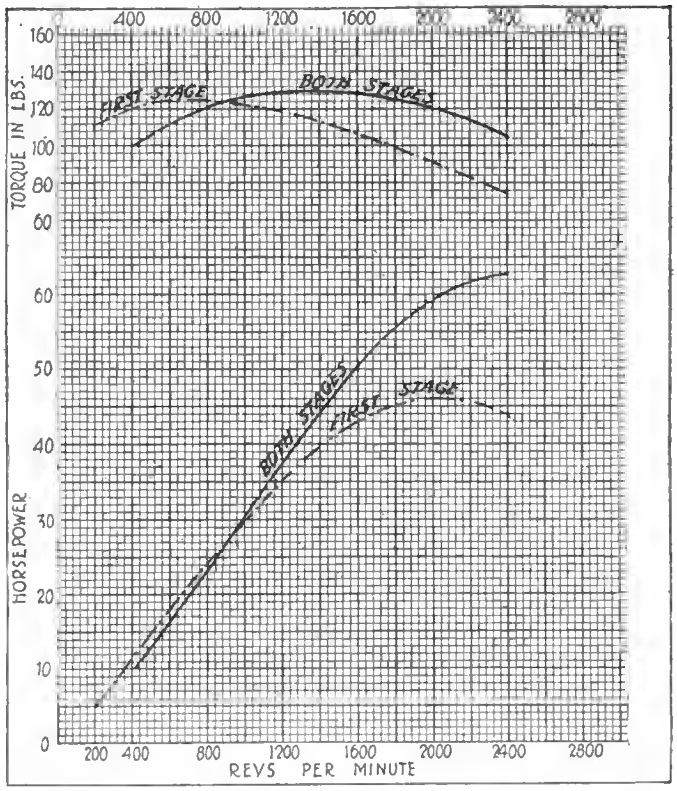

Fig. 21—An illustration of the effect of dividing a carbureter into two stages

The two-stage instrument is peculiarly adapted to obtaining high fuel efficiency, as will be seen by referring to Fig. 19.

In this case the setting of the primary stage is such that the mixture is very lean. The high atomizing of this stage and the pick-up discharge make this practicable, and the resulting fuel efficiency is very high.

Under these conditions, the setting of the second stage is made for a rich mixture so that when it is brought into service for maximum power, the resulting quality from the combined jets will be rich enough for maximum torque.

Fuel Efficiency

Inasmuch as more than 90 per cent of the running of the motor is done with the primary stage, the fuel efficiency is practically determined by the quality of mixture used in this stage.

Referring again to Fig. 19, it will be noted that the quality diagram of the primary stage differs somewhat from the quality diagram of the simple air valve carbureter in the preceding pages. This is explained by calling attention to the restricted air passage, or throat, under the air valve, which becomes a fixed orifice control of air when the valve has opened slightly.

With this arrangement, the air valve simply bridges over from the primary venturi throat to the largest fixed orifice under the air valve.

This arrangement limits the capacity and could not be used with success with a single stage carbureter of normal capacity.

Power and Torque Curves

Fig. 21 is an interesting illustration of one of the effects of dividing a carbureter into two stages.

The torque curve shows this effect most clearly. It will be noted that at about 900 r.p.m. the torque is the same whether the single stage or both stages of the carbureter are in service.

At this speed, the loss of atomizing of the large capacity offsets the gain due to low resistance, and with the primary stage, the gain due to higher atomizing is offset by the higher resistance.

Below this speed the primary stage shows the higher torque because of the superior atomizing, and above that speed, the lower resistance of the full capacity results in the higher torque. It will be noted that a proper use of the two stages produces in effect a very flat torque curve.

Heretofore it has generally been customary, in running power curves, to make the minimum speed 300 or 400 r.p.m. It is now becoming common to drive cars on high gear at a minimum speed corresponding with 100 r.p.m. or less, and it is required to pick up promptly on open throttle from these low speeds, therefore, because of this exacting service, power curves should be continued to 100 r.p.m.

There are other phases of the relation of a carbureter to the performance of a motor that might be interesting, but the authors of this paper will feel well repaid for their work if it results in showing a little more clearly the peculiarities of each type of carbureter that has been discussed. The discussion on this paper will be reported in THE AUTOMOBILE for May 11.

New Motor in Sunbeam Six Racer

THE Sunbeam Six racer entered for the opening races at the Sheepshead Bay motor speedway, May 13, has arrived at the track, and its driver, Joseph Christiaens, is tuning it up for the race and getting accustomed to the track. The chassis of this car is the same that appeared in races in this country in previous years, but the motor is entirely new. Since its arrival at the Sheepshead Bay track it has been possible to secure photographs showing both sides of the motor with its overhead valve mechanism, and these are reproduced herewith.

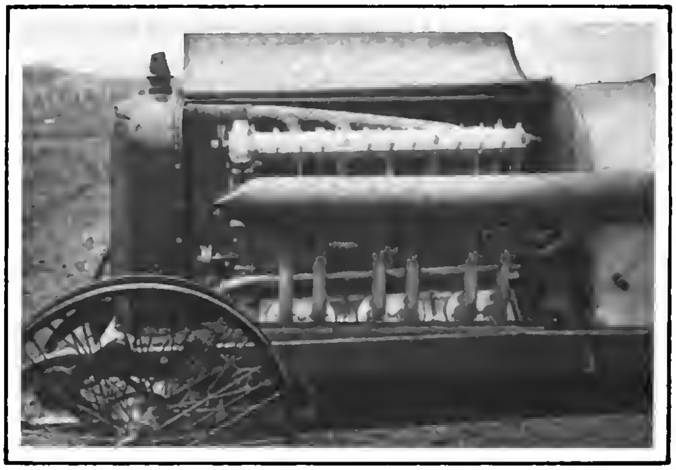
Details of specifications and equipment of the new Sunbeam motor which it was previously impossible to obtain are now available. The motor is a six-cylinder type with a bore of 81 mm. and a stroke of 150 mm., or 3 3/16 by 5⅞ in. One set of spark plugs is used, ignition being by a single Bosch magneto driven at three-quarter engine speed. There are two oil pumps, one for the ball bearing crankshaft and the other for the two camshafts. At present it has not been decided whether to use aluminum or steel pistons. The motor has a single breather pipe to each cylinder as shown in the illustrations.

There are four valves to each cylinder, making twenty-four valves in all. The camshafts are mounted overhead, the valves being set at an angle in the top of the cylinder head and the camshafts are driven by a vertical shaft and gears from the front of the engine.

Two carbureters are used, as shown in the illustration at the bottom of the page, with a separate intake manifold for the three forward and three rear cylinders respectively.

A four-speed gearset is employed and the gear reduction on direct drive is 2.7 to 1. There is a revolution counter fitted. The exhaust manifold is carried outside the hood and is pointed at the forward end.

The car has been driven for about fifteen laps on the Brooklands track in England but no high speeds were made due to the bad condition of the track caused by army trucks, and neglect.



Sunbeam racing motor showing mounting of exhaust manifold, individual breather pipes and double set of shock absorbers

The History of the Pneumatic Tire

Tires Constitute One of the Most Important Factors in the Development of the American Automobile Industry—Discovery of Vulcanization and Invention of Pneumatic Tire

The History of the American Automobile Industry—

By David Beecroft

HAVING traced the thread of growth in the gasoline field from the sinking of the first well in 1859, it is now necessary to make another historical detour before beginning the modern period of automobile building from 1890 up to the present. The rubber tire, in solid and pneumatic types, has been such an essential of the practical automobile that the true estimate of car progress would be impossible without following the trend of rubber and rubber tires from the earliest date up to the present. The practical automobile did not arrive until the pneumatic tire was developed, and the tire has played a much greater part in the evolution of the automobile than it is given credit for. Tires and roads have been great factors in automobile development.

Milestones in Tire History

The automobile tire, like the internal explosion engine, and like the petroleum industry, had its great milestones during the period of its development.

We saw how 1876 gave us compression in an engine, which was the missing link in its development. So it was in gasoline. So it was in tires. Tire history has its epochal points, nuclei around which broad activities of progress are clustered.

Three epochal dates should be borne in mind:

First was the discovery of vulcanization in rubber manufacture, and which process is the warp and woof of rubber manufacture. The credit goes to Charles Goodyear. The date was 1835.

Second came the invention of the pneumatic tire in 1845, by an Englishman named Thompson.

Third came the practical production of pneumatic tires in 1889, after the pneumatic having spent forty-four years in relative obscurity, until Dunlop, an Irishman, re-invented the pneumatic, from which date its growth has kept pace with car development.

Here again we have an example of an invention lying dormant, arriving before its time. In 1845, when Thompson invented the pneumatic, the explosion engine was in the dark ages of its development, oil wells had not been started, and roads were bad. There was little need for the pneumatic. Later, in 1889, after the practical explosion motor was built, the pneumatic came into its own. The country was ready for it.

Tires might seem to be more properly treated under wheels, but since the modern tire represents such a considerable development, it has seemed best to treat them as a separate device. They were originally simply made for tying or holding the parts of the wheel together, whence their name, and were not used on wheels that were solid, as were some of the earlier cast wheels and wooden wheels. An ancient chariot wheel said to have been dug up in Ninevah and believed to date from about 2000 B. C., has six spokes which carry the load and twelve thongs which bind the rim to the spokes and hub. These thongs are radial, whereas most tires depend upon their strength in the circumferential direction. Iron has been a very favorite material for tires because of its tensile strength and its ability to resist wear.

There have been many attempts in later years to secure elasticity from iron or steel springs, most of which have been so unsatisfactory as to have been found no use and even the better forms have not remained in use very long.

Patents Ice Cream Truck Design

OMAHA, NEB., April 29—A motor truck body for a special service, unique in construction, yet apparently the last word in efficiency, is the design recently patented by Howard B. Graham, wholesale ice cream manufacturer of Omaha.

The body is built of sheet iron, with cork insulation, and it eliminates at once the unsightly load of boxes, cans, ice and tarpaulins which are so frequently met with on the streets of any large city. Also the driver or his helper can do about 90 per cent of the work on the ground.

At the rear of the body, toward which the metal floor slopes, there is a chute with a baffle door, from which ice may be taken with a shovel as desired, and a similar arrangement on a smaller scale is provided for the salt, thus disposing of the awkward shoveling of ice and salt while the man stands upon the top of the body or on the cans themselves.

Running boards 15 in. wide are provided for the whole length of the body on both sides, and cans are simply lifted from the tank to the running boards and thence to the ground, thus cutting this phase of the work to a minimum. A drain hose with a valve connection is attached to the bottom of the tank, and this is laid upon the ground to avoid splashing salt water on the body or chassis.

A half ton of extra ice on rush days may be carried in the collapsible bin on the top of the body, which folds within the trap doors when not in use. The whole body, made of automobile iron and very well finished, costs but little more to construct than the ordinary truck body, says the inventor.

The FORVM

FURTHER DISCUSSION OF ABANDONING DIFFERENTIAL IN TRUCK DESIGN—MAY GIVE SOLID AXLE A TRIAL—TIRES MUST SHOW UNIFORM WEAR—MODIFIED TYPE OF DIFFERENTIAL POSSIBLE

Intends to Try Out Solid Type of Axle

By H. G. Burford,
H. G. Burford Co.

I HAVE read THE AUTOMOBILE for April 13 and the interesting article on the question of the possibility of disposing of the differential in motor trucks and passenger cars with very great interest.

The answer to anyone who had questioned me on this important matter prior to my visit to the Sheldon Axle Co.'s works at Wilkes-Barre last week, where the company's engineer, Mr. Laycock, demonstrated to me that it not only was a question of experiment, he, however, demonstrated beyond all dispute that it is possible to run a truck and a pleasure car successfully without this fitment which all manufacturers have been burdened with since motor traction became the world-wide usage which it enjoys to-day.

G. A. Greene, who is a personal friend and whose opinion I value, undoubtedly speaks with authority and with the knowledge of facts which it would be very hard to dispute.

I am certainly of the opinion that the experiment which has begun will have far-reaching results, especially for service conditions similar to that performed by the omnibus company of which Mr. Greene is the engineer.

The impression made by Mr. Laycock on me is such that I am making a similar experiment at once on the Burford 2-ton truck and should be pleased to let you know the results of my application of an idea which I am indebted to the engineer of the Sheldon company for bringing to my notice.

Points Out Need for Equal Tire Size

By John Younger,
Pierce-Arrow Motor Car Co.

THE article in THE AUTOMOBILE for April 13, dealing with the possibility of eliminating the differential from trucks, is interesting. It is somewhat early, however, to draw any conclusive results from these tests.

The differential, it will be remembered, was used on road vehicles for steam tractors or steam road rollers with a comparatively short wheelbase. It was then used on the ordinary pedal tricycle, also with very short wheelbase. The automobile has been gradually evolved from the short wheelbase tricycle, and each step taken has really tended toward a lengthening of the wheelbase, the differential being retained. The absence of a differential has never been tried out exhaustively until Mr. Laycock did so, and it is difficult to say at present exactly what will be the results.

The absence of a differential is attended with some disadvantages, notably an increased tendency for front wheel skids and also an increased tendency for wear on one set of tires, if a vehicle is always making corners one way, as occasionally happens, and we think these disadvantages would offset the advantages of having the power conveyed to the wheel of greatest resistance.

There is one point in truck use which must be remembered and that is, that truck tires on both wheels are not always changed simultaneously, and occasionally a new tire will be met with in conjunction with a half-worn tire.

There are still a number of these points to be considered, and only a free discussion of the subject can hope to bring them out.

Would Like Modified Mechanism

By E. H. Farmer,
H. E. Wilcox Motor Co.

WITH reference to eliminating the differential from trucks, we have tried out trucks without differentials and found them satisfactory in a great many ways. But taking everything into consideration, we found that the conventional differential gave us the most satisfactory results under all conditions. There is no question but that on the straightaway the truck without the differential has more power and greater tire and gasoline mileage. For a truck operating on very bad roads and with a very few turns to make, the solid axle is the best, but for trucks operating in the city where there is a great deal of turning to do, the solid axle is not very satisfactory; the main trouble encountered being the wear on tires and jackshaft breakage.

In our opinion the nail would be hit on the head if a modified mechanism could be substituted that would allow a positive drive on the straightaway, but would act when turning sharp corners. Such a mechanism we are sure would give satisfaction.

Fears Effect of Maneuvering in Cities

By H. D. Church,
Packard Motor Car Co.

WE have been following, with a great deal of interest, the experiments which are being conducted on chassis without differentials, but we feel that the information as yet available, is not complete enough to warrant any prediction as to whether or not the differential can be completely done away with.

It seems to us that the main question with reference to the elimination of the differential is that of tire wear, and it is our opinion that the tire results obtained on a test conducted by the Fifth Avenue Coach Co. would be conclusive, only as regards bus operating conditions. A truck in ordinary commercial service, which has much maneuvering around in freight yards and alleys, and at loading platforms, would undoubtedly have to do a great deal more short-turning-radius work than would a chassis in bus service, and to our minds a differential-less truck ought to be tested in this class of service to obtain the real answer on tire wear.

Elimination of the differential would not only result in a very material weight saving, particularly on worm-driven trucks, but would also do away with from six to eight gears and their bearings, with the attendant necessity for lubrication.

Present Differential Far From Satisfactory

By Lewis P. Kalb,
Kelly-Springfield Motor Truck Co.

REGARDING the possibility of eliminating the differential from trucks, the writer holds the same opinion that most engineers do in regard to this point. That is, that the differential is a necessary evil. It is questionable, however, whether it could be completely discarded.

In the article no mention is made of fuel economy, although the tire wear is stated to be no greater than when the differential is used. It would seem, however, that the power loss involved in the slippage of one wheel would amount to a considerable item.

The present style of differential is far from satisfactory, and there is a crying need for a successful mechanism that will compensate for the unequal travel of the wheels, and yet be able to transmit power to one of the road wheels when the other has lost its traction.

Differential Troublesome When Traction Is Poor

By C. C. Clayburg

I AM much interested in the discussions in THE AUTOMOBILE of the rear axle question. This question has been before the automobile engineers ever since the conception of the industry. It has laid dormant for some time because of the belief of very many that an axle could not be designed that would drive both wheels when rounding corners without frictional losses, and would also be able to drive car on one wheel should occasion require without hand-controlled mechanism.

A chain is judged by its weakest link, so an axle system is judged by its failings. The ordinary geared differential will drive on curves and corners with practically equal power on both wheels, and very little wasted energy. On a well-balanced, well-sprung car, at reasonable speeds, the amount of slip of wheels is very little and its tendency to cause side sway is very problematical. But should you lose traction with one wheel in hole or sand, and you do not have momentum enough to carry you across, ask any man who has been there.

A geared differential that will perform all its usual functions when turning, etc., but will automatically transmit practically all the power to the wheel that retains traction when one wheel slips, and as automatically readjust itself when the slipping wheel regains traction, and this action occurs when driving either forward or backward, seem to me to be the logical solution of the problem.

I understand such a differential system has been designed and patented, and will soon be put upon the market.

For boulevard driving such an axle system is not an absolute necessity. If the car manufacturers would use an axle with the usual geared differential features, but so designed that with very little work the extra mechanism required to make the car suitable for touring and rough country work, could be attached or detached, I believe it would be a very great improvement.

Tire Wear Serious Without Differential Device

By C. C. Hancock

THE article by A. L. Clayden on differential-less trucks is one of considerable interest. While the conventional differential has many disadvantages, it does not appear that we can get along without some device which will allow of a small variation in the speed of the rear wheels.

It is not pleasant to imagine what is happening to the slipping tire, or tires, of a heavy truck, taking a sharp curve, without a differential on a perfectly dry road, when one considers the flat on the tires which results from only one application of a fierce brake. The acceleration of such a mass as a truck rear tire, during the small interval of time it is off the road, cannot be sufficient to affect the tire as seriously, even though it is taking place frequently, as a few right-angle turns.

Two years ago I designed a runabout with live axle and without differential. I ran this 2700 miles and found the tire wear to be extremely rapid, the rubber studs being completely worn off the rear tires in less than 100 miles. The plain surface did not wear so rapidly, due partly to the greater surface in contact. Two sets of tires were worn down in this mileage, or rather, the tires were reversed, the unworn fronts were put on the rear, these wore down at the same rate as the first set. It took two persons to push the car, with the wheels fully locked, although the weight unloaded was only 950 lb., and from examination of the tracks it was easy to account for the state of the tires. There was never a sign of side slip, even on snow and ice-covered roads, and I never got stuck through want of traction.

Steering is undoubtedly harder, and there is a queer sensation of the back of the car swinging out when turning at any speed, due probably to the rear wheels not following in concentric tracks. It is necessary to allow for this swinging out in steering.

Apparently the serious objection, from my somewhat limited experience, is the tire wear, and it is difficult to understand how this can be anything but serious on tires of a heavy vehicle with a very wide track.

I believe a mechanism which would allow a variation in wheel speed, limited to 180 deg. travel, would give very desirable results. The M. & S. differential, due to its friction element, gives valuable results, and is a step in the direction of differential elimination.

Experiments in this direction will be watched with interest.

Truck Differential Unnecessary

By M. K. Woodford

ELIMINATING the differential from trucks, the subject of the interesting discussion now being carried on in The Forum, seems to me a very timely and constructive bit of agitation. The modern motor truck has progressed so far in its field of design that it seems deplorable that it should be tied down to the limitations which should be left behind as characteristics of its experimental stages. In other words, we should not continue to incorporate in our truck axles that heavy, expensive and unnecessary mechanism which, under the name of the differential, has been uncomplainingly carried around by our trucks since the inception of the industry, increasing cost of operation and maintenance for the owner and manufacture and service for the manufacturer.

The Rostrum

Low-Test vs. High-Test Gasoline

EDITOR THE AUTOMOBILE:—Is low-test gasoline the best for touring work? If so, why is high-test most sought?

2—How many cubic feet of vapor will a gallon of gasoline produce, and how is this calculated, having given the ratio of mixture and the test or gravity of the gas?

3—How is drawbar pull calculated?

4—What became of that synthetic gasoline man who claimed that he could produce fuel so cheaply? What was the drawback to this fuel?

Frankfort, Ind. T. W.

—While there are more heat units in low-gravity gasoline than in high the high-gravity is sought because of its easier vaporization.

2—The amount of vapor that will be produced from a given quantity of gasoline depends on the composition of the gasoline and the temperature. It is not affected to any definite degree by the gravity, as you seem to indicate. The calculation is one which is very lengthy and involves a great many theoretical formulæ. A vapor is the gaseous or elastic fluid which emanates or evaporates from the surface of a solid or liquid at temperatures below its boiling point. Gasoline, being volatile, evaporates rapidly at ordinary temperatures. When the vapor is allowed to accumulate in a closed space such as in a carbureter or a motor the saturation point will be reached when the vapor pressure is sufficient to prevent further evaporation of the gasoline. It has then reached its saturation pressure. The volume that a given amount of gasoline will occupy at its saturation pressure is a definite quantity and depends altogether on the temperature and the volatility of the gasoline.

The formulæ involved in the calculation of saturation pressures and volumes are so complicated and require such a fundamental comprehension of the basic laws of thermodynamics that space does not permit a complete review of the entire subject. The fact is that actual results do not coincide with the theoretical due to losses of heat in changing from the liquid to the vaporous state. The changes in the specific heat of a liquid undergoing vaporization are also very complex and indeterminative. For actual calculations data regarding water and steam is more reliable than other vapors due to the extended amount of study which has been put upon this particular topic. The calorimetric data is very difficult to secure, but if you desire to go into the subject deeply a great volume of material has been collected on this subject in Winkelmann's handbook and in Landolt's and Bornstein's tables. Even these results show great variations in accuracy and show that even the best observers vary among themselves.

3—Regarding your question as to how draw-bar pull is calculated, the following is a formula which has been in use for two or three years on trucks:

$$P = \frac{5.18364\, B^2\, SNR}{D}$$

When P is the drawbar pull in pounds, B is the engine bore in inches, S is the engine stroke in inches, N is the number of cylinders, R is the gear reduction and D is the diameter of the driving wheels in inches.

4—The drawback to the synthetic gasoline so far put on the market is that when it actually came down to commercial practice the cost of manufacture was much higher than that of natural gasoline.

Lapping in New Piston Rings

Editor THE AUTOMOBILE: What is the proper way of lapping new piston rings in one-year-old cylinders, also the best type of piston ring to use, whether a patent type or the old style?

White Plains, N. Y. J. McG.

—In lapping piston rings great care must be observed by any amateur. The objection to allowing a novice to lap piston rings is that he is apt to push the piston too far into the cylinder, causing it to stick or break a ring or possibly both. To overcome this difficulty the rings can be clamped between two wooden disks slightly less in diameter than the cylinder. The rings are arranged between the disks, a rod is slipped through and the nuts at each end tightened. A handle on one end of the rod is used for the lapping process which consists in moving the rings slowly in and out with a rotary motion. The lapping compound can be secured from any well-equipped supply store or emery dust and oil may be used.

Kerosene and Carbon Deposits

Editor THE AUTOMOBILE:—I note a statement by an engineer a few days ago that the use of kerosene instead of gasoline will really decrease the carbon deposit.

Others have observed that a lean mixture overheats worse than a rich one. A car came in one cold morning last winter boiling so badly that the driver had to stop several times on the way. I asked about his needle valve. He examined it and found he had left it as he had started it open above two turns. He reduced it to the normal opening and had no more trouble. Will the lean or rich heat most?

Connersville, Ind. H. L. F.

—The rich mixture will heat most.

Adjusting Schebler Model L Carbureter

Editor THE AUTOMOBILE:—Kindly give directions how to adjust the model L Schebler carbureter.

Thompson, Pa. C. A. L.

—Connect carbureter to intake pipe so that it sets about 6 in. below bottom of gasoline tank, that the bowl may be filled by gravity. For best results the carbureter should be as close to the cylinder as possible, and in case of multiple cylinders, equidistant from each one. Connect a pipe or tube from gasoline tank to gasoline pinion. Pipe to be brass or copper and not less than ⅛-in. hole. Do not use rubber tube, as float chamber will not fill properly and rubber makes a sediment in gasoline. Be sure, before connecting, that the gasoline tank has no scrapings, filings or other particles of dirt on the bottom and that the tube or pipe is thoroughly free from dirt or corrosion.

Before adjusting the carbureter make sure that your ignition is properly timed, and that you have a good hot spark at each plug; that your valves are properly timed and seated, and that all connections between your intake valves and carbureter are tight, and that there are no air leaks of any kind in these connections.

In adjusting the carbureter, first, make your adjustment on the auxiliary, air valve *A* so that it seats firmly, but lightly; then close your needle valve by turning the adjustment screw *B*, Fig. 2, to the right until it stops. Do not use any pressure on this adjustment screw after it meets with resistance. Then turn it to the left from four to five complete turns and prime or flush the carbureter by pulling up the priming lever *C* and holding it up for about 5 sec. Next, open your throttle about one-third and start the motor; then close your throttle slightly and retard your spark and adjust throttle lever screw *F* and needle valve adjusting screw *B* so that the motor runs at the desired speed and hits on all cylinders.

After getting a good adjustment with your motor running idle, do not touch your needle valve adjustment again, but make your intermediate and high-speed adjustments on the dials *D* and *E*. Adjust pointer on the first dial *D* from 1 toward 3, about half way between. Advance your spark and open throttle so that the roller on the track running below the dials is in line with the first dial. If the motor backfires with the throttle in this position and the spark advanced, turn the indicator a little more toward 3, or if the mixture is too rich, turn the indicator back or toward 1 until you are satisfied that your motor is running properly with the throttle in this position or at intermediate speed. Now, open the throttle wide and make your adjustment on your dial *E* for high speed in the same manner as you have made your adjustments for intermediate speed on dial *D*.

Steamers Require Pilot Flame

Editor THE AUTOMOBILE:—Why is it that gasoline cars are more popular than steam? Does the steam car not possess the qualities that manufacturers of gasoline cars are to-day working for, namely, the most power for the amount of expense and care required to maintain same?

Los Angeles, Cal. W. H. H.

—Necessity for maintaining a pilot flame to always have heat in the boiler and the more complicated system of control have militated against the extensive use of steam cars. Basically with steam there always remains the necessity for having some type of boiler outside the engine itself.

Oiling Diagram of Duesenberg Racer

Editor THE AUTOMOBILE:—Kindly publish oiling diagram of the Duesenberg racing cars, giving direction of oil travel, check vales, etc., to come from reservoir tank on rear of car, position of inlet and outlet pipes in tank and internal oiling arrangement of motor.

2—What year was the Coca Cola trophy race run?

3—Is this trophy still competed for?

Providence, R. I. H. C. O.

—The diagram you request of the Duesenberg oiling system is given in Fig. 1. Duesenberg motors are all lubricated by a double oil pump carrying fresh oil from the tank at the rear of the car to the motor from which the hot oil is forced by the exhaust pump to the tank again. You will note from the sketch that the exhaust oil pipe extends up into the tank for a considerable distance in order that the hot oil may be let out on top. The pump, in addition to maintaining a constant level in the crankcase, also forces oil to the rocker arm chair and to a distributer pipe, giving a small stream to each connecting-rod. The level in the crankcase is controlled by a level tube which is under constant control of the operator. There are no check valves in any of this piping to the rear tank, these being only used when a hand pipe is connected up.

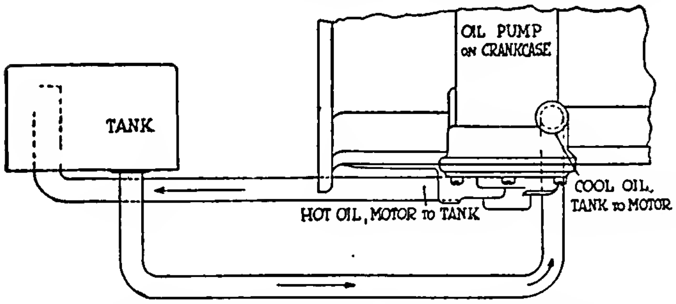

Fig. 1—Diagram of oiling system used on the Duesenberg racing cars. A double oil pump lubricates the motor

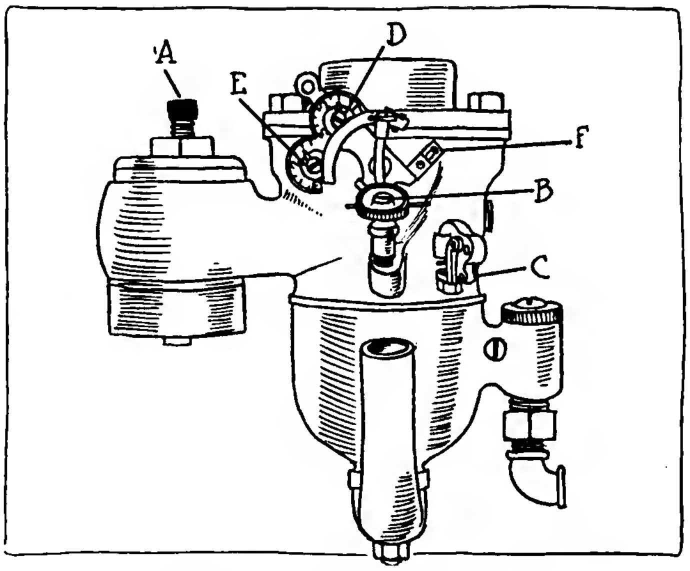

Fig. 2—Schebler model L carbureter, showing the various points at which adjustments may be made

2—The last Coca Cola race was run in Savannah, Ga., in the spring of 1912.

3—This trophy is no longer competed for.

Composition of Freak Fuels

Editor THE AUTOMOBILE:—Kindly state the main factor in the new fuel such as was used in Marmon car on the Indianapolis speedway, whether it was camphor, naphthaline, etc., and water.

2—What are most of the tablets made of which are intended to put in gasoline to increase mileage?

Newark, N. J. G. H. M.

—This was a secret compound.

2—Naphthaline, ether and picric acid are most used. THE AUTOMOBILE does not recommend any of them.

Putting Ammeter on 1913 Studebaker

Editor THE AUTOMOBILE:—Is there any reason why an ammeter may not be installed on our 1913 model 35 Studebaker with a single unit starter and generator, and if not, what scale should the instrument have for the 12-volt system used?

Cherry Valley, Ohio. J. F. H.

—An ammeter may be satisfactorily installed on this model, but it should not be placed in the heavy cables leading from the starter to the battery, since these carry a very heavy starting current. A 20-amp. scale will be sufficient if the ammeter is installed only in the generator circuit which may be done by disconnecting one of the wires leading to the relay contact points and inserting the ammeter in this circuit.

Grinding Is Due to Worn Parts

Editor THE AUTOMOBILE:—I have a Ford car that when I run in high there is a grinding but as soon as I throw it in neutral the grinding stops. I have had the motor a transmission out and there is nothing that is cutting out or seems to be wrong. I have noticed this noise for more than a month. What is the trouble?

Laceyville, Pa. B. W. F.

—As far as can be determined from the data furnished by you, the grinding noise probably originates in the rear axle assembly. There is also a probability that it is more noticeable at certain speeds. Noisy rear axles as a rule result from worn parts which cause play resulting in improper meshing of the gears. The usual remedy is the complete overhauling of the rear axle with replacement of all the worn parts, including the differential, drive gear and the driveshaft pinion. There have also been cases of a rasping or grinding noise especially noticeable with turning corners or traveling on the rough road. This follows universal ball cap gear being too tight and in such a case a shim 0.005 in. thick can be installed between the ball cap rear and front.

Working Out Generator Gearing

Editor THE AUTOMOBILE:—I am installing a lighting system generator and would appreciate your advice as to the ratio of dynamo to engine speed. The manufacturers recommend 100 r.p.m. per mile per hour car speed. Thus 15 m.p.h., 1500 r.p.m. I use 37-in tires and the gear ratio of engine to wheels is 2½ to 1.

Brooklyn, N. Y. A. B. N.

—This altogether depends on the design of the generator and how it is wound. Some generators are intended to be driven at engine speed and others at three times that amount. From the information you give with your generator the gearing could be worked out readily. A 37-in. wheel at 15 m.p.h. makes 136.3 r.p.m. At a gear ratio of 2½ to 1 the engine on your car at 15 m.p.h. would be turning over 340.75 r.p.m. If you wish to have your generator revolving at 1500 r.p.m. at 15 m.p.h. it would have to be geared at about 4.4 to 1. This seems rather high.

Adjusting 1910 Buick Differential

Editor THE AUTOMOBILE:—I have a model 17 Buick 1910, which had a continuous grind in the differential, so I took it down to find the trouble. I found that the bearing on the shaft near the differential was broken in pieces and before I put it back I would like to know the proper way to line up and adjust the differential, also the wheelbase of same.

Newark, N. J. R. T.

—The position of the pinion can be changed by removing the adjusting cover on the pinion flange and the snap rings on the adjusting nuts at either end of the pinion shaft. To adjust the pinion toward the gear loosen the nut on the outer end of the shaft and tighten the nut on the inner end with a spanner. Position of the ring gear may be adjusted by removing bolts and separating the two halves of the gearcase, then remove the snap rings on the adjusting nuts on either side of the inner main shaft bearing.

Formula for Car Performance

Editor THE AUTOMOBILE:—Referring to your issue of March 23, 1916, will you kindly advise if the 40 late closing of exhaust on Sheepshead Bay Packard is correct?

2—Kindly give one or two ability ratio formulæ, when factors of car weight, horsepower, gear ratio, wheel diameter, etc., are given?

Detroit, Mich. R. C. L.

—Yes.

2—The formula for measuring car performance is as follows:

Roadability $= A$

$B =$ Bore of engine.

$S =$ Stroke of engine.

$N =$ Number of cylinders.

$R =$ Final gear ratio.

$D =$ Diameter of wheels.

$W =$ Total weight moved.

$$\frac{B^2 \times S \times N \times R}{W \times D} = A$$

Ability figure—good	0.00105—for American conditions
Ability figure—low	0.00065—for European conditions

Wants Data on Mercer 22-72

Editor THE AUTOMOBILE:—In regard to the Mercer 22-72 four-passenger sporting model, kindly give me the weight of this car ready for the road with water, oil, gas, tools, etc. About how many miles may one expect per gallon of gas on good country roads?

Minneapolis, Minn. W. S. H.

—The weight of this model is given by the Mercer company as 3400 lb.

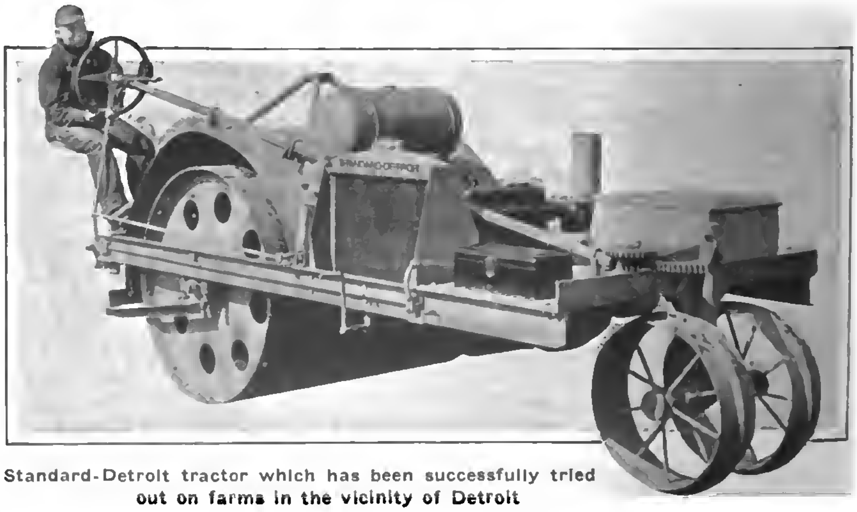
Its average gasoline mileage is 12 to 14 m.p.g., according to the same authority.

Piston Displacement Formula

In the Rostrum for April 20, page 730, appears an error on the method of finding piston displacement. The entire formula given should be divided by four, and the correct reading of this is bore × bore × 3.1416 × stroke × number of cylinders divided by four = piston displacement.

Standard-Detroit Tractor for Farm Work

THE Standard-Detroit Co., Detroit, Mich., of which M. L. Pulcher, vice-president and gen. mgr. of the Federal Motor Truck Co., is president, has brought out the Standard-Detroit tractor which has a drawbar pull of 2000 lb., weighs 3900 lb. and sells for $1,065. It is built largely along automobile lines, having a 10-20-hp. valve-in-head motor in unit with clutch and transmission, the entire assembly being oiled from the engine. All parts are inclosed and hung from the frame so that no misalignment of the bearings can occur. Only three controls are used in the operation of the tractor, which has a speed of 2½ to 3 m.p.h. One hand lever does all ordinary work and automatically disengages the gears and throws in the clutch for belt work. The radiator is unusually large and is of the cast tank type.

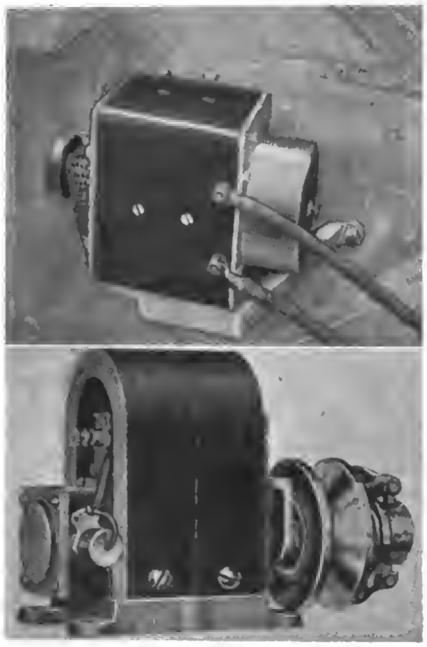


Standard-Detroit tractor which has been successfully tried out on farms in the vicinity of Detroit

ACCESSORIES

Henricks Electric Systems

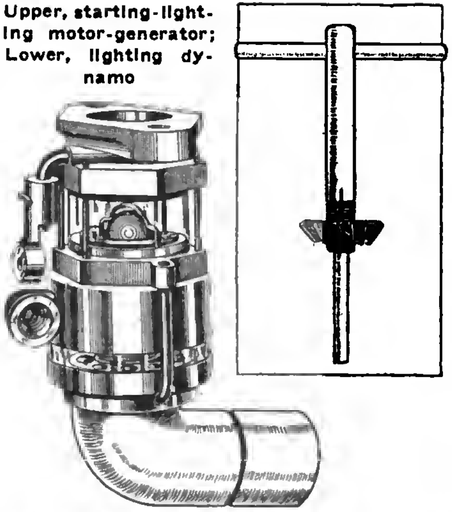
THIS company specializes on starting and lighting equipment for existing cars. The Light-a-Ford is a magneto type generator for Ford cars and has a V-grooved pulley with governor, cut-out and ball bearings. It will charge a storage battery at 6 or 7 amp. and will light lamps of an aggregate candlepower of 35 to 40. The price is $30. A complete outfit is sold, consisting of the generator, a 6-volt 60-amp. battery, a pair of 9-in. headlights, a Cutler-Hammer dimming switch, tail light and all minor equipment, such as belt, wiring, connectors, terminal blocks, etc., at $65. Special outfits for lighting are manufactured for Marmons, Overlands, Premiers and Hupmobiles, models from 1909 to 1914. The Henricks single-unit motor-generator will spin a Ford motor at about 200 r.p.m. and weighs 50 lb. Complete starting and lighting outfits for Fords cost $75, including motor-generator, storage battery and all accessories; outfits for Marmons, Overlands, Hupmobiles and Premiers cost $125.—Henricks Magneto & Electric Co., Indianapolis, Ind.



Henricks apparatus; Upper, starting-lighting motor-generator; Lower, lighting dynamo

Shain Ball Carbureter

In this carbureter the fuel supply is through fixed nozzles, and air through ports, both of which can be adjusted by screwing in plugs with holes of various sizes. Directions are furnished with each carbureter for fitting air and fuel nozzles of the proper capacities. The spraying device consists of a ball resting on a seat by gravity, there being no spring; a yoke limits the rise of the ball under suction. The fuel nozzles open under the ball; when the engine is running part of the air is taken up through the opening left by the ball, which is raised by suction, and part through ports around the ball seat. Fuel spreads in a thin layer on all sides of the ball and is readily vaporized by the air passing up at high velocity. The ball automatically shuts off the fuel when the engine stops. Glass cylinders are used around the air ports and the ball valve, so that the carbureter can be seen in actual operation. The 1 1/16-in. size weighs 1½ lb., complete with hot air horn. Price, 15/16-in., 1 1/16-in. or 1 3/16-in. outlet, $10.—Charles D. Shain, Brooklyn, N. Y.



Left — Shain ball carbureter. Right—Noonan valve-seating tool

Ton-Ford Truck Attachment

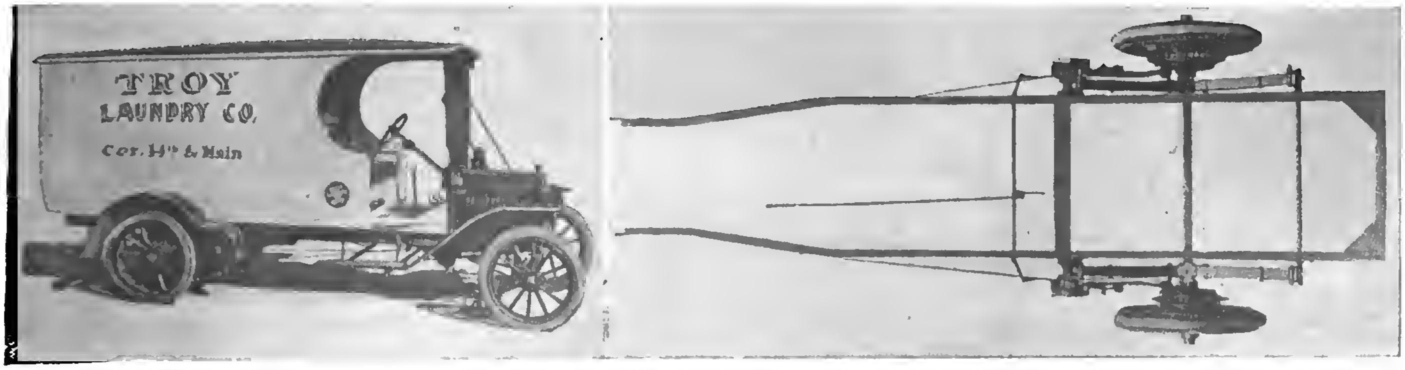
A Ford may be converted into a 1-ton truck by replacing the rear portion of the running gear with a heavy frame, driving gear and wheels. The sprockets are placed on the regular Ford axle ends and these drive to the rear wheels through chains. The frame is a 4-in. channel section. The axle is a forging 1¾ by 1⅞ in. and the wheels are mounted on Timken bearings. The brakes are of the expanding type acting on the rear wheel drums and on drums on the jackshaft. The gearing is 6 to 1 or 7 to 1 as desired. The body space is 8 ft. 4 in. long and 34 in. wide, and the wheelbase is 124 in. Price, $385.—Woodward Truck Attachment Co., Los Angeles, Cal.

Noonan Valve-Seating Tool

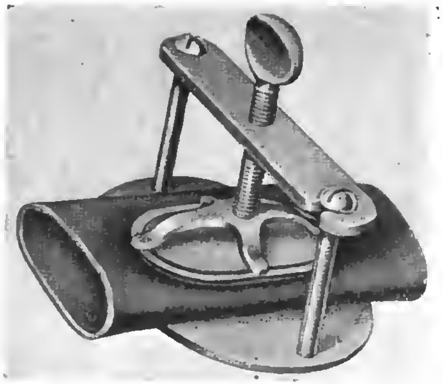
The tool is made in twenty-five sizes, and there is one that will fit each make of car. Price, $5.—D. R. Noonan, Paris, Ill.

Mutual Starting Switch

This is a starting switch of the plunger type which is designed to pass the current to the starting motor in a particular way when the plunger is operated. At first just sufficient current is sent to the motor to start the armature turning; secondly, the current is cut off long enough to allow the pinion time to mesh with the gear; and thirdly, the full current is turned on for the actual starting of the engine. This is all done at one stroke of the plunger. The throw of the switch is short, 1⅜ in., the mechanical action is smooth and easy, the parts heavy and durable and the working parts



Ton-Ford truck attachment. Right—Additional gear furnished to transform Ford into 1-ton truck. Left—Appearance with change made



Five-minute tube vulcanizer

are surrounded by a thick wall of a composition which resists both heat and electricity. The switch can be mounted on top of the electric motor or in any other desirable location. Contacts are of pure copper, very heavy and readily accessible. The makers state that the most important feature of the switch is its extremely low millivolt drop when carrying currents greatly in excess of its rated capacity; the drop on 160 amp. is given as 15 millivolts.

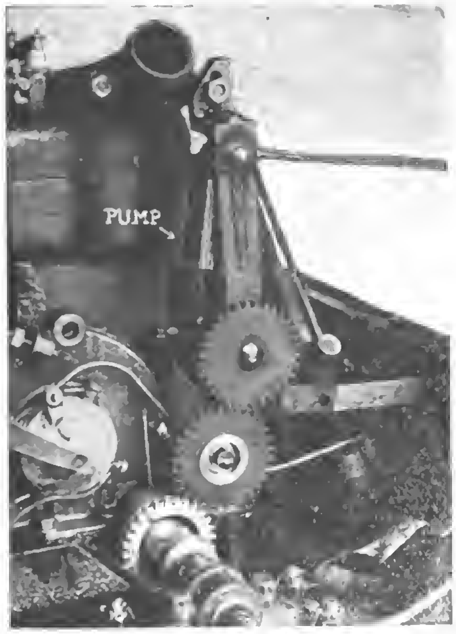
Another product is the Mutual foot switch, designed to complete the circuit between the battery and starting motor when the foot button is depressed; it contains no resistance. Each terminal is connected with four Vandam bronze finger springs and each spring carries a solid copper contact button; the eight contacts are arranged in a ring. A central cone of copper is forced into the circle by the foot button and takes current from one set of contacts and delivers it to the other. The cone is mounted so that it can turn freely; in use it gradually works around so that the wear is distributed around its surface. By removing two screws the inside of the switch can be removed and inspected without disturbing any permanent adjustments. No adjusting is needed.—Mutual Electric & Machine Co., Wheeling, W. Va.

Low's 5-Minute Vulcanizer

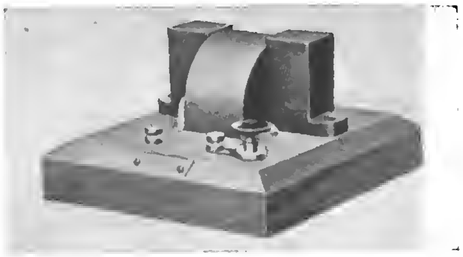
This is a tube vulcanizer of the simplest possible construction. Its claim to superiority is based not so much on the apparatus as on the principle involved in the application of the patch. The vulcanizer is merely a screw clamp with a three-armed spider on the end of the screw. The patch is of pure gum rubber and comes set into the concave side of a metal pan; a rim around the pan forms a shallow cup on the side opposite to the patch, and in this cup is a disk of cardboard impregnated with a chemical substance which causes it to burn without flame and with exactly the amount of heat required to vulcanize the patch. Thus the patch, the patch mold and the fuel are combined in a unit; the metal pan is thrown away when a patch has been applied. To apply a patch the metal pan is clamped on the tube, rubber side next to the tube, the cardboard disk is lighted and allowed to burn out and the job is finished in five minutes. The gum rubber is liquified by the heat and runs to a feather edge all round, making a permanent repair. Long rents in a tube can be repaired by applying a row of patches with overlapping edges. Price, with twelve patches, $2; extra patches, $1 per doz.—5-Minute Vulcanizer & Auto Supply Co., Kansas City, Mo.

Mutual regulating starting switch

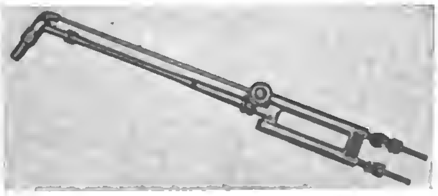
Mutual plain starting switch



Juleco F pump for Fords



Teco remagnetizing device



Meco welding torch for all work

Juleco F Pump for Fords

This motor-driven tire pump is installed permanently on the Ford engine, taking its power from the forward end of the crankshaft. A thumb-screw pushes the pump gear into mesh, and, upon attaching the hose, it will pump the tires to the required pressure in two to three minutes, it is claimed. A whistle gage gives warning when this point is attained. No change is necessary in installing the pump, a process which can be completed with a wrench and a screwdriver. The pump lists at $4.50, including hose and whistle gage.—Judd & Leland Mfg. Co., Clifton Springs, N. Y.

Teco Magnetizer

This magnetizer has a single magnet with pole-pieces projecting from opposite ends of the core mounted on a wood base; binding posts for connecting the lead wires and a switch for controlling the current are provided. The magneto magnets to be recharged are placed against the pole-pieces and the current passed through the winding of the magnet. The pole-pieces are sufficiently broad to take any standard magneto magnet. There are no moving parts other than the switch. The makers state that with a fully charged 6-volt 60-ampere storage battery from 75 to 100 magnets can be recharged. Price, $10.—Tritt Electric Co., Union City, Ind.

Meco Welding Torch

This model C welding torch is said to give a neutral flame of 6300 deg. Fahr. Tips supplied range from No. 1 to No. 10 and will do any work which can be done by the oxy-acetylene process. The cutter attachment to the torch is very simple, there being no necessity to remove the hose connections. Two operations are required, removing the nut on the oxygen valve and the union nut on the gas conduit and the torch is ready for the cutter. Other features are a thumb-controlled needle valve, automatic check valve system and a one-piece handle.—Modern Engineering Co., St. Louis, Mo.

C-Cleer for Wet Windshields

When this compound is applied to glass it is claimed that rain, snow or steam will not settle on the surface. Price, 25 cents per can.—Sole Mfg. Co., New York City.

Aviation and Automobiles

THE Packard twelve-cylinder aviation engine described in this issue of THE AUTOMOBILE is the first aeroplane motor to be manufactured by one of the great automobile firms of America. It is interesting to speculate upon the probability of others following the lead and making the needs of air craft a part of their business. Packard is following the lead of Mercedes in Germany, of Sunbeam in England and several of the first rank French makers of automobiles. Like these foreign firms Packard has taken the engine which it believed to be the best for high power, light weight and dependability, reproducing the stock design in a stronger and lighter form. The results so far are, of course, only experimental, but this stage has long since been passed by the European manufacturers whose confidence in their original designs has been proved correct and justifiable.

The production of good aeroplane engines is almost a toolroom job; it demands greater accuracy than is necessary for automobile work, but the production of very high-grade engines in small quantity is an excellent thing for the *morale* of any automobile factory. In the near future it is certain that there will be a good market for the best possible aviation machines; it may not be a very large market, but it will be large enough to be worth sharing. There are many firms in the American automobile industry well suited to turn out the right sort of engines and it seems that they will not be slow to grasp the opportunity.

Compound Engines

THE compound engine has been a dream of many a gas-engine engineer and a good many motors of this sort have been developed. Where weight is not important, and where slow speed is all that is required, an engine with a very long stroke allows sufficient expansion of the burning charge to prevent much waste in the exhaust, but with engines for automobiles the requirements of the case have made the stationary type of gas engine impossible.

The truck, however, has followed the passenger car, and the truck engine has been developed from much smaller sorts intended for passenger car use. Economical operation being so all-important in heavy truck service, there does appear to be a possibility, however, that the automobile type of motor is not entirely the best. The question at present is whether we can afford to add somewhat to the weight of a big truck in order to obtain a better fuel economy.

There is more than one kind of engine wherein the expansion stroke can be carried far beyond the usual automobile limits, and its natural compactness encourages the idea that much might be said in favor of a double expansion design. In any case the experiment should be worth trying.

1819 Miles

THE congratulations of the whole automobile world are due to Ralph Mulford and the Hudson Motor Car Company to-day. Man and machine covered more miles in two rounds of the clock than ever any man or any car have done before. In these days of wonderful speeds the senses become dulled to mere figures, but if New York is taken as a center and a circle struck of 1819 miles radius the prodigious length of Mulford's journey can be appreciated.

Striking from Sheepshead Bay along a straight line he could have run past Denver. Another line would have seen him in Santa Fé before the twenty-fourth hour had expired. Southward, Nicaragua would have been reached, and to the north the 1819-mile circle cuts deep into Greenland.

In thinking of this run the splendid endurance of the man is the uppermost thought, just as it was eight years ago when S. F. Edge bettered 60 miles an hour for the whole twenty-four, but the endurance of the car must not be forgotten, as this is quite as splendid. Only a very few years ago 500-mile races were run and won at speeds less than 75 m.p.h., and the cars that took part mostly broke up under the stress. All the mechanical trouble that the Hudson suffered was the destruction of six spark plugs and a couple of pins in the carbureter. Yet again, three of the four tires endured for the whole distance, which is conclusive testimony to the efficiency of the cord principle of construction and to the virtues of wood surfaced speedways.

Albright Locomobile President

A. L. Riker and J. F. Roche Are Vice-Presidents—F. R. Hickman, Sec.-Treas.

Bridgeport, Conn., April 21—At a recent meeting of the directors of the Locomobile Co. of America, this city, the following officers were elected: Raymond K. Albright, president; Andrew L. Riker, vice-president, James T. Roche, vice-president, and Frank R. Hickman, secretary and treasurer.

Boston, Mass., April 26.—The Locomobile Co. of America has filed with the Massachusetts Secretary of State a statement of its financial conditions, dated March 31, 1916, which compares as follows:

Assets	1916	1915
Real estate	$186,500	$186,500
Machinery	2,452,697	2,029,527
Merchandise, material, stock in process	4,148,055	4,235,684
Cash and debts receivable	830,554	1,049,014
Patent rights, trademarks and good will	5,515,952	5,310,798
Sundries	206,921	203,511
Total	$13,340,681	$13,015,031
Liabilities		
Capital stock	$6,250,800	$6,250,800
Accounts payable	317,673	897,426
Funded debt	2,018,500	1,176,000
Floating debt	2,775,681	2,789,448
Reserves	670,437	559,469
Profit and loss surplus	1,307,589	841,886
Total	$13,340,681	$13,015,031

100 Armored Locomobiles for U. S.

Bridgeport, Conn., May 3—It is reported here that the United States Government has ordered 100 armored cars from the Locomobile Co. of America. The cars are to carry two machine guns, the chassis used being six-cylinder types strengthened and heavily armored. They are to be equipped with pneumatic tires and will be capable of 60 m.p.h. on the road, according to the report, which credits A. L. Riker, vice-president and chief engineer of the Locomobile company and a member of the Naval Consulting Board, with the design of the cars.

In response to an inquiry as to the reliability of the report, Mr. Riker stated that he could neither affirm nor deny it.

Allen Controls Fuel Pump Co.

New York City, May 1—Wm. A. Allen, head of the Allen Auto Specialty Co., and who formed last January the Allen Pressure System Co., with a capital of $10,000, to produce gasoline and oil-storage equipment for garages, has come into full control of the latter company, having recently taken over the half interest held by F. F. Davis, who with Mr. Allen started the company.

Mr. Allen's latest product is called the Apsco system and is applicable in the pumping of gasoline or other liquids on any floor of a garage by means of pressure. This means that by leading pipes from the main tank under the garage to any part of the building, gasoline or any other fuel may be had at any time.

Few Changes in 1917 Crow

Elkhart, Ind., May 1.—The present Crow Motor Car Co.'s chassis will be continued practically without change for 1917. It will be furnished with five-passenger touring body at $725, and with special three-passenger clover-leaf body at $795. The motor is a 3½ by 5-in. L-head block with dry-plate clutch and three speed gearset on the rear axle. Specifications include: Connecticut ignition, Zenith carbureter, Dyneto two-unit starting and lighting, 112-in. wheelbase and 32 by 3½-in. tires.

New Worm-Driven Brockway

New York City, April 29.—The Brockway Motor Truck Co., Cortland, N. Y., is making deliveries on its new Model O, which is a worm-driven 1-tonner, the chain-driven Model G, of ¾-ton capacity, being dropped. The new model resembles other Brockways, having a motor under the hood, a cast-case finned-tube radiator and a unit mounting of engine, clutch and gearbox, final worm drive being on the Hotchkiss principle.

Premier Offers $300,000 Stock

Chicago, Ill., April 30—The Premier Motor Corp., Indianapolis, is offering through F. M. Zeiler & Co., this city, $300,000 in 7-per cent cumulative preferred stock, redeemable at 110 per cent and accrued dividend. The company has outstanding $1,000,000 in this stock, its par value being $100. This stock is entitled to quarterly dividends of 1¾ per cent, payable on the first day of January, April, July and October.

Collins Joins Springfield Body

Detroit, Mich., May 2—B. W. Collins, formerly assistant treasurer of the old Lozier Motor Co., and for some time connected with the United States Tire Co., has been appointed assistant treasurer and assistant to the president of the Springfield Body Co.

Dakin with Continental Motors

Detroit, Mich., May 2—C. B. Dakin, formerly in charge of the purchasing service buying of the Oakland Motor Car Co., has joined the purchasing force of the Continental Motors Co.

Illinois Roads Day May 19

Springfield, Ill., April 29—The date of the fourth annual good roads day of Illinois has been set for May 19.

Goodyear Wins Tire Machine Suit

Court Holds Seiberling-Stevens Patent Valid and Infringed by Firestone

Cleveland, Ohio, May 2—An opinion in favor of Frank A. Seiberling, president of the Goodyear Tire & Rubber Co., has been handed down by Judge J. M. Killits in the suit against the Firestone Tire & Rubber Co., charging infringement of the Seiberling-Stevens tire-making machine patents Nos. 725,135 and 726,561. The court held the Seiberling-Stevens patents valid and infringed by the Firestone company. The suit was in the U. S. District Court for the Northern District of Ohio, Eastern Division.

The Goodyear company contended that the Seiberling-Stevens machine of 1902-1903 was the pioneer, and that it paved the way for the present-day semi-automatic tire-making machine; that it was the first machine ever produced to make automobile tires, and that while a majority of the tire manufacturers have been building their tires on machines licensed under the Goodyear patents a few, among whom was the Firestone company, refused to conceive the validity of the patents covering Goodyear machines. It was alleged that about three years ago the Firestone company installed tire-making machines in its factory without taking a license under the Seiberling patent. Goodyear maintained that the Firestone machines infringed Goodyear patents and asked Firestone to discontinue their use. The suit charging infringement followed.

Machine Patented in 1904

The machine covered by the patent in suit was built by F. A. Seiberling and W. C. Stevens and patented in 1904. Its purpose was to supplant the uncertain and inefficient results of hand work in tire casing building in stretching the fabric layers with uniform machine processes. With the hand methods the tension on the fabric layers would differ with the muscular strength or degree of fatigue of the workman. Prior to 1902 automobile tire casings were made by hand and some are still made that way. Later improvements were made upon the original machine, and by 1908 nearly all Goodyear automobile tire casings were machine-made, as is the case to-day. In 1907 the company produced 28,685 tires; in 1916 its output will exceed 3,000,000, and for 1917 facilities are being provided to produce 5,500,000. This growth the company's officials attribute in a large degree to the better and more uniform product built by the machine method than was possible by hand work.

U. S. Accepts Rittman Patent

Inventor Retains Rights on Foreign or Imported Oil—10 Licenses Granted

WASHINGTON, D. C., May 2—Professor Rittman, formerly of the Bureau of Mines, has assigned his patent covering processes of producing gasoline and other products of petroleum to the government, and the Senate yesterday accepted the assignment in accordance with the joint resolution proposed by Senator James of Kentucky and Secretary Lane.

The assignment gives the government the right and title to the process patents as applied to all crude oil produced in the United States, but does not convey the interest in patents for application to oil produced in foreign countries or imported, the inventor retaining these rights.

On the assumption that the government would accept the assignment many applications for licenses to operate under the patent already had been filed and the government had granted ten applications on condition that Congress accepted the gift. The assignment by Professor Rittman is for all time and is made to the Secretary of the Interior for the use and benefit of the American people.

Stout Is Scripps-Booth Sales Mgr.

DETROIT, MICH., April 28.—William B. Stout has been appointed general sales manager of the Scripps-Booth Co., taking the place of R. H. Spear, resigned. Mr. Spear will become general sales and advertising manager of the Gramm-Bernstein Co., Lima, Ohio.

Mr. Stout has figured prominently in the affairs of the Scripps-Booth concern since the production of light vehicles was begun. He was first known as engineer for the company during the design period, and when the car was ready for distribution he was placed in charge of advertising.

Collins To Leave Buick

FLINT, MICH., April 28—R. H. Collins, well known in automobile circles as general sales manager of the Buick Motor Co., will, on July 31, sever his active connection with the Buick organization. No announcement of future plans has been made by Mr. Collins, and it is not yet known who will succeed him in the sales work of the Buick organization.

Reeke Is Jeffery Sales Mgr.

MILWAUKEE, WIS., April 29.—Alfred Reeke, president of the Reeke-Osmond Motor Car Co., 455 Broadway, Milwaukee, State agent for the Jeffery, has been appointed general sales manager of the Thomas B. Jeffery Co., Kenosha, Wis., and assumes his duties on May 1. Mr. Reeke takes the position of Edward S. Jordan, who resigned some time ago to become head of the Jordan Motor Car Co., which now is erecting a factory at Cleveland, Ohio.

Mr. Reeke's interest in the Milwaukee company has been purchased by the other stockholders, N. E. Osmond and H. M. Vogel, who will continue the business under the same name and policies.

Riker a N. A. C. C. Director

NEW YORK CITY, May 3—A. L. Riker, vice-president and chief engineer of the Locomobile Co. of America, was elected a director of the National Automobile Chamber of Commerce, at its regular monthly meeting to-day. Mr. Riker succeeds S. T. Davis, Jr., former president of the Locomobile company, who died last September.

The chamber reports shipments of approximately 28,000 carloads during April, as compared with 18,912 in the same month in 1915, and 29,540 in March, 1916. The freight car situation is better. The traffic committee met today and reported that the increased demurrage charge of $2 after three days is now in effect, though only temporarily.

A resolution was passed opposing any legislation which was antagonistic to the efficiency in the American industries, which in itself would be effective by the passage of the Tavenner bill, introduced in the House of Representatives, claiming to stop premium work and the pay of higher wages to those who do it.

There will be a meeting in this city on June 7 of the commercial vehicle interests. This will be just one day before the annual meeting of the N. A. C. C.

Short Northway Chief Engineer

DETROIT, MICH., May 1—C. R. Short, former engineer for the Russell Motor Car Co., Toronto, Can., has assumed the duties of chief engineer of the Northway Motor & Mfg. Co., succeeding E. G. Gunn, who recently resigned to become chief engineer for the Premier Motor Corp., Indianapolis, Ind.

Wade Resigns from Maxwell

DETROIT, MICH., April 27.—F. A. Wade has resigned as purchasing agent of the Maxwell Motor Co. His future plans have not yet been announced. Mr. Wade's long connection as purchasing agent of the Ford Motor Co., E-M-F Co. and Studebaker Corp., at different times, has made him one of the prominent men of the field.

Westcott Moves To Springfield

New Plant Will Permit Doubling Output—Davis Takes Westcott Factory July 1

RICHMOND, IND., May 1—The Davis Motor Car Co. has taken over the local plant of the Westcott Motor Car Co., and will occupy it on July 1. The Westcott company will move its plant to Springfield, Ohio, and will occupy the Buckeye division of the American Seeding Machine Co. Operations in this new plant are expected to start around July 1. The company now employs about 200 men and is turning out about 1000 cars a year. In the new plant the company will have facilities to more than double its output. It is understood that the plant is to employ about 400 men. The Davis company will increase its force. The management, it is stated, will remain the same, G. W. Davis retaining the title of president and general manager, W. H. Cummins as treasurer and factory manager and E. W. Winchester as mechanical chief engineer.

Moore Vim General Manager

FLINT, MICH., April 28—The Vim Motor Truck Co., Philadelphia, has formed a connection with D. K. Moore who will be assistant general manager. Mr. Moore, who for five years was sales manager of the Weston-Mott Co., this city, and who remained in that capacity until the sales department was abolished by that concern, has long been connected with the accessory field. Recently he has been engaged in the strenuous work of purchasing and rounding up materials for Weston-Mott.

The Vim company reports a sales increase for the month of March of 702 per cent, and an increase so far for April of 722 per cent.

By June 1, the company expects to be producing 1000 cars a month. The average of its contracts with the source of supply are fourteen months in advance of date.

Schwartz Resigns from Metz

WALTHAM, MASS., May 1.—W. H. Schwartz, sales manager of the Metz Motor Car Co. since 1909, has resigned. He was very active in the affairs of the company, traveling throughout the country looking after dealers and branches when not aiding in production. Mr. Schwartz will rest for some months and then enter business for himself. There have been rumors that prominent men in the West want to back him to produce a new make of automobile.

Brunswick-Balke To Make Tires

Big Billiard and Bowling Alley Fixture Firm Plans 1400 a Day

MUSKEGON, MICH., April 28—The Brunswick-Balke-Collender Co., maker of billiard tables, bowling alley fixtures and equipment, among many other products, is going to enter the automobile tire manufacturing field, and has ordered tire manufacturing machinery which will be here within two months, it is said. The Brunswick concern will enter the tire field well equipped for such production, since careful investigation and canvass of the field was made before launching on the new plan. At the start, from fifty to 100 tires a day are to be turned out, but within twelve months, it is expected that the daily output will be in the neighborhood of 1200 to 1400 tires. Immediate addition of 100 men to the present 1200 working force at the factories of the concern here will result from the taking on of this new manufacturing activity, and within a year it is expected that the added force will be 800. Present plants will take care of the tire business, but very likely additions will be necessary later.

The manufacturing plant is to be in charge of E. L. Sherbondy, who at the present time is in the east purchasing the necessary machinery. Mr. Sherbondy was for nineteen years in the experimental department of the Goodrich Tire & Rubber Co., from which he resigned to take up his present work.

The officers of the company are: B. T. Sellers, president; E. Knickerbocker, vice-president; C. H. Nash, treasurer; E. D. Ward, secretary, and L. A. Spinelli, director.

To Make Timers in Mobile

MOBILE, ALA., April 29—The Universal Commutator Co. has been organized here for the manufacture of timers for automobiles. Capitalization is $30,000 and a plant to cost nearly that amount will be established. E. B. Marshall, is president; W. C. Bumhauer vice-president; A. M. Jackson, secretary; W. A. Dozier, treasurer.

Reeps Mfg. Co. Incorporated

NEW YORK CITY, April 29—The Reeps Mfg. Co., with offices at 50 Church Street, this city, has been incorporated under New York laws for $25,000. The company will manufacture the Reeps dashboard oil and gasoline gages for automobiles; a warning signal for bicycles and motorcycles; and several other electrical and mechanical appliances.

Chas. S. Shuman, formerly with the Western Electric Co. at Philadelphia, is president and treasurer.

Aero-Cushion Tire Gets Plant

SAN JOSÉ, CAL., April 29—A factory site has been obtained by the Aero-Cushion Tire Co., this city, which was recently formed. Installation of machinery in the old Caton foundry building on West Santa Clara Street near the West San José station is being made and the plant will be working in two months.

Rich Twist Drill Co. to Move to Battle Creek

BATTLE CREEK, MICH., April 29.—The Rich Twist Drill Co., Chicago, Ill., the bulk of the manufacture of which is automobile accessories, has decided to move its factory to this city, in order to be closer to the principal market for its products. A plant to cost $45,000 will be erected at once, the site for which is 3 acres in extent and advantageously situated on the railroad. The new plants plan to start operating here July 1, and will consist of a main building 40 by 250 ft., two stories high, and two other buildings 35 by 150 ft., in addition to an office structure.

Canadian Ford Production Passes 1915 Mark

FORD, ONT., April 29—The total production of the Ford Motor Car Co. of Canada, Ltd., figure for the entire fiscal year last year already is passed, and there are three and a half months of the present fiscal year to go. It is evident by the orders coming in at the factory that although the company will be able to turn out its estimated production of 40,000 cars, even this quantity will not begin to supply all the cars for which dealers both in Canada and in overseas territory are asking.

Ideal Co. Postpones Operations

COLUMBUS, OHIO, April 29—The promotors of the Ideal Light Car Co., this city, incorporated about six months ago with an authorized capital of $100,000, which was formed for the purpose of manufacturing a light pleasure gasoline car to sell for $750, have abandoned the project for the time being because of the high cost of materials and parts. If conditions improve the project might be taken up later.

Detroit Seamless Tube Buys Land

DETROIT, MICH., April 29—The Detroit Seamless Steel Tubes Co. has acquired a large tract of land of 12 acres at Fort and Waterman Streets, this city, on which it intends to erect a new plant for the manufacture of its product. Greatly increased facilities and a larger working force will be the results.

Federal Rubber To Expand

Company Awards Contracts for Erection of Three Large Factory Additions

MILWAUKEE, WIS., April 29—The Federal Rubber Mfg. Co. has made official announcement that a large extension program has been undertaken. The contract has been awarded to the Fred T. Ley Co., Inc., Springfield, Mass., for the erection of three large buildings, and ground will be broken as soon as sub-contracts are let.

The new buildings to be erected are: Manufacturing building, steel and brick, seven stories and basement, 112 by 235 ft.; storage and shipping house, reinforced concrete and brick, one story, 106 by 113 ft.; manufacturing building, steel and brick, 200 by 116 ft., with foundations for seven stories, of which one story will be erected now.

The Federal company recently passed into the control of the Fisk interests of Chicopee Falls, Mass. Prior to the transfer, the Federal doubled the size of the plant, established in 1911, making it one of the really important tire and commercial rubber goods manufactories in the Middle West. B. H. Pratt is general manager of the Federal company.

Lane Truck Starts Work on New Plant

KALAMAZOO, MICH., April 29—The Lane Motor Truck Co., recently organized to manufacture commercial vehicles, has begun the erection of its factory here. The plant will be one-story, 400 ft. long and 80 ft. wide. It is expected that the new concern will occupy its quarters by June 1.

Doehler Gets American Die Castings

BROOKLYN, N. Y., May 2—The Doehler Die-Casting Co., Brooklyn, N. Y., and Toledo, Ohio, has acquired a controlling interest in the American Die Casting Co., Newark, N. J., which will hereafter be known as the Doehler Die-Casting Co. of New Jersey. Its present management remains unchanged.

Strike at Westinghouse Plant

PITTSBURGH, PA., April 29—A strike occurred at the East Pittsburgh works of the Westinghouse Electric & Mfg. Co. on April 21. No reason was given as no grievances had been handed in to the standing committee representing both the company and employees. However, it has developed that the principal demand is for an 8-hr. working day, and it is understood that the management was later in receipt of a communication demanding a reduction of working hours from

52 to 48 hr. a week, with no reduction in wages, this in addition to a 10 per cent advance in wages recently granted all shop employees. The company is known to be committeed as opposed to a reduction of working hours at the present time.

All the Westinghouse company plants are closed. The main works at East Pittsburgh were closed by the strikers whereas the other plants, including the Westinghouse Air Brake, Union Switch & Signal Co., and the Westinghouse automobile equipment plant at Shadyside were closed by the management. There has been no disorder of any importance.

—

Harrow Spring Completing Additions

KALAMAZOO, MICH., April 29—The Harrow Spring Co., this city, is pushing to completion the additions to its plant, and it is contemplated that the new electric furnace equipment will be in operation within three weeks. A 10-per cent wage increase was recently given the 200 employees of the spring concern.

—

Liberty Co. for Preparedness

DETROIT, April 29—A spirit of patriotism and preparedness is shown in a letter written by Percy Owen, president and general manager of the Liberty Motor Car Co., to the president of the University of Michigan, in which the statement is made that the Liberty company offers to start a movement whereby it will assume the payment of all expenses incurred in giving a military training to suitable college students at the military training camp at Plattsburg, New York. This offer includes transportation expenses to Plattsburg and return and all expenses which will be contracted at the training camp by the men who may be selected.

—

Jeffery Opens Athletic Field

KENOSHA, WIS., April 29—The Thomas B. Jeffery Co., Kenosha, Wis., one of the pioneer western manufacturers to establish closer relations between employees and employers, has broken ground for an athletic field, to be known as Jeffery Field, for the benefit of its 2000 workmen. The stadium will be equipped for baseball, soccer, football and other sports.

—

Motor Prevents Dort Shut-Down

FLINT, MICH., April 29—When the Flint river rose 16 ft. recently the factory of the Dort Motor Car Co. was threatened with a shut-down. The engines of two chassis attached to a 4-in. centrifugal force pump lent by the local fire department, however, kept the shops and offices free of water for several days while the water was high.

Commissary Truck Requirements

Philadelphia Section S. A. E. Hears Major Lawton of U.S.A. Commissary

PHILADELPHIA, PA., April 27—Major Francis Lawton of the Commissary Department of the East, U. S. A., was the speaker of the evening at the meeting of the Pennsylvania Section of the Society of Automobile Engineers held at the Engineers' Club last night.

Major Lawton's paper was in the nature of a presentation of facts which would inform motor truck owners, manufacturers and dealers what problems they would have to meet in taking care of the commissary department of an army in time of war. His opening remarks urged the necessity for promptness in laying out a plan of operation. He dwelt on the difficulty of transportation, especially for the fast-moving columns which are employed in modern warfare.

"No branch of preparedness has received so little attention," Major Lawton said, "and the neglect is no doubt due to the fact that few realize that conditions have changed. Animals can always be secured, but motor trucks are different. Conditions are all changed now and the lessons of Europe show that rapidly-moving troops must rely on motor trucks. The American soldiers would never be able to operate a line of communication from Columbus, N. M., to Casas Grandes without the use of motor trucks which they were obliged to purchase in order to maintain a line of communication.

S. A. E. Support Necessary

"The tactical unit of an army is the division consisting of 22,000 men. This requires 175,000 lb. of food per day. In the armies of to-day the men are numbered by millions instead of thousands, and to accomplish the great task of organization necessary to handle the problems presented by these large armies we must have the support of the Society of Automobile Engineers.

"Two methods of securing food are available to men on the march or fighting in hostile countries. First, forage, and second, by carrying. Gustavus Adolphus and Napoleon, the two great tacticians, used both methods. Modern armies rely on the country in which they are operating and also draw from the rear. The French regulations state that an army in the field must draw on the country as if it were the only source of supply and the rear must be drawn upon as if it also were the only source of supply. The amount carried on the march amounts to about 1,250,000 lb. for a division and the method is to ship from the purchase point or main base to the advance depot, from the advance depot to the refilling point and from the refilling point to the various distributing points along the firing line. The carrying is done between the refilling points by supply trains, ammunition trains, sanitary trains and engineers' trains.

"The supply train carrying the food, etc., is the most active, as it must supply provisions for both animals and men. The distance of the firing line from the advance depot determines the number of refilling points, but the distance from the firing line to the last refilling point should not be more than one day's march. Each wagon, therefore, carries two days' food per load.

"With animals, the average march is 18 miles per day, and with a total distance of 75 miles from the base 780 wagons would be required. With motor trucks of about two tons' capacity the work could be done with 120 vehicles. With 240 trucks a division could operate 150 miles from its base. A division operating 40 miles from its base would require thirty trucks.

Special Types Unnecessary

"Lessons from the present war in Europe teach us the following facts:

"1. Ordinary commercial trucks are best; the special body types not necessary.

"2. Light chassis for ambulance work is best.

"3. Best all-around car, 1½ tons.

"4. Heavy armored cars have proved satisfactory.

"5. Motorcycles on a grand scale are unsatisfactory.

"6. Passenger cars make good ambulances, but the body should be arranged so that the driver is over the engine and the wounded lie between the axles.

"7. Radiators are proving to be the weak spots.

"8. The steel plate wheel is satisfactory.

"9. Electric starting is satisfactory.

"10. Electric headlights should be mounted on universal joints.

"The United States Government favors the 1½-ton truck on account of its ability to traverse the ordinary bridges without breaking them down. This, of course, only refers to the divisional trains, as larger trucks can be used satisfactorily on the main roads. To attempt to use 3-ton and over trucks on poor roads spells disaster. It has been found an absolute necessity on stone highways, however, to use these larger trucks.

Must Be Organized

"A force of 500,000 men requires over 8000 trucks of 1½-ton capacity, and the problem is where and how to get these trucks. They must be organized into units of the same make if they are to be effective. The problems are as follows:

"1. Properly organized truck units.

"2. Correct truck specifications.

"3. Lists of where these trucks and suitable chauffeurs can be found.

"4. Determination of the best body for use.

"5. A list of the necessary repair parts for each make of truck and the equipment of the repair car.

"6. A field repair shop.

"A recommended organization of the cars is into groups of sixty cars in squads of twenty. For each squad there should be one repair car, three fuel cars, one company headquarters car, four officers' touring cars and eight motorcycles. At the head of each squad there is one captain and under him three lieutenants, one first sergeant, nine first sergeant repairmen, fifty-eight sergeant drivers, eight corporal drivers and three corporal repairmen with seventy-eight privates and three corporals. The regulations adopted by the War Department have twenty-seven cargo trucks, 3000-lb. capacity; one repair truck, 3000-lb. capacity, under an organization of one truck master, three assistants, two machinists and thirty-five enlisted men."

Economy at Posts

An interesting suggestion made by Major Lawton was that if motor trucks were substituted for the ordinary horse wagons used around the posts a saving of over $700 every five and one-half years per vehicle would be made.

New Company Will Sell Parts for Orphaned Cars

NEWCASTLE, IND., April 29—Because of the rapid increase of manufacturing operations at the plant of the Maxwell Motor Co., in Newcastle, Ind., it is announced that the sale and manufacture of parts for the Stoddard-Dayton, Brush, Columbia and Alden-Sampson cars will be taken over by the Standard Motor Parts Co., Newcastle.

Now Singleton-Hunting Co.

CLEVELAND, OHIO, April 29—The corporate name of the Singleton-Tripp Co., general advertising agents in this city, has been changed to the Singleton-Hunting Co. The change is being made in recognition of J. P. Hunting, who has been vice-president since Jan. 1.

Truck Exhibition for Savannah

SAVANNAH, GA., April 29—An exhibit of motor trucks, tractors and other road equipment will be a part of the annual convention of Georgia Society of Wardens and Road Superintendents, to be held in Savannah from May 23 to 25. Harry Rose, acting secretary of the convention, is making arrangements for the exhibit at the fair grounds.

Mack AC Averages 35 M.P.H.

Covers 90 Miles in A. C. A. Test—52 M.P.H. Is Maximum Attained

NEW YORK CITY, May 1—Loaded with 200 rear axle forgings, a Mack AC model 3½-ton truck has been undergoing some strenuous tests under the direction of the engineering department of the Automobile Club of America. These tests have been undertaken by the International Motor Co. to demonstrate the adaptability of heavy trucks to high speeds, such as demanded in fire, police, motor bus and military work; and to show what fuel consumption may be expected.

The first test was made Wednesday, April 4, on the Long Island Motor Parkway, a 45-mile stretch of speedway, after the refusal of the Sheepshead Bay Speedway Assn. to permit the truck to be tested on the Sheepshead Bay track. This test was preceded by a run from New York to Yonkers and return, under full load and with the standard sprockets. Between 45 and 50 miles were covered with an average fuel consumption of between 6 and 7 m.p.g.

The speed test on the parkway consisted of about 90 miles of running, during which time the truck averaged about 35 m.p.h., the maximum attained being 52. The total weight of the truck and its load was 16,770 lb., of which about 9000 was the weight of the chassis itself, leaving a net load of 770 lb. in excess of the rated capacity of the truck.

Few Changes from Stock

The only changes from stock were the application of an auxiliary oil tank back of the cab with a hand-pump feed, by which the oil might be pumped into the crankcase, a restricted overflow passage on the upper oil tank to increase the oil pressure and 25-tooth sprockets on the jackshaft to give a 5.42 to 1 gear ratio.

A second test is being conducted on the Motor Parkway to-day, using a different make of carbureter. The Automobile Club has not issued its report on the tests as yet and so only approximate results can be given here. In the first test a valve-stem was broken and the full distance of 100 miles was not covered, which requires that a second test be conducted.

France Bars Incompetent Drivers

PARIS, April 2—Only automobile drivers who held a Government driving license prior to the war are now eligible for truck and car service in the French army. This measure has been adopted in order to weed out incompetents. During the past twelve months an immense number of automobile schools have been formed in France and soldiers on leave have been entitled to take driving lessons. Government licenses have been granted these pupils, but very few of them can do more than hold a steering wheel and the men are really dangerous in active service among the convoys at the front. Under the new scheme men who have had three or four driving lessons and no practical road experience cannot get into the army automobile service.

Trucks for French Army Transport Supplies from Docks

PARIS, April 7—American trucks imported for the French army no longer make their initial trip from the port to the central depot near Paris without a load aboard. It has been the practice to put these trucks in charge of military crews and send them by road from Havre, St. Nazaire or La Rochelle to Paris under their own power. These trips were always made empty, as a matter of official routine, although these three ports, and particularly Havre, were congested with hundreds of tons of goods the railway was incapable of handling. Under the new arrangement every convoy going out of these ports toward Paris will pick up a load of either military material or general merchandise and will deliver it at Paris or at some point along the route.

The first two of these live convoys comprised sixty-six Whites and forty Velies, carrying between them 232 tons of general merchandise, came through to Paris this week. These 232 tons have been brought through at practically no cost; without the automobiles the goods would have still been lying on the dock side waiting railroad facilities. The system is so simple and is so satisfactory to everybody concerned that the only surprise is that it has not been adopted earlier. For over a year big convoys have been coming empty four or five days a week from Havre to Paris, while perishable goods and urgently needed material was left behind on the docks. An intelligent understanding between civil and military authorities was all that was needed to overcome the difficulty.

Westinghouse Ford Starter Now $85

EAST PITTSBURGH, PA., April 29—The Westinghouse Electric & Mfg. Co. has recently announced an increase in the retail price of their starting and lighting equipment for Ford cars to $85. This increase is due to the marked rise in the cost of raw materials.

To Discontinue Moore Truck

LOS ANGELES, CAL., April 29—The Moore truck, manufactured by the Pacific Metal Products Co., Torrence, Cal., will no longer be manufactured according to a decision recently reached.

S. A. E. Standards Appreciated

Will Be Used by National Gas Engine Assn. Wherever Possible for Tractors

NEW YORK CITY, May 1.—That the work of the Standards Committee of the S. A. E. is being appreciated widely is shown by a letter which is being circulated to members of the National Gas Engine Association, announcing that body's Summer meeting, June 27 to 29, in Chicago.

"If there should be any doubt in the minds of the users, dealers or manufacturers interested in engines and tractors," says Secretary H. R. Brate, "we would call attention to the automobile situation for 1916. It is said that of the 1,000,000 cars that will be sold during the present year, three-fourths will be standardized cars selling at less than $1,000. The standardized parts will consist of starters, carbureters, speedometers, ignition and lighting systems, transmissions, differentials, tires, wheels, axles, rims, bearings, etc. In a large proportion of these cars you may substitute one carbureter or magneto for another, you may use any make of tire you wish, you may change the spark plugs at will. And in addition to this, you would be paying at least double the price of the car were each make to have had other than a standardized dimension of rim, differential, etc. It is something along this line of work that we expect to accomplish through the National Gas Engine Assn."

Railroads Standard

"Railroads were standardized with respect to the distance the rails should be from one another. Before that time, you might be shipping a carload of stuff from Cleveland to Chicago and perhaps every hundred miles the railroad companies would change their gage. As a result, the car could not be carried through, and every time the gage changed, the car had to be unloaded and the goods loaded into another car. What more simple thing could be done than to set the rails the same distance apart from New York to San Francisco and run cars through? That is what standardization means—time and labor and expense saved.

"In the automobile lines it has come about that the Society of Automobile Engineers has adopted certain rules of this sort. No one is obliged to use them. There is no compulsion about it. Every spark plug manufacturer, for instance, can make his plugs of different dimensions and with different styles of threads. But if the owner of a car steps into an automobile supply store to get a spark plug, he wants one to fit his car. With standardized plug dimensions, any plug will go into his cylinder heads. With each manufacturer using a different thread, imagine the confusion. It might be all right for the manufacturer, provided he could tie up all his business, but he can't. What one loses, another may make, and vice versa. Therefore, the spark plug people find they sell more plugs and satisfy their dealers and users better if any plug can be put in.

Will Use S. A. E. Standards

"The work of the National Gas Engine Assn., then, along the line of standardization is not with the effort to make all engines or all tractors alike. Automobile standards do not always suit in engine and tractor design. Where they do suit, it has been the spirit of the N. G. E. A. standards committee to adopt them. Where they do not fit the conditions, it has been decided better to try to work out some size, style or condition that is fairly uniform and that may be used quite generally to the best advantage. If any particular manufacturer finds that the size recommended for standard does not meet his needs, he is welcome to use what he thinks best. Magneto standards, for instance, have been fairly well worked out, so that almost any make of magneto may be applied to an engine without changing the design. If, however, some manufacturer thinks a special design is better for him he can have it used on his outfits.

"Much of the attention of the coming convention of the National Gas Engine Assn. will be devoted to the extension of this work. A considerable interest has been created as was manifested at the recent meeting of the standards committee in Chicago, so that there will undoubtedly be opportunity for accomplishing a great deal along this line when the association meets at the Sherman Hotel, Chicago, June 27, 28 and 29."

France May Provide Compulsory Technical Education for Workers

PARIS, April 7—The French automobile industry is directly interested in a new law now before Parliament providing for free and compulsory technical education for workers under eighteen years of age. The general scheme is based on that already adopted by Germany, Austria and Switzerland. It provides for the establishment of technical schools in every district, the central and local authorities sharing the expense, which must be attended by all young factory workers. These schools can be established by employers in the factories, if desired. Lessons will be given during the legal working day, and will be four hours per week or 100 hours per year minimum and eight hours per week and 200 hr. per year maximum.

Allies' Aero Engines Water-Cooled

Fixed Cylinders Also Win Preference in France Over Rotary Types

PARIS, April 2—In the extension of the Allied aeroplane fleets, there has been an important slide to the fixed cylinder water-cooled six, eight and twelve-cylinder engines, to the detriment of the rotary types which held the board prior to the war. It is no secret that French, Italian and English firms have more or less faithfully copied the Mercedes six-cylinder water-cooled engine, which is practically identical in design to the 1914 Mercedes Grand Prix engines, one of which is now owned by Ralph de Palma. The feature of these engines is steel cylinders with steel jackets and either two or four valves in the head, operated by an overhead camshaft. While some makers have produced an exact copy of the Mercedes, others have made detail improvements, and a few have produced the same type of engine with twelve cylinders. A respectable number of captured Mercedes aeroplane engines are in use on French aeroplanes, and many partly damaged engines have been put into service again after being repaired with spare parts from the French shops.

Factors in Car Price Classes in Order of Importance

NEW YORK CITY, May 2—In the report appearing in THE AUTOMOBILE for April 20 of the paper by Paul Smith, sales manager of the Chalmers Motor Co., before the Detroit S. A. E., on Interpreting the Public to the Engineer the five most important factors in the different car price divisions were arranged incorrectly.

Mr. Smith's idea was to show the relative significance of these factors in each of the price divisions by arranging them in the order of their importance. The list is correctly given herewith:

G. M. Sales Estimate $100,000,000

Gross Earnings for First Eight Months of Fiscal Year Ending July 31

NEW YORK CITY, May 2.—Estimated earnings of the General Motors Co. for the eight months of the fiscal year to end July 31, made public yesterday, showed gross sales of $100,000,000, an increase of $42,637,161. The balance available for the common stock for the period, based on the report, was given as $17,000,000, equal to 103 per cent on the issue for the eight months, compared with 58 per cent earned in the same period a year ago.

President C. W. Nash, president of the company, in his report says: "The demand for cars made by your companies continues strong and indications are that it will not lessen during the balance of the fiscal year. Earnings should continue satisfactory unless the difficulty in obtaining sufficient material necessitates curtailment.

"On account of the material situation, it has been necessary to stock larger quantities than in normal times, but notwithstanding our larger inventories and the disbursement of more than $12,000,000 for dividends on common stock and the retirement of the 6 per cent five-year notes since Aug. 1, the cash position of your company is very strong, showing at this date $3,000,000 in excess of a year ago."

The General Motors estimated report for eight months compares as follows:

Cars and trucks sold—

1916	1915	Changes
86,568	48,487	38,081

Gross sales, estimated to March 31—

1916	1915	Changes
$100,000,000	$57,862,889	$42,637,161

Balance available for common, estimated—

1916	1915	Changes
$17,000,000	$9,581,542	$7,418,458

Rubber Prices Lower

NEW YORK CITY, May 2—The further lowering in prices of crude rubber featured the materials markets last week. Up-river Para dropped 2 cents a pound to 71, and Ceylon, first latex, dropped 2½ cents a pound to 79. This grade dropped 1 cent the previous week.

Aside from the rubber situation, the market was steady. Lead departed from its usual high quotation and dropped 12 cents per 100 lb. to $7.38. Tin was strong at $51.50 per 100 lb.

Copper is holding strong at 29½ cents a pound. A preliminary statement, issued by the U. S. Geological Survey, gives the smelter production of primary copper in the United States in 1915 as 1,388,000,000 lb., compared with 1,150,000,000 in 1914, an increase of 21 per cent. At an average price of 17.5 cents a pound, the 1915 output would have a total value of $242,900,000, compared with $152,900,000 in 1914. Michigan has displaced Utah as the third largest producer, the latter having outdistanced Michigan in 1914. The four leading States in the order of their rank now are Arizona, Montana, Michigan and Utah.

Steel prices have remained unchanged at $45 per ton. The demand for automobile steel is forcing the steel companies to expand. Following the report that the Carnegie Steel Co. is to add to its cold rolled strip steel production by changes at the Edgar Thomson works, comes the announcement that the Trumbull Steel Co., Warren, Ohio, is also to add sixteen stands of rolls for rolling the same product. Both increases are to meet the demand of the automobile trade, which is pressing heavily for this product on all mills.

Monarch Creditors to Meet

DETROIT, MICH., May 1—First meeting of the creditors of the Monarch Motor Car Co., which was adjudicated bankrupt by Lee Joslyn, referee in bankruptcy for the eastern district of Michigan, on April 24, has been called for May 9, at which time creditors have been requested to appear and prove their claims. The company's liabilities are set at $5,753.03 and the assets at $20,833.15.

Security Prices Higher

Favorable News from Abroad Results in General Rise of Quotations

NEW YORK CITY, May 1—Automobile and accessory issues responded last week to the favorable news in regard to the amicable settlement of affairs with Germany, most of the stocks being most favorably affected. Maxwell issues recorded most substantial gains as did Chevrolet, General Motors, and Willys-Overland. Chevrolet rose 18 points; General Motors rose 26 points; and Willys-Overland went up 18 points.

The market awoke from its lethargy on Saturday with much activity on the Exchange. Apropos of the Maxwell activity, there have been two distinct well-sustained bull moves in its stocks. On the first rise last week, the pace was too fast for those inside and they dropped their stock rather too soon. Maxwell common came back some 30 points. Predictions of a 7 per cent dividend on the first preferred and 6 per cent on the second preferred, leaving a 10 per cent dividend on the common, was responsible for a quiet accumulation of that stock.

Some of the other issues which went up last week were: U. S. Rubber common, 24½ points; Chalmers common, 4 points; International preferred, 2 points; Peerless, 2 points; Studebaker common, 11 points, and Goodrich common, 2¾ points.

S. O. Doubles 1914 Earnings

NEW YORK CITY, May 2—The Standard Oil Co. of N. Y. reports net earnings after deduction of depreciation charges of $15,761,663 for 1915 as compared with $7,735,919 in 1914. This is at the rate of about 21 per cent on a capital stock of $75,000,000 as compared with 10.3 per cent in 1914. During the year it has paid out in dividends $6,000,000 leaving a surplus of $9,761,663 as against a surplus of $1,735,919 in 1914. Added to a previous surplus of $16,701,591 there is a profit and loss surplus of $26,463,254.

Ideal Wheel Triples Capital

MASSILLON, OHIO, April 29.—The Ideal Wheel Co., which operates a factory at Massillon, where steel wheels for motorcycles, automobiles and aeroplanes are manufactured, increased its capital stock from $50,000 to $150,000 at a meeting of stockholders at Cincinnati. Ten thousand shares will be issued at $10 par value.

The Ideal Wheel Co. was organized in 1912 and was the owner of the patent and manufacturing rights of the

Ideal Steel Wheel Co., which had a plant at Winton Place. The latter company moved its plant to Elkhart, Ind., in 1914, and in 1915 went into the hands of a receiver. The Ideal Wheel Co. bought out the receiver, E. C. Crow, Elkhart, and moved the plant to Massillon.

The following are the directors of the company: L. E. Levassor, L. L. Dolle, W. B. Hall, D. T. Mount, Anthony Schemel, Charles Ayres and F. H. Goosman. Mr. Ayres is from Wilmington, Ohio. The other men are Cincinnatians.

Dividends Declared

Milwaukee Motor Co., Milwaukee, Wis., second dividend of 10 per cent, amounting to $25,420.55, in favor of creditors of that defunct company.

Prest-O-Lite Co., $1.50 a share, payable May 1, to holders of record April 24.

B. F. Goodrich Co., quarterly of 1 per cent on common, payable Aug. 15 to stock of record Aug. 4.

Yale & Towne Mfg. Co., extra dividend of 5 per cent out of past earnings, payable May 8 to stock of May 1.

Lee Rubber Co., initial quarterly of 50 cents a share and an extra dividend of 25 cents a share, payable June 1 to stock of record May 15.

Briscoe Motor Corp., initial quarterly of 1¾ per cent on preferred to holders of record April 27.

Studebaker Declares 1 Per Cent Extra

Studebaker Corp., quarterly of 1¾ per cent on preferred, 1½ per cent on common and extra of 1 per cent on common, all payable June 1 to stock of record May 30.

Good Crops Predicted for Texas

Farmers Optimistic and Are Investing in Automobiles—Large Sales Promised

AUSTIN, TEX., May 1—Favorable prospects for another splendid crop season all over Texas are serving to stimulate the automobile trade very considerably. Inquiry of dealers in different sections of the State bring the unanimous answer that the demand and sale of automobiles, motor trucks and delivery vehicles are larger than ever before known. Many farmers who had deterred placing order for cars on account of the drouth that prevailed during most of the winter have had their optimistic feeling as to the crop prospects revived by the heavy and seasonable rains and they are investing money in automobiles instead of holding on to it as a means of tiding them over what promised a few weeks ago to be a dry season.

110,000 Cars in Texas

It is claimed by men who are in close touch with the automobile trade in the State and who have gathered more or less complete statistics on the subject that there are now not less than 110,000 automobiles in use in Texas. This late estimate is considerably in excess of the figures that were given in some reports that were issued a few months ago which placed the number of cars at 80,000 to 85,000.

It is the opinion of many dealers that there will be many more cars sold in Texas this year than in any one year before. The average farmer of the State has now reached the point that he regards the automobile as one of the prime necessities of his business. The introduction of these vehicles to the farming class has opened a new world to that element of citizenship. They are not only able to obtain practical and profitable benefit from the use of the cars, but they are able to enjoy pleasures that were never open to them before.

Truck Sales Large

The increasing prices of mules and horses are having a tendency to enlarge the demand for motor trucks and motor delivery vehicles, it is stated. Nearly every industrial plant of any magnitude in Texas now does its hauling by means of the motor truck. This is true not only of the cities and towns, but of the country districts as well.

Ford to Fight California Tax in United States Supreme Court

SAN FRANCISCO, CAL., April 29—The Ford Motor Co. will carry its fight against the payment of a State franchise tax of $24,000 to the United States Supreme Court. Governor Johnson several weeks ago ordered the company's license to do business in California revoked, following its refusal to pay the tax.

Detroit Drivers Responsible for All Accidents to Pedestrians

DETROIT, MICH., May 1—Police Commissioner John Gillespie, who has figured prominently in many of the traffic re-

forms that have gained such wide adoption throughout the country, and who is responsible for the tennis court traffic lines and the Stop and Go semaphores at street intersections, has come out with another edict that is new to the regulation of traffic in this country. Due to the great number of traffic accidents in this city in which pedestrians have figured, the Commissioner holds that hereafter the driver of a car is responsible for accidents to foot traffic under any conditions. That is, even though a pedestrian carelessly backs into the street and gets run down, or if someone drops apparently from nowhere in the path of the car and gets hurt, or for any other similar circumstances, which heretofore has been regarded as no fault of the car driver, the latter henceforth will be held responsible and will have to go to jail.

One Drink Makes Car Driver Guilty of Negligence

Louisville, Ky., April 29—Persons operating automobiles while under the influence of liquor or even after partaking of strong drink, no effort being made to define the number of drinks required to cause intoxication, are guilty of negligence per se, according to a ruling made by Judge W. H. Field in instructing a jury in the case of E. G. Heartick against W. C. Semple, and acting on the instruction the jury returned a verdict awarding Heartick a judgment of $400 against Semple.

The case is the first on record in local courts in which an instruction was given covering intoxication in which the court held that to operate an automobile after indulging in drink was an act of contributory negligence on the part of the driver.

Slater Bill a N. Y. Law

Albany, N. Y., April 27.—Governor Whitman has signed a bill introduced by Senator Slater, making it a misdemeanor to wilfully place on a highway any glass, tacks, nails or other substance which might injure an animal or person or puncture an automobile tire.

Driver Responsible for Violation of Law

Madison, Wis., April 29—The Attorney General of Wisconsin holds, an an opinion handed down recently, that only the driver, and not the owner, should he be seated in the motor vehicle, is responsible when the law is violated. Richland County officials brought up the point and were instructed to prosecute only the chauffeur in a case where the car was not stopped for a frightened horse, as required by law. The owner of the car was in it at the time.

$4,500 for Master Drivers

Bosch Co. To Present $1,000 Trophy and $3,500 Cash to Winners

New York City, April 29—By arrangement with the contest board of the American Automobile Assn. the Bosch Magneto Co. will present the Master Driver selected by the board with the silver Bosch trophy valued at over $1,000 and $2,000 in cash. The trophy will also bear the secondary title of Champion Motor Car Driver Trophy. To the driver rated second in the number of points awarded in the Master Driver contest the Bosch company will give $1,000 in cash and to the third driver, $500 in cash. All these prizes will be won outright.

It is planned to hold a banquet in Chicargo during the 1917 show week for the awarding of the trophy and cash prizes. In the past six years the Bosch company has donated over $25,000 in cash prizes for various events.

O'Donnell in Duesenberg Wins Raisin-Day Race

Fresno, Cal., April 29—Eddie O'Donnell, driving a Duesenberg won the 300-mile Raisin-Day Race from the field of seventeen starters making his third win this month. His time was 4:54.13 and his average speed 61.01 m.p.h. Jim Parsons was second and Frank Elliott third. Earl Cooper was ruled out at the end of the 25th lap for failure to report a change of mechanicians. O'Donnell receives a cash prize of $3,000 and a silver cup. O'Donnell has used Oilzum in all his races this year.

Bert Dingley Back Again

Los Angeles, Cal., April 25—Bert Dingley, who was injured in the Tacoma Speedway, July 4, 1914, has recovered from his injuries sufficiently to enable him to return to the motor car industry. Dingley was recently appointed manager of the William R. Ruess Co., and will devote his energies to the selling of Mitchell cars.

Gardena Race Meet May 6

Gardena, Cal., April 25—The speed event for semi-professionals that will be staged at Gardena on May 6, will be the first road race ever held in Southern California minus an admission fee. This race will be a part of the Strawberry Day celebration, another feature of which will be a great floral pageant.

Entries will be restricted to cars having a piston displacement of 231 cu. in. or under. The event will be classed as a class "C" division 5 race, and will be the first of its kind ever sanctioned by the A. A. A. in Southern California. In addition to the prize money, a valuable trophy will be offered, and it is expected that a large field of small cars will be entered.

23 Sheepshead Entries to Date

New York City, May 2—The entries of an Adams Special and another Sunbeam for the Sheepshead Bay Speedway race on May 13 brings the total entry list up to twenty-three. The Adams Special is entered by George Adams, a wealthy sportsman. The Sunbeam is entered by Joseph Christiaens and is a duplicate of the six-cylinder car which he will drive in that race. No driver as yet has been named for the car. The latest Sunbeam entry is now on its way here from London.

24-Hr. Sheepshead Race Postponed

New York City, April 26.—The 24-hr. race scheduled for the Sheepshead Bay Speedway on June 16 and 17 by the Trade Racing Assn., this city, has been postponed. Several of the automobile makers who are contemplating entering the event pointed out to the association the advisability of postponing the race until such time as their new models appeared.

Luverne Adds Combination Fire Apparatus to Its Line

Luverne, Minn., April 29—The Luverne Automobile Co., manufacturer of a touring car, has added to its line a combination motor fire apparatus, to meet the needs of small and medium size cities and to give fire protection in country tributary to the cities in which the trucks are operated.

The motor has six cylinders, 4 by 5 in. Tires are cushion type, dual at the rear. Wheelbase is 150 in. The motor has self-starter, and there are electric lights and double ignition.

Fire equipment is chemical tank, chemical hose with reel, hand extinguishers, ladders, axes, etc. The steel hose body has space for 1200 ft. of 2½-in. hose and standing room for eight men. Price of the outfit is $3,500.

The Luverne company has also placed on the market a hearse which it has listed at $3,000. The chassis carries a 60-hp. six-cylinder engine electrically equipped. Wheelbase is 150 in. and tires 36 by 4½ in.

Riley Goes with Jordon

Cleveland, Ohio, May 1—W. B. Riley, formerly assistant sales manager of the Thomas B. Jeffery Co., has become assistant to E. S. Jordon in the direction of sales of the Jordon Motor Car Co.

Twenty Entries for Indianapolis

List Includes 4 Peugeots, 1 Sunbeam and a Delage—One Unnamed Car

INDIANAPOLIS, IND., April 28—Twenty entries have been made to date for Sixth International Sweepstakes Race on the Indianapolis Speedway May 30. The latest entrants are Ralph Mulford, Resta, Aitken and Merz in Peugeots; Oldfield in a Delage; Rooney and Anderson in Premiers; Osteweg in a Osteweg Special, and DuChesneau in a DuChesneau.

Oldfield on Delage

Merz and Aitken will drive cars owned by the Indianapolis Speedway Team Racing Co.; Oldfield will drive one of the Delages built for the Grand Prix in Europe in 1914. This car has a block type motor, with valve in the head, with a bore and stroke of 3.70 by 6.3, and a cu. in. piston displacement of 271.8. He finished third with this car at Elgin last year in the C. A. C. cup race. He also entered it at the Sheepshead Bay Speedway race last year, but was forced out at the end of the 16th mile with a broken piston and connecting rod.

Rooney on Premier

Rooney will be at the wheel of the new Premier that was designed for the late Bob Burman. The Osteweg Special entry is from Lee, Ill., is entered by Apperson & Osteweg, who have built a special car. The car weighs about 2400 lb., has four cylinders, 4 11/32 by 5 in., and a piston displacement of 296 4/10 cu. in. O. Bloomberg or J. Booth will act as relief driver and mechanician to Osteweg.

The entries to date are:

Car	Driver
Sunbeam	Christiaens
Peugeot	Aitken
Peugeot	Merz
Frontenac	L. Chevrolet
Frontenac	A. Chevrolet
Frontenac	G. Chevrolet
Peugeot	Mulford
Premier	Anderson
Premier	Rooney
Premier	Stillman
Du Chesneau	Du Chesneau
Peugeot	Resta
Maxwell	Rickenbacher
Maxwell	Henderson
Duesenberg	O'Donnell
Duesenberg	D'Alene
Duesenberg	Unnamed
Delage	Oldfield
Osteweg	S. Osteweg
Unnamed	Unnamed

INDIANAPOLIS, IND., April 26.—Howard C. Marmon, chief engineer of the Nordyke-Marmon Co., has been named referee for the 300-mile race at the local speedway on May 30. G. M. Dickson, general manager of the National Motor Vehicle Co., this city, has been appointed starter. Chester S. Ricker has been appointed the head of the timing, scoring and technical committees for the local speedway race May 30. He will be in charge of the three departments. G. A. Weidely will be the first assistant head of the technical committee; O. A. Porter will be the first lieutenant of the timers, and D. G. Ong will be chief clerk to Ricker in the scoring booth.

Five Entries for Chicago Race

CHICAGO, ILL., May 2—Five entries for the Chicago speedway 300-mile race on June 10 at Speedway Park, have been made to date, including a Sunbeam, driven by Christiaens; Sunbeam, unnamed driver; and three Duesenbergs with O'Donnell and D'Alene driving. The third driver has not as yet been selected.

Electricians Plan Show

NEW YORK CITY, April 29—Representatives of electrical interests of the United States with capital investments of more than $4,000,000,000 met recently and decided upon a countrywide celebration of the electrical resources of the United States from Dec. 2 to 9 next.

27,220 Miles by Ajax Winner

New Haven Man Wins $500 in Tire Mileage Contest—Drove Cadillac

NEW YORK CITY, May 1.—The Ajax Rubber Co., this city, has announced the winners in its third annual tire mileage contest. The winner of the first prize of $500 was G. C. Mathis of New Haven, Conn., who drove a Cadillac for Mrs. J. D. Jackson. He made a record of 27,220 miles, or 5,200 miles better than last year's winner.

The first thirty capital prize winners averaged 19,411 miles. The average of the 208 prize winning chauffeurs was 8076 miles, as against 7722 miles last year.

Other winners were: Second, C. V. Finfrock, Pierce-Arrow, 25,648 miles, $300; third, L. E. Pederson, Rambler, 25,337 miles, $200; Jos. Rozek, Pierce-Arrow, 24,896 miles; A. D. Silvia, Simplex, 24,002 miles; W. S. Bliss, White, 22,870 miles; John Laffy, Alco, 22,687 miles, and Fred Weitzmann, Ford, 21,200 miles. The last five received $100 each.

The accompanying tabulation gives the first thirty winners:

Westinghouse Equipment for Murray

EAST PITTSBURGH, PA., April 29—A contract was recently signed by the Murray Motor Car Co. of Pittsburgh, Pa., for Westinghouse starting and lighting equipment for the new Murray eight.

Olds Establishes Permanent Service School

LANSING, MICH., April 29—The Olds Motor Works have established a permanent school for Oldsmobile service men

at their plant here. The first meeting recently was attended by over 200 service men connected with Oldsmobile dealers in all parts of the United States, and much good is expected to come of the move. Meetings are to be held regularly, and the idea is to make every Oldsmobile man an expert diagnostician so as to save time in making repairs and giving service. The school will also establish a standard method of doing various work on cars, such being the result of accurate time studies of different operations made by the factory experimental department.

Thousands of American Cars Arrive in London

LONDON, ENGLAND, April 13—American automobiles lately have been arriving by the hundreds on nearly every ship from New York City, and there are several 10-acre yards along the upper Thames where these cars, in boxes, may be seen stacked ten boxes high. The majority are trucks for the army, and they are allowed to accumulate till wanted.

Jersey City Jitney Charge 5½ Cents

JERSEY CITY, April 29—Five and one-half cents a ride will be charged by local jitney bus owners hereafter because of the additional expense they will be under when the Kates law goes into effect on May 15.

Hupmobile Men Report Prosperity

Branch and District Managers Find Car Sales Booming in All Sections

DETROIT, MICH., April 28—Hupmobile branch and district managers held their semi-annual meeting here last week, and the keynote of the meeting was the exceedingly prosperous condition of the general market for motor vehicles in all parts of the country. Representatives from the four distributing branches and the twelve selling districts of the country reported business more thriving than it has been in several seasons, and every indication is that the demand will exceed the supply. In fact, if the reports from the Hupp men are a good indication of the business for this season, the manufacturers will not be able to meet the demand by about 50 per cent. This is the first season that no cars have been stored by the big factories and very few dealers have machines on hand, so that by the middle of May it looks very much as if the old condition will prevail in the business, when it was necessary to order a car four to six weeks in advance in order to secure it at all.

The meeting brought out the fact that during the nine months of the present selling season, Hupp is far ahead of the entire twelve months of the previous selling year. Every section of the United States is ordering large quantities of cars, and the prosperity is not confined to any one section.

Auto Parts Co. Has Co-operative Plan

PROVIDENCE, R. I., April 29—A dealers' co-operative plan has been launched by the Auto Parts Co., this city, which will enable the dealer in parts and accessories for the Ford car to compete with the mail-order and cut-price houses. It includes the listing and describing of the products of reputable concerns that guarantee their products in a special catalog which is to bear the name and address of the dealer. The products of the United Specialties will be nationally advertised and the dealer will be co-operated with in local advertising. There will also be store and window displays and a bulletin service, the latter to include practical selling suggestions for the salesmen.

149,500 Registered in Ohio

COLUMBUS, OHIO, April 29—W. H. Walker, head of the Ohio State automobile department, announces 149,500 registrations up to April 20, as follows: Gasoline cars, 143,000; electrics, 4000; dealers' and manufacturers', 2560.

24-Hour Record Gained by Hudson

(*Continued from page* 799)

termine whether or not he was in condition to continue the drive. Mulford went ahead.

Tenth stop, 688th lap, 12 gal. gas, 1 gal. oil, 2 qt. water. Time, 4 min.

Eleventh stop, 760th lap, 14 gal. gas, 1 gal. oil, 1 qt. water. Changed left rear tire, as it was looking worn. This was the only tire change made. Time, 6 min. 0.8 sec.

Twelfth stop, 780th lap. This was the first engine stop. Pivot pins for the carbureter float weights had worn out and were replaced. Time, 4 min. 8 sec.

Thirteenth stop, 798th lap. This stop was caused by dirt in the carbureter. The screen was removed and the gaspipe sucked out. Time, 4 min.

Fourteenth stop, 799th lap, changed No. 3 spark plug. Time, 2 min. 13 sec.

Fifteenth stop, 802d lap. Changed remainder of spark plugs. Time, 3 min. 40 sec.

Sixteenth stop, 877th lap, 13 gal. gas, ½ gal. oil, 1 qt. water. Tightened grease cups, etc. Time, 6 min.

For the whole run the average gas consumption works out at 11.4 miles per gallon, which is an excellent showing when the very high speed is considered. Oil consumption was fairly high, being at the rate of 1 gal. per 150 miles, this being about 50 per cent better than the consumption of the average racing car.

Before the engine was stopped 1460 miles had been covered. Throughout the run Mulford drove with marked consistency, as is shown by the speed figures for the various stages. The average speed for the first half of the run was 76.9 m.p.h., only about 1 m.p.h. faster than the average for the whole distance. The following figures show the speeds at various distances above 500 miles:

Miles	M.P.H.	Miles	M.P.H.
500	77.1	1200	77.33
900	77.2	1400	76.8
1000	76.4	1700	76.66
1100	77.04	1800	75.82

The Hudson car used in the run was a stock Super Six with the ordinary body removed and a taper tail fitted. The gear ratio was 2 11/18 to 1. The oil used was Veedol and the grease, Whitmore compound. The car traveled with head-lamps and side lamps lit.

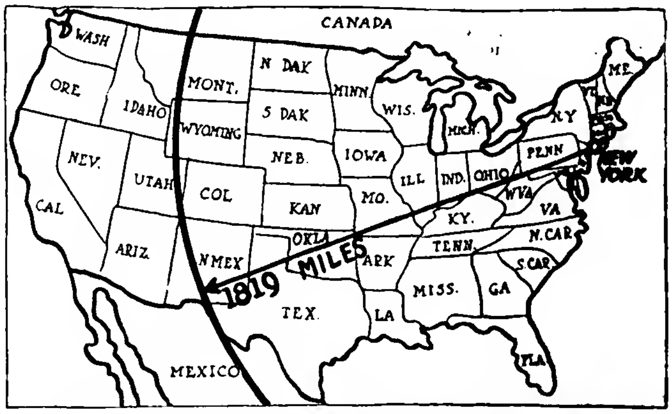

Diagram map, showing what Mulford's run of 1819 miles in twenty-four hours in the Hudson Super Six would mean in cross-country travel

Factory Miscellany

Mid-Continent Tire to Build—The Mid-Continent Tire Mfg. Co., Wichita, Kan., has obtained plans for a one-story plant, 280 by 450 ft., at an estimated cost of $250,000.

Berlin Fabric Erecting New Plant—The Berlin Fabric Co., Berlin, Wis., manufacturing advertising novelties, seat covers, pennants and similar goods, is erecting a new plant, 60 by 70 ft., two stories and basement, costing $15,000.

To Make Wooden Parts — Wooden parts for automobiles will be made in the factory which is to start operation in Ionia, Mich., within a few days, and in which H. B. and George W. Webber are the principal stockholders.

Makes a Gasoline Regulator—The Duplex Vitalizer Mfg. Co., Elmira, N. Y., has been formed with a capital of $10,000 and is manufacturing a device to regulate the consumption of gasoline in automobiles. S. A. Pulford, 401 Realty building, Elmira, is president; J. T. Hawley, vice-president, and Clayton Hulslander, secretary and treasurer.

To Make Motors—The Keystone Motor Co., East Greenville, Pa., has been formed to manufacture motors. It will erect a plant in the near future. Arthur Yocum is president; A. L. Miller, vice-president; J. L. Dimnig, secretary, and F. M. Moll, treasurer.

Signalite Co. to Build—The Signalite Mfg. Co., Kansas City, Mo., recently formed with a capital of $50,000 by W. M. Farr, L. F. Jones and L. R. Fraker, will equip a plant to manufacture automatic automobile signaling devices. O. R. Williams is vice-president and general manager; J. R. Clark is treasurer, and Barry Shannon, secretary.

Michigan Stamping's New Plant—The Michigan Stamping Co., manufacturer of auto parts and metal specialties, now located at 759 Bellevue Avenue, Detroit, has contracted for a new plant to be located on Mack Avenue, adjacent to the Lozier plant. It will be partly a one- and partly a two-story structure, 400 by 600 ft.

To Make Electric Horns—The United Electrical Mfg. Co., Adrian, Mich., has been incorporated to make electric horns and other electrical goods. The concern starts with a capital of $50,000. B. D. Hayes is president; K. F. Wagner, secretary; Walter Haly, treasurer. These officers and E. J. Wagner are directors, the fifth one to be elected in a few days.

Work Started on Gillette Plant—The Gillette Safety Tire Co., 316 Barstow Street, Eau Claire, Wis., has awarded all contracts, and work is now under way on the superstructure of its new plant, foundations for which were laid last fall. The building will be fireproof, 60 by 250 ft. one story high, and is to be ready for operations some time in June. The equipment was purchased during the winter. The investment in buildings is to be $30,000 to $35,000, and the equipment complete cost $45,000.

Lefever to Add—The Lefever Arms Co., Syracuse, N. Y., has just placed a contract for an addition to its plant to take care of additional production. The building will be a two-story building, 41 by 144 ft. It will be devoted entirely to manufacturing purposes in producing transmissions and transmission gears. At the same time, another building has already been started, which is one story, 60 by 75 ft. These additions will take care of their present large volume of business and also provide somewhat for the future.

The Automobile Calendar

May 6	Sioux City, Iowa, Speedway Race, Sioux City Speedway Assn.
May 9-12	Hot Springs, Va., N. A. A. A. J. Meeting.
May 13	New York City, Sheepshead Bay Speedway Race. Metropolitan Trophy, 150 miles; Queens Cup, 50 miles; Coney Island Cup, 20 miles, and Brooklyn handicap for non-winners, 10 miles.
May 14-20	Milwaukee, Wis., Sheridan Road Week to Complete Highway Connecting Milwaukee and Chicago.
May 18	S.A.E. New York Section, May Meeting.
May 20	Chicago Non-Professional Speedway Race, Western Interclub Speedway Park.
May 22-26	Chicago, Ill., N. E. L. A. Convention, Electric Veh. Section, Congress Hotel.
May 25	Pennsylvania's Second Good Roads Day.
May 26-27	Del Monte, Cal., Meeting, Three Divisions of National Assn. of Automobile Accessory Jobbers.
May 30	Des Moines, Iowa, Iowa Derby, 20 miles; Des Moines Special, 10 miles.
May 30	Tacoma, Wash., 10, 20 and 30-Mile Races, Tacoma Speedway Assn.
May 30	Elmira, N. Y., Track Race, Elmira Auto & Motorcycle Racing Assn.
May 30	Indianapolis Speedway 300-Mile Race.
May 30	Minneapolis, Minn., Speedway Race.
June 4	Sheepshead Bay Speedway, 30-mile Race, American Liberty Day Committee.

The Week in the Industry

Goodyear to Establish Canadian Branches—The Goodyear Tire & Rubber Co., Akron, Ohio, will establish branches in Canada. A plant will be located in New Toronto, Ont., where the company expects to spend $1,000,000 on it. The company will employ 1,500 hands.

Canadian Trade Items—The Ford Motor Car Co. of Canada, Ltd., Ford, Ont., has taken out a charter to do business in the Province of Saskatchewan. Its capital is $10,000,000.

McLaren Bros., 1470 Saint Lawrence Blvd., Montreal, Que., are handling the U. S. L. battery, Dann spring insert and the Outlook windshield cleaner for the Province of Quebec.

A company is being organized in St. Catharines, Ont., for the purpose of acquiring the rights to manufacture and sell Globe tires in Canada. The concern will be called the Globe Tire Co. of Canada, and will manufacture automobile and truck tires.

Connecticut Trade Items.—R. H. Smith, formerly of the Stanley Works, New Britain, Conn., has joined the sales force of the A. C. Hine Co., 314 Pearl Street, Hartford, Conn., state Oakland distributor. Alfred Nordstrom of New Britain has also joined the Hines forces and will look after the New Britain retail sales.

R. R. Ashwell, 341 Trumbull Street, Hartford, Conn., has taken on the service representation of the Bijur electric system.

Minneapolis Stewart-Warner Moves—On May 1 the Minneapolis branch office of the Stewart-Warner Speedometer Corp. will move into its new quarters at 1309 Hennepin Avenue.

Northwest News—Rothweiler & Co., Seattle, manufacturers of a 1-ton truck, have recently opened a branch in Spokane, Wash., at 224 Washington Street. The Spokane office will serve all of Montana, eastern Washington and northern Idaho. The branch is in charge of Al Sharp.

Two new automobile connections were opened in Portland, Ore., during the past week. D. C. Warren, formerly connected with the Oregon Motor Car Co., has taken the State agency for the Velie car. The new agency is known as the Warren Motor Car Co.

A. H. Knaus has resigned his position with the Braly Auto Co. to accept the managership of the Portland branch of the Gerlinger Motor Car Co., Pathfinder, Hollier and Federal dealers.

Trade Happenings

Curl Continental Purchasing Agent—L. C. Curl has been appointed purchasing agent for the Continental Motors Co. plant, Muskegon, Mich. He was formerly purchasing agent for the Buda Company of Harvey, Ill.

Hood Maxwell Purchasing Agent—R. M. Hood, former assistant purchasing agent of the Maxwell Motor Co., Detroit, has been appointed purchasing agent of the company.

Munsell, Delco-Light Agent—J. J. Munsell of Dayton, Ohio, soon is to assume the duties of general agent in the Columbus district for the new Delco product, Delco-light, which is made by the Domestic Engineering Co. of Dayton. The Domestic Engineering Co. was incorporated recently. The management is the same as that of the Delco.

Blackley Boulden's Assistant — B. E. Blackley, formerly New England division sales manager of the Chase Motor Truck Co., Syracuse, N. Y., on May 1 assumed the duties as assistant to H. T. Boulden, general sales manager of the company. He will have direct charge of the dealer's aid department and motor truck research work, succeeding W. A. Clare, who resigned as Mr. Boulden's assistant on April 1 to become sales manager of the Atterbury Motor Truck Co., Buffalo, N. Y.

Barker Hupp District Supervisor—A. E. Barker, Cleveland district representative for Dodge Bros, Detroit, Mich., has been promoted to the position of supervisor of the district. A. T. Stanton, formerly the Dodge Bros. representative for the British Isles, making his headquarters at London, has been transferred to Cleveland to succeed Barker.

Dodge with Dayton Rubber—G. A. Dodge, who has spent a number of years in the manufacturing and engineering departments of several of the largest tire companies in the country has become chief engineer and factory manager for the Dayton Rubber Mfg. Co., Dayton, Ohio.

Gramm Opens N. Y. Office—The Gramm-Bernstein Co., Lima, Ohio, has opened an Eastern office of the Gramm Co., Inc., at 1457 Broadway, at Forty-second Street, New York City, for the sale of Gramm worm-drive trucks from 1 to 6 tons' capacity.

Goodrich Station in Harrisburg—The B. F. Goodrich Tire Co., Akron, has opened a service station at 1412 North Third Street, Harrisburg. The Harrisburg depot is in charge of W. F. Mower, who has had a number of years of experience in the service department of the Goodrich company. J. R. Sauter, the sales representative in the Harrisburg district, has been connected with the Goodrich company for the past twelve years.

New England Trade Notes—An agency for the KisselKar has been placed at Portland, Me., with the Forest City garage.

The Chevrolet Motors Co., of New York, has opened a direct factory branch at Providence, R. I., and with R. B. Keyser of Boston, Mass., as manager. The temporary salesrooms are on Broad Street.

W. E. Whitten has taken the agency for Empire cars at Providence, R. I.

Illinois News Items—The Rock Falls Casket Co., Sterling, which has been engaged for many years in the manufacture of caskets and other mortuary supplies, but which recently added the construction of automobile hearses, has decided to discontinue the casket manufacture and devote the plant exclusively to motor hearses. All of the machinery and supplies used in casket construction were sold this week to the Central Mfg. Co. of Dixon.

D. U. Smith, Springfield, has resigned as manager of the Cadillac agency in that city to become sales manager for the Cadillac company, with headquarters at Evansville, Ind., and with a territory consisting of thirty-two counties. H. D. Fulmer, Peoria, Ill., has been appointed sales manager at Springfield to succeed Mr. Smith.

C. F. Ball and J. E. Ball, Springfield, have opened a garage at 327-329 North Sixth Street, and will specialize in electric and battery work. They will do a repair business exclusively, carrying a line of supplies and accessories.

Farle & Miller, 978 South Michigan Avenue, Chicago, have been issued articles of incorporation with capital stock of $25,000, to manufacture, buy, and sell automobiles and accessories. The incorporators are: J. H. Farle, R. A. Miller and A. A. Miller.

The Williamson Motor Co., Freeport, Ill., has removed from the Wilcoxson Building to a new location on Galena Street, due to the necessity of securing larger quarters. A complete line of automobile accessories will hereafter be carried.

Improving Splash Oiling

Dipper Lubrication Systems Could Be Much Improved—Some Conventional Designs Highly Inefficient—Effect of Load and Gradient Analyzed

By L. V. Spencer

VERY many of the splash lubrication systems found in present-day automobile engines are capable of much improvement. They work well on the level, as a rule, but let the car get on a grade, even as low as 10 per cent, and most of them are so constructed that less than the required amount of oil is splashed as it should be. This refers particularly to the splash system, but some of the pressure type and the combined pressure and splash systems can also be criticised in this respect.

It almost seems that engine and car designers have been so deeply concerned in the development of good-looking, silent-running and generally efficient cars that they have had very little time or inclination to attack the engine oiling, since in the average case it is sufficiently good. Yet surely the lubrication of the motor is one of the first things that should be worked out satisfactorily. So much of the efficient operation and general satisfaction that is derived from a car depends upon the oiling system that it would seem the engineering fraternity has sidetracked a very important step in car development in its haste to attack those things that are more evident on the surface.

The foregoing applies most strongly to the low or medium priced car; the higher priced types are generally better because of more careful designing for a more exacting clientele. The really absurd part of it is that the cost of such improvements as would make the average engine greatly better, so far as lubrication under general operation conditions is concerned, is small indeed, and the wonder is that these designers persist in the use of systems that are fundamentally wrong when the cost of alteration is so greatly out of proportion to the benefits to be derived from simply rectifying these conditions.

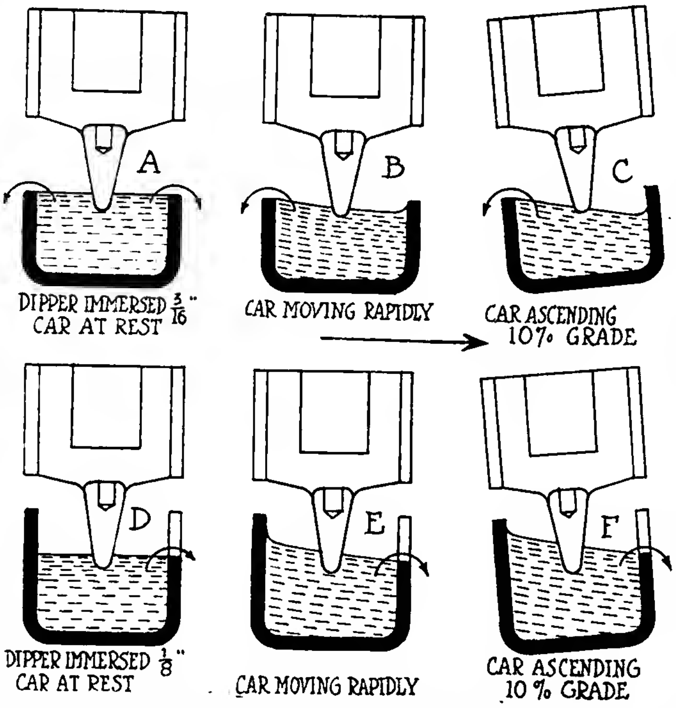

Fig. 1—A, B, C—Action with equal sided trough. D, E, F—Action with overflow trough. A—Dipper immersed 3/16 in., car at rest. B—Car accelerating. C—Car ascending 10 per cent grade. D—Dipper immersed 1/8 in., car at rest. E—Car accelerating. F—Car ascending 10 per cent grade

Probably a great many engineers will not agree with the stand that has been taken and will maintain that the normal schemes for getting an equal amount of oil to each cylinder and bearing are practically sound. It is not with the intention of attacking any system specifically, but with the thought of showing the faults in many of the well-known arrangements that this article has been prepared. Often a very small modification will make a wonderful difference in the working of a system, and it is hoped that such criticism as follows will be productive of some good results generally. The diagrams have been taken from the actual drawings of certain representative designs.

Our attention will first be directed to some of the flagrant violations of good practice that are to be found in certain widely used types of splash systems. The full

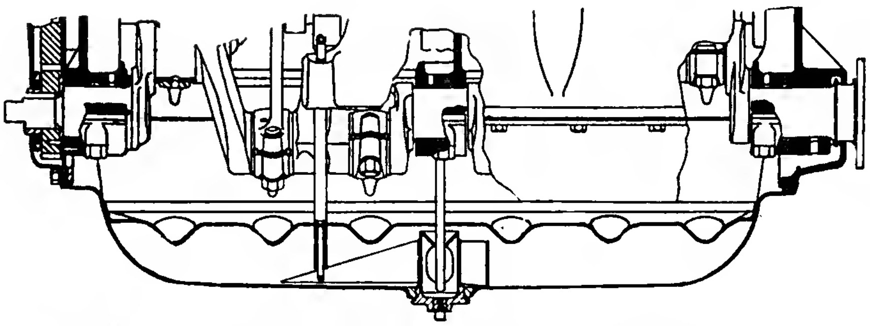

Fig. 2—Section of oil trough construction in common use. There is no provision for retaining sufficient oil in the splash troughs for hill work. The front troughs are starved on up-hill going and get too much oil on down grade

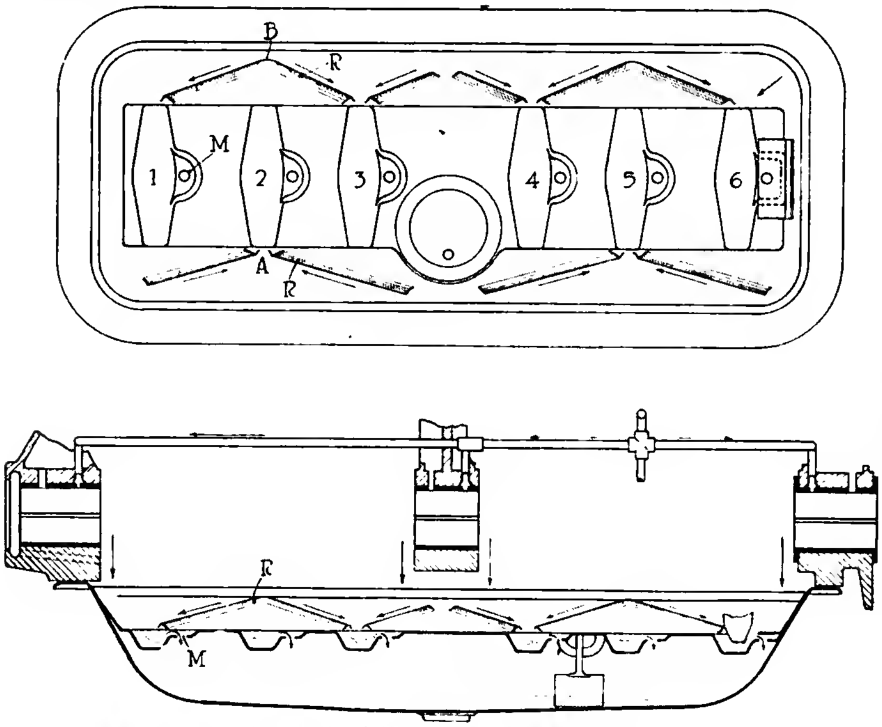

Fig. 3—Showing an adaptation of return ridges pressed into the trough to redistribute the splashed oil evenly

advantage of the fact that gravity is the big factor in the handling of the oil in such systems is very evidently often overlooked. Take for example the conventional form of splash trough that you will find in at least two-thirds of the engines using splash. This is shown in Fig. 1, and it will be noticed that the two sides are on the same level, with overflow either way. Now suppose the engine with this trough to be inclined as in ascending a 10 per cent grade, as at *C*. The oil backs away from the front side of the trough and flows out at the rear, thus lowering the working level, and reducing the possible dip of the splasher on the end of the connecting-rod. Obviously, as the grade increases, less and less oil can be dipped by the splasher. Yet on steep grades it is especially desirable that more oil be sent to the cylinder walls and bearing surfaces. Thus the action is exactly the opposite from what it should be.

Several Simple Remedies

There are several simple remedies for this defective trough construction. Would it not be possible to raise the rear side of the trough about ¼ to ⅜ in. to prevent the oil from flowing out this way when on a grade, and of such a height that the dipper would get a maximum at about 20 per cent grade? Such a suggested construction is shown at *D*. As the grade increases, the more the liquid is backed up on the rear side, and hence the greater the depth the dipper enters, and the more oil is splashed, which is as it should be. Obviously if both sides were made of this greater height without some provision for lowering the level when on flat ground, the dipper would dip too deeply and an excess of the requirements would be supplied. But to prevent this, and to bring the level to just what is needed for flat ground, an overflow can be cut in the front side of the trough to reduce the level to the minimum. The action is clearly brought out in the diagrams which compare this simple modification with the conventional trough. A similar trough arrangement has been noted in several motors.

This is but one illustration of the point that it is hoped to bring out—that a little ingenuity will do great things for motor oiling, and with a minimum of expense.

Take another instance of an inefficient arrangement that could be very readily improved so as to work most advantageously under practically all operative conditions. This is the typical splash trough and connecting oil pan of a well-known motor.

When Going Up Hill

Referring to Fig. 2, it will be noted that the troughs under the connecting-rods are pressed into the sub-base and there is no special provision to compensate for running on hills. Suppose the car to be going up a hill. Then the front end of the oil pan is elevated, and there is a tendency for the oil to run out of the front troughs, starving the forward cylinders and giving too much to the rear ones. If the grade is not steep enough for much of the oil to run out of the troughs, it will at least act as already shown by the diagrams in Fig. 1. On descending a hill the result is the opposite and the front cylinders get more than their share of the oil.

The writer believes that some sort of overflow device would greatly relieve this undesirable condition without very materially affecting the cost of construction. If a slot were cut in the forward side of each of these troughs at the proper height and the rear side were pressed out a little higher than it is normally in Fig. 2, this would have the effect of drawing off the oil through the overflow slots when the car is on a down grade, preventing excess from working its way back to the rear cylinders. While it is true that such lowering of the level in the troughs would prevent a normal amount from being splashed, it must be remembered that it is not necessary to have as large a supply when going down grade. On ascending, the higher rear sides of the troughs would also prevent the oil from overflowing back to the rear cylinders, and the greater dip would result in more oil being splashed to the bearing surfaces—a desirable feature for up-grade work. There are, doubtless, many variations of this idea and, while a number of cases have been observed where some such principle is involved, the number of splash installations in which the troughs make no provision for any angular positions of the engine is surprising.

It is doubtful if this modification of the simple trough would alone effect the most satisfactory results, although there is no question of its value. It could very cheaply be made in conjunction with little ridges or channels that might be pressed into the sub-base to direct the oil running down from the cylinders or other points, on which this oil had landed after being thrown up by the rod ends. Such ridges would serve to distribute the returning oil, and prevent one trough from getting an over-abundance.

Recently a very neat adaptation of this idea was observed in a certain design, somewhat similar to the diagram reproduced in Fig. 3. Diagonal ridges *R* were raised in the pan as indicated, and led to the different troughs in such a way that each was calculated to be cared for properly. By this arrangement, oil that finds its way to point *B* for instance, would be directed either to trough No. 1 or to No. 3, whereas directly opposite to point *B*. Such distribution is quite autoany that arrived at *A* flows into trough No. 2, although directly opposite to point *B*.

Incidentally the diagrams in Fig. 3 also show a scheme for taking care of the trough level by means of overflow ducts *M*, with the idea of compensating for variations of motor angle. Such a combination involves patents held by E. M. White, Detroit, Mich.

Fig. 4 shows another arrangement of this kind that is entirely of the splash type, and is somewhat of a variation from the scheme of Fig. 3, although the principles are exactly the same so far as the dividing of the splashed lubricant and its return to the troughs is concerned. In addition, this indicates a good method of insuring clean oil getting to the main bearing through the lead *N* which is arranged so as to catch some of the splash and direct it to the bearing through a standpipe brought a slight amount above the level of the pocket in the bearing support. Any particles of metal or grit will settle in the pocket and only the clear oil flows through the pipe to the bearing. This is a refinement, which, though seemingly small in itself, has much to do with the efficient lubrication of these important points. It is a thing small in cost but, when added to other little refinements, aids materially in securing the most from the lubrication system.

Insuring Distribution

There are other methods of insuring distribution of the lubricant in splash systems, utilizing gulleys or ridges pressed into or cast in the side of the crankcase or stamping that forms the holder for the troughs. One patented way of doing this which indicates the possibilities of efficient lubrication with great simplicity is shown by the diagram in Fig. 5. In this case all the oil is introduced at the front, going either first to the timing gears and then to No. 1 trough, or to this trough direct. Excess over the amount required for this trough overflows through the hole at *D*, and on being splashed from this No. 1 reservoir, the lubricant is caught in the diagonal ridge *C* and led to the next trough. From this it is carried by the next diagonal to the next successive splash reservoir and on back until it eventually enters the end trough, the excess then overflowing through hole *E* into the reservoir.

The action is obviously one in which the minimum amount of oil is splashed when the engine is idling or the car is running very slowly, and increases with the speed of engine and car, for the speed of the car serves to back the oil away from the overflow holes somewhat, making a greater level for the rod ends to dip in the master troughs, thus increasing the splash to the others as well. As the engine speeds up the pump delivers an increasing quantity, which is reflected in the added amount the intermediate troughs get as well as the controlling ones at the ends.

The shape of dippers has a great deal to do with the splashing of the oil. If a narrow face meets the oil then the dip is not nearly so efficient as in the case where a wider dipper is used, which serves to scoop the oil, the effectiveness of the splash of course depending upon the needs, and the shape made accordingly. Some designs of engines are to be found in which no special dippers are fitted, but the ends of the cap bolts are relied upon to do the work, similar to Fig. 8. This is probably satisfactory when the engine occupies a level position, but if on a grade of even moderate steepness, the trough level is apt to slant so that such a narrow dipping surface barely touches the oil. To overcome this, some form of wider dipper is advisable—one that will get into the oil no matter what the angle. Fig. 6 will illustrate this point. The round dipper here shown, in connection with the round-bottomed trough, works equally well in getting into the oil on even very steep grades. The wider the dipper face, the less deeply it has to enter the trough, hence generally speaking, the dipper shape has a bearing upon the form and depth of the trough section. Simplicity of manufacture would seem to dictate a wide shallow trough with a wide-faced dipper. It looks like putting the cart before the horse to design the rod dipper and then think about a trough to fit it, but the dipper design should not be considered as an afterthought—anything that will be easiest to fit. It is

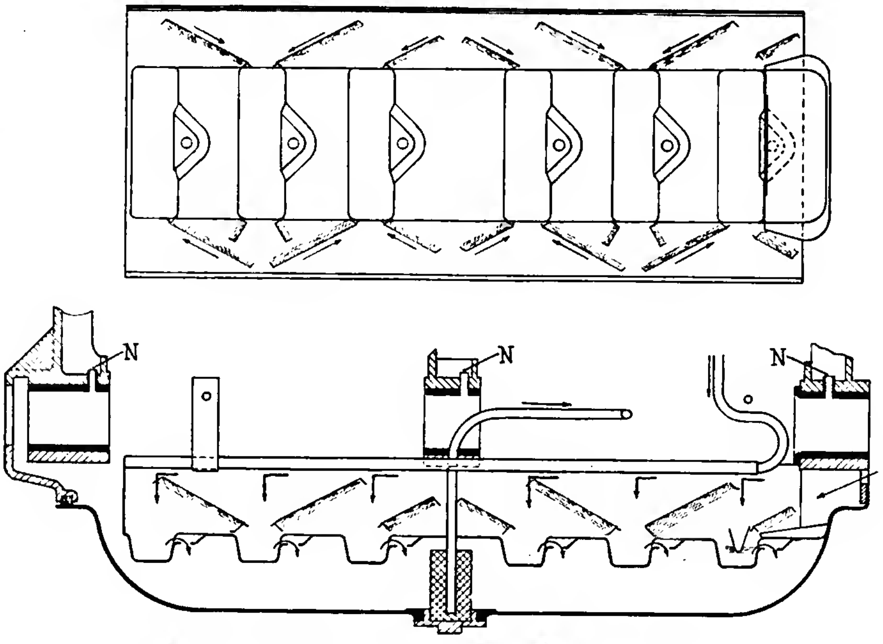

Fig. 4—Return splash trough and pan arrangement for a six

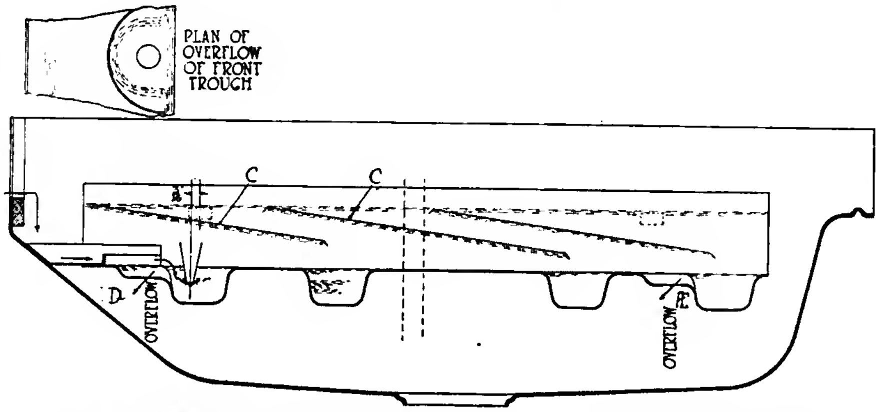

Fig. 5—A circulating splash arrangement which introduces all the oil at the front trough and eventually allows it to overflow at the rear trough

as important to general results as any other feature. A deep trough is not required provided the circulation of the oil is in conformity with the rapidity with which the oil in the trough is depleted, and there is provision for maintenance of level for various motor angles.

In some splash systems, the troughs do not follow the circumference of the crank circles far enough to maintain oil in the troughs at the various angles to which the engine is sometimes tipped sideways. While this is not so important a consideration as that of proper care for uphill and down-grade operation, nevertheless there are times when the road slopes to one side to cause even as much as a 15 deg. angle from the horizontal, and this should be taken into account in designing a system that will be adequate for any conditions that might be met in service. It is not much trouble to curve the troughs up at the sides so as to retain oil under such conditions, and no trough that is nearly straight can hope to act efficiently when the engine is tipped sideways to any extent. Fig. 7 illustrates a trough designed to take care of this condition. Note that the trough follows the crank circle sufficiently on either side to hold plenty of oil at even extreme side angular positions of the crankcase.

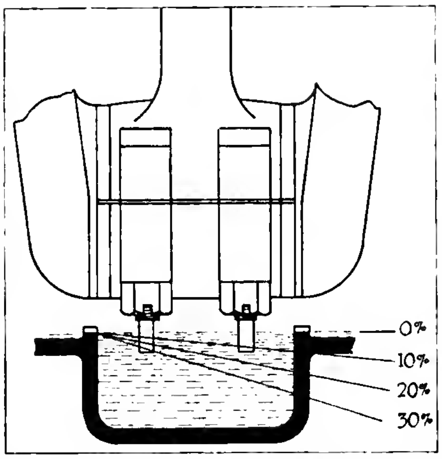

Fig. 8—Illustrating the ineffectiveness of dippers of the form shown when on grades of carrying amount

Two Important Factors

In one respect the engineer's task is very hard, for there are two things to keep in mind: the bearings need all the oil that can be supplied to them, and the details of dipper and trough design so far considered have been regarded from this viewpoint. On the other hand, the pistons must not receive too much, or else the oil will get to the combustion space in quantities, producing smoke and rapid carbonization. The reason that such extremely narrow dippers are used on some high-speed engines with splash lubrication is that any increase in width floods the cylinders at once.

Must Not Impair Bearing Supply

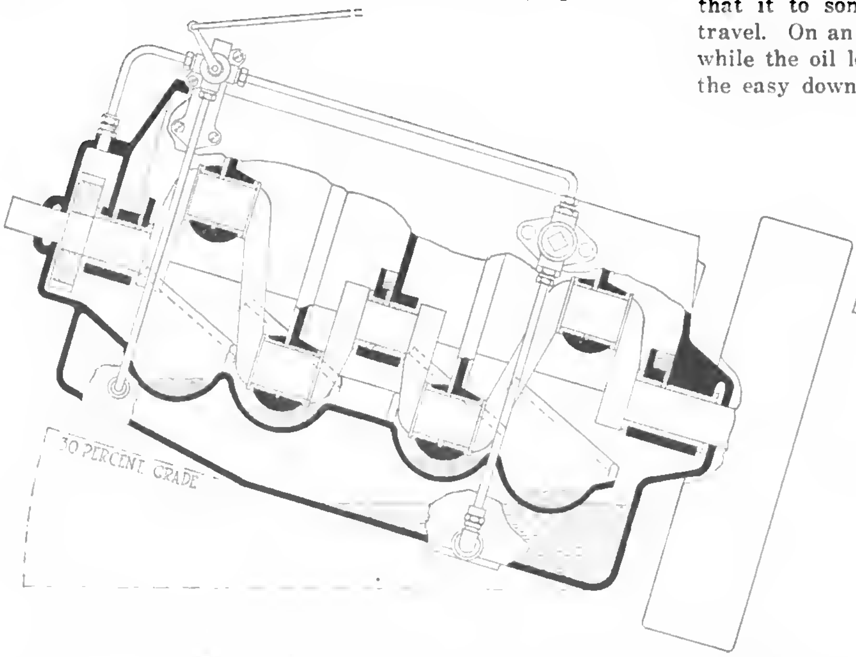
It seems, however, that it is fundamentally wrong to cut down the bearing supply in order to prevent too much reaching the cylinder walls. It is not difficult to design pistons to resist the passage of the tremendous whirl of oil thrown out from the bearings of a full force lubricated motor, baffles to deflect the spray and a proper piston design being able to cope with almost any oiling conditions.

First, a long piston is a great help, and luckily aluminum alloy has made long pistons possible without substantial increase in the reciprocating weight. Grooves in the piston with small holes leading to the inside of the skirt are another effective method. A few large holes drilled in the skirt is another solution, much favored in European high-speed engine design, while there are all sorts of alternative designs for scraper rings.

Another point in lubrication which has been much neglected, is means for varying the oil supply to suit the amount of work the engine is doing rather than to suit its speed. Examples of this idea are seen in the Marmon and the Rolls-Royce designs, where the oil is throttled by a cock in connection with the carbureter throttle. Both these systems are full pressure ones, but the idea has been applied to splash oiling, notably by Chas. Y. Knight, the neatest example being seen in the Minerva-Knight engine.

In this design each trough is a separate piece. Seen from the front of the motor the edges of the trough are curved as in Fig. 7, to maintain the level when the trough is tilted, but instead of being fixed to the crankcase base, each trough is hinged at one end to the crankcase side. On the opposite side of the crankcase there is a rod running from end to end having a series of small arms projecting inward and links from the ends of these arms support the free ends of the troughs. The extreme end of the rod passes through the crankcase and a final lever is here linked to the throttle control. On opening the throttle the rod is turned so as to lift the troughs, so increasing the depth of dip of the connecting-rod splashers. As the throttle is closed the troughs are lowered again so that the dippers only just lick the surface at idling speed, this arrangement giving sufficient distribution under these conditions.

This device, though complicated, has a double advantage in that it to some extent compensates for up and down hill travel. On an up grade the throttle is open and the dip deep, while the oil level drops with the closing of the throttle for the easy down hill run.



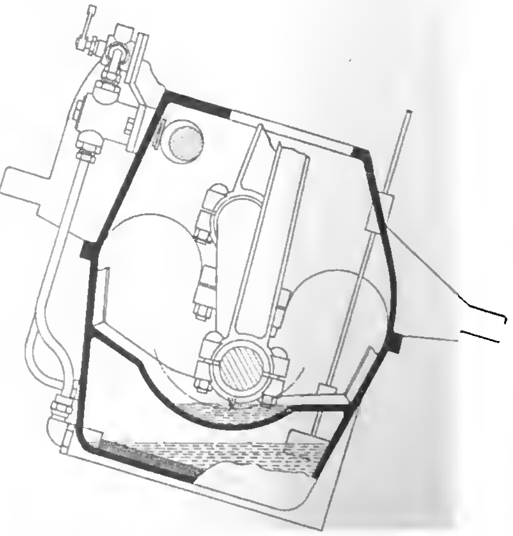


Fig. 6—Left—How a round flat dipper gets into the oil equally well at all angles up to the limitations of the engine. Fig. 7—Right—Trough rounded to care for condition when engine is tipped considerably to one side

Extraordinary Transmission System

Danish Design Eliminates Rear Axle—Rear Wheels Can Move Independently

By A. Ludlow Clayden

IT is but rarely that a practicable automobile invention appears that is utterly new and has little reference to anything that has gone before. The idea illustrated on this page, the invention of P. Jacobson, Jyderup, Denmark, appears to possess this sort of novelty and is highly interesting, even though it must remain for trial to demonstrate the validity of the claims.

The inventor states as his chief aim the reduction of unsprung weight, and his design provides for very little more of this than the weight of the wheel itself. There is no rear axle in the accepted sense of the word, and the two rear wheels are quite independent of each other. With an axle connecting two wheels the passage of one wheel over a high spot causes compression of the spring on one side and so tilts the axle and both wheels relatively to the body of the car. The Jacobson transmission, on the other hand, arrests all tilting and allows either rear wheel to lift in a truly vertical plane.

No Rear Axle

The device is shown in section in Fig. 1. Attached rigidly to the frame of the chassis is a differential housing which may easily be combined with the gearset. The differential is driven by bevel gear in the usual way and operates two ordinary driveshafts, the casing being supported by the outer tubes *A*. Leaving the question of drive for a moment, the method for supporting the wheels may be explained. Between the casing *A* and the drive shaft is a tube *B* mounted in ball bearings at either end and free to revolve without affecting either the casing *A* or the driveshaft. To the outer end of this is fixed a steel forging *C*, which is shaped to a kind of oval, something like a short chain case, and there is a cover plate of steel *D* which has a tubular projection on which the road wheel bearings are mounted. On the back of the case *C* there is a pin, in line with the wheel center, and to this pin the end of the cantilever spring is fitted. Thus the effect is the same as if the wheel were attached directly, and individually, to the end of the spring, lateral stability being given by the case *C* and the tube *B*. The three parts, *B*, *C* and *D* together form a piece which may be likened to one-half of a floating axle with a crank in it near the outer end.

By these means the inventor has provided a system for supporting the two wheels independently so that a rise or fall of one wheel has no effect whatever upon the other. The next step is to provide means for driving both wheels through the medium of the centrally placed differential.

To do this a circular plate *E* is attached to the end of each driveshaft and an exactly similar plate

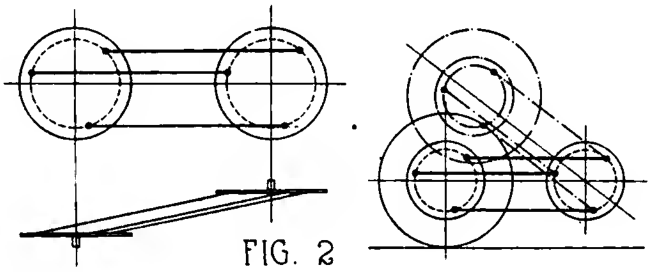

FIG. 2

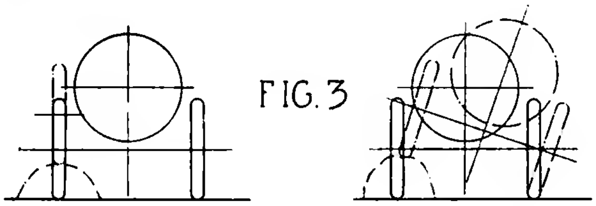

FIG. 3

Fig. 2—Diagram showing that the velocity ratio of the driveshafts is unaffected by spring action

Fig. 3—Contrasting the tilting action of a road shock on the ordinary axle, and the vertical movement of the wheel in the Jacobson design

is forged with a short driveshaft *F* connected to the road wheel just like the driveshaft of a floating axle. To transmit the drive from *E* to *F* there are three short connecting rods, arranged as shown in diagrammatic form in Fig. 2. These rods are mounted on ball bearings at either end and are quite short, about 8 in. between centers being the inventor's suggestion.

This brings us to an important stage in the idea, namely that the drive velocity ratio is unaffected by movement of the spring. Let us suppose that a gear drive had been used instead of the connecting rods. Had this been so, then moving the wheel up and down would cause relative rotative motion between the main driveshaft *H* and the final driveshaft *F*. In other words, passing over a bump would cause the speed of rotation of the road wheel to vary as the spring was compressed by reason of the movement of the center of *F* around the center of *H*. Imagine a gear on the end of *H* held stationary meshing with a pinion on *F*, and it is obvious that *F* could not be lifted upward without causing the pinion to turn.

With the connecting rods this does not happen because each rod is free at each end. The simplest explanation is that given in the diagram, Fig. 3, which shows that the driveshafts are not affected by spring action.

The inventor sums up his claims as follows:

"No small advantages are claimed for the mechanism described compared with orthodox design. No rear axle is needed which has to be strong enough to carry the weight of the car under shocks. All parts may be of light weight; the heaviest, the steel-cover, has but small dimensions. The remaining parts of the transmission may be inclosed in light covers, as they are not influenced by very strong forces and can be braced by rigid girder constructions.

"Springing will be much improved, the wheels move in an ideal manner, causing the car to be light on tires and sideway rolling is absent, making for better stability on the road. The lubrication may be easily made perfectly automatic, as all the transmission forms a unit. By two lengths of tubing the lubrication of the transmission system may be connected to the lubricating system of the engine.

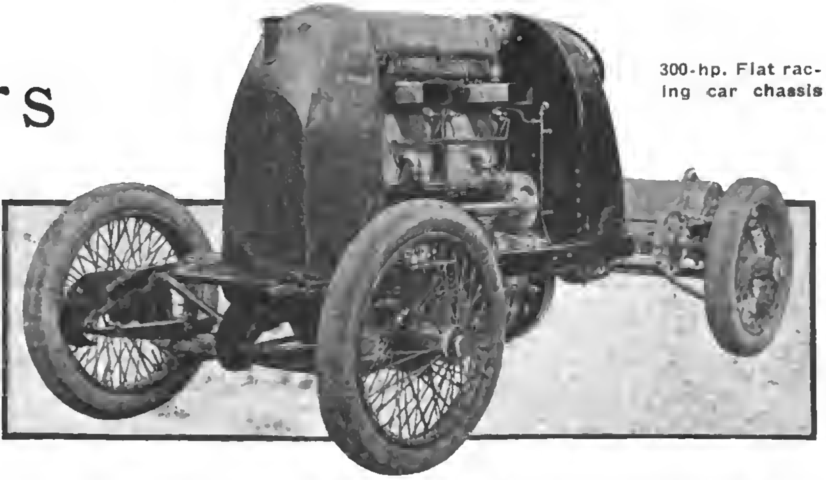
"Yet this novel proposition gets its greatest importance from its perfectly even transmission of power from the engine to the wheels, unaffected by the condition of the road. Combined with the perfect springing this provides a comfort hitherto undreamed of."

Mulford's Driving a Factor in Hudson 24-Hour Record

LAST week THE AUTOMOBILE published in conjunction with its account of the 24-hr. record made by the Hudson Super Six at the Sheepshead Bay Motor Speedway an illustration showing Ralph Mulford at the wheel of the car ready to start on his round-the-clock run. This week our readers may get an idea of the conditions under which part of the trial was made from the accompanying illustrations, that at the top of the group showing the car during one of its brief stops for supplies some time in the watches of the night. Below at the left, is Mulford as he appeared before starting his trial for the world's record and at the right his somewhat tired but still cheerful countenance after the task was accomplished. In spite of the nerve-racking grind at racing speed, however, Mulford's stamina and recuperative powers are shown by the fact that at eight o'clock the following morning he was tearing around the speedway again in the Peugeot he will drive in the May 13 races.

Hudson Super Six stopping for supplies on its world's record 24-hr. run. Below, left, Mulford at the start; right, after the run was finished

Monster Cars Hold Few Records



300-hp. Fiat racing car chassis

THE world's biggest and fastest automobile will always be attractive to the motorist, no matter what his personal views may be on practicability and economy. Fiat holds the record for both size and speed with a 300-hp. car which was driven by Duray at Ostend, Belgium, at a speed of 142.9 m.p.h. This racing freak has a four-cylinder motor of 7.48 by 10.4 in. bore and stroke, giving a piston displacement of 1828 cu. in. The car was built to the order of a Russian prince, and was first driven by Nazzaro. The ambition of the prince was to break the world's straightaway record, and with this object in view he sent Arthur Duray and the car to Ostend in November, 1913. The Italian car was officially timed on several occasions to cover the kilometer at a fraction more than 142 m.p.h. But in order to satisfy the European regulations the run had to be made out and home within a quarter of an hour. Owing to variable weather conditions—wind from the sea, sand blowing in from the shore, rain, etc.—Duray could never make the two trips within the time allowance. Thus, although his speed was never doubted, it was never officially recognized.

Valves in the Head

This giant Fiat has its four cylinders cast in one block, with valves mounted in the head and driven by an overhead camshaft concealed under an aluminum housing, this arrangement tending to increase the height of the motor, which stands more than 5 ft. from the ground. The vertical shaft driving the overhead camshaft is at the rear of the group of cylinders, while the water pump and magneto are respectively to left and right of the casting and driven off a cross shaft. Despite its size, the motor is a remarkably clean design; its hood fits around it as closely as a suit of clothes made to measure. The drive is taken through a three-speed gearbox, jackshaft and side chains to the rear wheels. This car has seen little road service. When it was submitted to the French authorities it was refused the technical license without which no car can be driven over French roads. At the present time it is in cold storage at the Fiat factory.

Exhaust side of 300-hp. Fiat chassis. This view gives an idea of the height of the motor in proportion to the wheelbase

Although the 300 hp. Fiat has been the most spectacular of big cars, it has to take second place in matter of size to a 350-hp. Fiat with which Nazzaro made some demonstrations on Brooklands track three or four years ago. The engine in this case had a bore and stroke of 9.4 by 12.6 in., giving a cylinder capacity of 3498 cu. in. It was estimated that this car would show a speed of 155 m.p.h., but as events proved, it was practically impossible for any single man to hold it on the road. It was not well proportioned and many thought it should have had a wheelbase of 16 ft. or so and, perhaps a 72-in. tread. After the trials on Brooklands track the car was returned to the factory, the motor eventually serving aboard a racing boat.

Some Big Benz Motors

Benz has been responsible for some very big racing motors, the most successful of which was a machine of 7.87 by 9.8 in. bore and stroke, giving 1913 cu. in. piston displacement. This car climbed Gaillon hill, near Paris, one kilometer in length, with an average gradient of 8 per cent, at an average of 101.5 m.p.h., thus creating a record which remains unbeaten.

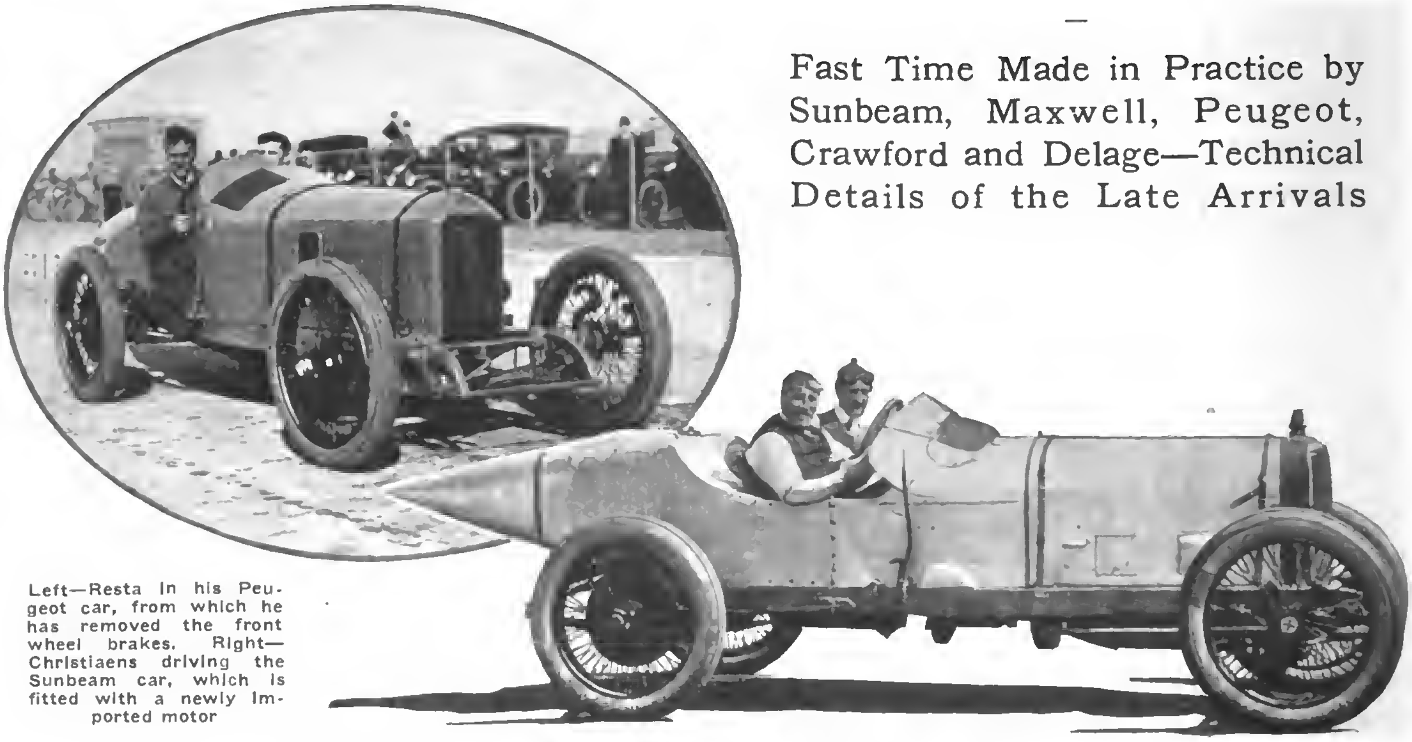
The biggest Fiat long-distance road racers ever built were the machines with which the late David Bruce-Brown took part in the French Grand Prix at Dieppe, in 1912. These cars had four-cylinder motors of 6.1 by 7.87 in. bore and stroke, giving 920 cu. in. piston displacement. They were defeated by the Peugeots of only 447 cu. in., this being the biggest racing car ever built by the French firm. It was this same Peugeot car which won the 1913 race at Indianapolis.

Tendency Toward Smaller Engines

There are indications that for record-breaking stunts, and for the publicity which they secure, the building of big freak cars will be continued. Nevertheless, for competition work on road and track the whole tendency is toward smaller and smaller engines. An example of this is shown in the case of Peugeot, whose biggest racing engine had only 447 cu. in., and was barely capable of 100 m.p.h. A smaller car of 275 cu. in. piston displacement, showed a speed of 110 m.p.h.; the smallest car, built just before the outbreak of war, and not yet seen in public, had 152 cu. in. and showed a speed of 95 m.p.h. average over the measured kilometer. Had it been possible to put this little machine in the 1913 Indianapolis race it would doubtless have defeated Goux's 447-cu. in. Peugeot, which covered the 500 miles at an average speed of 75.94 m.p.h., beating Wishart's Mercer by 13 min. and 8 sec.

1916 Racing Cars at Sheepshead

Fast Time Made in Practice by Sunbeam, Maxwell, Peugeot, Crawford and Delage—Technical Details of the Late Arrivals



Left—Resta in his Peugeot car, from which he has removed the front wheel brakes. Right—Christiaens driving the Sunbeam car, which is fitted with a newly imported motor

NEW YORK CITY, May 9—Day by day the activity on the Sheepshead Bay track is increasing, and about the line of garages beneath the curved sides of the great 2-mile bowl there is a hum of excitement and preparation for the opening of the racing season of 1916. On the track Christiaens in his Sunbeam, Billy Chandler in his Crawford, Ralph Mulford in the Peugeot, Rickenbacker and Henderson in Maxwells, and Miller in the Mulford Special are already trying out their mounts in preparation for the event of May 13.

Considerable interest attaches to Christiaens' Sunbeam, as it is a brand new motor, built with the special intention of bringing racing honors back to the Old World. The chassis of this car is the same that appeared in races in this country in previous years, but the motor has never been used until its arrival in this country, except for a few short trial spins at Brooklands. It is said that a sustained speed of 115 m.p.h. is not beyond the possibilities of this engine, and the car is looked upon as one which is sure to make itself heard from in this year's events. The motor is a six-cylinder design with a bore of 81 mm. and a stroke of 150, or approximately 3 3/16 by 5⅞ in.

One set of spark plugs is used, these being placed in a single line along the center at the top of the cylinders. The current source for ignition is a single Bosch magneto driven at three-quarters engine speed. There are two oil pumps, one which provides lubricant for the ball bearings supporting the crankshaft and the other for the two camshafts. A feature of the motor is the individual breather pipe for each cylinder.

Four Valves per Cylinder

Twenty-four valves, four to a cylinder, are employed. The camshafts driving these are mounted overhead, and the valves are set at an angle in the top of the cylinder head. Camshafts are driven by a vertical shaft and gears from the front of the engine. Christiaens' old specialty of two carbureters is again in evidence on this car, which is fitted with two neat intake manifolds, providing an interesting layout for gas distribution.

The gearset has four speeds with a final reduction on direct of 2.7 to 1. The car is equipped with a revolution counter, and the exhaust manifold is carried outside of the hood with a pointed entrance line.

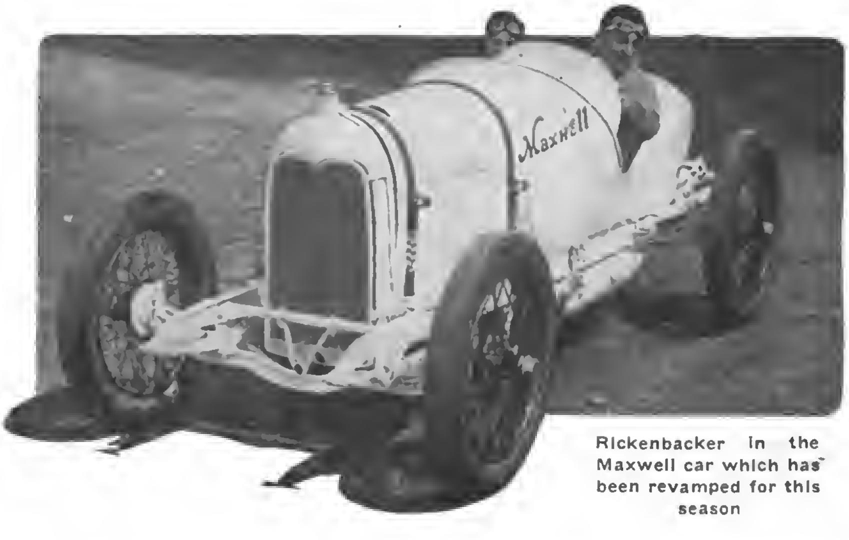
The sixteen-valve Duesenberg motor used in the Crawford cars should also be of great interest in the coming race and in other events on the national circuit. This motor is the one which was experimented with last year but which was completed too late to be used in any of the events. It is built very much along the same line as the eight-valve Duesenberg, having the valves operated by long rocker arms on the side. These rocker arms extend up the side of the motor and act directly on horizontally-placed valves located above the cylinder.

The Duesenberg motor stood up well in last year's races. At Indianapolis the car driven by Alley suffered no trouble of a mechanical nature beyond a loosened exhaust pipe. O'Donnell stopped only three times at Indianapolis, and his mechanical adjustments consisted of the replacement of a nut, which had jarred off the brake bracket, and a quick adjustment of the shock absorber. On the whole, these cars performed very consistently throughout the entire season and, while they were not so fast as some of the other entries, were generally in the money on account of their steady performance.

With the new sixteen-valve motors the same reliability should be acquired with an increased amount of speed, due to the greater gas passages, and a creditable performance is generally expected.

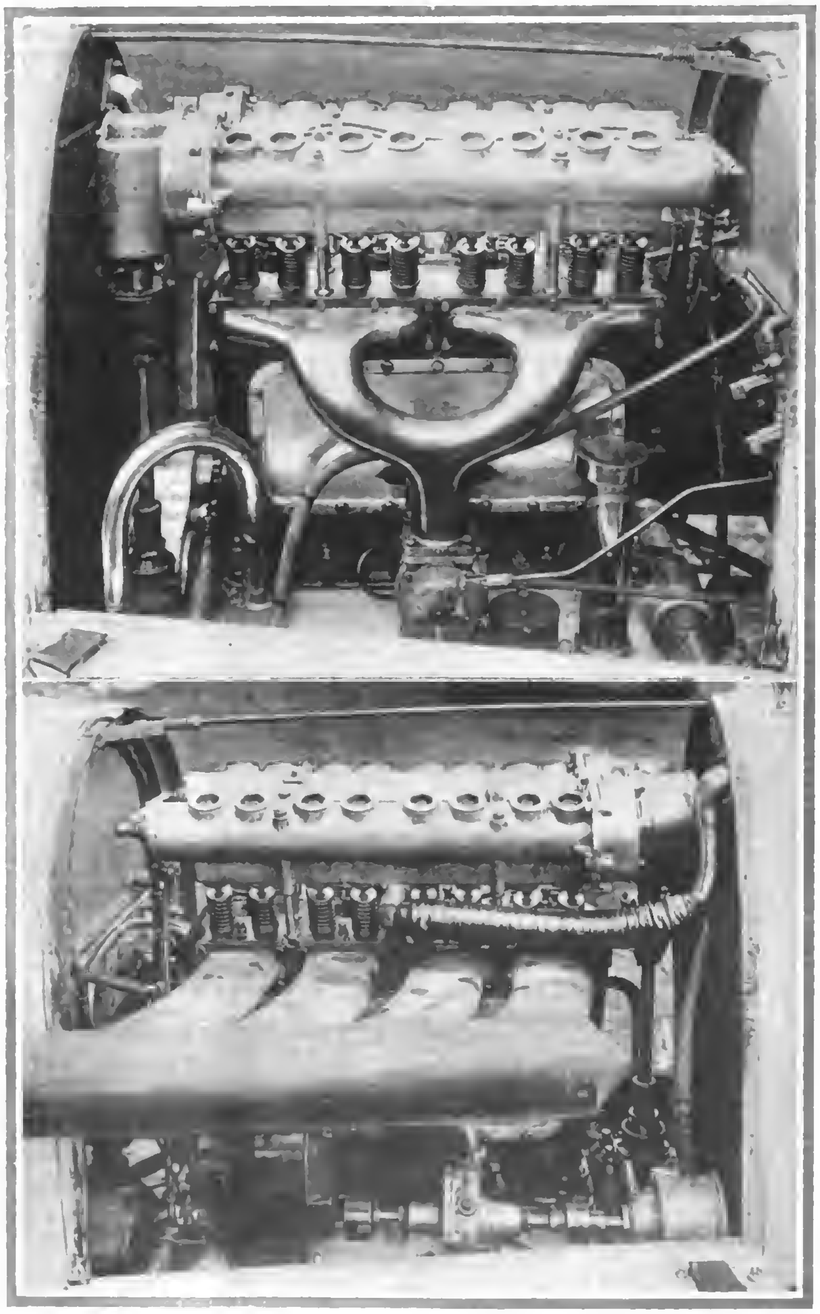
The Maxwell Racers

Every once in a while a flash of white around the 2-mile saucer betokens the presence of the Maxwell racing cars of the Indianapolis team. These cars are faster than the Max-



Rickenbacker in the Maxwell car which has been revamped for this season

Stern view of the Maxwell car showing the new pointed tail piece



Intake and exhaust sides of the new engines now fitted in the Maxwell chassis

wells of a year ago, due to the incorporation of a number of detail changes calculated to reduce the wind resistance and to increase the motor efficiency.

Instead of the stub-ended rear portion of the earlier cars, a long tail has been fitted, designed to a true streamline form, and thus cuts wind resistance to the minimum. Within it is carried the fuel tank of very large capacity with an exceptionally large opening, by which gasoline can be dumped into it in record time. This is the main fuel supply, and is by pressure. In addition there is an auxiliary fuel supply of less capacity, carried in the cowl, and which feeds by gravity, so that if the main supply becomes exhausted the driver can run in on the auxiliary by throwing a valve underneath the steering wheel.

The motors incorporate the only other changes from last year's practice. In most respects they are identical with the 300-in. sixteen-valve motors of the Maxwell team of 1915. Like those motors, they have a bore of 3¾ and a stroke of 6¾. These dimensions bring the displacement to just within the limit. To be exact, it is 298.2 cu. in.

The valve sizes have been changed slightly, the intakes being increased to 2 in. This is ¼ in. greater diameter than in the 1915 racers. The exhaust valves have not been changed, but the lift of all valves has been increased ⅛ in., the cams opening now 7/16 in.

The divided intake manifold of the 1915 cars has given way to a more direct and probably more efficient intake, in which the whole side of the cylinder head casting above the intake valves is opened up to the gas, thus giving a blanket of fresh gas over the entire intake valve area. Incidentally, the new manifold has been copper-plated and rounded off.

The original practice of having a large carbureter intake air horn outside the hood has been discarded, and the new cars have the whole within the bonnet.

Top, Right—Exhaust side of the Duesenberg eight-valve motor, showing the location of the magneto and the oil filler opening

Lower—View of the exterior of the Duesenberg car, illustrating the narrow front and the long tapered tail to reduce wind resistance

The oiling system has been changed somewhat, chiefly through the use of a triple-gear pump instead of a double one employed earlier. The system is a force-feed circulating type, in which fresh oil is drawn continually from a torpedo-shaped oil tank under the frame and returned to the tank after use. This keeps the oil cooler than would be possible otherwise. The details of the method of forcing the oil through the hollow crankshaft and camshaft to the connecting-rods and main bearings have been dwelt on before.

Uses Unique Crankshaft

The real feature of the Harroun motor as exemplified in these Maxwells of the Prest-O-Lite team, is the unique counterbalanced crankshaft construction, which eliminates the flywheel. This has not undergone any change for the past season.

Connecting-rods still are made of chrome-vanadium steel, and have been subjected to accurate machining over all. The I-beam section is further strengthened by forging webs on either end of the section, making a very sturdy rod.

The use of magnalium pistons is continued. The piston heads are domed to give them strength, and each has five rings. There are two diagonally split rings in each of the upper grooves and one wider ring below, which is used for a retainer for the wristpin. The use of magnalium reduces the piston weight from over 2 lb., the weight of a similar cast-iron piston, to about 15 oz.

In explanation of the counterbalanced crankshaft, it might be explained that the flywheel function is distributed along the entire length of the crankshaft, and is productive of fine engine balance. The counterbalance weight opposite each rod bearing is equal to the weight of the lower part of the rod and its bearing; thus the active forces are balanced with respect to the center of gravity, and the centers of masses revolve in the same or parallel planes. Vibration is materially reduced thereby.

The cylinders are cast in a block, and the head, carrying the valves, their rockers and the camshaft, is detachable. Intake and exhaust passages are on opposite sides of the casting, and they are large and free, so that the least possible interference with the passage of the gases to the manifolds is obtained.

Billy Chandler in the Crawford car which is equipped with a Duesenberg motor

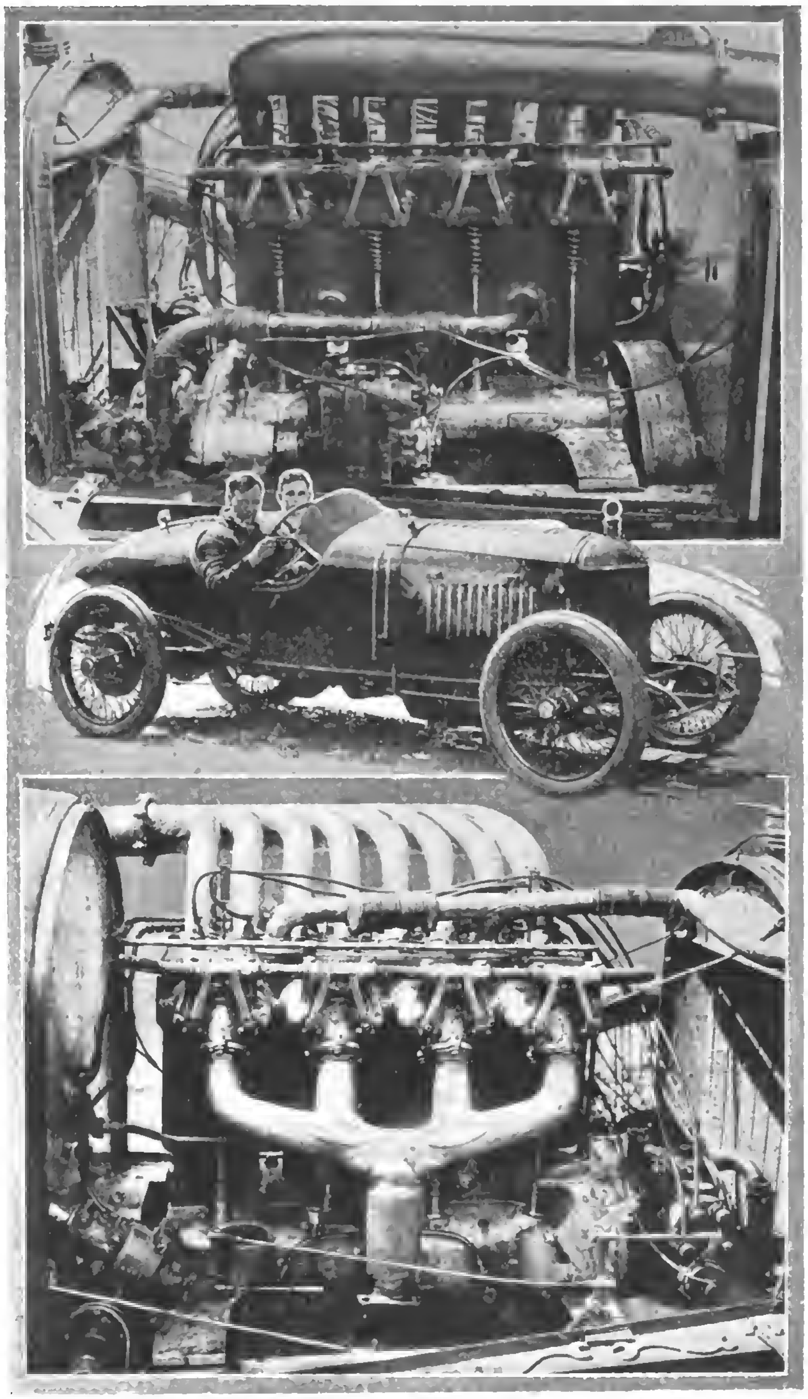
Although there are four complete cars, all in shape to make fast time, it is the intention to use only two of them in any race, holding the other two back for emergencies. In addition to the two completed cars held in reserve there is a very complete supply of spare parts and a thorough system of shipping and storing of parts so that they will be on hand when needed. One of the features of this preparedness program includes a combination motor stand and shipping crate; another, a parts bench, which becomes the parts locker for transportation. Altogether Rickenbacher, the team manager, has made very thorough plans for a successful campaign.

Mulford Special Withdraws

The Mulford Special was out on the track without its complete body, but is now withdrawn due to motor trouble. The motor in this car disclosed little from an exterior view. It is a square block in appearance, having four cylinders 3.98 by 6, giving a piston displacement of 299 cu. in. The valves are operated by vertical rocker arms. Everything is being done at the present time to make this car faster. In the last Sheepshead Bay race the Mulford Special was flagged at the 274th mile.

The Erwin Special has been out on the track for a few short trial spins but has had a little trouble with the engine, probably due to the fact that the bearings have been set up too tight. The engine is the same as the Erwin of last year, while the chasis is new although of similar design to the former one. The car is made by the Erwin Motor Machine Co., Philadelphia, Pa., and has a bore of 4 and a stroke of 5 15/16 in. The cylinders are L-head, cast in pairs, with the intake valves in the head and the exhaust valves on the left. All the valves, however, are operated from one camshaft. Rudge-Whitworth wheels with 33 by 5-in. tires are being used in practice. The wheelbase of the car is 108 in.

Harry Harkness's team of Delage cars which were described in THE AUTOMOBILE fully on March 23 have been showing excellent speed on the track and if they have the stamina of the other old Delage whose motor is illustrated on this page they should be well to the front. The new tails that have been fitted make them suitable for speedway work and they have created a good impression.



Intake and exhaust sides of the older type of Delage motor with the Delage car in the center

The engine of the new cars are considerably different from the older motors as the horizontal valves have been abandoned. There are now four valves per cylinder arranged in the head in the usual way at an angle of about 45 deg. The two camshafts are driven by a single vertical shaft with a nest of bevel gears at the upper end, the spark plugs being in the center of the cylinder heads. A small peculiarity is that the cylinders are bolted on from beneath the studs fitting in the cast iron foot with the nuts inside the aluminum crankcase. The valves are operated positively in both directions by a stirrup which passes right around the cam, only a cushion spring being interposed, so there can be no possible lag in closing.

There are two Claudel carbureters on each engine, operating simultaneously with throttles interconnected.

The engines are well within the 300 cu. in. limitation being 94 by 160 mm. or 3.7 by 6.3 in. This gives a piston displacement of almost exactly 270 cu. in. The wheelbase is 106 in., and the tires 34 in. diameter on Rudge Whitworth wheels.

Just back of the seats there is an immense tank for gasoline and oil, the latter being fed by hand pump when desired, and circulated in the engine by a centrifugal system.

The National Road

A book which should help give to the noted highways of America the prestige they deserve by awakening a greater appreciation of them among motor tourists has been written by Robert Bruce under the title "The National Road." It is descriptive of that historic thoroughfare, the old National pike, running from Baltimore, Md., and Washington, D. C., via Frederick, Md., and Cumberland, Md., through southern Pennsylvania, to Wheeling, W. Va., and so to the banks of the Ohio River.

Paragraphs on Current Topics

By MARIUS C. KRARUP

Many are thinking worm gear. Worm drive for trucks. Worm drive for electrics. Why not worm drive for light cars? Nay, even two worm drives in tandem might be arranged and the gearbox dispensed with. Or perhaps three would be easier to manage, with two of them to be cut out to give direct drive. What delightfully silent little cars that would make. But halt. "Never pick up a snap" is a safe rule, which translated into mechanics means that the obvious is usually not so. Trouble lurks somewhere. Have you thought of coasting efficiency? Well, the light car needs a lot of coasting efficiency, and the worm drive, even of 45 deg. pitch, has not any to spare. We would like to know just how great the coasting efficiency of a worm gear can be made, and we know of others to whom it would be useful to know it. Coasting efficiency is the winged word of conservatism in worm gear speculations at present and has to be considered, though it need not be accepted as an insuperable bar to hopeful planning.

□□□□□

May we say it is the employment of a suction which is beyond direct control that has made carbureter construction difficult, still makes carbureter adjustment ticklish and necessitates many sizes? To be sure, a 900 r.p.m. suction can be managed so as to pull itself up to a 2000 r.p.m. suction in a few seconds, giving as rapid acceleration as is usually wanted. This is marvelous, but a better action could have been accomplished much more simply with compressed air on tap. The Decupli system of forced induction demonstrated so much, at least, several years ago. To remind us, it is illustrated on another page.

□□□□□

Citified automobilism is well along, but here—at the movies—we see an armored motor car stalled in Van Cortlandt Park because one of the front wheels has sunk into the soft ground and not more than halfway to the axle. Volunteer soldiers are digging it out. The scene is filmed to exemplify Preparedness work. But a wheel that would roll out of the hole would seem fully as patriotic to some of us, so much more as the design—in the case of a front wheel or a trailer wheel—is almost obvious.

□□□□□

When publicity ceases, stagnation and worse sets in; competition is corrupted. Without the searchlight of public comment constantly playing on every detail in automobile and motor truck construction, furnishing the facts and nomenclature for thousands of interested discussions and conversations all over the land, can anybody imagine just how much the zest for improvements would have lagged and how much smaller the pressure would have been for combining high quality with economical construction? Where publicity has met the greatest obstacles and has been farthest behind—as in all matters relating to durability and in all details and refinements of motor trucks and delivery wagons—there too the accomplishments of the industry have been least worthy of admiration. Why these remarks, trite and self-evident? They are for the express benefit of truck salesmen who unexpectedly and suddenly lose promising prospects without knowing why. They have run against the axolotl. An axolotl is a blind newt having its habitat in subterranean waters, but it is also a motor truck made to be sold through the influence of interlocking directorates. No ray of light is shed upon its construction from outside of the charmed circle. Its parts yield profits to several sets of directors. Its assembling and sale to other directors and bankers. In the corporations which purchase the axolotl trucks to do their transportation work there are directors who make three profits on the deal. If there are shortcomings in the construction, the common shareholder in the purchasing concern will pay for them. It is his lookout. And he sits in a subterranean cave with no ray of publicity to help him see, no disinterested comment to make him hear. Truck construction is not yet quite far enough advanced and, especially, the public appreciation of the requirements is not yet so ripe and deliberate as to make this sort of development a welcome feature. It courts abuse of confidence and discourages fair play. But there is no remedy, it may be said, if those who are to pay the bills are not bright enough to look out for themselves. How about contests? Such contests, for example, as the army departments of foreign governments have held to determine what makes of trucks should be entitled to subsidy or what price should be paid for them.

□□□□□

Truck contests in the past have been uninteresting and inconclusive because everybody knew that durabilty, the main factor in serviceability, was not tested.

□□□□□

In a tight place in the traffic we press the accelerator hard to jump out of the squeeze. But there is a little time gap between the actuating of the pedal and the desired movement. This important little gap varies for different cars, and in acceleration charts, by the Wimperis accelerometer, it does not seem to be recorded. In comparing acceleration by test for different types of motors, it might be interesting to plot a separate curve for the gap, beginning with the intention to accelerate and ending one to two seconds later. Most of the luxury in prompt acceleration is concentrated in this period.

□□□□□

Differentials always do what they are designed to do. They are forgotten when weather and roads are fine. If there is trouble it is because the road or one of the wheels fails to do its part in operating the differential. Every improvement, so far, consists in making it differentiate less perfectly; making the axle operate more nearly as a unit when one of the tractor wheels fails to tract. The next step in this direction is the solid axle, which is now proposed for trucks. Probably it is a question of average road conditions which method will involve the greater expense for wear of tires and extra demands upon the motor power. There are some other possibilities. The free wheel in conjunction with a reverse gear whose operation automatically locks the wheel has not been fully tried. But the radical remedy relates to the wheel. With caterpillar traction the differential has only its cost against it. Eventually there must be developed a real "automobile wheel" whose traction will be reliable enough to relieve the differential from unmerited blame. We see it coming by way of army trucks, agricultural tractors and light steel castings or sheet steel construction.

□□□□□

Specifications for army trucks have been framed, on request of Major-General Leonard Wood, by Robert McAllister Lloyd, W. P. Kennedy and Joseph A. Anglada, all of the S. A. E. metropolitan section, in consultation with Captain Gordon Johnston and Major C. S. Lawton. The specifications are in three classes, representing first, second and third choice. The object is the double one of guiding the army authorities in purchases and the truck manufacturers in construction, as well as to have a large percentage of commercial trucks eligible for army work. It would be a remarkable vindication of this method if the new specifications were locked up for a while and the work done over again with three other engineers—say from the Detroit section—and substantial correspondence was found to exist in the results in both instances. Should divergencies appear, a most excellent debating material, for both army men and truck builders, would have been created, much for the advancement of the cause.

* * *

It would be interesting, in addition, to stage carefully all those army requirements which are special and indispensable, have them visualized in a few hundred photographs with explanatory captions, have all of these published or distributed in full sets and invite all S. A. E. members to specify means for meeting the needs. Division into as many classes of vehicles as the army men think should be allowed would simplify the designers' work.

Forced Fuel Feed vs. Automatic

VARIOUS means for operating a motor at will with a charge higher than its normal maximum and with the compression correspondingly increased have engaged attention, with a view to getting high power and speed from a small motor and an economical power development over a much wider range than would be at disposal by using a larger motor. In the ordinary high-speed motor a similar object is accomplished mainly by large overhead valves, narrow valve faces, increased valve lift, internally polished induction pipes with a minimum of abrupt bends, suitable valve timing and a number of refinements necessary for taking care of the inertia forces. In comparison with these means, or in conjunction with them, the system of forcing the intake of the gas and air charge has the advantage that it may be used for increasing the force of explosions at slow motor speed, when the motor is handling an overload, and that the surcharge at any speed can be made much greater; in fact so large as to involve the risk of burning out exhaust valves and plugs and injuring the motor generally. Additional interest attaches to the whole idea of forced intake now, because it gives promise of assisting greatly in reaching complete success in the use of other fuels than gasoline, especially kerosene and alcohol. This prospective advantage depends upon being able to apply the forced intake at any desired point in the cycle, rather than being limited to the suction stroke.

The most practical example of forced charging was the Decupli arrangement, which was described and illustrated in THE AUTOMOBILE in 1912, when it was fitted in a car and submitted for trial to the French Automobile Club. Eric Walford draws attention to this construction again in a recent issue of *The Autocar*, giving the illustrations which are reproduced herewith. Fig. 1 shows diagrammatically the general arrangement in fitting the system to the test car.

Alongside the gearbox there is mounted a short shaft driven by a belt from the clutchshaft and carrying a clutch, so that the pumpshaft can be rotated or not, at will. At the rear end of the shaft is the compressor supplying compressed air to the carbureter, which is of the construction shown in Fig. 2.

With modern provisions for motor-starting and electric lighting, these cumbersome arrangements can evidently be much simplified, and the facilities now existing in this respect are among the factors causing renewed interest in the subject.

In the carbureter there are two jet nozzles, *A* and *B*, the former operating in the usual manner when no forced charging is desired. At such times extra air for the carbureter enters by the valve *C*, which is interconnected with the throttle. When compressed air is supplied, on the other hand, the plunger *D* over jet *B* rises, uncovering this second jet. Supplementary air and safety valves are provided, as shown in the cut, and the float chamber is in communication with the spraying chamber, so as to balance the pressures.

At the trial this system was fitted to a 12-hp. Mors car and the records show that the car climbed a hill at an average speed of 24 m.p.h. without making use of forced charges, and that it was possible to raise this speed to 33.6 m.p.h. by admitting the compressed air, such admission producing at once a forward leap of the car, the weight of which was 3360 lb. It was figured that the charge forced into the cylinders with the Decupli device was double the normal maximum, which would also nearly double the compression and probably set up stresses so high as to call for special design in many details of the motor.

The situation looks different in many ways when it is contemplated to have the cylinders draw their normal charges in the usual manner and to employ the compressed air only for introducing the surcharge at a later moment; or else to draw in air alone by suction and shoot in the fuel with a little additional air later, as should be especially suitable for fuels whose vapor, as that of kerosene, is liable to cracking while exposed to a temperature which is not quite sufficient for ignition.

In Diesel motors with high compression the air-compression plant is said to absorb an average of about 6 per cent of the power output, and it may be doubtful if any smaller allow-

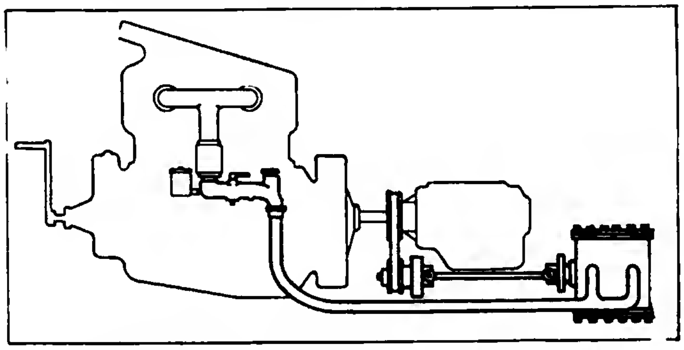


Fig. 1—Arrangement of drive, compressor and carbureter in Decupli system of 1912

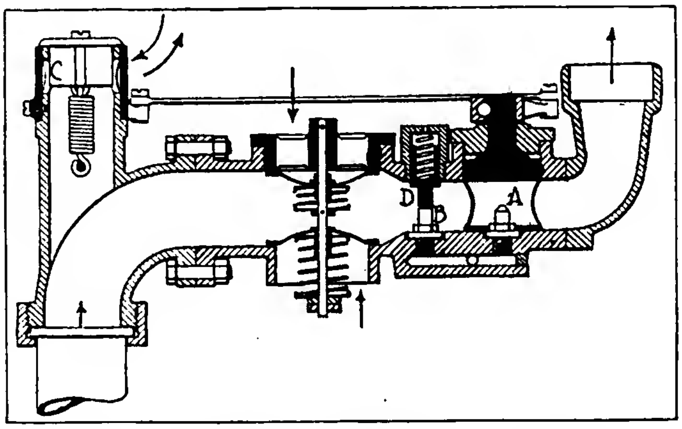

Fig. 2—Construction of Decupli carbureter for increasing fuel charges by compressed air

ance should be estimated for automobile motors whose small dimensions would make for lesser efficiency in this detail.

The Blower System

Mr. Walford, in his above-mentioned review of the attempts made to materialize forced induction as an adjunct to motors not originally designed for it, mentions those made by Alexander in 1907, by Kessler in 1909 and by Lewis a year or two later, as well as a patent by Gore which does not seem to have been tried in practice. In a general way it is found that neither the use of air compressed in the crankchamber nor that of force blowers is fully acceptable.

R. M. Alexander used a blower in the inlet pipe between the carbureter and the engine and obtained a decided increase of power. The fan used was about 6 in. in diameter and was run half as fast as the engine by means of a friction disk actuated by the flywheel.

If a blower were placed so as to force air through the carbureter it would interfere with the carbureter action, so long as this depends upon producing an atmospheric depression around the fuel jet in order to draw the fuel out. This objection may be overcome, however, as in the Decupli device, by putting the float chamber and the fuel tank into communication with the inlet side of the carbureter.

The blower device fitted by E. W. Lewis was coupled direct to the induction pipe and drew gas from the carbureter without the use of any reservoir between the engine and the blower. Its dimensions were large and cumbersome and no tests were made to determine approximately what gas pressures or horsepower were produced.

The Kessler system was applied to a two-cycle motor fitted to an American Kessler car which was taken to England in 1909 and tried out on the Brooklands track. The principle was that of utilizing the piston stroke for compression of air in the crankchamber and sending this air into the other cylinder in addition to an almost full charge introduced by suction. The four-cylinder motor developed great power at all of the three gear speeds, but was very noisy.

In another instance a four-cylinder, four-cycle motor of the horizontal type with two opposed air-cooled cylinders was operated with forced charges on a principle similar to that used in the Kessler two-cycle motor, and in this as in the other cases there was no doubt about the increase of power; but the attending drawbacks, both in construction and operation, pointed to larger size of the motor or the usual expedients of high-speed design as being preferable for attaining the desired power and acceleration.

Summarizing the Impression

The data on forced fuel feed to the cylinders are vague so far. One feels that the experiments which have been made were partly on the wrong track. The idea of forcing power and speed by cramming the cylinders overfull with explosive charge does not appeal strongly to mechanical sense; not at this date. But there is a larger view. The methods used for cramming the cylinders point to better ones which may be used similarly but for a more moderate purpose: For improving carburetion, cylinder-charging, combustion, lubrication, acceleration; for introducing an improvement over the automatic cylinder-charging now universal; an improvement likely to prove more important than the change, of old, from automatic to mechanically operated inlet valves, which was the beginning of higher-speed motors and decisive for efficiency and motor control.

It is known that the practical limits for high motor speed can be reached and exceeded without more than full charges in the cylinders. The difficulties which set these limits must operate even more strongly against additional forcing of the charges. But if, for example, the extreme valve timing which is resorted to in racing motors could be avoided, as seems more than likely, by positive cylinder-charging—supplementing a partial charge with air by suction—the useful range of motor speeds would be largely increased, and the high-speed motor would become flexible as well as powerful and economical.

This and the relation to other fuels than gasoline lends the subject an interest which must continue to grow and must result in many experiments in the industry.—M. C. K.

Rule for Obtaining Correct Tension for Silent Chains

THERE is nothing that is so destructive to a silent type chain as is running it slack. If the tension is incorrect the slack side "thrashes" and this quickly beats the life out of the chain. Probably a large percentage of chains used for electric generator or starter drives give much less service than they ought to do because they are allowed to get slack. The automobile owner and even the repairman is often at a loss to decide how tight a chain ought to be, hence the opinion of an expert is of great value. F. L. Morse, maker of the Morse rocker joint chain, gives the following simple rule for obtaining correct chain tension. It is:

"Tighten the chain by the adjustment till it growls when running; then slack it off by slow degrees till the growl just ceases. The chain is then at the right tension."

Mistakes Impossible

Mr. Morse also says the adjustment is so easy that to make a mistake is almost impossible. Nearly everyone with any mechanical knowledge knows the way to adjust a cup and cone ball bearing, namely, to tighten it till it runs stiff and then slack back the cone till it just, and only just frees itself. The method for chain adjustment is almost exactly similar. Mr. Morse gives as his opinion that adjustments ought to be made as accessible as possible, since any owner can keep a chain properly tensioned without professional assistance, if he can get at the adjusting nut. He considers inaccessible adjustments militate against the proper maintenance of tension and so against the life of chains.

Dodging British Taxation

THINGS are usually supposed to move slowly in Great Britain but something seems to have been doing since the motor car taxes were raised. The government has just announced a new schedule of horsepower taxation to come into force in June which makes the annual license fee for Ford cars $90.72, three times the old tax. The Ford suffers because it has a large bore and falls in the class between 80 mm. and 102 mm. which has this sum as the annual due.

It is now announced that a company is in course of formation and will commence operations immediately, to supply cylinder liners and new pistons which will fit any Ford motor and reduce its bore to come within the next lower tax schedule of $30.24 per annum.

Our British contemporary *The Autocar* for April 22 is filled with letters bewailing the injustice of the new taxes and pointing out how vicious an effect upon design is exercised by a tax upon bore which takes no regard for stroke or total piston displacement. *The Autocar* in an editorial points out that the money must come from some place and suggests that if the automobile is to be taxed as heavily as this the same total amount could be raised more fairly by charging so much per 100 cu. cm. (about 6 cu. in.) as this volume normally produces about 1 hp. Even this, it is pointed out, falls harshly upon owners of old cars with large, inefficient engines, and this sort of vehicle has been used largely by people of small wealth owing to the low first cost. It will certainly spoil the used car market.

Sun Six Uses Ejector Exhaust

Well Known Parts Used In Assembled Product

A LIGHT six-cylinder car has been put on the market by the Sun Motor Car Co. of Elkhart, Ind., in five-passenger touring, four-passenger roadster, and five-passenger sedan style. The touring car sells for $1,095.

Five-passenger touring car on Sun light six chassis, listing with full equipment at $1,095

Although this is an assembled car, in exterior appearance the lines are characteristic. The wheelbase is 116 in. and this space has been used in a way to give good body room in both the forward and rear compartments.

Has Suction Exhaust Effect

The motor is a six-cylinder L-head 3 by 5 with removable cylinder head and featured by what the Sun company calls a dual ejector exhaust, the idea of this being that the ejector principle is used in having the exhaust from one cylinder create a suction to lessen the back pressure on the next cylinder. Both the intake manifold and the hot air connections for the carbureter are integral with the cylinder casting. The 20-gal. gasoline tank is placed at the rear of the chassis and fuel is fed to the carbureter by the Stewart vacuum system. The carbureter is a Rayfield.

Large diameter valves are used and light pistons. The crankshaft is carried on three main bearings and is balanced by the curved web system in which the crank cheeks are claimed to act largely as their own counter weights.

The valve actuating mechanism is located within the crank case where it is subjected to the spray of oil due to the splash lubrication. Pump circulation is used for the oil which is kept at a constant level in the splash troughs. Circulation of the cooling water is by thermo-syphon. The water circulates entirely around the cylinder wall and the valve seats and both the intake and outlet water pipes are 2⅜ in. in diameter. The radiator is a honeycomb type having a water capacity of 2½ gal.

Single Disk Clutch

From the motor the power is transmitted by a Borg & Beck single plate dry disk clutch to a three-speed selective type of gearset. This is mounted as a unit power plant and the entire unit is supported at three points to avoid distortion. The rear axle is a floating type with the weight of the car carried on a pressed steel housing. Both ball and roller bearings are used to take the drive and weight.

The front axle is an Elliot type with a cup and cone ball bearing. The frame is designed to be rigid, being of channel section 5/32 in. stock, reinforced by six cross members. The frame width in front is 28 in., giving a small turning radius. Semi-elliptic springs are used, front and rear, the latter being 52 in. long by 2¼ in. wide. Cross-rolled vanadium steel is used in their construction and the frame channels are arched over the axle at the rear with the springs swung directly underneath.

Equipment Is Complete

Some of the other features of the car are Remy starting, lighting and ignition, Burd high-compression piston rings, Jacox irreversible steering gear, twelve-spoke wheels, 34 by 4 in. tires with non-skids in rear, one-man top, Jiffy curtains and a full line of equipment.

This includes ventilating rain-vision windshield, electric motor-driven horn, tire carrier at rear of chassis and Firestone demountable rims.

The standard color is Brewster green with hood, fenders and running gear black enamel.

Effect of Compensating Jet

How the Zenith Carbureter Operates and Theories Underlying Its Design

By V. R. Heftler

Manager Zenith Carbureter Co.

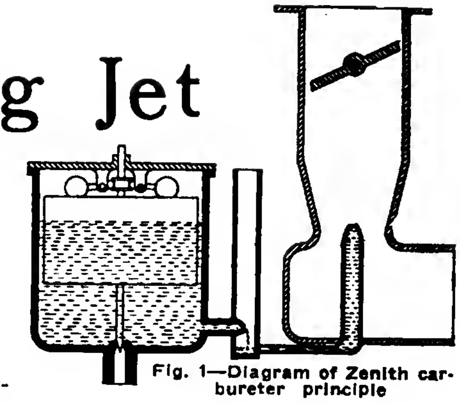

Fig. 1—Diagram of Zenith carbureter principle

THE paper on carburetion read recently before the Cleveland section of the S. A. E. by F. O. and H. O. Ball and published in THE AUTOMOBILE for April 27 provoked considerable discussion, a prominent participator being L. V. Heftler of the Zenith Carbureter Co., who took exception to some of the deductions made by the authors. Mr. Heftler's remarks cover the basic theory of the Zenith design and are thus of considerable interest, and in the following are given practically in full:

Krebs' View of Carburetion

It strikes me that, in the first part of the paper, the theoretical deductions are made under certain assumptions which, as the paper says, are contrary to a more prevalent opinion. This prevalent opinion was presented by Professor Rummell and was contrary to the view of Krebs presented in 1902. Krebs, as all carbureter engineers know, held the view that while the air curve follows a parabolic law the gasoline curve also follows a parabolic law having a slight lag at the start. He attributed this difficulty to the slight difference in level between the constant level and the tip of the nozzle. Krebs determined experimentally this curve lag and he found the corrective term to be equal to 21 mm. when his nozzle was not 21 mm. above the level.

Suggests a Test

It seems to me that, if this law upon which all those curves are based were true, the engineering community would be very much interested in knowing in what manner this new opinion, contrary to the view that we have, has been arrived at. It would be a very easy matter to find out if these considerations are correct; the obvious way to do is to eliminate that disturbing influence caused by the nozzle being too high above the level. We could very easily make, for experimental purposes, a carbureter in which the nozzle should be, say, ⅛ in. below the level. Of course, such a carbureter will be impractical for use in an automobile, because it will spill gasoline while at rest, but while being used to test on the dynamometer, we could find out whether or not that is the cause which prevents the gasoline curve from following the air curve. This would be a simple way of testing that theory. The theory of Krebs, to which Messrs. Ball now revert, was very much opposed by various authors, and the theory that is adopted now by the majority is that the gasoline curve of a fixed orifice is a parabola, but the apex of a parabola is not on the horizontal axis, as in Krebs theory. It is somewhat below.

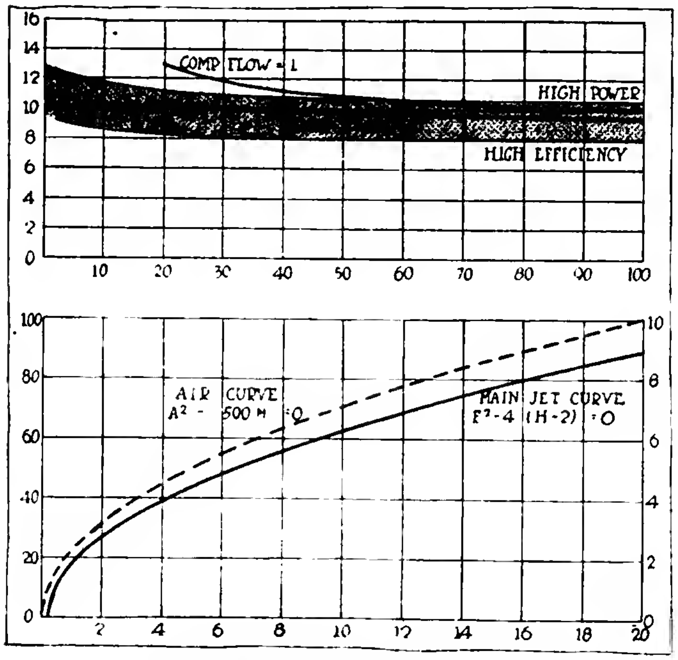

Fig. 2—Curves obtained with Zenith carbureter

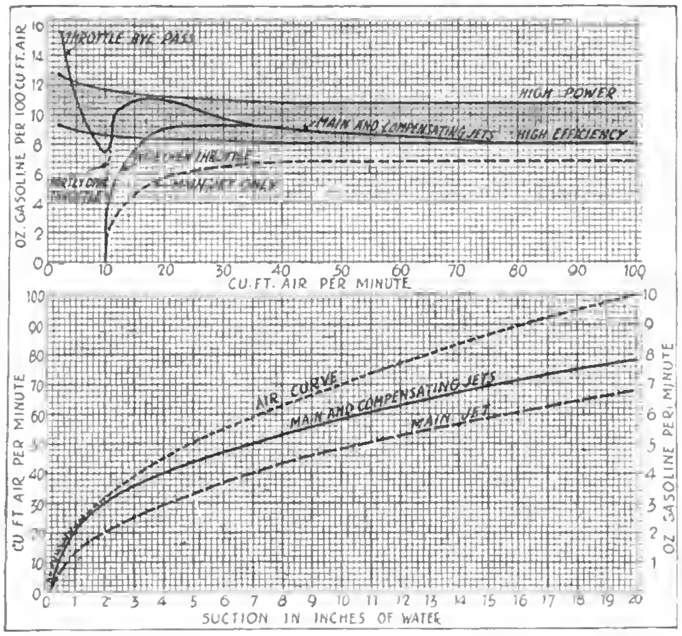
But even taking the premises used in making the theoretical analysis of the various carbureters, I believe that it is possible, at least in one case, to arrive at a different conclusion. I have reference now to Figs. 3 and 4 and to the compensated fixed orifice carbureter. This type of carbureter is described as follows: "A second supply is drawn from a well open to the atmosphere and supplied with a constant quantity of gasoline from the float chamber by gravity." This quotation from the paper reproduces the term of a patent to Baverey, and therefore is referring, and can refer to only one carbureter, with which I am associated. Taking Fig. 4, I have considered the parabolas used in making the curves, and I find that the air curve is very accurately, absolutely accurately represented by the equation $A^2 = 500\ H$ where A is the air flow, and H the suction, and that the fuel curve of the main jet is represented by the equation $F^2 = 2.316\ (H - 0.2)$. These equations can easily be verified.

The Compensating Jet

The compensating jet has been assumed to follow a more complex law. It has been assumed to be constant and give a quantity of fuel equal to 1 oz. per minute provided the suction is greater than 2 in. Before the suction reaches 2, the carbureter jet does not get constant flow. I will see later whether this is justified.

$$C = 1 \text{ provided } H > 2$$

Now, the analysis of this carbureter does not show very well, but the remedy is obvious. If I had a carbureter like that, that does not show very well, I would simply increase some of the jets, and I am assuming exactly the same premises that have been assumed in the paper. The analysis in the paper shows a tendency for the mixture to become too lean at high suctions, while it is about correct at low suction. Let us therefore increase the size of the main jet, that is, change the parameter in the main jet equation. For instance, $F^2 = 4\ (H - 0.2)$. If I were to keep the same compensator, I find that with the quality diagram at 20 cu. ft. per minute, the quality number would be 13, and that at 100 cu. ft. per minute it would be 9.9, but, obviously, all I have to do is to take a smaller compensator. I take for this compensator one



Above—Fig, 3, Below—Fig. 4—From Ball paper curves for carbureter with fixed orifices and compensating device

represented by C = 0.5, the compensator giving only ½ oz. per minute and the quality diagram varies for 20 cu. ft. from 10.5 to 9.4 for 100 cu. ft. What a difference! The accompanying curves show the quality curves with $C = 1$ and with $C = 0.5$. Now, the assumption has been made that the compensating flow obtains constancy only when the suction is 2 in. of water. This might be correct if the carbureter were designed that way. In order to make myself clear, I will make a very rough diagram of what this constant fuel device is like, Fig. 1.

I have very roughly here shown a constant level fuel chamber and I have neglected to show, because it is a complicated drawing, the main jet, the one referred to in the curve as the main jet, so that we have here the constant level fuel, a well open to the atmosphere, a fuel orifice below the level, and a connecting channel terminating in this nozzle. Now, the suction at which the flow of the compensator becomes constant depends on various factors shown here, which are the area of the nozzle, the area of the compensator and the height between the nozzle and the connecting channel. At exceedingly low suctions, the fuel drops in the well, then a suction is soon reached at which the air passes through the channel to the main nozzle, and from that time on the flow through the compensating orifice is practically constant. As I said, the suction at which this constancy is reached depends on the instrument. In the instrument, such as our company makes, this constancy of flow is reached for a much lower suction than 2 in. of water, and the fair average would be 1.1 in. of water, so that we have there one reason why it is legitimate to continue the curve of quality of the main compensated jet nearer toward the origin of co-ordinates.

When Throttle Is Wide Open

There is another reason why it can be continued still further. There is a statement in the paper, which I will read: "When the throttle is wide open and the motor is slowed down by additional load, the decreasing suction of the motor permits the atmospheric well to fill gradually with gasoline, thus decreasing the gravity head in the float chamber and causing the quantity discharged into the well to decrease."

It would seem that way, but it is not correct. This is a peculiar point, which is hardly known outside of our own organization, and I don't wonder that an error can be made. After the suction is reached, we have no gasoline in channel but an emulsion, but it is much lighter than gasoline, and it would take a good deal less suction to hold it up and carry it up, so that if the critical suction is 1.1 of water, going up, it doesn't follow that the well will again fill up when this suction of 1.1 of water is reached, going down; this kind of hysteresis effect causes the flow from the compensating jet to remain constant for suctions much lower than have evidently been assumed.

Summing Up

To sum up, I have taken the premises under which this theoretical analysis has been made, and have shown that, by simply changing parameters, which is equivalent to changing the sizes of the jets, I arrive at results quite different.

There is, therefore, a question in my mind as to whether or not, by following exactly the same course, changing the jets, it would not have been possible, when operating with the actual carbureter, to obtain, likewise, entirely different and much more satisfactory results.

I am not questioning the accuracy of the curves. I am not questioning that at all. I do adopt, for purposes of argument, the theories that were evolved from the facts and from these theories, as well as from the fact, I have deduced what the facts would have been if a larger nozzle had been chosen. This is quite different. I am taking the very premises that are presupposed by both curves. I have taken those premises, and by choosing the parabola, or, in other words, by choosing the size of the opening, and the amount of constant flow, I have obtained this curve. We know by experience that this is what is done in a practical fitting of a carbureter to an engine. When you change those jets, those curves are changed.

Cleveland Gets Cars by Water

Ninety cars worth $65,560 were shipped by water May 6, by the Willys-Overland Co. to Cleveland on the steamer City of Buffalo, establishing a new record for automobile shipments.

The Willys-Overland, Inc., of Cleveland, uncertain as to whether it would receive its spring shipments of cars in proper time, owing to a shortage of freight cars, decided on this procedure to get prompt delivery.

The City of Buffalo left Cleveland Friday evening and reached Toledo Saturday morning at 10 a. m. At 10.30 the City of Buffalo moved forward to the dock and the cars were run on board. Less than two hours later the ship was steaming down the river. The boat reached Cleveland that evening and was met by a hundred drivers.

Automobiling Hard Hit in England

Touring Car Importation Prohibited, Gasoline Taxed 12 Cents Per Gallon and Triple Car Taxes with Strict Driving Regulations—Contrasting Situation in France

By W. F. Bradley

LONDON, ENGLAND, April 20—With the importation of touring cars prohibited, a tax of 12 cents per gallon on gasoline, no benzol supplies, and a proposal which will almost certainly become law to triple present taxes, the position of British motorists is not at all enviable, Further, there is an active campaign against what is termed pleasure motoring, quite an appreciable amount of money having been spent in posters and other printed matter asking motorists not to use cars for purposes of pleasure. As a matter of fact, automobiles have been very little used during the last six months for anything but utilitarian purposes, the high cost of gasoline and the all-around increased cost of living being quite sufficient to eliminate motoring for pleasure. Nevertheless, the effect of the official appeal has been to create an impression in the minds of the public that car owners are squandering money which ought to be kept in the country and used for more useful purposes.

$1,000,000 in Taxes

The new taxation proposals are a very severe blow. It is officially announced that $1,000,000 will be gathered in by means of these taxes, but as owners have the facility of storing their cars and thus avoiding the payment of the taxes, it is quite possible that the taxable material will disappear and that the object of the government will be defeated. This danger is so great that many are inclined to believe the taxes have been levied with a view to suppressing motoring rather than to getting additional revenue.

Up to 16 hp. taxes are doubled; from 16 hp. and upwards they are trebled. The method of calculating horsepower is on cylinder bore only. A four-cylinder car of 2 11/16 in. bore is less than 12 hp. and normally pays an annual tax of $15; up to 3 5/32 in. bore is less than 16 hp. and pays $20 tax. Up to 4-in. bore cars are rated at less than 26 hp. and are normally taxed $30. While in the two lower classes the taxes are doubled, in the third and all higher classes the tax is trebled. This strikes particularly hard at all the cheaper American cars, for with the exception of the Overland model 75 and the small Saxon these come into the third or higher classes and have to bear treble taxes. The Ford, which is in a numerical superiority in England, has to bear a triple tax. The following table shows the original and the new taxation on some of the leading American cars on the British market:

Car	Original Tax	New Tax
Ford	$30	$90
Overland 6-cyl.	40	120
Overland 83	40	120
Overland 75	20	40
Dodge	30	90
Buick D-54, 6	50	150
Buick D-44, 6	30	90
Studebaker, 4-40	30	90
Studebaker, 6-50	50	150
White, G. A. H.	30	90
White, G. E. D.	40	120
Saxon, 14-15	20	40
Saxon S-2	30	90
Saxon 17	30	90
Pierce 66 A-4	100	300
Packard 12-cyl.	100	300

Old type cars of any make, the value of which is now very low, are so highly taxed that it is practically impossible for their owners to run them. There must be hundreds of old-type Panhards, Charrons, Mercedes, De Dion, and other established makes, the value of which is less than $300, but which on account of their big cylinder bore have a high-rated horsepower and are taxed $90 to $150. Under the English law if a car is not in use it does not pay taxes, thus it is quite likely that many owners will prefer to store their cars at the end of June and avoid paying the increased duty. In these cases the State will lose not only the car tax, but also the gasoline and the annual driving tax. In drawing up the budget it appears to have been assumed that cars of 16 hp. and above are all costly vehicles belonging to wealthy persons.

Horsepower Inequalities

The fact has been overlooked that the horsepower rating is quite an arbitrary one, and that many a small bore, long stroke, high-speed European motor has a bigger cylinder capacity and develops greater power than a big bore short stroke American car. As an instance, the 3.1 by 7.08 in. Hispano-Suiza is only rated at 15.9 hp., and will pay a $40 tax, while a 3¾ by 4-in. Ford, which develops less than half the power and costs a third of the price of the French car, is rated at 22.4 hp. and has to pay a $90 tax. Scores of such examples could be quoted to show the illogical nature of the new taxation.

Automobile dealers are very hard hit. There are very few English cars available for the market, and all agents have in consequence been glad to take up agencies for American cars. Now that this source of supply is shut off, nothing remains for dealers but to close their stores. Many of the smaller dealers who were unable to get American business closed months ago, but the larger firms have managed to keep going until the present. Now such big firms as the Fiat company and the Renault branch have decided to close their doors. The value of used cars, particularly small models and modern types, is strengthening; big, old type cars have lost in value.

Few Restrictions in France

Reports, which were prevalent a few weeks ago, of the Government control of gasoline, which would only be given out to those persons who could show a valid reason for motoring, are now receiving little attention. The prohibition of imports, the increased taxation and the high cost of gasoline are doubtless sufficiently restrictive measures. Motorists are still receiving very close attention in the matter of lighting regulations, headlights being forbidden in practically the whole of England and only feeble sidelights being permissible in most of the coastal area.

Motoring conditions in France contrast strangely with those of England. In a country where the war is being decided there are, outside the army zone, practically no restrictions on the use of automobiles. Unlike England, lighting regulations have undergone no change; automobile taxation has not been increased, although a rise is promised for immediately after the war; the gasoline tax remains as before the war, although high freights and other causes have sent the price of fuel up nearly 40 per cent. All motorists must register monthly with the police, but this measure is intended to weed out undesirables and not to restrict the use of cars. The whole of the army zone is rigorously and unconditionally closed to civilian motorists, but in the remainder of French territory it is possible to use a car with as much freedom as in peace times.

Very few factories are producing cars for private consumption, although there are rumors that a few of the leading firms will shortly get a release from army orders permitting them to build for private customers. Too much importance must not be attached to this, for in very many cases the automobile factories are now so efficiently organized for the production of shells and other war material that it is more profitable to continue on the present work than to build cars for private use. During the last twelve months some of the biggest factories have been so completely converted and so thoroughly equipped for shell production that it would be unprofitable to build cars. The only advantage of car orders is that in some cases it enables old stock to be used up which could not be employed in normal and more critical times.

Demand for Cars and Trucks

A certain demand has sprung up during the past few months for both touring cars and trucks of American construction. The touring car demand is almost entirely dependent on military requisitions. If the army authorities visit a certain district and requisition the private cars to be found there, that district immediately becomes a buyer of American cars. There are now very fews cars in France not indispensable to their owners. Thus, if the army steps in and purchases the cars, paying cash for them, the motorist immediately becomes a purchaser of an American car.

Seeing that the net result of the requisitions is to increase the sales of American cars, the agents for these cars have endeavored to sell direct to the army. In this way the army would get American cars instead of the private motorist, and the latter would not be subjected to any loss and inconvenience. While the army is quite willing to examine all offers made, and will cause sample cars to be stripped so that all details can be examined, there does not appear to be a single case of an order having been placed. About 1000 ¾-ton Jeffery trucks were ordered recently for ambulance service, but not a single order appears to have been placed for American touring cars for general army work. It is certain that no orders can be got direct out of Paris, and if any business were done it would go through the buying commission in New York.

American Firms in France

The American firms now doing touring car business in France are Ford, who easily heads the list, Buick, Overland, Dodge, Chevrolet, Maxwell, Mitchell and Saxon. It is understood that H. B. White, who has been Ford European representative for a number of years, will shortly return to America, and that Mr. Perry, the present English manager, will take charge of Europe, with an independent company for France. It is also known that Ford will erect big factories near Southampton, producing there for the whole European market. This would free the cars from any import duties which may be imposed, for it is practically certain that there will be some preferential tariff among the Allies after the war. Another feature of this ever-changing problem is the high taxation which falls on American cars by reason of the European system of determining horsepower by bore alone. If this present system of taxation is continued it is likely to have a serious effect on the sale of American cars.

The Buick is being very vigorously handled by a former Delage sales manager. Overland is in the hands of M. Falconnet, one of the oldest members of the French automobile industry, with very fine quarters in the Avenue Malakoff near the Etoile and Avenue de la Grande Armee. Dodge is placed on the market by Gaston, Williams & Wigmore, the Goode Brothers, formerly in charge of Packard interests, looking after the automobile section of this firm. The other American firms are doing a lesser volume of business; the attempt to put the Chalmers car on the market has not been followed up. Fairly high prices are being asked and obtained for American cars. Ford prices have been increased $200 in order to cover higher freight and increased rate of exchange. The two Buick six-cylinder models are being sold at $2,100 and $3,000 respectively. The Overland models are $1,640 and $1,860 each. The Dodge is sold at $1,600.

Up to the present there has been no increase in the import duties on foreign automobiles, the rate being about 8 per cent of the value of the car. It is well-known, however, that French manufacturers are determined to defend their interests, and that they are working for a higher tariff. Reports are circulated in the trade that there will very shortly be a duty of more than 50 per cent on foreign automobiles, or a total prohibition of imports. The probabilities are that prohibition will be preferred at the present time to an increase in duty; it is certain that a tariff as high as 50 per cent will not be adopted. The arguments in favor of prohibition are the example set by England, the necessity of releasing freight for more necessary articles, and also of getting monetary exchange back to a more favorable rate.

The French Industry

The French automobile industry is a wonderfully organized section of the munitions department. There is not a factory but has increased either its ground area or its plant, or both. In the big factories the increase runs as high as 60 per cent. In the small shops the value has gone up not less than 200 per cent. Among these latter are garages and small repair shops which before the war possessed a lathe and a drilling machine, but which are now very finely equipped machine shops capable of doing the best and most economical work. There is a strong tendency to invest profits in additional plant and factory improvements for the future, rather than show a high profit now.

Not a few manufacturers are asking what they will do with their enlarged and improved factories when the war is over. In practically all cases the original cost of the plant has been wiped off by war contracts, but work must still be found for it. The future is so uncertain that it is a most difficult matter for any manufacturer to decide what set of conditions he will have to meet and to prepare to meet those conditions.

It is evident that Allied automobile manufacturers will make a determined stand against foreign competition. All kinds of schemes are suggested, and while many of them have not and never will get beyond the talking stage, it is evident that common action is in contemplation. According to one well authenticated report a group of Allied manufacturers, small in number but representing powerful interests, will arrange to build in their respective factories a uniform type of cheap popular car on American lines to be sold at home and abroad at a price which will eliminate the American car of the same class. These cars will differ only in the names they bear. There will be a clearing house, so that a shortage of any one make can be met by the other firms, and profits from these sales will be pooled. It is impossible to say what chances, if any, this scheme has of being put into execution. It is certain, however, that at least one powerful European firm has already produced a popular after-the-war-model on American lines with the single exception that the motor dimensions are better adapted to European taxation conditions than are the dimensions of the average American engine.

The History of the Pneumatic Tire—2

Early History of Rubber—First Mentioned in 1525 as Used by Natives in Mexico—Early European Experiments—Early Making of Waterproof Fabrics

The History of the American Automobile Industry—29

By David Beecroft

THE modern automobile tire is so completely a thing of rubber and the automobile is so dependent upon its tire, without which many people think it could not have proved successful, that it seems necessary to begin with a history of rubber itself. Rubber, while largely an American product, is found in all the tropical countries of the world and is the product of a great many plants. The best rubber, however, is from a South American tree, which has, in recent years, been introduced into many of the tropical countries, so that a large amount of our modern rubber comes from rubber plantations of recent growth, a majority of our rubber coming from the plantations of the Straits Settlements in the East.

Rubber First Mentioned in 1525

The first mention of rubber dates back to 1525, when certain Spaniards in Mexico saw the natives playing with balls of a noticeable elasticity. They bounced more than did balls with which the Spaniards were acquainted. In 1536, Orviedo y Valdas, in his history, described articles made from the coagulated latex of the rubber tree by the Amazonian Indians. They not only made balls and flexible jugs, like horn bulbs or syringe bulbs, but also made boots and waterproofed their fabrics with it. The jugs or bulbs were made by dipping a clay form into the juice and letting it coagulate, often assisted by smoking over a fire. When a sufficient thickness was obtained, the clay form was broken so that it could be taken out through the narrow neck. They also fitted tubes to these bulbs and used them for various purposes, the tubes being hollow reeds or bamboos.

Its Use in South America

Two hundred years later, in 1725, the French government sent La Condamine to South America in charge of a scientific expedition, and he sent a small quantity of rubber to Paris and described its uses as he found them in South America at that time. It had been brought to Europe before that time or about the beginning of that century, but neither its origin nor nature seemed to be known. In 1751, Fresneau described the rubber tree and how the natives obtained the material. This is done by cutting into the bark of the tree and catching the juice which exudes or flows therefrom. The name, Caoutchouc, comes from the original native name which implied that the juice exuded. Small pieces of coagulated juice may often be picked from the trees, and frequently cups were cut into the bark which collected the juice, but more commonly, the method is to catch the juice as the sap of the maple is caught for producing maple sugar. Rubber is not, however, a sap, and is not found in the body of the tree, but in the bark. It differs widely from gutta percha.

Early Experiments in Europe

Two French chemists, Herissant and Macquer, communicated to the Paris Academy, in 1768, the results of their experiments, showing that India rubber is soluble in oil of turpentine and in pure ether, but no commercial use seems to have been made of this knowledge in the next twenty years. From 1791 to 1815, several people prepared garments by the use of rubber solutions. In 1820 Nadier cut it into threads and made tissues of these. In 1770 Priestly suggested its use as an eraser for pencil marks, but in those days there were practically no pencils and therefore very little use for erasers. Its common name, however, comes from this use.

Benzine as a Solvent

The first industrial application worthy of the name seems to have been that of Macintosh of Manchester, England, who, in 1823, or possibly a little earlier, found that rubber would dissolve in benzine, a fairly cheap solvent, and who began making waterproof fabrics, to many forms of which his name still attaches. In 1832, the Roxbury India Rubber Co. was formed in Massachusetts to engage in this work and Charles Goodyear was one of its employees. In the same year, both Hayward in England, and Luedersdorf in Germany, independently used sulphur to prevent adhesion of rubber articles to each other. It does not appear that either of them recognized any vulcanizing or curing effect, however, as no mention of their doing so is made in any of the references to their work as recorded at that time. This discovery was reserved until three years later when Goodyear attained the first knowledge of such possibilities. His early work in this direction and its results will be taken up next week.

The FORVM

HABIT IN AUTOMOBILE CONSTRUCTION KILLS PROGRESS OR IMPROVEMENT—THE STEERING FACTOR IN THE DIFFERENTIAL PROBLEM—MORE CYLINDERS AND COMPLICATION—TWO ENGINES

Two Engines as Solution of Differential Problem

By W. J. P. Moore

YOUR article in THE AUTOMOBILE for April 13 on the suggested Abandonment of the Differential, like your article of Sept. 2, 1915, on Improving the Steering is a most important one, and should attract considerable attention, and discussion in regard to this rather complicated and expensive, and apparently useless, mechanism of automobile construction. It seems to point the way to important improvements, that are possible and is quite in line with the advanced ideas you have put forward, and advocated with a number of your articles that have appeared from time to time.

Some of these articles, however, do not appear to have attracted the attention their importance justified, at least so far as discussion of them in your journal indicates, although they may have taken deeper root than thus appears and set many thinking and scheming.

There is a saying, "Force of habit beats competition," and it would almost seem that, so far as many things that go into the construction of the present day automobile are concerned, this might be modified to, "Force of habit in the construction of automobiles kills progress or improvement."

Your illustration of the motor truck axle without a differential may show one way that it can be done, but is not this way of doing it a step in the wrong direction and accomplished at a great sacrifice of power and efficiency?

This seems like going right back to the old car axle type mentioned in the beginning of your article, which appears to be the most inefficient form of axle known, and in which there has been no improvement or progress made since the early ages and it does not seem probable that we will get anywhere by following such obsolete and out of date practice.

Railroad Car Axles Crude

There is nothing in the history of development of railroading to show that any serious attention has ever been given to increase efficiency or reduce the power required to handle a given trainload, but that all their attention has been given to increasing size of load to be handled by merely increasing the power of locomotives, size of cars and weight of rails necessary for these increased loads.

Some day, and it does not seem to be very far off, they will reach their limit of power for their locomotives, and the strength of rail required to carry them, and will be compelled to give consideration to efficiency and abandon their crude axles, for a more efficient form and then the locomotive of the future to draw equal size loads will compare with the locomotive of the present day about as a Ford compares with a Packard twelve, and with these improvements will come cheap transportation. Also they will be compelled to see the "self tracking tractor train" of the motor truck and take a lesson from this and learn how to pull their trains in the direction of least resistance. How long a tractor train would a motor truck haul (even on rails with flanged wheels) when pulled by the body of tractors and the wheels unguided except by grinding on the flanges as guides? Now with the one-wheel-drive motor truck without differential that you illustrate, you are driving always in one direction, straight ahead, and steering in many directions and never are these forces in unison except when moving in a straight line, hence loss of power and efficiency. This is admitted by your article, for you say that this motor omnibus required more throttle opening and was sluggish in making turns.

Further with a motor truck all these turns would be made at a much more moderate speed than with an automobile, and the amount of throttle opening would correspondingly increase as well as the sluggishness. Moreover, on slightly greasy or wet pavements the skidding of the front wheels would be greatly increased and danger of accidents be much greater.

You do not say how much harder it was for the driver to steer, but this must have been considerable on a heavy motor omnibus, and certainly would perhaps be even a greater factor in lighter and higher speed automobiles.

Decreasing the Spinning

As regards the apparently lesser tire wear mentioned, this improvement undoubtedly is accounted for by the "spinning" being decreased, which of course is the cause of the greatest wear in all tires. If spinning were practically eliminated probably the wear on the tire would be halved or say its life doubled. In this respect at least the differentialless axle marks an improvement and undoubtedly should tend to equalize the life of the front and rear tires and increase their life.

Is not your assumption as stated in the concluding paragraph of 99 per cent normal (straight) running rather high? Straight roads are few and far between, bends and corners very numerous, not to mention turnouts to be made and holes and obstructions to be avoided. It would be interesting to have, say, a day's record of the motor bus you mention showing the various turns and the degrees of each movement of the wheel, and probably this ratio would be nearer 3 to 1 than 99 to 1, for no matter how small the angle, the increased power factor and decreased efficiency would enter into it. However, that there are many advantages to be gained by a differentialless axle cannot be denied, and these are pointed out very thoroughly in your article, and the real question is how is the best way of accomplishing this.

Two Differential Drives

At the present time there are only two forms of drive axles with differential in extensive use, either for automobiles or motor trucks.

A—Single axle drive with differential.

B—Two axle drive with differential.

or the so-called "four-wheel-drive," and both having the same inherent defects due solely to the differential, namely:

Axle A—If either wheel lacks traction you are at a standstill and down and out.

Axle B—If either wheel on the front axle lacks traction you have, of course, still the other axle to drive the same as in A. This is not a four-wheel drive in reality, but rather a double two-wheel-drive and it is impossible to get a real four-wheel-drive and have a differential, as your driving wheels go out of commission by twos instead of singly. Of course the advantages of the two-axle-drives are not questioned, neither must the complications of this form of construction be overlooked. Probably the latter type of axle will never come into use in automobile construction and how long its use will be justified in truck construction is perhaps problematic.

Other Forms of Drive

Now your article on a differentialless axle shows how this can be done in the type of motor truck axle indicated, namely:

Axle C—A *single* two-wheel-drive without differential, but beyond this there is still another form of drive which you do not mention and which it seems should not be lost sight of, namely:

Axle D—A *double* two-wheel-drive having two bevel gears and pinions without differential, or a real two-wheel-drive, each wheel driven independently by separate dual or twin motors.

This latter form of axle seems to combine all the desirable features of the differential axle, without its disadvantages; and also to be free from the defects of the differentialless axle C, you mention.

The points of superiority of Axle D seem to be:

1. Unless *both* driven wheels are tractionless you are not at a standstill.

2. It gives you all the advantages of the so called four-wheel-drive without any of its complications for two wheels must be tractionless before you are at a standstill.

3. Your power and efficiency is maintained under all conditions of turning, for you can drive in the direction you are turning.

The Steering Problem

4. Steering is easier and almost a negligible factor as you drive around a corner or bend, the steering and driving practically timing together.

5. With a castor type of three-wheel truck like the Knox tractor, all steering could be eliminated and the machine be entirely manipulated by driving only provided that suitable means are adopted for driving one of the drive wheels faster than the other by proper controls. The same thing would be possible with any four-wheel machine having the steering knuckle in the center of the rotation plane of the wheel and of the castor type as advocated in your article of Sept. 2, 1915, referred to above.

6. With either of the forms referred to in 5 above, the steering gear could either be done away with entirely or used only as an auxiliary or secondary, and the irreversibility of the steering gear now so necessary, dispensed with and therefore much cheapened.

7. The power exerted to drive each wheel would be in proportion to the power required and the maximum of efficiency be maintained under all conditions of service and especially on curves.

Complications Are Increasing

8. The above results can undoubtedly be accomplished with less complication and fewer parts than with the present forms of twelve-cylinder engines (not to mention the sixteen or more cylinders we hear talked of) with their gearboxes, change speed gears, differentials, etc. Some of these machines have enormous power as for instance the Packard twelve which by published reports admits to 122 hp. under test and probably is equalled also under maximum working conditions on the roads or in speed tests as at Sheepshead Bay speedway. Probably also other of twelve-cylinder cars are equally powerful although no authentic published reports have appeared.

In fact an examination into what is being done by some of the important makers tends to show that size, complication and weight are continually increasing and there appears to be no limit they are prepared to go to in order that certain results may be obtained.

Such being the case, there has probably never been a time in the history of automobile construction that any modification or improvement that may be advocated would receive the attention that it would at this time.

Why Not Use Two Engines?

9. Assuming the driving power to be gasoline engines, twin fours or twin sixes would replace the V eights and twelves, the complication in the engines themselves would not vary materially and would be more than offset by the fact that it would be possible to do away entirely with gearbox and change speeds provided the size of the power units was anything like those now so extensively advocated and used in the present forms of construction or even with smaller units for that matter. All that is required is a type of clutch that can be slipped in starting and under other adverse conditions and it would appear to be an easy trick to arrange to water-cool the clutch if found necessary.

10. As it might be difficult to reverse the gasoline engines, that could be easily accomplished in the rear axle, this providing for forward motion and reverse as well as a neutral.

11. The various speeds of the gasoline engines could be controlled by a single throttle lever located on the steering wheel in the usual manner and so adjusted that when the steering wheel is in its central position and the car going straight ahead, each carbureter valve is opened and closed in unison, but when the wheel in steering is turned in either direction, the outside carbureter be automatically given a slightly greater opening and the inside one slightly closed, thus driving the outer driving wheel at an increased speed and reducing the speed of the inner driving wheel.

It seems as though this would make an ideal racing car for circular speedways, and give the maximum of power and efficiency on the curves and be able to beat out any car of its inches or displacement ever designed; for on a track like the Sheepshead Bay speedway, as one half the distance is on a curve, therefore the racing car as now constructed it is inefficient at least half the time.

Perhaps this also may account in part for the Sunbeam car mentioned in your article reverting to a differential as it would seem that with the increase of speedway racing the differential type as compared with the differentialless car as ordinarily constructed would have an advantage.

Undoubtedly there are other forms of differentialless axles that will be suggested to others by your article.

Comfort and Body Weight—Cylinders and Economy

By Chas. E. Duryea,
Consulting Engineer

PERMIT me to protest against Mr. Watts' paragraph in THE AUTOMOBILE for April 27, in which he classes cars as those of toleration weighing below 1800, those of comfort weighing from 1800 to 3000 lb. and those of luxury weighing above that. True, he qualifies this statement by saying that "there are notable exceptions," but does not say how they are obtained and leaves the matter based on the idea that his preceding paragraph covers it. That the ratio of sprung to unsprung weight and the ratio of sprung weight to passenger weight are the controlling factors in determining passenger comfort, although he has "never seen any mathematical proof," is, it seems to me, wholly unwarranted.

Any farmer boy who has jolted to town with a basket of eggs nestling in a small pile of straw on the floor of a springless farm wagon weighing nearly a ton has ideas different from these, and farmers are buying many cars these days. That same farmer boy finds the light spring seat he uses made with four hickory sticks for springs and no cushion at all fairly comfortable, although both he and the seat may not together weigh 100 lb., and although the floor of the wagon is bouncing so badly that his feet are actually suffering. This is no fanciful picture. I was that boy. Further, most of my automobiles have been well below the 1800-lb. figure and a number of them—some as light as 500-lb. total—have carried the power plant complete on a frame which rested at one end on the rear axle. Some of this construction have used solid tires. So if experience is worth anything, and most people prefer it to theory, I can assure Mr. Watts and your readers that light cars exist which are more comfortable than many cars of two to four times their weight. Comfort is secured by using springs proportionate to the load; by avoiding synchronous vibrations; by proper hanging of the body so as to permit the wheels to toss from side to side without greatly affecting the body and by again cushioning the riders so that body movements of short amplitude do not largely reach them. I do not believe that light passengers find a heavy-bodied car easier riding than do heavy passengers, but rather the reverse. For comfort passengers should be carried between the wheels and not over them and should be carried low so as to avoid the sidewise rocking. One's body does not well resist sidewise rocking. There are many factors affecting comfort and users should not assume that they cannot have comfort in a light car. The glass bead on the tip of the feather on milady's hat may do much moving about, but it is comfortable and runs no risk of being broken.

The Cylinder Question

Mr. Watts very properly sets forth the falsity of the idea that many engine cylinders are necessary for comfort when he says the engine impulses are absorbed in the flywheel. But even if the car is run at such low speeds that engine impulses are felt it is possible to kill them by introducing an elastic propeller shaft. Or if there is no slack between the engine and the wheels, and therefore no chance for the car to overrun the engine and then get a jerk when the impulse speeds up the flywheel, the engine impulses disappear. In fact, it is hard to imagine a sweeter application of power than the pressure of gases against a piston.

Since, however, most drive mechanisms are far from perfect, the number of cylinders must be considered. The single-cylinder need not be considered, because it cannot be mechanically and explosively balanced as can two or more. Most people judge the number of cylinders by the frequency of the exhaust and with muffled ears cannot tell whether the car has two or twelve cylinders. It is certainly folly to waste fuel that others need on inefficient many-cylindered motors when such is the case. Try it yourself. But do not compare an 1896 two-cylinder motor with a high-priced twelve-cylinder of 1916. Motors of all kinds have improved in twenty years. In fact, this is the answer. Automobiles are better to-day than last year in many respects and the difference in cylinder numbers is not the great factor it is credited with being.

Mr. Stratford's able article in THE AUTOMOBILE for April 20 very properly shows the necessity for filtering the air the motor breathes and he also points out the temperature losses which are a most potent factor in gasoline consumption. Why people complain of fuel costs and buy smaller and smaller water-cooled cylinders I cannot understand.

Mr. Laycock's no-differential argument should be read by everyone, although I cannot favor rigidly-connected rear wheels. The well known form of differential cannot leave us too quickly.

Mr. LeGare seems to think that a magneto jumps more than one plug gap at a time. I know of no warrant for this. The magneto spark is of much lower voltage and burns the points more rapidly, so several are provided that the gap may not burn too wide for the low voltage to jump. The battery and coil system does not use such a metal carrying current and so does not need to provide protection from wide gaps.

Your remarks on the constant pressure cycle are interesting. Professor Lucke has claimed that the Brayton cycle is as economical as the Rochas if properly built, but it certainly is not so easy to secure this theoretic economy. It seems to me that the gas turbine holds much promise for the near future and could easily be developed to the low efficiencies of the modern water-cooled multi-cylinder automobile engine. Your readers would appreciate information on this motor.

Thinks M. & S. Differential Near Ideal

By G. W. Smith

Chief Engineer Thos. B. Jeffery Co.

REGARDING the article dealing with the elimination of differentials, we have not conducted any direct experiments in this matter other than those having to do with the elimination of the differential from the transmission of the quad. I have no doubt that somewhat the same conditions are obtained here as in the conventional rear axle. It is certain, however, that the effects are much smaller and we have experienced no difficulty whatever although the differential has appeared in but one of our quad trucks.

I am inclined to think that the elimination of the differential from the touring car is not feasible on account of the short turning radius and the comparatively short wheelbase of most touring cars. The greatest difficulty to be met with would be the tendency of the rear axle shaft to twist and it is quite certain that these shafts would have to be approximately twice the strength of the present shaft to resist this continued action.

On the other hand I believe the differential could be dispensed with on cars having comparatively long turning radius and operated so as to favor the device to some extent. In other words the operator would be expected to make long turns at corners and other places, thus avoiding the great difference of tire travel in the outer and inner tires in a short length of travel.

It is my opinion that we have by far the best solution of this matter in the M. & S. differential and I feel that ultimately such a differential will be used on a majority of touring cars, thus avoiding any of the disagreeable features I have named above.

The Light Car Handbook

The publishing house of Iliffe & Sons, Ltd., 20 Tudor Street, London, E.C., England, in addition to producing *The Autocar* and several other British trade papers, is also responsible for a number of books on automobile subjects. The latest edition to its library is the Light Car Handbook, which has been produced for the instruction of owners of small cars. Although written with particular regard to a class of machine practically unknown in America, the book contains very clear explanations or a great many things applying to cars of every size.

It is profusely illustrated, contains very good instructions concerning care for the various parts of a car. It is a book which the earnest student of automobiles would be interested to possess. The price is 36 cents, or 48 cents prepaid.

The Rostrum

Unsprung Weight and Tire Wear

EDITOR THE AUTOMOBILE:—In various articles in THE AUTOMOBILE appearing from time to time, mention has been made of the subject of unsprung weight in connection with rear axle construction. I have failed to note any general discussion of the subject, however, and would like to learn more about the evil effects of much weight as applying particularly to the rear axle assembly. Is this effect confined to the matter of strength of rear axle housing or does it also cut quite a figure in wear and tear on rear tires?

How does it work out in the case of the electric vehicles having the driving motor actually inclosed in the rear axle housing?

Cincinnati, Ohio. H. G. C.

—It is generally conceded that the ratio of unsprung to sprung weight is of great importance in its effect on tire wear. The entire matter is one of common sense. It is quite apparent that if a car weighs a given amount the best results and the longest life of working parts will be secured if the greatest possible portion of this weight is cushioned by suitable spring action. On the other hand, it is necessary to increase the unsprung weight to hold the car on the ground and to take care of other features of design. Therefore, the best ratio of sprung to unsprung weight is always a compromise. It may be generally said, however, that in ordinary passenger car practice the efforts are on the side of reduction rather than increasing the relative unsprung weight.

Ideas on Body Design

Editor THE AUTOMOBILE:—I have read with great interest and also studied the body articles as appearing in THE AUTOMOBILE, especially so the one you published in the Feb. 3, issue entitled, Driver's Lot 99 Per Cent Discomfort. I wish to make a few remarks and will start at the diagram showing a section through a touring body on page 217. The steering wheel is fixed by *A*, *B* and *E*, as in Fig. 1. The rim of a wheel being 1 in. will determine the angle α of the wheel for different diameters of wheel; viz., 16 in., 17 in. and 18 in. as in Fig. 1.

$$\text{rim } (90\text{ deg.} - \alpha) = \frac{3.5\text{ in.}}{8} = 0.437 \text{ for 16 in.}$$

$$\frac{3.5\text{ in.}}{8.5} = 0.412 \text{ for 17 in.}$$

$$\frac{3.5\text{ in.}}{9} = 0.388 \text{ for 18 in. wheel.}$$

angle (90 deg. — α) for 16 in. diameter wheel is 25 deg. — 55;
$\alpha_{16} = 64$ deg. — 5
17 in. diameter wheel is 24 deg. — 20;
$\alpha_{17} = 65$ deg. — 40
18 in. diameter wheel is 22 deg. — 50;
$\alpha_{18} = 67$ deg. — 10

I just want to call attention to these angles as compared with what actually exist to-day on cars made. By checking up the same way over the table you have compiled from nineteen makes of cars you will soon see the fact that the angle α is between 45 deg. and 30 deg. and not as recommended in your article, 64 deg. to 67 deg., according to wheel diameter. I think the angle α should be included in the tables instead of the dimension E.

An important thing left off is the height of the sides and the height of the seat back. Also the distance from dash to front seat. Dimension *S* is given in such a way that it is difficult to say what is meant. Is it measured down at the floor, at the narrowest point between rear seat top and front seat back, or how high up from the floor, Fig. 1.

Many dimensions may be arrived at and as you suggest 1 in. either way is important. The position of the front door is not given properly—neither depth of front seat nor how much the underside of steering wheel rim projects into seat.

I would suggest that a standard diagram of a body be prepared so that the dimensions are absolutely fixed and that this diagram be submitted to the different manufacturers for fitting out. The way you have set this thing going is very admirable from the viewpoint of an engineer and there is no doubt you deserve the highest credit for your timely arrangement and opening up of discussion along the lines of body detail. I understand your viewpoint fully when you in starting this do not go further into details than already done, and presume you have laid the dimensions out as shown in order to get criticism started.

Chicago, Ill. A. S.

Steam vs. Gas Engine Power

Editor THE AUTOMOBILE:—Kindly point out the fallacies in the argument of some people that an internal combustion

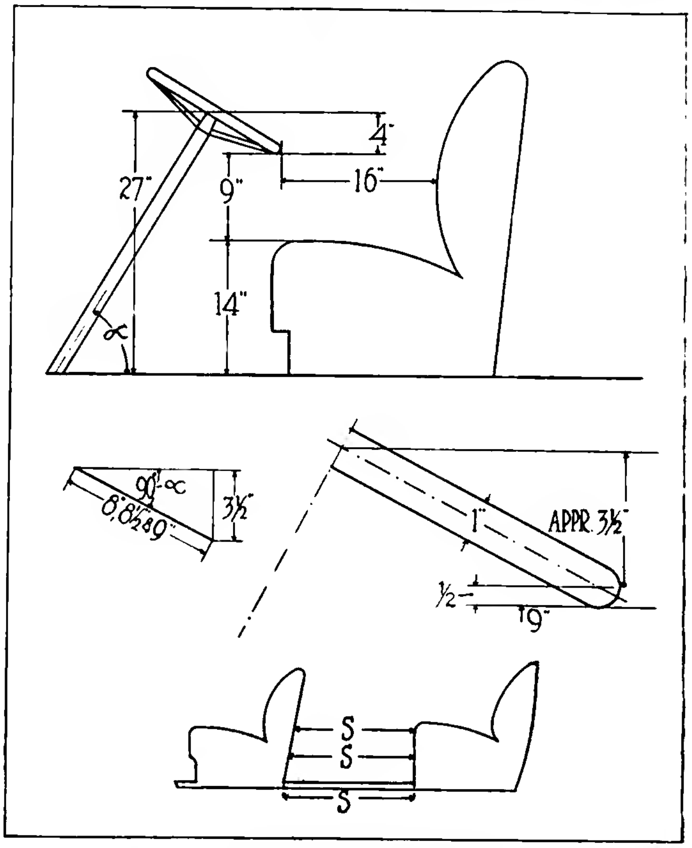


Fig. 1—Diagram of seating layout and arrangement of the steering wheel angle

motor of a given rated power has less real power than a steam engine of the same rated power.

2—Are not most of the high-grade stock motor cars of this country and Europe equipped with T or L-head motors?

3—With what type and location of valve has the highest efficiency on record been obtained in an automobile motor?

4—Has any change of much importance been made in motor or chassis design of the Pierce and Locomobile cars during the last six or seven years?

5—Has hydrogen gas ever been used as a fuel for internal combustion engines? If so, with what result?

Ithaca, N. Y. F. P. D.

—There are no fallacies in their arguments as they are correct. With a steam engine the steam can be admitted at much higher pressure, for instance, thereby giving much greater power than the normal rating.

2—L-head motors are in the majority.

3—We have no knowledge of any authentic efficiency record comparison.

4—No.

5—Yes, but owing to the fact that hydrogen gas is so expensive to make it is too costly for commercial use.

Wants To Enter Amateur Event

Editor THE AUTOMOBILE:—Herewith photograph of racing car which I am anxious to enter in some sort of a race. I am going to take this opportunity to ask if you will kindly advise us of any amateur races which are to be run this summer.

Kane, Pa. A. G. A.

—The only amateur drivers' race scheduled under A. A. A. sanction is for the Chicago speedway on May 20.

Changing Gear Ratio in Oakland

Editor THE AUTOMOBILE:—I have a 1912 Oakland 40. I have always used a 15-53 gear ratio in my rear construction. This ran with very little vibration to the car. I had plenty of power for what I needed, 90 per cent of my work being right in the city and flat country of Long Island. In making a change in my gears lately I was compelled to use a 13-53 ratio as there were no other gears in stock. On running the car I immediately noticed a great increase in vibration when running between 15 and 25 m.p.h. In fact, too much vibration for comfort. Now I am again contemplating a change in the gears and I want to know whether to leave the 13-53 and have the comfort of increased power plus vibration or to put in a 15-53 or even a 3 to 1 ratio.

2—I have a Bosch DU4 model 5 on the same car. While having new platinum points on the magneto we noticed that it gave a much hotter, fatter and yellower spark with the spark retarded and a thinner spark with it advanced. The repairman advised that I change the shoes on the magneto and reverse the spark conditions. He claimed untold increase in power would result after doing this.

Brooklyn, N. Y. B. G. G.

—You have changed your model 40, 1912 Oakland car from practically a 3½ to 1 gear ratio to a 4 to 1 gear ratio for the purpose of obtaining more power. Necessarily, in obtaining this additional power in a four-cylinder motor you got more vibration and there is no possible way to overcome this vibration, especially when running at a medium speed of from 15 to 25 m.p.h. If you desire to decrease vibration you can do so by going back to the old 3½ to 1 gear ratio or even to a 3 to 1 ratio, which would still further decrease the vibration, but if you leave the gear ratio at 4 to 1 you must expect this increased vibration unless your car is running at top speed.

2—The Bosch DU4 model 5 magneto is that model in which the overlap pole shoes are used. This construction provides a very efficient spark in the retarded position so that those engines having improper gas conditions can be started readily directly on the magneto. This construction does not provide a spark of equal intensity at low speed when the magneto is fully advanced, but the spark provided is more than sufficient for all-around efficiency. THE AUTOMOBILE would not advise experimenting with the pole shoes, as suggested, since it is advisable to take into consideration the individual characteristics of the motor. You will no doubt find that your motor will give satisfactory results with the magneto in its present condition. Undoubtedly you have had no difficulty in the past and we would advise no change.

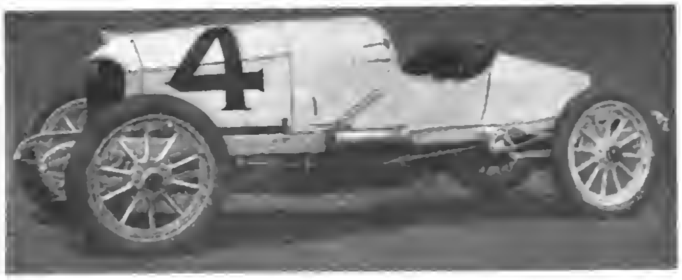

Fig. 2—Racing car reader wants to enter in amateur race

Kerosene as a Carbon Remover

Editor THE AUTOMOBILE:—Will water remove carbon? If so would you advise running it through the carbureter? My car is equipped with a Stromberg. How much would you advise using? I have been told that it was a good idea to use 2 gal. of very hot water followed by a gallon of kerosene put through the carbureter in the same manner. What is your advice?

2—My car has force feed lubrication. Would it injure it to run the motor, say, for one minute, with kerosene in the crankcase instead of lubricating oil? This, of course, is with the idea of running out all the foul deposits.

Bessemer, Ala. L. M.

—There are a great many who believe very strongly in the use of water for carbon removing, and there is no doubt but that it assists in this respect to some extent. It would be better, however, not to introduce it into the carbureter but into the intake manifold between the carbureter and the cylinder. It should be allowed to enter in very minute quantities. The action which probably takes place is this: When the water enters the cylinder it is probably transformed into steam which cuts away the carbon binding substances in the cylinder.

2—It would probably do no harm to run the engine very slowly for only a minute. It would be inadvisable, however, to extend the period beyond this.

How Speedometers Operate

Editor THE AUTOMOBILE:—What makes the hand or dial of a speedometer move? Is it a governor or is it through a spring?

New York City. O. K.

—In fundamental principle there are four methods of operating the needle or dial on a speedometer. These are by magnetism, by centrifugal force, by air or by hydraulic drive.

The magnetic principle as indicated in Stewart-Warner and American Ever-Ready instruments, utilizes a revolving magnet positively driven from the car wheel or other part. The magnet exerts its influence on a metal part which is separated from it by an air gap and which in turn is connected with the indicating mechanism. The metal part is generally aluminum as the inertia of the part must be kept as low as possible to make the speedometer quickly sensible to speed changes. A feature of the magnetic design is that the travel of the dial bears a direct ratio to the speed of travel of the magnet, and in order to compensate for changes in the drag due to temperature differences, a compensating unit is fitted.

Centrifugal control as utilized in speedometers is very much the same as that on a fly-ball engine governor. Standard, Johns-Manville, Sears-Cross, Corbin-Brown, Hoffeker and Garford use this principle. Weights are mounted on the revolving shaft by bell crank levers which allow them to travel further from the axis of the shaft as the speed of the drive increases. The centrifugal force of the weights increases as the square of the velocity of the shaft.

Weights Actuate Needle

This tendency of the weights to fly from the axial center of the shaft under the influence of centrifugal force furnishes the basis of the indicating needle movement. An ingenious feature in centrifugal design is that although the movement of the weights would naturally vary as the square of the speed, the levers or cams governing the movement are so calculated that calibrations on the dial are uniform or nearly so. Another feature which is carefully watched is the balance of the weights. The governors are made very sensitive so that even at low speeds the correct rate of travel may be indicated. Improvements in this direction have been made within a year by at least one of the centrifugal speedometer manufacturers.

The air principle is used only on one make, the Van Sicklen, in which a blast of air from a pump within the speedometer forms the source of operation of the indicator needle. As the speed of the drive increases the volume of air flow becomes greater, thereby increasing the travel of a pivoted dial, calibration of which is effected by governing the size of the passages through which the air flows.

One instrument, the Veeder, which employs the hydraulic system, uses a centrifugal pump which is connected with the drive and which lifts a liquid to a height proportional with the speed of the drive. The tube in which the colored liquid is lifted is calibrated to register speed.

Setting Camshaft On 1909 Rambler

Editor THE AUTOMOBILE:—What is the proper way of setting camshaft and is a model R Remy magneto suitable for a Rambler model 44 serial 20277 1909 car? If so how would you time same?

Sewalls Point, Va. G. S.

—In setting the camshaft proceed in the following manner: Set the number 4 piston on dead center and so place the camshaft that the cam that operates the exhaust valve on number 4 cylinder, which is the front cylinder on this car, is just leaving the roller. Then turn the motor with the crank until cam on number 4 cylinder is just coming onto the roller. At this point the mark on the flywheel should be on top even with the indicator. This mark should be the one which is about 7 in. ahead of the center mark on the flywheel. If this does not come even the remedy is obvious. Turn the camshaft one tooth at a time until you get the result as described above.

Not a Locked Differential

Editor THE AUTOMOBILE:—Kindly give sketch and description of the locked differential which I have seen so much about in your journal recently.

Dumbarton, Va. A. R. JOHNSON.

—If you will refer to THE AUTOMOBILE for April 13 on page 672, you will note that the matter which is being discussed is not some form of differential lock, but the abandonment of the differential altogether.

On that page appeared a drawing of the Sheldon worm-driven axle with a solid driveshaft replacing the differential. A number of tests on this type of axle have been made in this country lately and the Fifth Avenue Coach Co. has some buses running in New York City which are equipped with them. So far tests seem to show that, contrary to general expectations, tire wear has been decreased.

Must Decrease Compression Space

Editor THE AUTOMOBILE:—I have a motor 5½ by 6, T-head, 2¼ valves, 60 lb. compression. How much thickness will have to be added to piston heads to raise compression to 85 lb.?

West Milford, West Va. B. BROS.

—You will have to decrease the compression space to about three-quarters of its present volume.

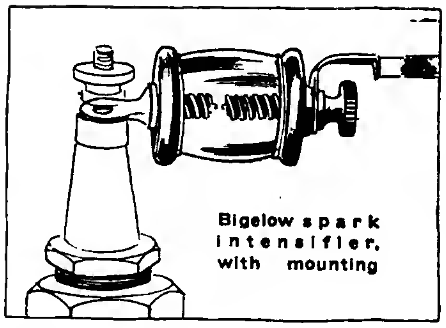
Mitchell-Lewis Stock Rooms Are Overflowing

Chassis assembling department of the Mitchell-Lewis Motor Co., Racine, Wis., giving an excellent idea of the abundant supplies of material laid in by the company to insure delivery of cars on schedule. Steering gears, engines and rear axles for which there is no room in the stock department, are stored here. Other departments are similarly situated

ACCESSORIES

Bigelow Spark Intensifier

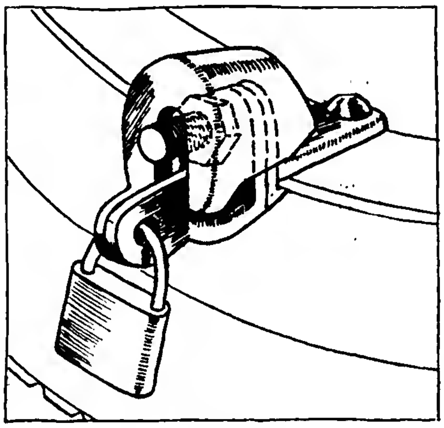
THIS little spark plug attachment, illustrated herewith, is attached by simply screwing on the spark plug binding post and to the wire terminal. By merely looking at this device the spark can be seen jumping the gap, so that spark plug trouble is readily detected. The barrel is made of magnifying glass, and this feature shows up the spark clearly, at night giving a glow like that of an electric light. The intensifier is claimed to overcome all spark plug troubles, making a plug fouled with grease, carbon or soot, or with a broken porcelain, fire perfectly. It is also claimed to intensify the current so that a hotter spark is given, increasing the engine power by 20 per cent and doing away with clouds of black smoke. It is claimed to increase the engine power by 20 per cent and to obviate the necessity for the removal of carbon. Price 75 cents.—Bigelow Co., Chicago, Ill.



Bigelow spark intensifier, with mounting

Haco Tire Lock

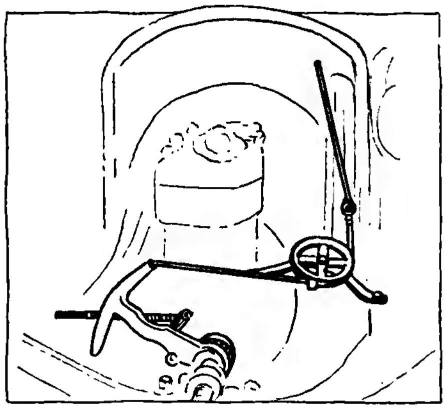
This lock fits 1916 Buicks, Maxwells, Chevrolets, Saxons and other cars using the same type of tire carrier. It is applied to the tire carrying rim and prevents the tire from being taken off until the padlock is unlocked and the stop removed. A Yale lock is fitted to the device. Price, $2.—Howard Automobile Co., San Francisco, Cal.



Haco tire lock

Brinnon Starter for Fords

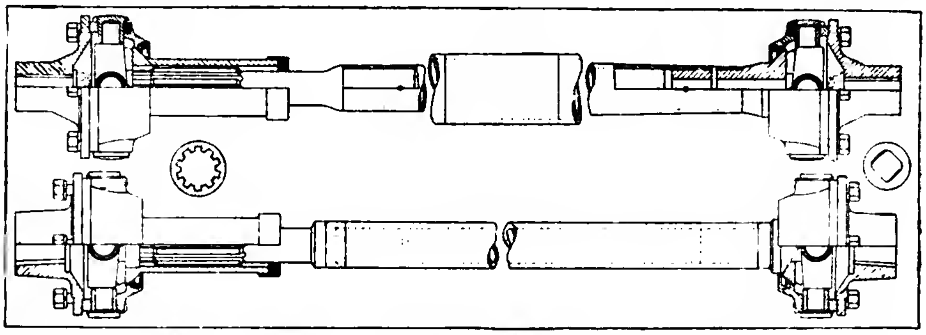
Starting the motor by hand from the dash is accomplished by this device which consists of an arm which is connected to the front of the crankshaft by a ratchet, and from whence a cable runs to the handle mounted on the dash. Price, $10. —Peters Sales Co., Columbus, Ohio.



Brinnon hand starter for Fords

Arvac Universal Joint

As shown in the accompanying illustration of the Arvac propeller shaft assembly, the universal joints are fully inclosed so as to be dust, dirt and fool proof, the design being very compact, simple and accessible. The joint consists of a ball yoke in a socket fitted with cross block and pin, the housing being of forged steel and the entire joint easily disassembled. Bearing surfaces are as large as is consistent with maximum strength and minimum friction. The piece parts being standardized, the few wearing parts may be renewed promptly at minimum expense. The housing is oil-tight and is packed with lubricant, the yoke of the slip joint being made proof against grease leakage by a threaded steel cap containing a soft felt washer. The ample bearing surfaces are hardened and ground to size, thereby guaranteeing long life, minimum friction and uniform accuracy. The Arvac joint is made in one size only—5 in. diameter of flange. This is suitable for all types of passenger cars and trucks requiring a standard joint of this size. The propeller shaft assemblies are made with flanges bored to meet the customer's requirements and with suitable solid steel or hollow shafts. They may be obtained with or without companion flange and with square or 1½ in. ten spline S. A. E. slip fitting.—American Rotary Valve Co., Anderson, Ind.



Arvac propeller shaft assemblies, showing compact, self-lubricating and fully inclosed universal joints

Frame Extension for Fords

The object of the extension is to lengthen the Ford wheelbase enough to permit the carrying of larger loads of bulky stuff. It is not intended that the normal carrying capacity, in pounds, should be exceeded.

The frame is extended at the rear by bolting on a new rear frame section, the forward end of which fits the curved cross-member, which takes the spring. The rear end of the extension is made exactly as the regular Ford frame rear end, and the spring is attached to it in the regular way, by the regular Ford clips. All the fastenings used are already provided for in the Ford frame and it is not necessary to do any cutting or drilling.

The propeller shaft is shifted backward when the rear axle is moved back to the rear end of the extension and leaves a gap between its forward end and the gearbox at the rear end of the power plant. This space is filled by inserting a tubular housing containing a short shaft with universal joint connections at each end, fitting the corresponding joint sections on the propeller shaft forward and on the driving shaft at the rear end of the gearbox. The casing bolts rigidly in place, the bolt holes already existing being used. The shaft and joints are packed in grease.

Material is furnished for lengthening the brake rods, and new running boards are supplied, of pressed steel. Everything required to do the work is furnished; it is not necessary to purchase anything extra.

The outfits are furnished in two sizes; one increases the wheelbase 15 in., making it 115, and the other 30 in., making it 130. The weight of the car is increased about 50 lb.

Apart from enabling the car to carry a longer body, in which light but bulky loads can be carried—hats, bakery products, millinery, etc.—the appearance of the machine is greatly improved and its riding qualities as well. Extended tests have indicated that the added length is not sufficient to cause weakness of the frame even under the maximum normal load conditions and on rough going. This is due to the sturdiness of the Ford frame and also to the easier riding resulting from the longer distance between the axles. Prices, 15-in. extension, $45; 30-in., $50.—Hays Diefenderfer Co., New York City.

Weco Vaporizer

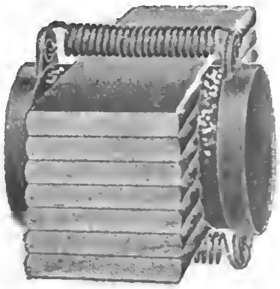
For the purpose of supplying a small quantity of water vapor, or steam, to the motor with the fuel mixture, a copper tank is mounted on the exhaust pipe, where the heat from the exhaust heats the water. A small tube leads the steam to the intake manifold above the carbureter. The tank holds 2½ qt. of water. Better vaporization, lower consumption of fuel and absence of carbon deposits are claimed to result from the use of the device.—Weco Mfg. Co., Boston, Mass.

Temoc Specialties

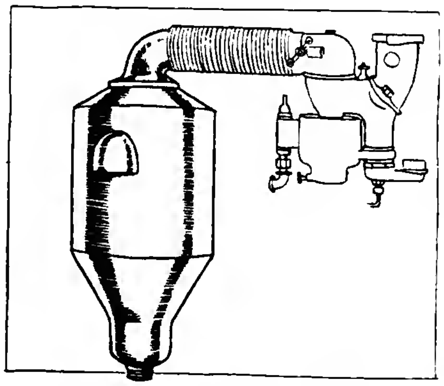
A brush for washing the car may be attached to a hose and with it a car may be washed in 10 to 15 min. without wetting the hands or soiling the clothes. The brush is made of polished aluminum with Chinese bristles and is equipped with a mud scraper for removing chunks of mud from fenders, etc.

A spark plug brush is made of steel wire and is designed to remove carbon from plug points. It also embodies a screwdriver for adjusting the points, and an alligator wrench.

Weco water vaporizer which supplies steam with the fuel mixture



Sterling oiler applied to spring. Note the pads of oil-retaining fabric



Bennett carbureter air cleaner

A wire wheel washer is attached to the hose also. It is made of stiff bristles on flexible, rust-proof wire. Prices are: Washing brush, $3.50; spark plug brush, 40 cents; wire wheel cleaner, 75 cents.—Temoc Mfg. Co., Inc., Chicago, Ill.

Sterling Spring Oiler

This device consists of two shallow cups held one on each side of the leaf spring by means of spiral springs extending crosswise; in the cups, on the side next to the spring leaves, are pads of oil-retaining fabric. These distribute oil to the leaves and carry a sufficient supply for about a month's running. The pads are replenished without removing the oilers. Price, 40 cents.—Sterling Mfg. Co., Cleveland, Ohio.

Bennett Air Cleaner

The object of this device is to remove from the air going to the carbureter all dust and other solid matter in suspension. Much of this matter is of an abrasive nature and has a deteriorating effect on bearing surfaces, and all of it is clogging to the oil used for lubrication. There are no moving parts and no cloths to clean, no screens and no adjustments. A cap is removed to empty out dust; otherwise the cleaner requires no attention. Prices, 1-1¼ in., $10; 1½-1¾ in., $11; 2-2½ in., $12.—Wilcox-Bennett Carbureter Co., Minneapolis, Minn.

Tenox Liquid Gasket

This liquid gasket is a new preparation designed to take the place of copper, asbestos, fiber, or other gasket materials. It is said to be suitable for all purposes and is not affected by heat, oil, water or gasoline. It is applied the same as paint, an ordinary brush being used.—Stone Mfg. Co., New York City.

Culver-Stearns Searchlight

In the description of the windshield type searchlight made by the Culver-Stearns Mfg. Co., Worcester, Mass., in THE AUTOMOBILE for April 20 the price as given is $2.25. This was an error, the correct price being $2.50.

True Efficiency

EFFICIENCY is the watchword of the age. It is another word for civilization, for civilization is nothing but efficiency applied to life. The aim of every man and of every community is to make life as happy a thing as possible and civilization grows because of its efficiency in producing happiness. A savage may be happier than a civilized man, but America to-day is a far happier land than America of five centuries ago. Therefore it may be said truly that everything which improves efficiency in anything also advances civilization and makes for a better condition of living.

It is impossible to think about efficiency in some particular application without seeing the effect that one thing has upon another. Often obtaining more efficiency in one thing leads to a corresponding sacrifice in another; an apparent gain may be an actual loss in the final analysis. Particularly is this so in the highly specialized field of automobile engineering, and it is useful sometimes to examine the aims and ambitions of the automobile user and the automobile industry so far as possible in the light of true efficiency.

The basic thought, which should always be remembered, is that the automobile industry exists by reason of its service to civilization—exists and has grown with such wonderful rapidity because of the efficiency of the automobile as a servant of man.

The value of the automobile to the world was somewhat clouded by the unexpected pleasure-car growth, the efficiency of the truck and the tractor are obvious, but if we consider what the passenger car has done by improving means of communication, by educating the mind while exercising the body, it may well be wondered whether the greater good to civilization has not been done by the touring machine.

Races and Records

LAST year saw racing of a very high order of quality throughout the season. New speedways and new cars combined smashed records right and left. The average speed of racing increased largely, while the reliability of the better cars seemed unaffected by the greater pace. With the first big speedway event of the year about to take place the possible character of this year's racing becomes a topic. Shall we see still higher speeds or still greater durability?

So far we have no hint of the coming of any new team likely to stand out as did the unconquerable Stutzes last year. The two Sunbeams are the only new cars likely to come from Europe. That the Peugeots will show much more speed than last year is doubtful; the Delage team may be a surprise. They are certain to be at least as speedy as their French competitors and later there will probably be one or two new American teams.

Two things point to greater speeds in 1916 racing. One is the number of shorter races and the other the fact that tires to-day are better than they were a year ago. Average speed for the whole field in any event is sure to increase, because several cars that started new last year were only got into proper shape by the end of the season. Lessons on ignition, on carburetion and on lubrication, provided by every race in 1915 have not been overlooked and the cars to face the starter in the classics of 1917 will be the finest group ever gathered together.

Lubrication

IN Europe automobile engineers are still undecided as to the merits of different lubricating systems. While they usually prefer a fully forced scheme for engines but little below the racing type in volumetric efficiency there are many who consider a dipper system is the better for ordinary touring cars. There are many French and British chassis with small engines of high power output which use trough and dipper lubrication with complete success, and recent American developments have shown that the high speed motor does not have to have a pressure oil feed to every bearing.

Splash lubrication is, however, like many other things: it is good if carried out properly, but if designed indifferently, indifferent results are to be expected. Furthermore, exponents of well designed splash systems claim for them the greatest obtainable economy of oil, and this desirable feature is thrown away if the detail is not such as to insure the proper depth of dip all the time.

S. A. E. Aids Army on Trucks

Officials of Society Confer with Military Men on Revised Specifications

New York City, May 10—A conference was held at the rooms of the Society of Automobile Engineers this week with representatives of the United States Army on revised annual specifications for military trucks of 1½ tons' capacity. Lieut.-Col. Chauncey B. Baker of the Quartermaster Corps, U. S. A., addressed the meeting. William M. Britton, electrical and mechanical engineer of the War Department, was also present, together with other S. A. E. members convened for the purpose of conferring in an informal way on standard specifications as to quality of materials, interchangeability of parts, load capacity, road speed, location of control, ground clearance, engine capacity, suspension, electrical equipment and many other elements.

Henry Souther, past president of the society and now consulting engineer of the United States Signal Corps, presided at the meeting, the following being in attendance:

H. W. Alden, chief engineer, Timken Detroit Axle Co., Detroit, Mich.

Joseph A. Anglada, consulting engineer, New York City.

B. B. Bachman, engineer, Autocar Co., Ardmore, Pa.

Chauncey B. Baker, Quartermaster Corps, U. S. A., Washington, D. C.

P. J. F. Batenburg, chief engineer, Four Wheel Drive Co., Clintonville, Wis.

William M. Britton, electrical and mechanical engineer, Quartermaster Corps, War Department, Washington, D. C.

A. Ludlow Clayden, chairman standards committee, S. A. E., New York City.

Chester E. Clemens, mechanical engineer, Perfection Spring Co., Cleveland, Ohio.

H. D. Church, chief engineer truck division, Packard Motor Car Co., Detroit, Mich.

Coker F. Clarkson, general manager, S. A. E., New York City.

Howard E. Coffin, chairman Naval Consulting Board, Industrial Preparedness Committee, New York City.

Herbert Chase, chief engineer, Automobile Club of America, New York City.

D. L. Gallup, professor gas engineering and consulting engineer, Worcester Polytechnic Institute, Worcester, Mass.

R. H. Johnston, New York manager, the White Co.

Lewis P. Kalb, chief engineer, Kelly-Springfield Motor Truck Co.

J. A. Kraus, chief engineer, Garford Motor Truck Co., Lima, Ohio.

Robert McA. Lloyd, consulting engineer, New York City.

A. F. Masury, chief engineer, International Motor Co., New York City.

W. T. Norton, Jr., chief engineer and general superintendent, Selden Motor Vehicle Co., Rochester, N. Y.

H. W. Perry, secretary truck committee, National Automobile Chamber of Commerce, Inc., New York City.

Alfred Reeves, general manager, National Automobile Chamber of Commerce, Inc.

A. L. Riker, vice-president and chief engineer, Locomobile Co. of America, Bridgeport, Conn.

C. B. Rose, chief engineer, Velie Motor Vehicle Co., Moline, Ill.

Arthur J. Slade, consulting engineer, New York City.

G. W. Smith, chief engineer, Thos. B. Jeffery Co., Kenosha, Wis.

Henry Souther, consulting engineer, United States Signal Corps.

W. R. Strickland, chief engineer, Peerless Motor Car Co., Cleveland, Ohio.

F. A. Whitten, chief engineer, General Motors Truck Co., Pontiac, Mich.

John Younger, chief engineer motor truck department, Pierce-Arrow Motor Car Co., Buffalo, N. Y.

S. A. E. Military Standards

The meeting marks the beginning of the establishment of comprehensive S. A. E. military standards. Once the fundamental requirements for the service in mind become clear, any additional detail recommendations necessary can be formulated with due promptness. The work is of a very broad nature and must obviously be conducted carefully. The extremely hard conditions under which trucks operate at the front in time of war constitute a large study in themselves.

President Huff expressed the view that, in addition to the work of formulating ultimate standards, the society should, through what might be called exigent committee work, give all possible advice on specifications submitted to it. Accordingly a committee was appointed this week to take up with the government officials detail data considered pertinent to standard specifications for gasoline motor trucks of 1½ tons' capacity. This committee, which has already held one long session, is constituted as follows: Coker F. Clarkson, chairman; B. B. Bachman, H. D. Church, L. P. Kalb, William T. Norton, Jr., A. L. Riker, C. B. Rose, John Younger, G. W. Smith, W. R. Strickland and A. Ludlow Clayden.

Another meeting of this committee will be held on May 18, at which time further discussion had by correspondence between the members will be considered, together with special reports of the springs division and of the electrical equipment division of the society.

9000 Trucks Monthly for U. S.

Could Be Supplied by Makers if Pressed—Weight Limited to 5000 Lb.

Washington, D. C., May 6—The War Department has made some inquiry as to the number of motor trucks of suitable characteristics available in this country on short notice for use by the army. All the manufacturers in the country, about 200 in number, were approached and 113 responded.

3000 Trucks a Month

It was found that by throwing out motor trucks that are too light or too weak and those that are too heavy or cumbersome, it would be possible to obtain, according to representatives of the manufacturers, something more than 3000 trucks a month of a type that will conform in all main essentials to army needs. It also will be possible to obtain 6000 additional trucks a month of a type that nearly conforms to departmental specifications and that could be used in an emergency. In other words, if the situation were pressing, there would be available an output of 9000 trucks a month.

Weight Limit 5000 Lb.

The specifications, among other things, limit the weight to 5000 lb., for the reason that heavier trucks are apt to cut through the crust of roads or break through country bridges and give much trouble generally over such poor roads as are likely to be used.

Automobile Corps in Military Maneuvers in Mohawk Valley

Utica, N. Y., May 5—War was declared in Utica for a day and military measures of defense worked out in the practice maneuvers of an automobile battalion, April 30. Under command of the officers of Company B of the First Infantry, New York National Guard, the automobile reserves dashed 22 miles through the Mohawk valley to afford emergency relief for the Remington Arms plant at Ilion, N. Y., and the factory of the Savage Arms Co., at Utica, reported besieged by imaginary enemies which the militia and motor reservists met and routed in a sham battle.

Sixteen Studebaker passenger cars and one repair car composed the motor equipment. An automobile reserve corps of twenty cars will probably be organized to participate in the maneuvers of this kind to be held May 21, at the Sheepshead Bay speedway.

A. C. A. Tests Aero Motor

Christofferson Aircraft Product Tested for Power, Economy and Endurance

New York City, May 10—A test has been made by the technical committee of the Automobile Club of America on the aeronautic motor made by the Christofferson Aircraft Mfg. Co., San Francisco, Cal. Two runs were made, one to secure data on horsepower, torque, fuel consumption and speed and the other to get a line on endurance. The endurance run extended to 7 hr. 18 min. when the motor stopped due to magneto trouble. During the interval one stop was made to replace a broken rocker arm. This was at 5 hr. and 40 min.

The information secured on the first test run showed that the motor which is a four-cycle valve-in-head 4¾ by 6-in. watercooled type with vertical cylinders, develops 96.5 hp. at 1199 r.p.m.; 113 hp. at 1390 r.p.m.; 130.9 hp. at 1655 r.p.m.; with fuel consumption at these speeds of 0.68, 0.68 and 0.64 lb. per brake horsepower hour. The weight of the motor including inlet manifold, one carbureter, two magnetos, water manifolds, water pumps, oil radiator, but not including exhaust pipes, propelled flange or flywheel, is 511.6 lb. The weight given includes a small quantity of oil which could not be readily drained from the motor.

The endurance run started at 1.39 p. m. with the intention of making an 8-hr. endurance test. The throttle was open wide and the speed maintained by load at an average of 1449 r.p.m. At 5.40 p. m., that is, 4 hr. and 1 min. after the motor had started, the rocker arm operating the exhaust valve of cylinder six was broken and the motor had to be shut down. At 6.40 p. m. the rocker arm had been replaced by a new one and the motor was again started. The time taken to make the replacement was 24 min. The motor then ran until 7.18, when it suddenly stopped and it was found that neither of the magnetos were operating, the one on the exhaust side had broken its armature while the other had developed troubles of an electrical nature. For about ½ hr. before the motor stopped it had been missing considerably, due to the failure of the magnetos. The test was then discontinued. At this time the motor had been running a total of 5 hr. and 15 min.

The average speed during this test was 1449 r.p.m. The average brake horsepower was 113.6. The average gasoline consumption was at the rate of 75.8 lb. per hr. or 12.4 U. S. gal. The gasoline had a specific gravity of 61 deg. Baumé and during the test 2.26 gal. of lubricating oil were used. The motor was started with 10 gal. of castor in its crankcase and as oil had to be added Mobiloil Arctic, Mobiloil B and Mobiloil B B was admitted to the crankcase. The quantity of water circulated was 210 lb. per minute at an average inlet temperature of 150 deg. and outlet of 168 or at a temperature variation of 18 deg. As 210 lb. of water was circulated per minute the heat energy carried off in the cooling water amounted to 3780 b.t.u. per minute.

The motor was not taken down after the test but except for the broken parts mentioned above seemed to be in good condition.

Woods Has Gas-Electric Car

Chicago, Ill., May 10—Final announcement of the Woods dual-power gasoline-electric vehicle has been issued and shows the price to be $2,650, instead of $2,700, as stated in January, when the plans were first made public. The design is based upon the provision of a gasoline motor and an electric generator to provide current for an electric motor, either directly or through the medium of a storage battery. The gasoline motor is a four-cylinder design manufactured by the Woods factory. It is not a high-powered engine, but is sufficient to drive the vehicle economically, and in case additional power is desired the effort of the gasoline engine is supplemented by the electric motor.

Now Zapon Leather Cloth Co.

New York City, May 8—The Boston Artificial Leather Co., this city, has changed its name to the Zapon Leather Cloth Co. This concern has been in the leather cloth business for more than twenty-five years. The original Boston Artificial Leather Co. was located in Boston, Mass. The main offices were removed to this city in 1899. The original plant in Massachusetts was later removed to Milburn, N. J., and in 1904 to Stamford, Conn., where it is to-day. This plant has just been rebuilt, work having been started on it about one year ago, the size being trebled what it was three years ago.

The large increase in automobile business necessitated an increase in capacity and a larger working force, which now amounts to 600 employees. The company does a large business with the automobile manufacturers in heavy seating material. No light weight goods are made.

The use of the word "Zapon" brings the Celluloid Zapon Co. and that company closer than ever before. These two concerns have for more than a generation been closely affiliated, having always been owned and operated by the same interests. There will be no change in personnel of officers or management.

Miller Rubber 66⅔% Dividend

Common Stockholders to Receive That Sum—To Retire Preferred

Akron, Ohio, May 9—The directors of the Miller Rubber Co. have declared a stock dividend of 66 2/3 per cent on common and taken steps to retire the present preferred at an early date at 120. The present authorized and outstanding capitalization is $1,500,000 common and $500,000 preferred. It will be increased, subject to stockholders' approval, to $5,000,000, half common and half preferred. The new preferred will be offered at 105.

Raymond and Whitney Resign from M. & A. M. Board

New York City, May 8—At a meeting of the board of directors of the Motor and Accessory Manufacturers held May 5 the resignations of H. E. Raymond and C. E. Whitney as board members, as well as members of several committees, were accepted. Raymond explained it was in line with his general policy of retirement, whereas business reasons necessitated Whitney's retirement. H. E. Raymond served the Motor and Accessory Manufacturers as president during the years 1909 and 1910, as vice-president during the years 1904 to 1908 inclusive, as a member of the board since the year 1904, in addition to membership on a great many committees. Whitney served as a board member during the years 1905 to 1916 inclusive, as well as a member of many important committees. W. O. Rutherford, general sales manager of the B. F. Goodrich Co., was elected to fill Raymond's unexpired term as a board member, as well as an executive committee member. The president also appointed him a member of the finance committee. Christian Girl was made a member of the show and allotment committee. The election of Whitney's successor was postponed. The Lumen Bearing Co., Buffalo, renewed its membership at this meeting.

S. A. E. Reservations Going Fast

New York City, May 10—Although it is now more than a month before the start of the S. A. E. summer cruise on the steamship Noronic, there are very few accommodations left. The latest reports show that out of a possible accommodation of 558 there are now 528 engaged. This leaves only room for thirty. The cruise stars on Monday, June 12, from Detroit, and the route lies through the Great Lakes and Georgian Bay. The duration of the trip is four days.

Saxon Plans New Factory

Negotiates for Purchase of 38 Acres in Detroit—Present Quarters Outgrown

DETROIT, MICH., May 10—*Special telegram*—The Saxon Motor Co. is negotiating for the purchase of a tract of land on the Detroit Terminal Railway which comprises about 38 acres in the vicinity of Michigan Avenue. The Saxon company has outgrown its present quarters, and while no definite plans have yet been made as to size or form of structure it is proposed to erect a plant which will adequately take care of next year's production, and this will be added to from year to year as required.

Saxon Opens Detroit Assembly Plant

DETROIT, MICH., May 8—The Saxon Motor Car Co. has opened a branch assembly plant at Franklin and Beubien Streets, which will be devoted to building six-cylinder roadsters. This factory building, containing 60,000 sq. ft. of floorspace has for the past few months been used by the factory as a service station, but owing to the increased demand for cars, it was necessary to install assembling machinery and turn it over to manufacturing.

Haynes Production of Twelves Starts June 10

KOKOMO, IND., May 8—The Haynes Automobile Co. is completing the fifth addition to its plant within the present fiscal year. The new structure that is being completed at the present time, will house the production of the light twelve car. It is expected that the manufacture of the high power, light weight car will be under way by June 10.

Allen Motor Shortens Working Day

FOSTORIA, OHIO, May 6—An 8-hr. working day has been voluntarily put in effect at the Bucyrus plant of the Allen Motor Co., this city, manufacturer of Allen cars.

This plant has been operating on a 10-hr. day basis, and the 2-hr. reduction with 10 hr. pay was announced by the company.

The Bucyrus plant of the Allen company, in which all motors are made for Allen cars, has been working 24 hr. a day for some time.

Westinghouse Strike Ends

PITTSBURGH, PA., May 9—The strike of the 15,000 electrical workers and shell makers of the Westinghouse Electric & Manufacturing Co. ended this morning, and there was a rush of those who had been out to get back to their places.

Threats that they would not be reemployed unless they returned to work this morning broke the strike. President E. M. Herr had refused all the demands, which included an 8-hr. day. He told the strikers that unless they were at work this morning they would lose not only all chances to be employed by the company again, but would also lose all the benefits accruing to them under the company's compensation and pension system.

The strike began April 22 and the employees have lost $1,397,500 in wages.

51,739 Fords in April

DETROIT, MICH., May 8—The Ford Motor Co.'s output for the month of April was 51,739 cars as compared to 46,510 in April, 1915. According to the figures given, the company has now turned out about 370,000 cars since last August.

Record Shipment of Studebaker Cars

DETROIT, MICH., May 8—The biggest single day's shipment of Studebaker cars in the history of the Studebaker Corp. was made on April 29, the output being 490 automobiles, representing a value of approximately a half million dollars.

600 War Truck Order for Pierce

BUFFALO, N. Y., May 5—The Pierce-Arrow Motor Car Co., this city, has received a rush order for 600 5-ton trucks for the French Government, valued at $3,000,000, the last shipment to go forth in June.

First Stephens Car Made

FREEPORT, ILL., May 8—The first complete automobile turned out by the Moline Plow Co., Freeport, which has been forced to embark in this line, due to the decline in the demand for farm vehicles and buggies, was on exhibition this week. It is known as the Stephens, complimentary to a member of the firm by that name. The first car was a roadster and was purchased by a physician of Freeport. The Moline company has decided to make its own fenders, having ample facilities in the plow department and has received requests from other automobile companies to supply fenders for them also.

Liberty Car Deliveries in July

DETROIT, MICH., May 9—Deliveries of the new Liberty motor cars, manufactured by the Liberty Motor Car Co., according to Percy Owen, president and general manager, will probably begin early in July.

Grant Will Move to Cleveland

7 Acres of Land Purchased—Plant to Have 124,000 Sq. Ft. of Space

CLEVELAND, OHIO, May 9—The Grant Motor Car Co., Findlay, Ohio, recently recapitalized at $4,000,000, will locate its plant in Cleveland, where it will build a plant and office building costing $200,000. A 7-acre parcel of land at Colt Road and Kirby Avenue, N. E., has been purchased for the erection of a plant containing 124,000 sq. ft. of floorspace. The plant is to be erected immediately. The structure, including a two-story office building, is required to be completed July 15.

Jackson Concerns Shorten Working Hours

JACKSON, MICH., May 8—It has been announced by three manufacturing concerns here in the automobile field that the hours of labor are to be shortened. They are the Sparks-Withington Co., which will operate on a 9½-hr. working schedule instead of a 10-hr. working day, as heretofore, and will pay the same wages as before; the American Gear Co. after May 11 will give 10 hr. pay for 9 hr. work; the Argo Motor Co. will hereafter give 10 hr. pay for a 9-hr. day, and the workmen will be given the entire Saturday afternoon.

Overland Completes Another Addition

TOLEDO, OHIO, May 8—The completion of another factory structure at the plant of the Willys-Overland Co. adds an additional 500,000 sq. ft. of floor space. The entire plant has an aggregate floor space of 4,486,680 sq. ft., or 103 acres.

Shipments at the present time are averaging almost 900 cars a day.

Movies for Sparton Employees

JACKSON, MICH., May 8—After next week the management of the Sparton plant of the Sparks-Withington Co., this city, will provide a free moving picture entertainment daily for the employees of the company. The shows will take place during the noon hour. The pictures will be selected from the regular releases of the moving picture studios. Free pictures will be shown every Saturday afternoon in the dining room of the Sparton plant if the families of the workmen desire them.

Packard Employees Win Promotion

DETROIT, MICH, May 8—A large number of former factory employees of the Packard Motor Car Co. have been promoted to positions in the engineering department as the result of their study in the factory night school. A class of eighty has just completed the prescribed course in mathematics and mechanical drawing and has been presented certificates. The entire enrolment is more than 150.

These classes have no connection with the school for apprentices. The school work was greatly stimulated by the policy announced several months ago by Alvan Macauley, vice-president and general manager, that the Packard company wants its employees to become loyal Americans and that promotions to positions of responsibility and trust would be given only to employees so inclined. This announcement was followed by a general campaign among all employees, foreign born as well as native born, to help them become more efficient workmen and better citizens.

An additional class in English for foreign-born employees was started May 1.

Pickens Succeeds Schwartz

WALTHAM, MASS., May 8—R. A. Pickens has become managing director of sales of the Metz Co., this city. He succeeds W. H. Schwartz, who resigned last week. Mr. Pickens was formerly sales manager of the Regal Shoe Co.; sales manager of the Emerson Shoe Co.; advertising manager of the American Motor Co. of Texas; and a merchandising man in the same company.

Heartz Switches to Premier

DETROIT, MICH., May 4—Roy Heartz, promotion manager of the Hupp Motor Car Co., has resigned, having been appointed assistant sales manager of the Premier Motor Corp., Indianapolis.

Following the resignation of Mr. Heartz, James G. Roe, who has been doing special work in the sales department under Mr. Heartz, has taken charge of the promotion work and Arthur E. Dixon of the service department has taken Mr. Roe's position in the sales department.

Sawyer Jackson Sales Manager

JACKSON, MICH., May 6—C. B. Sawyer, former secretary of the Detroit Board of Commerce and of the Williams Bros. Co. here, has been appointed sales manager of the Jackson Automobile Co.

Young with Allen Advertising Staff

FOSTORIA, OHIO, May 6—T. L. Young, formerly with the Overland advertising department, is now with the Allen Motor Co., Fostoria, as assistant advertising manager.

Pfau Advertising Manager

CINCINNATI, OHIO, May 4—A. B. Pfau has been appointed advertising manager of the automobile specialty department of the Pfau Mfg. Co., this city.

Freight Situation Improves

Railroads Return Freight Cars to Manufacturing Territory — Relief in East

NEW YORK CITY, May 10—The car situation was reported somewhat better during the last two weeks, railroads having been responding to the efforts of the Traffic Department of the N. A. C. C. to have automobile cars returned from the West and South into the manufacturing territory. New automobile cars of eastern system roads have also been coming out of the shops in greater quantities. Railroad conditions in the East, while they are not normal, are reported showing a gradual improvement. Cars are moving more freely and embargoes are somewhat relaxed. Exports are still embargoed except on freight for which steamship bookings are assured in advance.

Bruenauer Is Gurney Gen. Mgr.

DETROIT, MICH., May 3—O. Bruenauer, formerly western sales manager of the Gurney Ball Bearing Company, will assume duties as general sales manager of the company on June 1 at Jamestown, N. Y., where the factory is located. The service engineering department of the company, herteofore located here, will also be removed to Jamestown.

Welborn Leaves Packard Co.

DETROIT, MICH., May 9—Earl Welborn, former assistant of Henry B. Joy, president of the Packard Motor Car Co., has resigned to become general manager of Isko, Inc., a new corporation which has taken over the old plant of the Grabowsky Power Wagon Co.

Donahue Joins Liberty

DETROIT, MICH., May 6—R. W. Donahue, formerly connected with the Oakland Motor Co., Studebaker Corp. and Dodge Bros., has joined the sales department of the Liberty Motor Car Co.

Freeman Resigns from Denby

DETROIT, MICH., May 9—L. C. Freeman, one of the incorporators and chief engineer of the Denby Motor Truck Co., has resigned his position, but will still retain his interest in the company.

Sullivan Fisk Advertising Manager

CHICOPEE FALLS, MASS., May 6—The growth of the business of the Fisk Rubber Co., and with it the natural increasing of their advertising, has made necessary a revision of this department.

On June 1, G. L. Sullivan, who has been associated with Bromfield & Field, Inc., advertising agency, New York City, will become advertising manager of the company.

Miss M. G. Webber, who has supervised the Fisk advertising in the past and G. B. Hendrick, who has been in charge of publicity, will act as assistants to Mr. Sullivan.

Mr. Sullivan's initial advertising experience was with the Boston Woven Hose & Rubber Co. in the sale of Vim bicycle tires. Later he became advertising and special sales manager of the Daniels & Fisher Stores, of Denver, Col. His first advertising agency viewpoint came with the Cheltenham advertising agency.

His experience in the automobile industry specially fits him for the work with the Fisk Rubber Co. For three years he was with the American Locomotive Co.

Mattison Is Engineering Products Mgr.

DETROIT, MICH., May 8—C. A. Mattison, former sales manager of the Detroit Engineering Products Co., manufacturer of Paramount interrupters and other devices, has been promoted to the position of general manager of the company, having assumed his new duties May 1.

Whyte Joins Prest-O-Lite Staff

INDIANAPOLIS, IND., May 6—J. Whyte has become manager of the storage battery service department of the Prest-O-Lite Co., this city. He was formerly electrical engineer of the Maxwell Motor Co., Detroit, and was at one time assistant chief engineer for the Scripps-Booth Co., Detroit.

Dupree Joins Caskey-Dupree

MARIETTA, OHIO, May 8—S. F. Dupree, Jr., formerly head of the Ford department of the Westinghouse Electric & Mfg. Co., Pittsburgh, Pa., has associated himself as vice-president in charge of sales and advertising of the Caskey-Dupree Mfg. Co., this city.

Gates with Smith Form-a-Truck

LOS ANGELES, CAL, May 9—W. O. Gates, Los Angeles, has been appointed Pacific coast manager of the Smith Form-a-Truck Co., with headquarters in Los Angeles.

New Mich. Stamping Building

DETROIT, MICH., May 8—The Michigan Stamping Co. will erect a new one-story building, 600 by 347 ft., on Mack Avenue near the Lozier plant.

National Can to Build

DETROIT, MICH., May 8—The National Can Co., manufacturer of radiators, is to erect a three-story building, as an addition to the main plant.

Tractors Till 1 Acre to 2½ Gal. Gasoline in Illinois Corn Belt

Department of Agriculture Analyzes Data of Nearly 200 Users as to Sizes Preferred for a Good Acreage and as to the Work Accomplished by These Machines

WASHINGTON, D. C., May 6—Under the title of "An Economic Study of the Farm Tractor in the Corn Belt," the U. S. Department of Agriculture Farmers' Bulletin 719 summarizes the experience of nearly 200 farmers in using different sized tractors on farms of different acreage. The object of the bulletin is not to draw general conclusions from facts and figures, but to place before the farmer the experience of others and leave it to him to calculate the probable value of the tractor for use on his particular farm. Before citing the information, the investigators point out that data on the operation of tractors soon become obsolete because of the changes and improvements in these outfits as well as on account of change in prices and the cost of fuel and oil.

The figures cited in the bulletin, the authors believe, are correct for conditions that existed in the spring of 1916 on the farms in Illinois, and they believe that these figures should be applicable not only in that State but throughout the corn belt, since the Illinois farms reporting are quite typical in most respects of general conditions prevailing in the corn belt.

Corn Principal Crop

On practically all of the farms reporting, corn is the principal crop, approximately 40 per cent of the entire acreage being planted to that crop. Oats are raised in most cases with an acreage of about one-half as great as for corn. Wheat is raised to a limited extent on more than one-half of the farms. Hay, including alfalfa and clover, form a large percentage of the remaining crops. Both spring and fall plowing are practised. The land on these farms is mostly level or gently rolling and quite free from stone for the most part. While there is a good deal of rather heavy loam, the plowing conditions are not severe except in very dry weather. The fields commonly are regular in shape, ranging in size from about 20 acres up.

These conditions under which the tractors were used should be borne clearly in mind in considering the following summary of the principal facts brought out by a careful study of the experience of the farmers as stated in their reports. Moreover, it should be understood that the figures given represent average results obtained in actual service and not maximum possibilities of the tractor. These averages, however, are believed to be worth more to a farmer in determining the possible value of a tractor in his work than are maximum figures from tests which, no matter how carefully conducted, can represent only a limited number of machines and a limited variation in conditions.

2½ Gal. Gasoline per Acre

The summary averages a large number of favorable and unfavorable reports from both competent and incompetent operators. The reports include new tractors with new sharp plows and older tractors using plows that have been sharpened several times and are not in perfect adjustment. For this reason the average fuel consumption of 2½ gal. per acre from so many users possibly is a safer guide to the farmer than would be gasoline rates obtained under fairly ideal conditions.

Three Chief Advantages

The chief advantages of the tractor for farm work, in the opinion of the operators, are: 1, its ability to do the heavy work and do it rapidly, thus covering the desired acreage within the proper season; 2, the saving of man labor and the consequent doing away with some hired help; and, 3, the ability to plow to a good depth, especially in hot weather.

The chief disadvantages are difficulties of efficient operation and the packing of the soil when damp.

The purchase of a tractor seldom lowers the actual cost of operating a farm and its purchase must usually be justified by increased returns.

Suitable Sizes Needed

One of the most important points in connection with the purchase of a tractor is to obtain one of suitable size for the farm on which it is to be used. In this connection experienced tractor owners in Illinois make the following recommendations:

For farms of 200 crop acres or less, the three-plow tractor.

For farms of from 201 to 450 crop acres, the four-plow tractor with the three-plow outfit second choice.

For farms of from 451 to 750 crop acres, the four-plow tractor with the five and eight-plow outfits tied for second choice.

A farm of 140 acres is the smallest upon which the smallest tractor in common use, the two-plow outfit, may be expected to prove profitable.

Medium-priced tractors appear to have proved a profitable investment in a higher percentage of cases than any others.

The life of tractors, as estimated by their owners, varies from six seasons for the two-plow to ten and one-half seasons for the six-plow outfits.

The number of days a tractor is used each season varies from forty-nine for the two-plow to seventy for the six-plow machines.

No definite figures on the repair charges for late model tractors can be given; it would not seem safe, however, to count upon less than 4 per cent of the first cost annually, this representing the average for farm machinery in general.

Under favorable conditions a 14-in. plow drawn by a tractor covers about three acres in an ordinary working day. Under unfavorable conditions large gang plows will cover less ground per day per plow pulled than will the small ones.

Tractor Size and Fuel

Two and one-half gal. of gasoline and 1/5 gal. of lubricating oil are ordinarily required in actual practice to plow 1 acre of ground 7 in. deep. The size of the tractor has little influence on these quantities.

Plows drawn by tractors do somewhat better work, on the whole, than horse-drawn plows. In Illinois the depth plowed by tractors averages about 1½ in. greater than where horses are used.

Efficient operation is essential to success with a tractor, and proficiency usually can be obtained more cheaply and easily by previous study and training than by experimenting with one's own tractor.

With a proficient operator the tractor is a very reliable source of power.

The use of the tractor for custom work is usually an indication that the home farm is not large enough to utilize it economically. The doing of custom work with the tractor, on the whole, appears to be a questionable practice, although nearly 45 per cent of machines are used for such work to some extent.

Displaces 25 per Cent of Horses

A tractor displaces on an average about one-fourth of the horses on the farm where it is used.

On a large number of Illinois farms brood mares constituted 33 per cent of the work stock before the purchase of the tractor. The use of the tractor increased this proportion only 3 per cent.

Experienced tractor owners do not consider even a two-plow outfit profitable on a farm of less than 140 acres. The average size of farm on which two-plow outfits are used in Illinois is 270 acres.

The four-plow tractor is most recommended by experienced owners.

Both increases and decreases in the crop yields are reported from the use of the tractor, although favorable effects are more common than unfavorable. However, increases are not sufficiently frequent to warrant a farmer placing much dependence on the tractor in this respect.

Department Store Trucks a Feature of French Army

PARIS, April 28—Department store trucks, from which commodities are sold to troops along the front, are now an established feature of the French army. The high cost of living in France is most severely felt by men in the active army, for they are obliged to purchase at the few village stores open just behind the lines, and have to pay the fancy prices imposed on the plea of high freight, danger, and scarcity. It was in order to remedy this unsatisfactory condition that the military authorities fitted up a certain number of Peugeot 3½-ton trucks as general stores, and sent them out to travel among the various armies in the field. All kinds of necessary articles likely to be required by men in the field—candles, soap, shoelaces, towels, paper, ink, shirts, socks, brushes and simple medicaments — are to be found aboard the automobile stores and are sold at practically cost price. These trucks have definite routes through the small towns and villages in which troops are quartered during their rest periods from service in the trenches. At first adopted as an experiment, this service has proved an immense success and has been extended to the whole of the French army.

Recently the French authorities have decided to equip and send to the front a series of automobiles specially equipped for giving shower baths, hot baths, for disinfecting clothing, and for washing linen. These automobiles will operate just behind the French front, among soldiers relieved from the trenches and the troops held in reserve.

F. W. D. Auto Co. Takes Over Four-Wheel Tractor?

CLINTONVILLE, WIS., May 6—It is reported on good authority that the Four Wheel Drive Auto Co., Clintonville, Wis., has taken over the Four Wheel Tractor Co., organized some time ago at Antigo, Wis., to manufacture a general utility machine employing the four-wheel-drive idea. The report says the entire business at Antigo will be moved to Clintonville at once and consolidated with the F. W. D. factory.

Hunting in Cars Prohibited in New York

ALBANY, N. Y., May 5—Hunting in automobiles in New York State is barred according to a bill which has just been signed by Governor Whitman.

Metal Wheels Gain in Europe

Cast Steel Type Employed on Trucks—Disk Wheels Also Used

PARIS, April 28—The war has been responsible for the almost complete elimination of the wood artillery wheel. For truck service the cast-steel wheel is generally employed by the French and Italian armies. The British, while large users of cast-steel wheels, also employ a percentage of disk wheels. For automobile ambulance service and light trucks, particularly those with twin pneumatics at the rear, the steel disk wheel is in a decided majority. American trucks brought into Europe for army service are all fitted with wood artillery wheels. These are allowed to remain, but in most cases when renewals are necessary they are replaced by steel.

Fiat, one of the largest manufacturers in Europe, and certainly the largest in Italy, uses no wood wheels. Heavy trucks are fitted with cast-steel wheels, ambulances and light trucks on pneumatic tires with steel disk wheels, and lighter touring cars with Sankey steel wheels. Renault, the biggest manufacturer in France, has ceased to use wood for commercial vehicles, although employing it for touring cars.

Require No Attention

The advantage of the metal wheel over wood is that it requires no attention. This is particularly important in military service, where trucks have to do a very great variety of work. While some trucks may have to run daily on a fixed schedule, many others have to stand for weeks by the roadside fully loaded, probably with one pair of wheels exposed to the sun and the opposite pair in the shade. It has been found, too, that when a truck is set on fire it becomes a total loss if fitted with wood wheels, for the spokes burn out and it is impossible to tow the vehicle home. If fitted with metal wheels the truck can always be salvaged. In most cases a burned-out truck can be put into condition at comparatively small cost, provided it can be towed to the repair shop. As one of the constant aims of the enemy is to destroy automobile convoys, it is important that the wheels should be the least destructible portion of the vehicle.

National Gas Engine Program

LAKEMONT, N. Y., May 10—William N. Hurley, vice-chairman of the Federal Trade Commission, and Dr. W. C. Huntington, commercial agent with the bureau of foreign and domestic relations, Washington, D. C., will be the speakers at the dinner of the National Gas Engine Assn. when the annual meeting is held in Chicago, June 27 to 29. A tentative program has been arranged by the secretary. A discussion of cost accounting will take up the afternoon session on the opening day, Chairman C. B. Segner to be in charge. The following papers will be read: Tractor Engines, W. J. McVicker; Tractor Design, William A. Horthy; Tractor Drawbar Ratings, Raymond Olney; Tractor Designing from the Automobile Designer's Viewpoint, William McGlashan; The Data Work, P. S. Rose; Ignition Selection, Harry G. Osburn: The Heavy Oil Engine, speaker announced later; Reducing Shop Costs, Theodore C. Menges; The Fuel Situation, E. E. Grant; Carburetion, E. E. Dean; Liquid Fuels, Present and Future, E. W. Roberts.

Experimenting with Ford Tractors

DETROIT, MICH., May 8—The little plant at Dearborn where Ford tractors are being experimented with, and which is destined to be the nucleus around which a great industrial organization is very likely to be built, is now busily turning out fifty of the latest type of Ford tractors for experimental purposes. These will be put to work on Henry Ford's estate at Dearborn, and if they prove satisfactory they will very likely be the design eventually built in large numbers. The public, however, need not look for the tractor on the market for a long time yet.

Tractor Demonstrations Without Medals

NEW YORK CITY, May 6—There will be no competing for medals by tractor manufacturers at the tractor farming demonstrations to be held this year in eight sections of the United States, under the auspices of the National Power Farming Committee. Nor will blue ribbons be awarded to the tractor which finishes its land first, or performs the most spectacular stunts.

Demonstrations will not be limited to plowing. Opportunities will be afforded to exhibit the work of disking, seeding, packing, manure spreading, and operating all other kinds of power equipment found on the average farm.

Ordnance Co. Buys Sterling Motor

BROCTON, MASS., May 7—The Sterling Motor Car Co., this city, has been acquired by the Consolidated Ordnance Co., recently incorporated in Delaware to engage in various forms of ordnance manufacture. The deal includes the taking over of the list of contracts the Sterling company has for the manufacture of shrapnel adapters, also the orders on regular commercial business for automobile companies.

Good Outlook in K.C. Territory

Bankers Report Business Conditions Are Excellent—Car Dealers Increase Sales

KANSAS CITY, MO., May 6.—Bankers in Kansas City have declared recently that the prospects for business in this territory are the brightest they ever saw, with another good crop coming on top of those of the past year or so, and high prices generally sure. Their statements followed an especially favorable report on conditions by the Federal Reserve agent at Kansas City.

These statements have the support of figures of gains in the automobile and accessory business. One jobber said, for instance, that his trade had shown a gain of 54 per cent in the first three months of the year over the same months of 1915. This was E. J. Hess of the Equipment Co. "And April was even better, though we haven't figured the exact percentage," he added.

For some reason not explained some of the towns in the territory have not been sharing this advance. In the Wichita district it is reported that business has been good only since April 20, prior to that time dullness having prevailed throughout the winter. Wichita dealers fared fairly well, however, though they suffered also from the slump in trade, and especially from the slowness of collections until the past few weeks.

Market Prices Steady

NEW YORK CITY, May 9—Market prices on automobile materials last week were steady with the usual fluctuations. Ceylon rubber continued its decline of the previous week when it dropped 2½ cents to 79. Yesterday it closed at 73 cents a pound. Para rubber is also quoting lower than last week, its lowest mark for the week being 67½ cents. Friday it rose to 69 and held at that price until the closing yesterday.

Lead has again dropped, this time 8 cents per 100 lb. to $7.30. Sulphuric acid has risen $1.00 to $3.00. These changes and the rubber situation were the features of the materials markets last week.

Rubber manufacturers are among those in the industrial field who are facing the problem presented by the high price of gasoline. Naphtha has been almost a necessity in rubber manufacture. The lines most dependent upon it are tire repair; dipped goods; tires and mechanical rubber goods. Wherever any union of parts is desired, naphtha is the usual agent to bring it about.

Gasoline is still quoting wholesale at from 20 to 24 cents a gallon. A rise is expected on account of the scarcity of crude oil. The present prices of crude oil are being watched eagerly by the gasoline interests as a rise in oil is expected to affect fuel prices in general.

Gasoline Prices Unchanged

NEW YORK CITY, May 8—Automobile owners are still paying from 27 to 31 cents a gallon for gasoline in the East, the retailers taking a profit of from 3 to 7 cents, according to the location of the garage and the overhead expenses.

The price has remained stationary so long that the opinion is frequently expressed that a change must come soon. It is now fully two months since the advance stopped, while all the factors in the situation appear to point to a further rise. Activity in the oil fields has failed to uncover any large wells.

The Maxim Munitions Corp. has closed a contract for the exclusive manufacturing rights of Louis Enricht's substitute for gasoline.

The Maxim company is now making experiments to prove conclusively that this invention is practical for commercial purposes as a fuel. The corporation has bought near the property of the inventor an acre of land on which it will build its laboratory and factory.

Another Fuel Substitute

BOSTON, MASS., May 8—Another man with a substitute for gasoline has made his appearance, this time at Stoneham, a suburb of Boston. His name is D. E. Smith, an attorney. While he claims to be the inventor, it is believed that a young fellow who has a reputation for experimenting in chemistry is the real inventor and Smith is representing him.

Last Saturday Mr. Smith went to Stoneham Square to the garage of D. G. Pratt, who handles the Maxwell line in the town, and said he wanted to prove that he had a gasoline substitute. Pratt allowed him to use one of his cars. In the presence of Mr. Pratt and some newspaper men the gasoline tank of the car was emptied.

The witnesses then certified to the conditions. Then Mr. Smith poured in a quart of colorless liquid from a glass milk bottle. The party of five then got into the car and it was started without trouble. A trip was made to Greenwood and back, maintaining a speed of from 20 to 25 miles an hour. Upgrades had no effect upon the fuel, which for lack of a better name Mr. Smith calls motive gas.

According to Mr. Smith, the chemicals are simple, and they are of American manufacture. They may be procured anywhere, and when mixed with water furnishes a fuel at 3 cents a gallon. He says all the operator of a car has to do is to fill the car with the mixture, and then by carrying a few bottles along and when the tank is empty pour in 5 gal. of water, empty the contents of a 6-oz. bottle in the water and continue on his journey.

Goodyear to Increase to $25,000,000 Capital Stock

AKRON, OHIO, May 5—The Goodyear Tire & Rubber Co., Akron, has applied to the Secretary of State for permission to increase its authorized capital from $7,000,000 to $25,000,000. The increase is necessary to take care of the rapid expansion of the concern and the erection of additions to the plant.

To Investigate Foreign Market Conditions

WASHINGTON, May 8 — It will probably interest automobile manufacturers who are interested in foreign trade that the most extensive investigations into foreign market conditions ever undertaken at one time by the Bureau of Foreign and Domestic Commerce, Department of Commerce, will be under way soon after the beginning of the new fiscal year in July. These investigations will be aimed at the newer and more undeveloped markets lying well outside of the fighting zone, especially those in South America, China, India, Africa and Australia. Twelve different lines are to be investigated, and fifteen distinct examinations to find suitable agents for the work have been announced for some time in May.

For South America agents are being sought to study and report on markets for motor vehicles and other American productions. In the Far East, Africa and Australia a study will also be made of the markets for motor vehicles. One agent is also sought to look into possibilities for American commercial and industrial investments in South America and another to make a similar study in the Far East.

New Financing for Perfection Spring

Cleveland, Ohio, May 5—Stockholders of the Perfection Spring Co., this city, have been notified that the company will issue treasury stock, $250,000 common and $250,000 7 per cent preferred. Arrangements have been made to sell the new preferred to a syndicate; the common is offered to shareholders at par, the entire offering being underwritten.

The company with these issues will have outstanding $1,000,000 preferred and $1,250,000 common, and will have all of its financing completed, having no obligations but current accounts.

Advance-Rumely Re-elects Directors

South Bend, Ind., May 8—At the annual meeting of the stockholders of the Advance-Rumely Co., Laporte, all members of the board of directors were reelected as follows: F. P. Mount, Maurice Fox and William Taylor of Laporte; Elisha Walker, J. W. Platten and F. N. B. Close of New York; S. S. Strattan and Edgar Elliott of Chicago; B. T. Skinner of Battle Creek; H. H. Wehrhane and S. B. Fleming of New York.

Maxwell Features Securities

Common Goes Up 5 Points on Dividend Rumors—Preferred Issues Higher

New York City, May 9—Rumors of mergers and dividend action were rampant last week and had their desired effect on security prices. Chevrolet, Studebaker and Maxwell shares advanced enthusiastically in the early trading on the Stock Exchange on Saturday on a report from Detroit which stated that there was in process of formation a huge merger embracing Chevrolet, General Motors, Maxwell, Continental, and Studebaker companies under the leadership of W. C. Durant, P. S. du Pont and L. G. Kaufman, with a capitalization of several hundred million dollars. While the rumor was subsequently denied by interests connected with the companies mentioned the result was a sensational rise in a few of the stocks.

On the curb Chevrolet sold up to 207, a new high record and an advance of 3 points over the old mark. On the Stock Exchange Maxwell common advanced to the new high price of 82⅝, a gain of 1½ points over the previous close and an advance of 9⅝ points over the low of Friday. Studebaker was another stock that made a considerable advance for the day, closing at 132¾, up 5½ points from the previous close.

Yesterday Maxwell common sold up to 86⅞ in anticipation of early dividend action on both that class of stock and on the second preferred as well. It was among the most active stocks on the list, 34,500 shares changing hands. About 80 per cent of the convertible warrants issued last January, in payment of the 14¼ per cent back dividends on Maxwell first preferred stock at par, leaving about $350,000 outstanding. The wiping out of the accumulation of dividends on the first preferred opens the way for the placing of the $10,127,467 second preferred on its 6 per cent basis.

Notice has been sent to holders of Chevrolet motor stock that all restrictions as to sale of their stock received in exchange for General Motors common have been removed. An offer is made of $2 a share for an option good until Aug. 1 next to purchase all or any part of their holdings at $210 a share.

Dividends Declared

Pratt & Whitney, quarterly of 1½ per cent on preferred, payable May 15.

Maxwell Motors quarterly of 1¾ per cent on first preferred.

Ajax Rubber Co., quarterly of $1.25 per share. Initial payment of $1.25 a share was made on March 15, payable June 15 to holders of record May 31.

K. C. Tire Capital $575,000

Kansas City, Mo., May 6—The Kansas City Tire and Rubber Corp., this city, has been chartered with a capital of $575,000. Harry Goodman of Chicago is president, P. E. Werner of this city is vice-president, W. R. Swisler of Chicago secretary and L. J. Smith, this city, treasurer. The factory covers a 3½-acre tract at the northwest corner of Fourth Street and Central Avenue.

23 Sheepshead Bay Entries

Mulford Special Withdrawn—Will Probably Appear Later in Season

New York City, May 9—Up to date there are twenty-three entries for the Metropolitan trophy race to be held at Sheepshead Bay Speedway on May 13. The Mulford Special has been withdrawn due to motor trouble which could not be overcome in time to enter the race.

Four events will be held on the Sheepshead Bay track on that day. The feature event will be the Metropolitan Trophy, a 150-mile race for cars within the 300-cu. in. piston displacement limit. Entrants will be required to make 90 m.p.h. to qualify, and the race will be limited to 90 min. It is an A. A. A. championship award event under the new plan of the contest board of that organization for determining racing champions. The trophy will be contested for over three or five years. There will be $15,000 in prizes, distributed over seven places, varying from $6,000 for first to $400 for seventh.

The other events are: The 50-mile Queens Cup race, carrying $2,500 spread over five places, both being for cars within the 300-in. limit; the 20-mile Coney Island Cup, with $1,500 for five places, both being for cars within the 300-in. limit, and the 10-mile Brooklyn Handicap for non-winners, the prize being the William Kemble Cup and $1,000 in five prizes. Anyone not taking a prize in the previous events is entitled to compete in this race. These three cups are given outright to the winners.

Special trains will carry the sportsmen from Chicago, Boston, Baltimore and Washington, while thousands from all over the country will tour to the speedway in automobiles. Inquiries sent out by the speedway management to automobile clubs have resulted in excellent reports on road conditions. A personal inspection has been made and motorists advised as to the best route to take.

Some of the times which were snapped were Henderson in the Maxwell, who reeled off a lap in 1 min. 9 1/5 sec., which is a speed of 104 m.p.h. Resta was timed in 1 min. 12 2/5 sec., which is 99½ m.p.h. Jack Lecain was out with the Delage and Billy Chandler with his Crawford. Jules Devigne also had his Delage out and J. Christiaens made a lap at 100 m.p.h. in his new Sunbeam. It is expected that there will be a feature race between the twelve-cylinder Sunbeam owned by Adams Bros. and the Blitzen Benz owned by Harry S. Harkness. These are supposed to be the two fastest cars in the world.

H. S. Harkness has made an added entry of a Pusun which will be driven by Aldo Franchi, an Italian. This car is built from a Peugeot chassis, with a Sunbeam motor. In its initial tryout the car averaged 106 m.p.h. Entries are:

Car	Driver
Adams Special	George Adams
Erwin Forty	Grover C. Bergdoll
Erwin Forty	Eugene Stecher
Peugeot	Ralph Mulford
Peugeot	Dario Resta
Peugeot	John Aiken
Crawford	Billy Chandler
Crawford	Dave Lewis
Crawford	Unnamed
Duesenberg	Eddie O'Donnell
Duesenberg	C. T. Devlin
Maxwell	Pete Henderson
Maxwell	Eddie Rickenbacker
Delage	Carl Limberg
Delage	Jack Lecain
Delage	Devigne
Delage	Unnamed
Sunbeam Six	Joseph Christiaens
Sunbeam Six	Aldo Franchi
Sunbeam Six	Unnamed
Mulford Olsen Special	C. W. Thompson
J. J. R. Special	Bert Watson
Pusun	Aldo Franchi

Chevrolet Takes Gardena Race

Gardena, Cal., May 6—George Hill, formerly Barney Oldfield's mechanic, won the Garden road race for cars of 231 cu. in. piston displacement and under in a Chevrolet here to-day, covering the 75 miles over the 2.2-mile course in 1:47:13. Robert Conner in a Ford Special was second, in 1:49:02. Dochterman in a Chevrolet was third and Bacon was fourth in a Fiat. The latter two were flagged as Conner finished, spectators crowding on the course to congratulate winners making it dangerous for the race to proceed. Stutzman in a Grant Six went out in the lead on the first lap and for eight laps had things his own way. He came to the pits for a tire change and, as he was using wooden wheels, lost almost a lap, Hill going into first, where he stayed until the finish. The Grant never got up into the lead again, going into the ditch in the eighteenth lap. Heacox, driving a Cadillac, went into the ditch with a broken steering knuckle in the twenty-ninth lap.

The Gardena race is to be an annual affair for 231-in. cars, to-day's event being held in connection with the annual Gardena Valley strawberry day fête.

Hyatt Branch Service Managers to Meet May 18-20

Detroit, Mich., May 9—The managers of the service branches of the Hyatt Roller Bearing Co. will gather at the general sales offices in this city May 18-20 for their first annual convention. The business sessions will be devoted to talks by officers of the company and to conferences on engineering, sales and advertising matters.

Thomson Sheepshead Director

New York City, May 5—A. E. Thomson has been appointed managing director of the Sheepshead Bay Speedway. Everard Thompson will continue as general manager and vice-president.

30 Entries for Indianapolis

Elimination Trials Will Be Held May 26-27—Three Crawfords Late Entrants

Indianapolis, Ind., May 5—The entry list for the Indianapolis 300-mile race May 30 closed May 1 but the records were held open until all entries which were mailed on the last day were received. The final list shows thirty entries for the International sweepstakes. The late comers included the three Crawfords which Billy Chandler is building at Hagerstown, Md., and two entries to be known as the Erwin Specials. These are entered by Grover Bergdoll, the Philadelphia millionaire.

The entry of Tom Alley in an Ogren car raises the total number of entries to date to twenty-eight. The speedway officials admit they have two more entries which they will not make public at present and a possible third.

Ralph DePalma, winner of the 500-mile race at the Indianapolis speedway last year, has wired for permission to enter his Mercedes car, stating that he has sold this car to Frank P. Book, a wealthy young Detroiter, who has had some racing experience and wants to drive at Indianapolis. Book will drive a Cadillac in the Chicago amateur race. DePalma did not get his entry in before the opportunity closed at midnight, May 1, so consent in writing must be obtained from all the other entries.

Rigid Tests Provided

Rigid physical tests must be passed by all entrants. Following are but samples of a whole volume of rules that are necessary to regulate such an enormous undertaking as this race: Each car must show 80 miles an hour in an official speed trial of one lap of the track to be eligible. Speed trials will be held on May 26 and 27. Cars shall start in the order of the time they make in the official speed trials; the fastest car starting in first position, next the pole. The racing numbers will be assigned in the same manner, the fastest car receiving No. 1. In event of rain the race will be postponed until Wednesday, May 31, or some subsequent date. Any driver who in the opinion of the officials or speedway management does not show sufficient skill and judgment in the handling of his car to make him a safe factor in competition shall be barred from the track. Any driver who on the day of the race gives evidence of exhaustion or other physical incapacity, making him a potential danger to others on the course, may be barred from further competition. The status of his eyesight, heart action, blood pressure and general condition must have been approved by the speedway surgeon at least five days before the contest. Steering wheel spiders other than steel or bronze will not be permitted. All chain-driven cars must be equipped with chain guards. All parts of cars, with respect to safety, shall be subject to the approval of the speedway technical committee.

The entries follow:

Car.	Driver.
Maxwell	Richenbacker
Maxwell	Henderson
Frontenac	Louis Chevrolet
Frontenac	Arthur Chevrolet
Frontenac	Gaston Chevrolet
Peugeot	Resta
Peugeot	Aitken
Peugeot	Merz
Peugeot	Mulford
Sunbeam	Christiaens

To Try for West-to-East Record in Cadillac Eight

LOS ANGELES, CAL., May 8—E. G. Baker and W. F. Sturm, both of Indianapolis, left here in a Cadillac Eight at midnight on the first leg of their 3375-mile trip across the United States. They will try to better the West-to-East record made by Baker in a Sutz last May, which is 11 days, 5 hr., 25 min.

Their route for the first 24 hr. lies through San Bernardino, Barstow, Needles, Kingman, Williams, Flagstaff and Albuquerque. The finish will be at New York.

In the route they have selected this year Baker and Sturm hope to cut down the mileage from that of last year by taking a more direct route. Last year's mileage was 3728.4, and touched Phoenix, El Paso, Plains, Kan., and Emporia, Kan. The mileage of the route which they hope to follow is as follows:

Los Angeles to San Bernardino	63
To Barstow	79
To Needles	165.8
To Kingman, Ariz	72
To Williams	138.5
To Flagstaff	34.8
To Albuquerque, N. M	381
To Santa Fe	66
To Las Vegas	72.9
To Raton	136.6
To Trinidad, Col	25
To La Junta	94.2
To Syracuse, Kan	114
To Dodge City	104.8
To Hutchison	153
To Florence	121.7
To Kansas City, Mo	134.5
To Columbia	159
To St. Louis	140.7
To Greenville, Ill	52
To Dayton, Ohio, via Indianapolis	322.1
To Greensburg, Pa	303
To Philadelphia	275.8
To New York	103
	3,375.7

Omar Wins Kern Co. Race

Hughes Driving Makes 100 Miles at 61.6 m.p.h.—Good in Stutz Second

BAKERSFIELD, CAL., May 7—*Special Telegram*—Hughie Hughes in the Omar won the 100-mile track race staged by the Kern County Fair Association here to-day, taking the event at 61.6 m.p.h. He jumped into the lead in the first lap and held front position to the finish, with but one stop at the pit. The 100-mile ramble was made in 1 hr. 36 min. 8.4 sec. Frank Good in a Stutz won second money, at 61.18 m.p.h., covering the 100 miles in 1 hr. 38 min. 4.8 sec. Third money went to Clyde Rhodes, a local speed king, who drove his Studebaker Special to the tune of 60.9 m.p.h. The Studebaker made the course in 1 hr. 38 min. 30.6 sec. Frank Elliott, in the old Mercer Monk, which now is known as the Gordon Special, won fourth place at 60.4 m.p.h., with 1 hr. 39 min. 20.6 sec. charged up to him on the timer's sheet. Lou Gandy in a Gandy Special was running fifth and was flagged in the ninety-seventh lap. Debolt in the McKees Special went out in the thirty-third lap with a broken oil line and Ed Waterman in a Gandy Special went out with a burned-out bearing in the sixty-sixth lap after driving a wonderful race.

Narrow Escapes from Accidents

Frank Good had a narrow escape when he blew a tire on the backstretch just after coming out of the turn. Only the clever driving of the pilot saved the crew and car. As the tire blew the car leaped into the air in a cloud of smoke, and the ambulance started across the field, but a second later the car was seen flopping across the course like a wounded animal. Good mastered the machine and rolled into his pit for a tire change.

Hughes Has Trouble

Hughes had a narrow escape also in the eighty-first lap when Rhodes crowded him on the turn, and he fought for his life in the dust. Hughes was called into the pit by Fred Aubert, chairman of the technical committee, in the eighty-sixth lap to wire up a loose tie rod which had jarred loose and at this time Hughes filled up with gasoline and went on through the race with a leak in the gas tank which was expected to put him out before he was given the checkered flag. The course was well policed and it was the best managed race staged in southern California this season, although there were only 3000 spectators.

In the 25-mile light-car race, Walter Smith in a Maxwell won first money. His time was 28 min. 58.8 sec. Fred Docherman in a Chevrolet was second. Ed. Gibson in a Studebaker went out with engine trouble in the twenty-first lap after leading for practically the entire race. Dominic Basse, who was to drive the Milac, was excused by Referee Bird when he reported that his car had been attached in Los Angeles.

Des Moines Speedway Changes Hands

OMAHA, NEB., May 10—Henry Gering of this city has sold his interest in the Des Moines mile and a quarter speedway to a syndicate of Des Moines men, the deal representing $50,000. Samuel Orloff of Des Moines, who with Gering promoted the speedway, has also disposed of a $10,000 block of stock to the same syndicate. He retains the rest of his interest and will continue to act as secretary of the organization. Gering, retiring as president of the company, is succeeded by A. H. Banks, with C. C. Taft as vice-president.

$1,000 Prize for 2-Mile Record on Chicago Speedway

CHICAGO, ILL., May 8—A cash prize of $1,000 has been announced to-day by the Speedway Park Association of Chicago to any driver who at the end of the season holds the world's 2-mile speedway record, providing this record is made on the Chicago speedway and in official time trials. The offer is open to any A. A. A. registered driver, whether American or foreign, and to any car of any displacement. The trials must be under the observation and rules of the American Automobile Association, upon whose certificates of performance the award will be made at the end of the season. This offer remains open until the close of the Chicago speedway season, Oct. 31. In the event that a record of 120 m.p.h. for one lap is made, $1,500 will be added to the prize. Any A. A. A. registered driver wishing to try for the record must give the Speedway Park Assn. ten days' notice and pay expenses of the trial, unless the driver is invited by the speedway to try for the record, in which case the expense will be borne by the speedway. It is intended to invite all of the more prominent drivers to try for the record.

Amateur Drivers Make Fast Time

CHICAGO, ILL., May 8—Entrants in the non-professional drivers' invitation race May 20 made some very fast time in practice yesterday on the local speedway. F. C. Sawyer made the fastest lap in practice so far when he drove his Mercer roadster one lap of the 2-mile course in 1 min. 30 and 4/10 sec. This is close to 80 m.p.h. There were twelve owner drivers in yesterday's practice, and in addition a number of tradesmen and preliminary workouts for the proposed trade race, which may be staged on the day of the owner drivers' event.

Factory Miscellany

Wisconsin Plant News—The Racine Steel Casting Co., owned and operated by the Belle City Malleable Iron Co., Racine, Wis., is now operating its new plant, which will have a monthly capacity of 300 tons of electric steel castings and 500 tons of electric steel ingots, produced by a 3-ton Heroult electric furnace. The foundry is 80 by 322 ft. in size, and the center bay, 50 ft. wide, is commanded by a 7½-ton Pawling & Harnischfeger crane. The company will make a specialty of manufacturing alloy steels to specifications. The subsidiary, as well as the parent company, has a large clientele in the motor car and tractor industry.

The Werra Aluminum Co., Waukesha, which specializes in aluminum castings for motor builders, is contemplating the enlargement of its foundry, established three years ago in the former Wisconsin Central car shops. The present facilities are not adequate to handle the great volume of business on the books.

The Thurner Heat Treating Co., 126 Ferry Street, Milwaukee, is installing a small furnace for producing high-speed tool steel.

The Milwaukee Auto Engine & Supply Co., 841 Twenty-ninth Street, Milwaukee, is enlarging its hardening furnace capacity.

The Warner Mfg. Co., South Beloit, has been incorporated with a capital stock of $10,000 to manufacture the Warner "Auto-Trailer" recently described. At the head of the company is A. P. Warner. J. W. Menhall and A. B. Cadman of Beloit are associated with him. A large production of trailers is now being made in the spacious shops leased by the company and re-equipped.

The Falls Machine Co., Sheboygan Falls, a large manufacturer of motors for several leading motor car manufacturers, has taken occupancy of its new assembling and testing floor shop, measuring 40 by 250 ft., and is making other important improvements looking toward enlargement and efficiency. A new record in motor construction was established at the Falls plant several days ago, when a cylinder block was finished in 38 min. This compares very favorably with the average made for similar work at the Ford works in Detroit, where a block is finished in 45 min. The Falls record was established on a six-cylinder motor casting, while the Ford average is on a four-cylinder. The Sheboygan Falls concern is also establishing commercial records. While 1915 business aggregated more than $1,000,000, the volume of the first three months of 1916 was more than $500,000, and at this time the company has orders for future delivery amounting to $2,500,000. Nearly 400 persons are on the payroll.

Van on 24-Hr. Schedule—The Van Sicklen Speedometer Co. has started continuous production in the assembly and machine departments of its Elgin, Ill., factory. These portions of the plant are now operated 24 hr. per day.

Tire Plant for Farwell—The Western Tire & Garage Co., Farwell, Tex., will shortly open a plant for the manufacture of automobile tires and rubber accessories. The plant when opened will give employment to 500 men. The officers are: Judge J. D. Hamlin, president; C. A. Robeson, vice-president; M. M. Craig, secretary, and C. L. McCallan, treasurer.

Jackson Shaft to Double Output—The Jackson Motor Shaft Co., Jackson, Mich., will erect an addition in the eastern part of the city, which will be 24 by 100 ft., directly adjoining the present structure. The new machinery required will cost nearly $15,000 and give employment to about fifty men, making a total of 200. The new addition will increase the output about 50 per cent. Between 10,000 and 12,000 cam shafts per month will be turned out. July 1 the plant will be taken over by the Briscoe Motor Corp., at which time the concern will be reorganized and the name of the firm changed, but the management as it now is will continue and the manufacture will go on as before.

The Automobile Calendar

ASSOCIATIONS

May 9-12—Hot Springs, Va., N. A. A. A. J. Meeting.
May 18—S. A. E. New York Section, May Meeting.
May 22-26—Chicago, Ill., N. E. L. A. Convention, Electric Veh. Section, Congress Hotel.
May 26-27—Del Monte, Cal., Meeting, Three Divisions of National Assn. of Automobile Accessory Jobbers.
June 12-16—S. A. E. Summer Trip on Great Lakes.
July 2-6—Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.

CONTESTS

May 13—New York City, Sheepshead Bay Speedway Race. Metropolitan Trophy, 150 miles; Queens Cup, 50 miles; Coney Island Cup, 20 miles, and Brooklyn handicap for non-winners, 10 miles.
May 20—Chicago Non-Professional Speedway Race, Western Interclub Speedway Park.
May 30—Des Moines, Iowa, Iowa Derby, 20 miles; Des Moines Special, 10 miles.
May 30—Tacoma, Wash., 10, 20, and 30-Mile Races, Tacoma Speedway Assn.
May 30—Elmira, N. Y., Track Race, Elmira Auto & Motorcycle Racing Assn.
May 30—Indianapolis Speedway 300-Mile Race.
May 30—Minneapolis, Minn., Speedway Race.
June 4—Sheepshead Bay Speedway, 30-mile Race, American Liberty Day Committee.
June 10—Chicago Speedway Race. International 300-Mile Race, Speedway Park, Speedway Park Assn.
June 16-17—Sheepshead Bay Speedway, 24-Hr. Race, Trade Racing Assn., New York City.
June 20—Galesburg, Ill., Track Race, 100 miles.
June 28—Des Moines, Iowa, Speedway Free-for-All, 300 Mile Race.
July—LaGrande, Ore., Track Race, LaGrande Motor Club.
July 4—Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4—Tacoma, Wash, Speedway Race, Tacoma Speedway Assn.
July 4—Minneapolis 300-Mile Speedway Race.
July 4—Sioux City Speedway Race.
July 15—Omaha, Neb., Speedway Race.
July 15—North Yakima, Wash., Track Race, Hillier-Riegel Co.
Aug. 5—Tacoma Speedway Race, Tacoma Speedway Assn.
Aug. 11-12—Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.
Aug. 12—Portland, Ore., Track Race, Hillier-Riegel Co.
Aug. 18-19—Elgin Road Race, Chicago Auto Club.
Sept. 4—Des Moines Speedway Invitation Race. Limited to six entries.
Sept. 4—Indianapolis Speedway Race.
Sept. 4-5—Spokane, Wash., Track Race, Inland Auto Assn.
Sept. 16—Providence Speedway Race.
Sept. 29—Trenton, N. J., Inter-State Fair. H. P. Murphy, Racing Sec.
Sept. 30—New York City, Sheepshead Bay Speedway Race.
Oct. 7—Philadelphia Speedway Race.
Oct. 7—Omaha Speedway Race.
Oct. 14—Chicago Speedway Race.
Oct. 19—Indianapolis, Ind., Race, Indianapolis Motor Speedway.
Nov.—Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

GOOD ROADS

May 14-20—Milwaukee, Wis., Sheridan Road Week to Complete Highway Connecting Milwaukee and Chicago.
May 25—Pennsylvania's Second Good Roads Day.
Sept. 6-7—St. Paul, Minn., Good Roads Congress, Auditorium.

MISCELLANEOUS

June 8—New York City, Orphans' Day Outing at Donnelly's Grove, College Point, L. I. Orphans' Automobile Day Outing Assn.

SHOWS

Sept. 2-9—Columbus, Ohio, Fall Show, Ohio State Fair, Columbus Automobile Show Co.

TRACTOR

July 17-21—Dallas, Tex., Tractor Demonstration.
July 24-28—Hutchinson, Kan., Tractor Demonstration.
July 31-Aug. 4—St. Louis, Mo., Tractor Demonstration.
Aug. 7-11—Fremont, Neb., Tractor Demonstration.
Aug. 14-18—Cedar Rapids, Iowa, Tractor Demonstration.
Aug. 21-25—Bloomington, Ill., Tractor Demonstration.
Aug. 28-Sept. 1—Indiana Tractor Demonstration.
Sept. 4-8—Madison, Wis., Tractor Demonstration.
Sept. 11-16—Milwaukee, Wis., Fall Show, Wisconsin State Fair, Milwaukee Automobile Dealers.

The Week in the Industry

Columbus News Notes—A new Westinghouse service station has been opened by Thane C. Hecox, under the name of the Auto Electrical Supply Co., at 269 North Fourth Street. The concern carries a full line of auto and electric accessories.

John Hoffman, 2522 North High Street, has taken the central Ohio agency for the Case.

Northwest News—The Roesch Motor Car Co., Seattle distributor of Velie cars, has secured new quarters in the Queen City at 1109 Pine Street. A new service department has been added by this company.

The Ahlberg Bearing Co. has opened a northern office in Portland, Ore. C. J. Bender is secretary and B. H. Bodley has been named Portland manager.

The Foster-Larson Co., Spokane, Wash., has opened a sub-agency in Walla Walla, Wash., which will handle the Paige and National automobiles and Stewart and Garford trucks. S. A. Heist is the new manager in the Walla Walla territory.

New England Trade Items—G. S. Bishop, who has the Premier and Westcott cars at Boston, Mass., has added the H. A. L. to his line.

F. H. Grow, manager of the Langham Motor Co., Boston, Mass., has taken on the Davis car, his territory extending from Boston to Portland, Me.

F. A. Dutton, who has the Empire for New England, has placed an agency at Waterville, Me., with R. C. Whitney.

L. A. Vanchon, Brookline, Mass., has taken on the Overland for that town.

Earl Davis, who has been a special factory representative for the Paige-Detroit, has gone to Providence, R. I., to take charge of the Paige service department.

Large Spark Plug Order—The Beckley-Ralston Co., Chicago, Ill., has ordered 300.000 A.C. spark plugs.

New Bosch Contracts—The Bosch Magneto Co., New York City, has signed contracts with six concerns to use its magnetos for the coming season. They are the Roberts Motor Co., Sandusky, Ohio; Henderson Bros., North Cambridge, Mass.; Jordan Motor Car Co., Cleveland, Ohio; Republic Motor Truck Co., Alma, Mich.; Nordyke & Marmon Co., Indianapolis, Ind., and the Ogren Motor Works, Chicago, Ill. The contracts of the two concerns last mentioned also include complete lighting and starting equipment.

Trade Happenings

Hanks Goes to Chicago—M. W. Hanks, who is in charge of the Western sales of the automobile equipment department of the Westinghouse Electric & Mfg. Co., now has his headquarters in Chicago. Mr. Hanks was formerly located in the sales service station of the company at Indianapolis. Service work at Indianapolis is now handled by the Kelly-Springfield Co. of Ind., and the sales of the Westinghouse automobile equipment in this district by H. H. Johnson.

Ritchie Transferred—R. C. Ritchie, formerly in charge of the office of the Automobile Equipment sales service station of the Westinghouse Electric & Mfg. Co. in Chicago, has been transferred to the main office at Shadyside Works, Pittsburgh, Pa.

Seaman Knight Tire Representative—L. I. Seaman, formerly with the Ajax Tire Co., has been appointed district representative of the Knight Tire Co. for western and northern New York.

Higgins Burd Ring Factory Manager—G. H. Higgins has been appointed factory manager of the Burd High Compression Ring Co., Rockford, Ill.

Service Station for New York Metz—Robert Lurie & Co., Eastern agent for the Metz, leased two buildings at 307 and 309 West Sixty-seventh Street, New York City, for a service station.

Graham to Manage Goodrich Plant—L. K. Graham will manage a branch factory to be established by the B. F. Goodrich Co., Akron, Ohio, in El Paso, Tex.

Austin Cleveland Saxon Sales Manager—L. A. Austin has been appointed retail sales manager of the Loveland Co., Cleveland Saxon distributor.

Ahlberg Opens New Factory Branches—The Ahlberg Bearing Co., Chicago, Ill., has opened two new factory branches at San Francisco, Cal., and Portland, Ore., completing a chain of eleven branches at New York City, Boston, Detroit, Cleveland, Minneapolis, St. Louis, Portland. Atlanta, Los Angeles, San Francisco and Chicago.

Mountain Retail—Tom Botterill, East Thirteenth Avenue and Broadway, Denver, Pierce and Hudson distributor for Colorado, Wyoming and Utah, and Dodge dealer for Denver, has added to his salesroom and garage a $12,000 building, for adjustments and quick repairs, on an adjacent site directly across the alley. The new service building is 50 by 125 ft., faces on Thirteenth Avenue and also Lincoln Street, thus extending the Botterill business place the entire width of the block from Broadway to Lincoln Street.

The Mitchell Tire Co., a new concern formed by C. E. Mitchell and F. W. Graham, has opened a Defiance and Midgley Wire Tread Tire agency at 1622 Court Place, Denver.

W. G. Dickey, 1441 Wazee Street, Denver, Monogram Oil distributor for Colorado, Wyoming, New Mexico, Nebraska, Kansas, Oklahoma and Western Missouri, has opened a warehouse and branch office at Kansas City.

The Roberts Auto Co., 1618 Court Place, Denver, Marmon distributor for Colorado and Wyoming and Stevens-Duryea service station, is moving into a remodeled garage building at 220 Sixteenth Street.

The Downey Garage, 3312 East Colfax Avenue, Denver, has been appointed official service station for the Chalmers and Hupmobile and has bought a Chalmers demonstrator for agency use.

The National Motor Co., 1616 Broadway, Denver, National distributor for Colorado and Wyoming, has taken the Elgin distributing agency for the same territory.

The White Automobile Co., Perry A. Mead, manager, Denver agent for the White, has moved into new quarters in a $12,000 building at 1330 Broadway, with 50 by 125 ft. of floor space for salesroom and garage.

D. M. Gillespie, district sales manager for the White in the Rocky Mountain district, has moved his Denver headquarters from 424 Broadway to the new local agency building of the White Automobile Co. at 1330 Broadway.

The Chandler Motor Co. of Colorado, 1518 Broadway, Denver, Chandler distributor for Colorado and Wyoming, has taken the Denver agency for the Stutz.

The Headington Auto Co., 1636 Broadway, Denver, Metz, Enger and H. A. Lozier distributor for Colorado and Wyoming, has secured the distributing agency for the same territory on the Inter-State.

The Stutz Motor Sales Co.. Greeley, Col., is the name of a new Stutz distributing agency for Colorado and Wyoming, managed by C. T. Ahlstrand.

Harold Beggs, formerly of the Boss Rubber Co., Denver, has opened a local agency at Pueblo, Col., for Knight and Blackstone tires exclusively.

Omaha Trade Items—The Overland Stores have bought a large block of property in the heart of Omaha's growing business section, the deal representing $55,800 in sales and $12,000 in leases. It is planned to hold the property as an investment until the company shall decide to build.

The Briscoe Nebraska Car Co. is being organized in Omaha, with A. Koppenhaver of this city as probable president. The concern will handle the Briscoe car in this territory.

The Foshier-Enger Co., Omaha, has moved its distributing agency and salesrooms from 1122-1124 Farnam Street to more commodious quarters at 2211-2213 Farnam Street, among its old associates along Auto Row. The firm handles the Enger and Dort cars.

The C. W. Francis Auto Co., Omaha, has enlarged and remodeled its space in the building at 2218 Farnam Street and now presents one of the most attractive interiors in the city.

Northwest News—One of the most important transactions in the commercial vehicle line ever made in the Pacific Northwest was recently consummated between the Northwest Buick Co. and W. H. Barnes, factory representative of the General Motors Co., whereby the Buick company will handle the entire truck line of the G. M. C. people throughout their territory, covering the States of Oregon, Washington, Idaho, British Columbia and Alaska.

Additional space has been added to the Seattle plant of the Northwest Buick Co. and particular attention will be given to the supplying of parts, the extension of service and the general welfare of the truck owners.

Will O. McKay has resigned as manager of the Newton Foster Co., Seattle, distributor of the Paige, Saxon, National and Garford truck lines. Mr. Foster has assumed the management of the business.

The Northwest branch of the Metz Co., under the management of J. P. Scearce, is now located in its new home at 1016 Pike Street.

The selling privileges on the Chevrolet line for Portland, Ore., and Multnomah county have been acquired by the Benj. E. Boone Co.

Thirty-three new Willard service stations were established by J. P. Schiller, Jr., district supervisor of the Willard Storage Battery Co. in the Pacific Northwest. There are now forty-six Willard stations in the territory, comprising Idaho, Montana, Oregon, Washington and western Canada.

The Oakland agency of Everett, Wash., has moved to its new building on Rucker Avenue.

Barnes and Beidler of Seattle, Wash., have taken the agency for the Vim delivery truck and opened salesrooms at Broadway and Pine Street.

The Simmons Co., Kenosha, the largest manufacturer of metal beds and springs in the world, which produces a large part of the spring sets used in motor car upholstery in this country, has purchased its largest competitor, the Rudgear-Merle Co., San Francisco, at a price said to be in excess of $2,000,000. The Pacific Coast plant will be enlarged at once and $100,000 will be expended for new machinery alone. Andrew Rudgear, president of the San Francisco concern, becomes a vice-president of the Kenosha company, in charge of the western division. L. C. Lance, formerly western manager for the Simmons Company, is made treasurer of the division.

Conn. Trade News—The White Motors Co., New Haven, has opened a branch in Hartford, at 45 Gold Street, under the managership of S. A. Foster, who has represented in Hartford and surrounding territory White automobiles during the past five years. A service station will be located temporarily at 22 Chapel Street. Next autumn it is the intention of the White Motors Co. to have a complete salesroom and service station under one roof.

A real estate deal involving $39,500 was consummated at Hartford this week when the Willys-Overland Co., Toledo, acquired a tract of land at the corner of Asylum and Hurlburt streets, on which will be erected a three-story concrete and steel service station and salesroom. The building will be 90 ft. on Hurlburt Street and 130 ft. on Asylum Street. There will be two levels, that from Hurlburt Street leading to the first floor or service station and that on Asylum Street to the salesroom. The building is to be ready for occupancy July 1.

Ill. Trade Items—M. S. Steele, formerly stationed in the home offices of the Moline, Ill., Plow Co., and later resident manager of the Henney Buggy Co. and the Freeport Carriage Co., both of Freeport, Ill., has been appointed Chicago sales manager for the Stephens Six, the automobile that is now being manufactured in Freeport by the Moline Plow Co., having recently added this line to the manufacture of plows and horse propelled vehicles.

The Castendyck-Hamel Co., Elgin, has outgrown its present quarters and is remodeling the building at 326 Third Street, that city, for a modern garage. In addition to a repair and storage business the firm will maintain a sales agency and carry supplies and accessories. The new building will be ready for occupancy by June 1.

The Charles Bradley Co., Springfield, Ill., has been organized and will open a salesroom and service station at 326-328 South Sixth Street about May 15. The company will be distributors for the Cole car.

The O. A. Zarth Wire Wheel Co., Aurora, located at 99 South Water Street, is now seeking larger quarters, having just secured an order from the Cole company of Indianapolis for 100,000 sets, and many other smaller orders. The Zarth wheel has several new features, particularly the method of attaching the spokes to the rim, and the lock which holds the removable wheel to the axle. The spokes are screwed into the rim, a new departure, which is said to make the joint permanent.

The new owners of the Stover Mfg. & Engine Co., Freeport, engaged in the manufacture of tractors and farm vehicles, made a thorough inspection this week of the property which came into their possession by reorganization and consolidation. The party included directors, investors and experts engaged to outline a plan of efficiency. Following the inspection the directors met and elected the following officers: President, W. A. Hance; first vice-president, J. F. Smith; second vice-president, H. H. Antrim; secretary, J. F. Smith; assistant secretary, R. H. Hubbart; treasurer, W. A. Hance; assistant treasurer, H. H. Antrim.

The Henton-Roberts Sales Co., Decatur, has opened an agency for the Enger and Argo cars at 252 East Main Street.

The Fisk Rubber Co. opened a branch at 434 Maine Street, Quincy, this week with A. R. Forse in charge as manager. A line of general supplies will be carried in addition to tires, and a complete repair shop for tires will be operated.

H. M. Wakelin, Melvin, has purchased the C. A. Platz garage. He will enlarge the plant.

A. F. Bloomfield of Indianapolis, and L. Saazer of Milwaukee, opened an automobile and commercial car body factory in the building in Streator, Ill., formerly occupied by the Central Garage at 125 South Park Street. Suitable machinery has been installed and a specialty will be made of woodwork for all makes of pleasure and commercial cars.

The King garage, Quincy, Ill., has been opened at 215 South Fourth Street by J. B. Thomas and B. F. Thomas. These quarters are but temporary, however, as a larger building is being sought in which show rooms can be arranged. A repair shop will be operated and a complete line of supplies and accessories will be carried.

Donald S. Hubbell, Elgin, Ill., has let the contract for a fireproof garage at 162 Douglas Avenue which will be 126 by 48 and two stories in height. The Ford agency will be housed in this building and a line of supplies and accessories will be carried and a general repair business conducted.

A Special

Stewart

Speedometer

Ford—Saxon Chevrolet

This special (Magnetic) Speedometer is a necessity for every Ford, Saxon and Chevrolet car.

It insures economical operation for it is an indisputable record in securing fair tire adjustments and in keeping tab on gasoline and oil consumption.

It adds a pleasure to driving which owners of these cars appreciate and are willing to pay a fair price for.

These manufacturers are building hundreds of opportunities every day for the sale of this special Stewart at $10.

Are you overlooking a big bet?

"No car is better than its accessories"

Maxwell Wins Trophy

Short Events Are Won by Peugeots—Limberg Killed

By J. Edward Schipper

ONCE again America has triumphed in the arena of speed. Eddie Rickenbacher, driving his Maxwell car at a pace of over 96 m.p.h., won the Metropolitan cup classic at Sheepshead Bay against a field of the best that the world could do in speed and endurance.

Close behind the Yankee winner came Jules Devigne in a Delage, one of the products of engineering skill of France. Less than 2 min. behind the winner he had covered the cruel course at over 94 m.p.h., having fought every inch of the way in the relentless struggle.

And, most remarkable of all, a car which two short weeks ago was attached to a touring body and was acting as a demonstrator came across the line in third position, just 5 min. and 13 sec. behind the winner. This was Ira Vail in a Hudson.

Popular as was the victory of Eddie Rickenbacher in his milk-white Maxwell, it was not without a touch of sadness. Carl Limberg and his mechanician, R. Pallotti, who were leading the race at the thirtieth mile in a Delage car, were both killed almost instantly by an

Rickenbacher in his Maxwell after winning 150-mile Metropolitan Trophy

Line up of the cars for the 50-mile Queens Cup race. Aitken has the pole, with Franchi, Rickenbacher, Vail and Mulford in the front row. Behind are Devlin, Devigne, Limberg and Henderson

accident occurring on the steeply banked curve just before entering the home stretch. Limberg had led the field from the start until Eddie Rickenbacher, who eventually won, and two others passed him on the back stretch. Urging his speedy mount to a pace of over 104 m.p.h. to regain his place, Limberg took the steeply-banked curve without hesitation. Then, just as he had reached that part of the curve at which the drivers prepare to straighten out to enter the home stretch, his right rear tire blew out, causing his car to waver and strike the fence at the topmost point of the banked turn. A wrench of the steering wheel brought the car momentarily back on the track but it was out of control and immediately struck the fence again a few feet beyond, pitching both driver and mechanician out over the edge while the car itself, broken in many parts, rolled down the steep side of the saucer a mass of fractured metal, flame and dense black smoke. Death came to both men almost instantaneously.

Aitken Breaks 20-Mile Record

Two shorter events preceded the 150-mile Metropolitan Trophy race, one of 20 miles for the Coney Island cup and a list of prizes starting at $600 for first and ending at $100 for fifth. This was won at a pace which makes a new world's record. Johnnie Aitken hurled his Peugeot ten times around the 2-mile track at a speed of 106.54 m.p.h., requiring but 11 min. and 15 sec. to cover the distance. Second in this was Joseph Christiaens in the Sunbeam six who crossed the line 6 sec. behind the winner. One second behind Christiaens was Carl Limberg in the ill-fated Delage car.

The second of the shorter events was the Queens Cup, a 50-mile race in which the first prize was $1,000. Ralph Mulford broke through his streak of bad luck long enough to win this at an average speed of 104.34 m.p.h. Twenty-eight minutes and 45 sec. were needed to cover the course. Second in this event was C. F. Devlin in a Duesenberg car and third a combination of a Peugeot chassis and a Sunbeam motor known as the Peusun driven by Alde Franchi.

Perfect Day for Race

A WARM sun tempered by a breeze from the bay afforded perfect weather for the race. It was about 2 o'clock in the afternoon when the stands began to rapidly fill with spectators and by 3 o'clock when the first race started the crowd of 25,000 presented a vari-colored picture which, from a distance, looked for all the world like an animated rag carpet. The events were opened by the graceful flights of a young girl aeronaut in a biplane who entertained the vast crowd by gracefully-executed spiral dips, loops and upside down flights.

Aeroplane Flights First

Around the board ellipse she flew while the drivers were lining up their equally fast but earth-confined mounts along the starting line.

One of the brushes in the Metropolitan Trophy race. Rickenbacher is taking the lead, passing Vail and Mulford just behind. Franchi and Aitken following close to the pole

Peugeot	Mulford	6	6	3	2	2	2	2	1	out																						

In the second lap of the Metropolitan Trophy race with Rickenbacher, Franchi and Watson followed by Lewis, Mulford and Limberg

Start of the 150-mile race with J. J. R. Special, Limberg's Delage, Devigne, Mulford and Rickenbacher in the front row and Franchi, Devlin, Adams, Vail and Resta behind

It was just 3 o'clock, lacking 2 min., when Fred Wagner started the thirteen entries around the track for a rolling start in the 20-mile event. Even then, the superstitious were shaking their heads as they counted the cars lined up across the track, but all superstition vanished in the whirling excitement as the cars flashed away on the 20-mile sprint. A 108-mile pace was immediately set up as Mulford's Peugeot took the lead in the first lap. Aitken, his team mate, was close behind followed by Rickenbacher in the Maxwell, then Devigne in the Delage, Limberg in another Delage and the hybrid Peusun with Franchi in sixth place. Christiaens' Sunbeam trailed along in seventh position.

Almost before the spectators had time to note the relative positions of the cars they were around again with Mulford still in the lead trailed by his team mate Aitken. These two were 300 yd. in advance of a group of five cars made up of Rickenbacher's Maxwell, Limberg's Delage, Devigne's Delage, Christiaens' Sunbeam which was now in sixth place having passed the Peusun which was seventh.

The third lap saw the two Peugeots with Mulford and Aitken an eighth lap ahead. Third place was still being held by Rickenbacher in the Maxwell and fourth place by Christiaens in the Sunbeam who had forged ahead of Limberg's Delage and Devigne's Delage. In the fourth lap Mulford and Aitken were increasing their lead, they were now almost a quarter lap before a group of three cars consisting of Limberg's Delage, Christiaens' Sunbeam and Rickenbacher's Maxwell. The other cars were trailing.

On the fifth lap the two leading Peugeots lapped the Adams Special directly in front of the stand. The group of three pursuers were still one-quarter lap behind the leaders with Christiaens in his Sunbeam back in fifth position. Thus they spun around the saucer, with the two Peugeots flying like hawks in advance of the field, followed a quarter lap behind by the group of three cars until in the seventh lap Christiaens began to creep up on the two flying Peugeots bringing his car into third position.

It was at this point that the break in the race came. Mulford had to stop for a tire and when, after making a quick change, he sought to again enter the race, his engine could

*Time for ninth lap; stopped and retired.

not be started. Glancing beneath his car a pool of gasoline could be seen and examination showed that a bolt had fallen from the carbureter, rendering necessary many precious seconds before it could be repaired. With this race a short sprint of 20 miles, it was hopeless for Mulford to go back, so he saved his car and strength for the next race. This left Aitken in the lead with Christiaens second and Limberg third followed by Rickenbacher in the Maxwell. These positions were held until the end.

Had the race lasted another lap it is doubtful if Christiaens could have finished. His engine faltered even as he crossed the finishing line and as he drew up in front of his pit he turned his car over to his attendants with a shake of the head signifying the doubt that was in his heart. Examination showed that the pulley wheel mounted on the end of the camshaft intended to drive the dash tachometer had broken through the housing and allowed oil to escape from the crankcase. This in turn caused seized bearings, which ended the activities of the Sunbeam car for the day.

Chandler Out on First Lap

Bill Chandler in the Crawford Special was another one whose ill fortunes came early. Chandler completed just one lap in the first event and was no longer a factor in the day's program. A piston seized and broken at the very start ended all the activities of this favorite of the speed world until he pilots his mount in the events at Indianapolis.

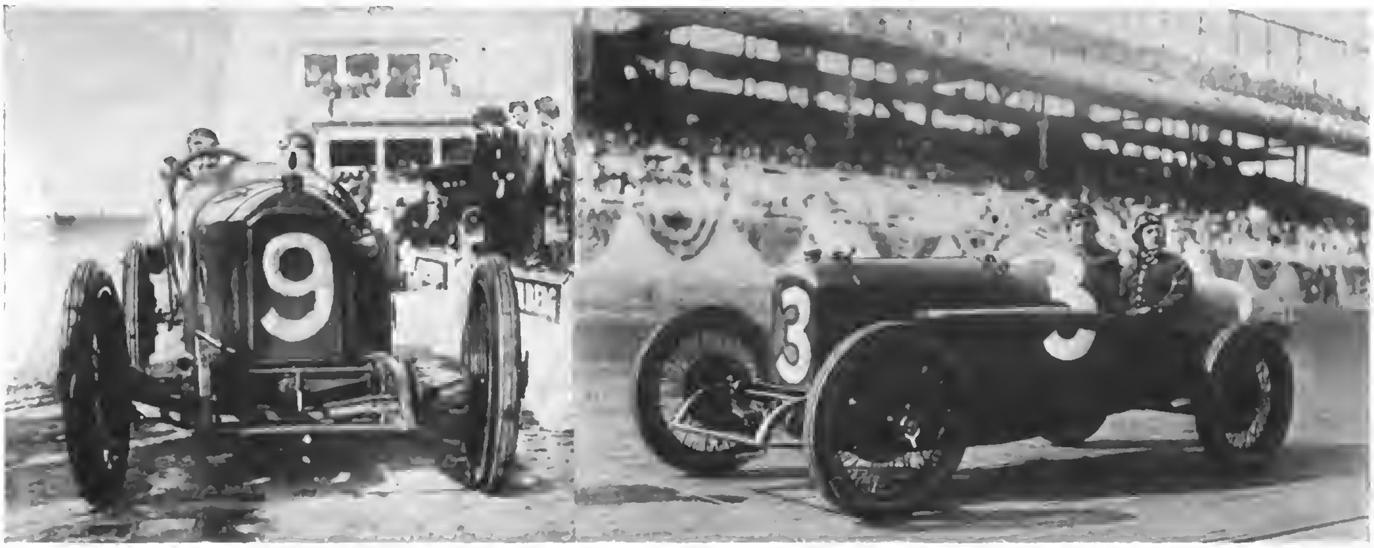
Above—Rickenbacher's Maxwell, which won the 150-mile race. Below—Vail's Hudson, which finished third in that race without making a single stop at the pits

Queens Cup Race 50 Miles

IN the interval between the 20-mile race and the Queens Cup, Katharine Stinson, a bundle of feminine courage of 20 years, entertained the spectators with some brilliant flying in a biplane. With two thin trails of smoke flying from the outer extremities of the wings of her air machine Miss Stinson drew figures of spirals and loops across the sky over the Sheepshead track.

Nine cars lined up before the judges' stand for the 50-mile event. This was started in the same way as the shorter race with a rolling start and all realized that the distance meant another sprint with better than 100 m.p.h. average to win. As the cars burst across the starting line Aitken's Peugeot, which had shown itself the fastest in the shorter race, again leaped forward to claim first honors, and at the end of the first lap the numbers 3 and 9 held respectively by Aitken and Mulford repeated the feat of holding the lead. The end of the first lap found Aitken and Mulford just ahead of Limberg in his Delage and Rickenbacher in the Maxwell. The next lap was covered in the same order with Henderson's Maxwell fifth, Devlin's Duesenberg sixth and Devigne's Delage seventh. Trailing behind were Franchi in the Peusun and Ira Vail in the Hudson. So close were the leaders to each other that the guidon of speed passed from hand to hand with Limberg in the Delage ahead at the end of the third lap. Aitken's Peugeot was now second with Mulford close behind in third position and Rickenbacher fourth.

The three leaders with their Nos. 6, 3 and 9 kept running around the track as regularly as clockwork through the interval between the third and thirteenth laps. The struggle for fourth place between Devlin in the Duesenberg and Devigne in the French Delage was keen until in the fifteenth lap when Mulford's Peugeot flashed to the front with Aitken in second place and Devigne's Delage in third, Devlin in the Duesenberg lodged himself safely in fourth place. Mulford



Left—Ralph Mulford in his Peugeot, which won the 50-mile Queens Cup race. Right—John Aitken's Peugeot, which won the 20-mile race in world's record time

was never again passed. Devlin crept up gradually holding third until the twentieth lap when he was passed by Franchi in the Peusun who had fought his way gamely all the way up from eighth place which he held in the second lap. The breaking point came for second place in the twenty-first lap when Aitken's Peugeot had to drop out with a burned-out bearing. Devigne's Delage which had been running fifth went out for good immediately afterwards for a second tire change which he realized destroyed his chances of finishing in the money. The four to finish were Mulford in the Peugeot first; Devlin, Duesenberg, second; Franchi, Peusun, third; Limberg, Delage, fourth.

Position Table of the 20-Mile Race for the Coney Island Cup

Car	Driver	1	2	3	4	5	6	7	8	9	10

Metropolitan Trophy Race—150 Miles

WITH the two short events over, the great crowd settled back with an air of expectancy to await the crowning affair of the day. This was to be a race of 150 miles for the Metropolitan trophy and a total of $15,000 in prize money. The winner was to secure $6,000 in cash with $3,500 for second place, $2,000 for third and graduated amounts down to $400 for seventh.

There were ten starters in this main event. Like greyhounds straining at their leashes as if it were with difficulty that they could be restrained from starting on their arrow-like whirl, they awaited the starter's word. Just shortly after 4 o'clock they were sent on their way for a flying start and crossed the line with a roar as they steadily gathered speed in a determined dash for a complete century and half another.

The slower of the cars had maximum speeds of close to 95 m.p.h. The fastest had speeds which none could tell as even the daring drivers hesitated to trust the masses of superfine steel to the powerful impulses which could thrust them forward at 120 m.p.h.

Every driver knew the race his car could run, and each was prepared to secure from it the best that was possible. The slower cars relied upon the destruction of metal and rubber that would accompany the speed of the high-strung pacemakers while the fast cars struck a pace which they knew would safely win if it could be sustained for the dis-

tance. It was a compromise with them between speed and material with the nerve of the driver and ability to hold his mount in control, taken for granted.

First to seize the lead in this event was Limberg in the Delage. The end of the first lap found him opening his space between the tail of his flying Delage and the radiator of Devigne in another car of the same make. Rickenbacher's Maxwell was third and Devlin's Duesenberg fourth.

Hot Pace Begins to Tell

Immediately the pace began to tell, and shifting positions among the leaders occurred. Limberg's Delage, however, was ever to the fore closely followed in the third lap by Resta and Mulford in their Peugeots. These cars set the pace. Close together they remained with Devigne in his Delage always struggling to be among the first three. He held this cherished position in the fifth lap but lost it again in the sixth and the order maintained until the end of the seventh lap was, with this momentary exception, Limberg, Mulford, Resta, Devlin and Rickenbacher. At the eighth round the two flying Peugeots nosed ahead of Limberg's Delage putting him into third place, but here the hot pace had its first telling effect when Mulford was forced to abandon the race with a broken piston head.

This left Resta in the lead in the ninth lap with Limberg second; Devigne, third; Rickenbacher, fourth; Devlin, fifth; Franchi, sixth, with Vail in the Hudson, Adams in the Adams Special and Watson in the J. J. R. trailing behind as seventh, eighth and ninth.

Resta's lead lasted but one lap as it was snatched away from him again by Limberg in the Delage. The Delages were proving to be fast as Devigne in his car was a close third and between these two French cars a hot pace was set. In the thirteenth lap a group of five cars was in the lead, the order being, Limberg, Resta, Devigne, Rickenbacher and Franchi. These were fully a half lap in front of the field and running at a speed which caused the spectators to prophesy well over 100 m.p.h. for the winner.

Limberg's lead was hotly contested. Resta, Devigne and Rickenbacher, closely pursuing, caught him on the back stretch after he had completed his fourteenth lap and then ensued one of the fastest sprints of the event. Danger was forgotten. None of the contestants thought of anything but the struggle for supremacy in the strife of speed. None would be first to obey the cry of caution to release to some slight degree the pressure of the foot on the accelerator pedal. Never did the gladiators of Rome battle better.

Up to this time there had been two stops at the pits, one on the ninth lap when Mulford was forced to abandon the race and one on the twelfth when the Adams Special had to change a right rear tire. Like meteors the speeding leaders were flying about the inverted dome but their positions varied from time to time as they fought for the key position. Limberg's gallant driving had won him a host of admirers and every time he passed the crowded stands he received a round of well-earned applause. But after he had passed his fourteenth lap and was soaring far up on the banked turn to enter the home stretch, the accident occurred which brought a chill to the hearts of the spectators and even caused the steel-nerved drivers to ease their pace until the average dropped below the hundred mark.

Resta Takes the Lead

With Limberg no longer in the race the burden of leadership passed to Resta, who held it in the teeth of the worrying pack of steel hounds who pursued him with unrelenting energy through many a weary mile between the fifteenth and thirty-fifth laps. All this time Rickenbacher in the Maxwell was in second place. A struggle for third and fourth was going on between Devigne and Devlin with Devigne holding third position in the twenty-fourth and twenty-fifth laps, Devlin holding it from the twenty-sixth to the thirty-seventh and then with third honors pass-

Whirlwind finish in the fight for second place in the 20-mile Coney Island Cup race. Christiaens crossed the line just ahead of Limberg and Rickenbacher

The new scoreboard, which is much more legible than the one used last Fall

ing to Devigne again until the fifty-eighth lap when he crawled into second place when Resta was forced to drop out and Rickenbacher took the lead.

Vail in his Hudson climbed into third place, beating out Devlin's Duesenberg in the seventy-first lap. Up to this time he had been running fourth with Devlin third. Fifth place was taken by Adams in the Adams Special which had run a consistent race throughout. Both the Hudson and the Adams while not so fast as Resta's Peugeot and the other speed creations had proved the value of the great increased factor of safety due to maintaining a steady but not excessive speed. Standing before the pits were the line of cars which had suffered in the grind and each one has meant a lesson which is far broader than the loss of a prize and which should be interpreted into invaluable stepping stones in the advancement of the art. Each broken car should prove a foundation for greater reliability and the lessons learned in this race will not only have their effects on the speed paths throughout the country this year but should also leave their imprint on the family stock car.

Handicap Race Postponed

A 10-mile handicap consolation race was scheduled to take place after the 150-mile Metropolitan trophy event. This was postponed indefinitely, however, out of respect for the death of Limberg and Pallotti. It is doubtful if it could have been run anyway, as darkness was beginning to spread over the track and the crowd was already leaving.

One of the features of the opening of the track for the 1916 season which was a great improvement over last fall is the new electrically-operated scoreboard. This was four or five times larger than the one used last year and could be read from the grandstand. It was a double-faced design so that the people in the bleachers on the back stretch could also read it. The scoreboard used during the 1915 season was blown down by the heavy gales during the winter. The new one has been placed in the center of the great ellipse.

It was only due to the skillful handling of their cars by some of the other drivers that other accidents did not follow that in which Limberg lost his life. The ambulance surgeon who reached Limberg's car which was then in flames at the bottom of the incline surmised that the occupants had been thrown over the edge when he saw that the burning car was empty. One of those who had reached the scene with the ambulance made a dash up the side of the track and reached the top, but the ambulance surgeon failed to acquire enough momentum to carry himself to the top and started to slip backward in the path of the oncoming cars. He was rescued from his precarious position by being pulled up by the man who had preceded him. Another physician in the meantime had rushed out of the grandstand where he was occupying a place as a spectator, and jumping into his car, had driven around to the outside of the track where the accident had occurred. He was the first to reach the body of Limberg and found the mechanician still breathing. Pallotti died in the ambulance on the way to the hospital.

Devigne was 50 ft. behind Limberg when the accident occurred and swung down the track to avoid the wreck. He spun around three times on the concrete level before he succeeded in regaining control of his car.

Pit Work Shows Poor Preparation

Nine Tire Stops and Eleven Mechanical—Eight Cars Drop Out at Pits for Permanent Trouble

Tabulation of Stops at Pits

20-Mile Event

Car	Driver	Lap No.	Time of Stop	Cause of Stop
Crawford Sp.	Chandler	1	Out	Piston seized and broken.
Adams Spec.	Adams	6	Out	Stripped driving splines on right axle shaft.
Peugeot	Mulford	7	Out	Connection between carbureter float chamber and mixing chamber broken.

50-Mile Event

Car	Driver	Lap No.	Time of Stop	Cause of Stop
Maxwell	Rickenbacher	7	20 sec.	Change right rear tire.
Maxwell	Rickenbacher	8	Out	Broken oil lead.
Delage	Limberg	12	30 sec.	Changed left rear tire.
Delage	Devigne	17	1:14	Changed right front tire.
Peugeot	Aitken	21	Out	Burned bearing.
Maxwell	Henderson	21	Out	Oil trouble, seized piston.
Delage	Devigne	22	1:	Changed right rear tire.

150-Mile Event

Car	Driver	Lap No.	Time of Stop	Cause of Stop
Peugeot	Mulford		Out	Piston head broken.
Adams Spec	Adams		1:	Changed right rear tire.
Peusuo	Franchi		Out	Broken connecting-rod.
Delage	Devigne		:40	Changed left rear tire.
J.J.R. Sp	Watsoo		1:20	Gasoline and oil.
Peugeot	Resta		1:	Changed right rear tire.
Maxwell	Rickenhacher		1:55	No. 4 ignition cable broken.
Peugeot	Resta		Out	Cracked cylinder.
J.J.R. Sp	Watson		:30	Misfiring, inspected ignition.
Delage	Devigoc		2:	Right front tire, engine on fire.
J.J.R. Sp	Watson		1:31	Right rear tire, inspected ignition.

IF short races give more excitement to the spectators, they certainly make a pit stop strike a very stirring chord on the heartstrings of the drivers and mechanics. In the 20- and 50-mile events a stop at the pit was a sacrifice of place. Three stops were made during the 20-mile event and as the drivers glanced around they saw that this meant withdrawal and none of them re-entered.

During the course of the afternoon there were twenty stops altogether, and eight of these were permanent. Nine stops were made for tires, four in the 50-mile event and five in the 150-mile. The remainder were mechanical troubles and of these only three were of a sufficiently trifling nature to allow the contestant to go on with the race, the others being so serious that this was impossible.

Looking at the pit work from the standpoint of efficiency, it was far below par. The importance of well-drilled pit crews seemed to be but little realized and the result was that in many instances there was considerable bungling of important jobs and consequent loss of time. An example of this was shown in an instance of a tire change. It seems almost foolish to say that a pit crew should be well drilled in making tire changes and yet an instance where considerable time was lost because one of the pit hands endeavored to take a wheel off by turning the retaining nut in the wrong direction is only one of the cases where time was lost. After he had thoroughly jammed the threads it was only with the greatest difficulty that the nut was spun off at all.

Resta's Cylinder Cracked

Another instance was when Resta stopped to change his spark plugs. It happened that the real cause of this trouble was a cracked cylinder and eventually he found that he could not go on. But at any rate after the plugs had been changed and he was again in his seat he found that although he had signalled for water the pit attendants had waited until he was all through changing plugs before they removed the radiator cap.

Going over the list of troubles as indicated by pit stops, it appears that lubricating difficulties are still too numerous. The light pistons and high speeds have rendered the oil film a very important part of the car's bill of health. The very first car out which was on the first lap of the first event was troubled with a seized piston. A broken oil lead put Rickenbacher's car out in the 50-mile event and Henderson's Maxwell went out with a seized piston due to oil trouble in the same race. In all probability Mulford's Peugeot which went out in the ninth lap in the 150-mile event after having won the previous race was troubled with this identical weakness.

Chandler Out at Start

In the first race Bill Chandler after making one lap had to withdraw his Crawford Special on account of a seized and broken piston. The Adams special went out in the sixth lap on account of stripping the driving splines in the right rear axle shaft and Mulford had to stop because a screw entering the nozzle passage of the carbureter became loose.

In the second, or 50-mile event, the first pit stop came when Rickenbacher brought his car in for the quickest tire change of the day. He was off in 20 sec. with a new right rear wheel. In his next lap, however, a broken oil lead forced him to stop until the next race.

Devigne's Delage took fire at the pits while changing a tire but the extinguisher brigade made short work of the blaze

In the twelfth lap Limberg changed a left rear tire in 30 sec. Devigne changed a right front in the seventeenth in 1 min. Henderson's Maxwell went out with oil trouble in the twenty-first lap and Devigne again changed the tire, this time a right rear in the twenty-second lap. The change occupied 1 min.

Mulford's Peugeot Breaks Piston

In the 150-mile race nine laps were covered before the first car stopped at the pits. Mulford's Peugeot then came limping in with a broken piston head which ended his participation for the day. In the twelfth lap the Adams special changed a right rear tire in 1 min. and no further stops were made until the twenty-fifth when the Peusun car, a combination of Peugeot chassis and Sunbeam motor, went out with a broken rod. In the twenty-sixth lap Devigne's Delage made a tire change in 40 sec. and in the twenty-eighth the J. J. R., with Watson driving, had to stop for gasoline and oil. This was the only stop of the day in which more fuel or lubricant was taken aboard.

A steady grind ensued after the twenty-eighth lap until the fifty-sixth was reached. Here Resta in the Peugeot changed a right rear tire, the shift of wheels occupying an interval of 1 min. A broken ignition cable connecting the distributor with the No. 4 spark plug held out Rickenbacher in the Maxwell for 1 min. and 55 sec. in his fifty-eighth lap. In Resta's fifty-eighth lap the broken cylinder occurred. When he first stopped he thought only a change of plugs was necessary, but after starting, a gush of water down the exterior of the motor showed that he was out for good.

The J. J. R. special paused for 30 sec. to inspect the ignition in the sixtieth lap and seven laps later a tire change was made on the right rear and another inspection of the ignition. In the sixty-sixth lap Devigne's Delage took fire but this was extinguished without lifting the hood by the busy Pyrene squad, whose energy on this occasion boded ill for any conflagration within reach of their streams.

Limberg Killed in Metropolitan Event

THE accident during the Metropolitan Trophy race to Carl Limberg was the first that has occurred during a contest at the Sheepshead Bay track, although Harry Grant was burned and fatally injured in his car last year. Carl Limberg was born in the West but came East in 1907, when he was very active as a bicycle rider. He attained prominence in the bicycle world while riding in six-day events and was paired in Madison Square Garden in 1904 with Hardy Downing.

Carl Limberg and his mechanician, Roxie A. Pallotti, just before the start of the 150-mile race

With Downing as partner and also with Burton Downing, a brother of Hardy's, Limberg took part in many of the bicycle races. As a member of the Chalmers team he won the American road championship and his knowledge of track work as picked up in the bicycle field stood him in good stead.

Limberg was married and since his wedding has lived in this city. His last place of residence was at the Woodstock Hotel on Forty-third Street. Although quite young in appearance he was about thirty-two years old, and it was quite difficult to believe from his youthful countenance that he had been in the cycling and automobile fields for nearly a score of years.

For several years Limberg was a team mate of Harry Grant, who, as stated, was fatally burned on the same track. He drove a Haupt-Rockwell in the 1910 Vanderbilt and an Abbott in the 1911 Vanderbilt and Grand Prix races. He raced with Grant in the 1915 Indianapolis and Chicago races, and in the Astor cup race last fall he finished in sixth place. After this event he was sent to France by H. S. Harkness, by whom he was employed, and who holds the office of president of the Sheepshead Bay Speedway Corp. At this time Limberg brought back three new cars, in one of which he was killed.

Roxie A. Pallotti, Limberg's mechanician, who was also killed in the fatal accident, was a native of Italy. He received his early training in the automobile business in that country and had been employed in various automobile factories in Europe and America.

Italian Car Factories Speeding Up

Plant Extensions Are the Order of the Day—Aeroplanes Increase Car and Truck Makers' Work—All Workers Placed Under Military Discipline

TURIN, ITALY, April 2.—Extensions are the rule among Italian automobile factories, and in every shop speeding up is being attempted. The factories are supplying all their own army's requirements and are shipping considerably to France. No foreign trucks or touring cars are being imported into Italy. Shipments to England appear to have fallen off, the best Italian customer now being France. In taking as many Italian trucks as possible, in preference to American, the French authorities avoid freight difficulties and the attendant high cost, and also have the advantage of a favorable monetary rate of exchange. The exchange between France and Italy is about 10 per cent in favor of the former country, while between France and America it is 20 per cent in favor of the latter country. It is claimed that practically all the trucks attached to the Verdun army have been supplied by Fiat. This army of 250,000 men is entirely dependent on automobile traction for its food, ammunition and general transportation. The position here is such that the Germans have been able to bombard all the railroad lines a considerable distance in the rear of the French, making it necessary for everything to be brought up by road. This appears to be the only case along the whole battle front of France in which complete dependence has had to be placed on automobiles. The manner in which the French have been able to hold in check the most formidable attempts of the German army to break through is proof that automobile traction has been equal to the task imposed upon it.

Aeroplanes Increase Work

Increased work has been thrown on the Italian automobile factories by the extension of the aeroplane service. After hesitating a long time between the airship and the aeroplane, and being the victims of interested partisans, the Italian authorities, like those of France and England, have decided definitely in favor of the heavier than air type. A well defined program is in course of execution, and its completion will place Italy in the front rank. In aeroplane design the Italians are receiving all their inspiration from France, every leading French army type of machine being built under license in Italy. The Italians are more independent as regards motors, and although the same general lines are being followed as in France, the design is entirely Italian. All the Italian automobile factories are actively producing aeroplane engines, and in addition the Italian Gnome and Rhone Company is producing rotaries. As in France, the Rhone motor appears to be preferred to the Gnome. This company was established in 1912 with less than a score of workpeople, and now has several hundreds and is still extending. Quite recently the Gnome people of Paris sold out the greater portion of their holdings in the Italian branch to a French group in which the Darracq automobile company predominates. The Seguin Brothers who founded the Gnome company in France, retain all their interests in the parent company, and in the Rhone concern which has been incorporated with it. There is a decided move toward motors of 200 to 300 hp., these of course all being of the fixed-cylinder water-cooled type. This same tendency is observable in other European armies.

Despite the war, experimental work is being carried out in most of the factories and new models are being prepared, although the number of cars built for private use is decidedly small. The small high-speed twelve-cylinder motor—a motor of not more than 2½ in. bore and running at 3000 r.p.m.—is receiving attention; also work is being done on small four-cylinder models, corresponding roughly to the cheaper American types but having a more elaborate finish than is usually found on cars of the less than $1,000 class.

Italy Independent of Outside Supplies

Italy appears to be fairly independent of outside supplies except of magnetos and tires, both of which are being imported from America. The result of the war has been to make the factories more independent. Fiat for instance, is now producing all electric equipment for its own cars—lighting and starting sets—and will, it is declared, build magnetos also within a very short time. As this factory is doubtless the largest in Europe, the move is of no small importance.

Italian, French and English automobile manufacturers intend to be independent of Germany for magneto supplies, and also, if possible, to be self-supplying in this matter. This independence has not yet been reached, for American magnetos are still selling freely. Recently a French commission agent received intimation from New York that 1000 magnetos could be shipped immediately. A communication was sent to the five leading French automobile factories, and in a few hours the lot of 1000 had been sold and application made for 3000 more.

Italy is very little disturbed by England's decision to forbid the importation of touring cars for private use. The volume of this business has been small, there are considerable difficulties in shipping, and the home army can absorb all that the factories can produce. France appears to be equally indifferent, for it is freely admitted that the production of private cars is not as profitable as the manufacture of shells and other war material. The net result will be that a number of Italian and French agents in London will close their showrooms.

All Under Military Discipline

All workers in Italian factories are now under military discipline. This applies not only to men who are eligible for active service in the field and who have been placed in the factories instead, but to those whose classes have not yet been called up for active service. The former are identified by a tricolor armlet, which must always be worn, and the latter have a special army badge in their buttonholes. Failure to report at work, or even late arrival, is punished immediately, and a second or third offence is liable to entail imprisonment. All strangers are kept away from the factories.

The normal working day is 10 hr., but most men do 2 hr. a day overtime, making a working day of 12 hr. All factories are running two shifts. On Sundays factories run half days. Some time ago the workers in the automobile and general engineering factories secured Saturday afternoon half holiday, as in England, but this has been abolished by order of the military authorities. One of the leading factories is endeavoring to enforce more stringent laws than are stipulated by the military authorities, and has given instructions that work must be carried on all day Sunday and on all holidays. From the standpoint of the manufacturer this is a move of very doubtful intelligence, it having been clearly proved elsewhere that if exerted beyond a certain degree labor goes stale and production falls off.

This attempt to enforce 360 working days a year is arousing the opposition of the working classes. In the socialistic press vigorous attacks are being made on the individuals directly responsible for the new conditions. There is no reason to believe that this move will become serious, for the spirit of the people is right; nevertheless there is plenty of material for the agitators, and when protesting against the attempt to speed up they do not forget to mention that last year the Fiat company earned more than $3,000,000, after paying big fees to the directors.

Gasoline now costs three times more than before the war. Italy is, of course, shut off from European supplies and must import exclusively from America, paying high freights and insurance. The army authorities get all the gas they require for automobile and aeroplane services, but it is not always an easy matter for the private owner to get enough to keep a car in commission. There are no restrictions on the use of cars outside the army zone, and no attempts to artificially control the gasoline supply. Within the interior of Italy motorists can move about as freely as in peace times, provided they can get supplies of gas; but toward the frontiers very stringent regulations are in force. This applies not only to the Austrian frontier, where fighting is in progress, but to the French frontier and particularly to that of Switzerland. Unless a special pass has been obtained, these zones cannot be approached in an automobile, the military restrictions being rigidly enforced in every particular.

New Scripps-Booth Four-Passenger Eight Has Sociability Seating

New Scripps-Booth four-passenger eight-cylinder model, showing seating arrangements

ALTHOUGH description and details of the new Scripps-Booth four-passenger, eight-cylinder model were given in a recent issue, actual photographs of the new car are just available, and reveal the fact that the latest creation lives up to the body standard already set by the earlier Scripps-Booth design.

The seating arrangement is what might be termed the sociability type, in which entrance to the rear compartment is effected through a 7-in. passage between the individual front seats, there being only two doors to the body. The same general curve and sloping lines which are given the roadster are carried out in the four-passenger car, with the windshield tilted backward at a slight angle, in conformity with the curve of the cowl at this point. Back of either front seat a semi-deck idea has been carried out which adds materially to the general appearance. At the rear the body is curved outward and the spare wire wheel lends a finishing touch. The fenders are crowned and follow closely the curve of the wheels, with nothing whatever on either running board to disturb the sloping effect of the whole.

The extreme body width is 46 in., while the rear seat has a width of 34 in., with a depth of 22 in. Front seats are each 16 in. wide and 21 in. deep. There is a surprising amount of leg room in either compartment.

Some of the mechanical details of this new Scripps-Booth include the 2⅝ by 2¾ in. overhead valve, eight-cylinder motor, which develops 35 hp.; Wagner starting and lighting by a two-unit system; thermo-syphon cooling system; Zenith carbureter; Remy ignition; multiple-disk clutch; three-speed gearset; three-quarter floating rear axle; cantilever rear springs, and 34 by 4 tires. The wheelbase is 120 in.

One of the features of the motor is the provision for easy adjustment of the inclosed overhead valves in that adjustment of the clearance between the end of the valve rod and the rocker which actuates the the valve stem is afforded by the adjusting nut protruding through the top of the cover plate. By means of these facilities it is possible to adjust the valve clearance while the engine is running, if desired. First the cap which goes over the adjustment proper is removed and then a screwdriver may be used to turn the slotted head of the adjusting nut, the locking nut having to be loosened first. An experienced person can tell by the feeling of the valve rod just how much clearance there is.

The Remy distributer is vertically mounted, so as to be driven by a worm gear off the front end of the camshaft. The coil is mounted in close proximity to the distributer and both are adjacent to the generator. Centralization of the electric apparatus is the result and it tends to shorter wiring.

Paragraphs on Current Topics

By Marius C. Krarup

Motto: Radical Thought, Conservative Action.

Many hopes were centered once in acetylene gas as a motor fuel. Absorption in acetone finally made it safe enough for illumination purposes. But its extremely wide range of explosiveness in admixture with atmospheric air operated against its use in any other form and still restricts its employment for autogenous welding and metal-cutting. The lessons in caution were taught mainly through accidents, and it was only at a comparatively late date that the figures were ascertained which explained them. Anywhere from 2½ to 65 per cent of acetylene gas mixed with air forms an explosive mixture. That is too dangerous. In these days of gasoline substitutes—formed in part by the decomposition of water, it seems, like acetylene—it might be well to reverse the order of proceedings and start with an examination of the fluids and their vapors rather than with accidents. Should it be found that the vapors form an explosive at almost any rate of admixture with air, it would be safe to insist on a suitable modification before employing the fluid in automobile motors. On the other hand, if a fluid such as that discovered by Enricht is found to be safe and may be produced from a relatively small quantity of solids, by their action on water—stating the case roughly—what a remarkable effect in military transportation affairs we would at once be called upon to consider. An expedition such as that which went into Mexico recently could then carry sufficient fuel to warrant the extensive use of automobiles for the transportation of soldiers, ammunition and other supplies. The rapidity of a raid could be trebled and therewith the chances for success. The anomaly of forced and exhausting marches for men and horses in this age of motor vehicles could then be avoided, and much of the laborious organization of the rear guard which is now necessary could be dispensed with.

□□□□□

The Preparedness parade in New York now being over and a receptive mood engendered, engineers ask with their usual professional frankness for complete specifications. We want an efficient Preparedness, if not necessarily the cheapest; plain preparedness, with a small p, in defense of PROSPERITY, in caps.

□□□□□

What is the difference between new construction and invention? The question has been asked and the S. A. E. committee on nomenclature has not yet supplied the answer. "Construct more, invent less" (*Mehr construieren, weniger erfinden*), was Guldner's advice to engineers, meaning about the same as the Roman: *Natura non saltat*, applied to industrial progress, or "Avoid leaps in the development." But there is a financial side also, and American investors will have none of construction, as a rule, while invention often appeals to their fancy, even though it usually has to be reconstructed afterward. Can it be that you "construct" for your own business and "invent" for somebody-else's? That no other distinction is possible?

□□□□□

Though a taste for hard work is now considered a virtue of the first order only in unskilled men and horses, it is noticed that a large majority of the air pumps used for compressing air, either in tanks or in tires, are of the hard working variety and are lacking in efficiency by reason of high piston friction and slow operation. If worked by hand they usually involve a large reciprocating movement of a human body. Probably the net efficiency does not exceed 5 per cent, and the rest is mortification of the flesh. Rotary motion by foot pressure is almost as uncommon as the employment of a liquid (glycerine) piston working perfectly without tight packings. There must be room for better average methods and a more widespread appreciation of what they should be. On another page an air pump construction is illustrated which may suggest ideas on this subject, although it is not directly applicable to any other automobile uses than that of keeping air tanks in garages supplied with pressure.

□□□□□

A New York daily insists repeatedly, and with some editorial chagrin, on the rule that pedestrians should cross at the crossings under the supervision of the traffic squad officer, as recommended by the Safety First Federation of America, and believes that strict enforcement of this regulation would reduce the number of accidents. That one person should be able and constantly willing to do better for thousands than each is able to do for himself, remains, however, a theory anything but plausible to those who have confidence in their own faculties, and many find it safer and far more comfortable to pick their own way, preferably at the middle of a block, where the periodic stoppage of the traffic at the intersections leaves a perfectly free passage at almost regular intervals. The rule is a good one to follow for the majority and to break for the few. It works best when not enforced.

□□□□□

Had a case ever come to notice in which a driver of a car operated one set of brakes to avert an accident and, after finding it out of order, operated the second set in time to accomplish his purpose, the belief that two sets of brakes are worth less than one might be hard to defend. As everybody knows, however, the emergency brakes are used in practice only to hold a car at a standstill on an incline, and the service brakes could easily be connected with a notched quadrant or bar for that purpose, still leaving the ordinary operation as free as it is now. This being the situation, it is obviously suggested that the equipment of cars with two sets probably is little more or better than a needless survival from the days in 1897 and 1898, when officials all over were nervous about the control of automobiles and imposed restrictions upon design and construction somewhat as their inexperienced fancy dictated. Brakes, particularly, became an official hobby for legislators, not here only, but in even higher degree in France. An imperative precedent was created. But at this more advanced stage it should be possible to reason on the subject. And it is well understood that one perfectly reliable set of brakes will do all the retarding required; that it is more easily and safely kept in good order than two; and that the use of two on the rear wheels interferes with the best construction and dimensions for each of them, the contracting band brake, for example, hindering the cooling of the expansion brake. It is also understood that, if one of the two sets were abandoned, there would be a better chance for getting perfected the sort of brake which could be used constantly on long declivities without overheating, or perhaps for getting adopted a system acting on both front and rear wheels in the most approved manner. At all events, the question of two sets or one should probably be a current topic, even though in reality it has not yet impressed either the industry or the public very seriously.

* * *

In Major Lawton's list of requirements for army trucks one of the most impressive is to the effect that all vehicles to be operated together should be of the same make, in order to have the repair department efficient. Among the lessons he draws from the present war he places in the first line that "ordinary commercial trucks are best; the special body types not necessary." But among the problems to be solved by American truck manufacturers, he mentions as the fourth: "Determination of the best body for use." A lightly built two-ton stake truck with large platform and storage for tarpaulins and rope in the platform was found the most useful type of all, according to another source of information, being especially valuable for the rapid shifting of troops over poor roads. It holds more men than any other type, and they can get on and off most quickly.

* * *

The buying public is the final judge of construction it is commonly said, even among engineers. The public's verdict is not based on technical argument, but on practical performance, they add. Against the trend of these statements let a few other ones be registered. For example: The public's verdict varies from day to day as well as geographically. Good technical argument gives full consideration to practical performance. Every smart salesman influences the public verdict. Every captivating advertisement does likewise. And does the public buy practical performance in anything else, aside from automobiles—in literature, stage productions, food, drinks, homes—or does it buy something which appears at the moment sentimentally satisfying? If there is a schism between technical conclusions and practical results, there remains the explanation that the technical argument is not quite strong enough or is not sufficiently fortified with human shrewdness.

WAR CORRESPONDENCE:—M. Krayn, Berlin—*Konstruktionsberechnungen* etc., by A. G. von Loewe, which you posted us in December, according to your letter of advisement which reached us in February, has not yet arrived. The censors at Falmouth or Kirkwall may suspect a code in the formulas and equations, or the information contained in the book may be too valuable to be passed along. Hoping that they will soon get through studying it, we remain——

Failing to reach the German publisher by letter, we are trying this method, as THE AUTOMOBILE still reaches Germany, at least occasionally, this being evident from the articles which are found translated in German automobile publications, some of the latter continuing to arrive, though at very irregular intervals. Von Loewe's book deals largely with formulas for design and methods of manufacture, and is said to be very interesting.

Rotary Valveless Air Pump Suitable for Garages

AMONG new constructions of British design there appeared last year in the market a rotary and valveless air pump well suited to be driven from a small electric motor, as the resistance to its operation is never concentrated at any one point and high pressures must be produced through high speed of the machine. It is made by Globe Pneumatic Engineering Company of London, but during war conditions is probably mainly of interest to Americans as a subject for study. The illustrations and description given herewith are taken from *Engineering* of July 23, 1915.

A photograph of the rotor is reproduced in Fig. 1, while Fig. 2 shows a longitudinal section of the pump together with a centrifugal device at its left for separating water from the air. and Fig. 3 shows an end view and cross-section. The essential parts of the pump are the rotor, Fig. 1, which is shown at *A* in Figs. 2 and 3, and the drum shown at *B* in Figs. 2 and 3. The casing *C* protects the pump from dirt and shields the rotating drum but takes no part in the action.

The rotor is built up of a cast central spider carrying an outer ring which has a deep double screwthread on its circumference. This thread is right-handed over half the width of the rotor surface and left-handed over the other half. Crosswise of these very deep threads there run partitions of half the depth, as shown in Fig. 2, and fairly close together all around, as can be seen in Fig. 1. The rotor is coupled rigidly to a shaft which is made in two parts with facing couplings bolted together through the center of the rotor. The part of the shaft to the left is hollow and the bore forms part of the suction pipe.

The pump is here described as a vacuum pump, but by reversing the operation it becomes a compressor and the hollow portion of the shaft becomes the discharge pipe for the compressed air. When used for high compression the speed of the pump must be proportionately higher than for exhaust work.

The rotor is carried on SKF ball bearings which are mounted on bosses forming parts of the frame *C*. Drum *B* is practically a plain cylinder with closed ends and is also mounted on ball bearings mounted on the same bosses that carry those for the rotor. But the relations of the drum to the rotor and of the two sets of bearings are eccentric, the drum being lower.

When the pump is to be operated, water is run into the drum through pipe *D*, Fig. 2, until it stands at the level of the bottom of the hole in the guard-ring *E*. If more water were run in, it would run out into the bottom of the casing *C*. The rotor is then driven around by an electric motor or any other convenient and suitable means. In rotating, the rotor tends to carry the water with it, partly owing to surface friction and partly to the trapping of the water by the cross-partitions between the helical circumferential grooves. The drum, being quite free to rotate on its bearings, is carried along with the rotor by the skin friction of the water, and 15 to 30 sec. after the movement is started the rotor and the drum therefore rotate together, and the water which is carried around between them distributes itself by centrifugal force at a uniform depth all around the inside of the drum.

Pumping now takes place owing to the action of the screw-thread grooves on the rotor and the eccentric position of the drum. The water being evenly distributed, any part of the partitioned circumference of the rotor

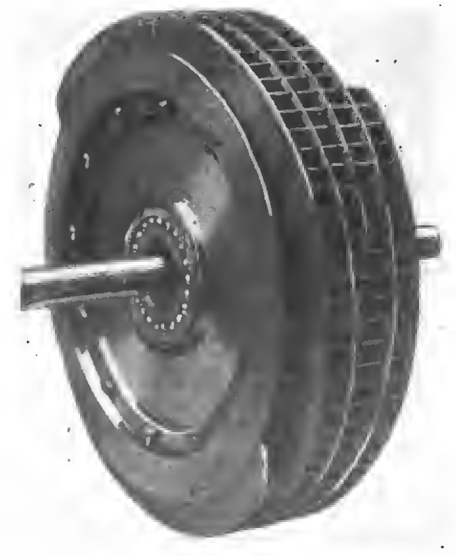

Fig. 1—Rotor of Globe-Johnston rotary valveless air pump

continually dips deeper into the cylinder of water surrounding it as that part approaches the top position, and it lifts partly out of the water as it approaches the bottom. This tide of water between the threads causes the pumping, as follows. Air passes from the hollow shaft through a space in the center of the rotor spider to the circumference of the rotor between the right-handed and left-handed threads. At the bottom of the rotor the tide is low, and, as a consequence, communication is established around the end of the inner thread—when this is at the bottom—between the suction channel and the unfilled space between the threads. As the rotor moves further around, however, it dips more deeply into the water and consequently the connection of the air spaces is very shortly severed, the rising water in the groove interrupting it. A bulk of air is thus isolated in the passage, and, as the rotor continues to move around, this air is driven forward through the passage between the threads, because the passage continually decreases in cubic capacity through the rise of the tide in it. The trapped air is thus driven along between two threads and is discharged when it reaches the end. It begins to leave the rotor at the point where the outer edge of the ring *F* leaves the water. At this point communication is established from the passage between the threads to the inside of the drum, and from there the air escapes into the casing through the holes *G* shown in Fig. 2. The discharge action can be clearly understood from the photographic view of the rotor, Fig. 1. The ring *F* is there well shown. Toward the top of the rotor this ring dips into the water, so that there is no connection from the passage between the threads to the inside of the drum. Toward the bottom of the rotor, however, where this ring leaves the water, the air escapes around the end of the last thread and passes to exhaust. As the rotor is double-threaded there are two discharges per revolution. The use of right and left-handed threads eliminates end thrust. Air enters at the center of the rotor, passes in both axial directions and is discharged at both sides.

It will be clear that in this interesting mechanical arrangement the rotation of the drum and of the water have nothing directly to do with the pumping action. The pump would work equally well if the water were standing still around it, provided such a thing were possible, but the rotation of the drum is of course necessary to maintain the water ring. It also has the advantage of eliminating friction, neither the rotor nor the drum having any motion relative to the water in the direction of rotation, and the drum no motion radially, either. Only some slip of the drum may occur, owing to the slight resistance in its ball bearings and external air friction within the casing.

The pump has no rubbing parts, except the bearings, and there is apparently nothing which is liable either to wear or to get out of order. No water is consumed except what is carried off by evaporation with the pumped air. The water is merely a seal. The drum may be filled to the correct height and left alone for a long time. But, if the level of the water falls seriously below this height, the capacity of the pump will decrease, and to avoid this a continuous water circulation may be arranged for.

When the pump is used as a compressor the water ring has to maintain the pressure of the receiver tank. If it could not do this, the water would be forced out of the drum over the guard-ring *E* and into the casing. It must maintain this back pressure by its centrifugal force, and consequently the higher the pressure the greater must be the speed of revolution.

[A loose estimate would indicate that for the purpose of compressing air in a garage tank a speed of 6000 to 8000 revolutions per minute might be required.—M. C. K.]

Adaptation to Fire-Engine Pumps

As the wide adoption of motorized fire-fighting apparatus for American municipalities bids fair to be continued and greatly extended, many designers are undoubtedly working on improvements for the type of fire engine in which the use of centrifugal pumps is the main characteristic. Were it not for the necessity—existing in those locations where the water supply is not under pressure—of priming these pumps with water in order to start the stream, they would oust the more cumbersome reciprocating pumps, and the apparatus on the whole would be cheapened and improved. In this connection, too, the Globe-Johnston air pump seems to suggest ideas which might be turned to excellent account in capable hands.

The subject is too large and specific to be dealt with in detail in this place, but to make the suggestion which the Globe-Johnston pump mechanism conveys a little clearer, it may be mentioned that the small water supply—sometimes 100 gallons—which is usually carried for starting the centrifugal pump occasionally fails to accomplish the starting, due to leaks in the suction hose or hasty coupling, and then delay is caused which may prove costly. A simple and positive rotary suction pump would overcome this defect and permit dispensing with the auxiliary water tank.—M. C. K.

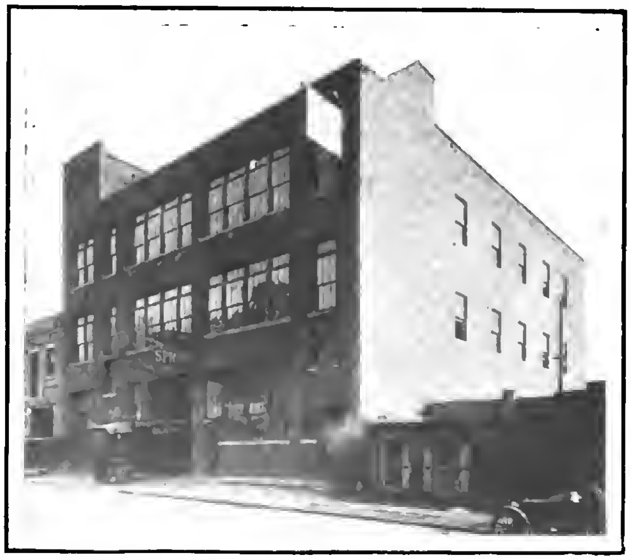
Perfection Spring Erects Service Building

Self-Supporting Plant in New York Manufactures Its Own Stock in Accordance with Home Factory Standards

A NEW standard in service for automobile spring users has been set by the Perfection Spring Co. in opening what may be called the first complete spring service plant in New York City. Housed in a three-story building which will eventually be increased to five, designed especially to meet the requirements of an ideal spring service station, the new plant of the Perfection company is of particular interest.

The service work is designed to not only take care of individual owners but also to lend a helping hand as far as springs are concerned to the automobile repair and service shops in the vicinity. There is nothing in the way of automobile springs which cannot be handled quickly and efficiently in this shop because it is not only supplied with a large amount of stock springs for standard models but is also in a position to manufacture springs for obsolete models or for special cars.

An interesting feature of the plant is that it is entirely self-supporting. It is equipped with its own heat-treating plant, pyrometer, testing machinery, etc., and in the hands of men who are familiar with the methods and standards of workmanship of the home plant in Cleveland. Hence, the work done in the main factory can be duplicated in this combination service and manufacturing plant. Primarily, however, the building has been laid out for service with manufacturing as a secondary consideration, although nothing has been neglected to make equipment for the latter complete.



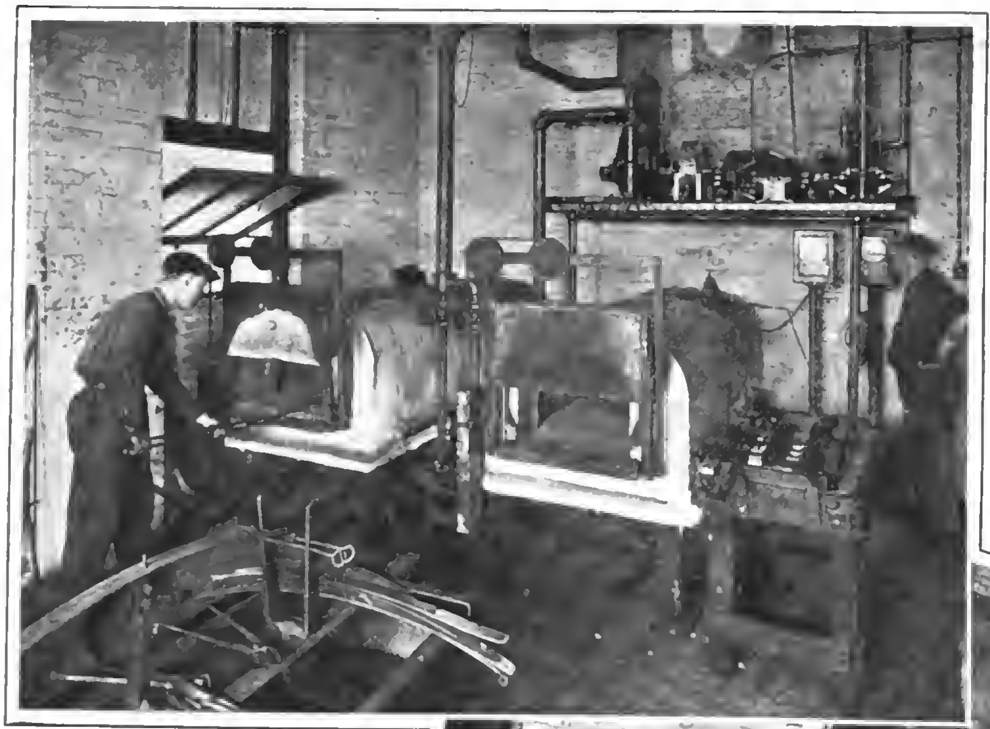
The three-story building which will eventually be made a five-story structure

There is no truck too large nor roadster too small to be taken care of in the shops; and, owing to the fact that the building has been laid out particularly for spring work there are a number of facilities which permit the workmen to operate at a great advantage and hence reduce to a minimum the length of time spent on any job. Perhaps the most noteworthy feature in this respect is the use of bays in which the cars are run over a long deep pit on tracks formed of built-up H-beams. There are twelve of these bays, nine being designed for touring cars of any size and three for trucks of any capacity. The width of the track of some of these bays is adjustable and cars other than of standard tread can be handled just as readily as those with the 56-in. span.

The area of each floor is 75 by 100 ft. with a wide aisle down the center of the first floor and the bays arranged six on a side. As a car enters the door, which is in the center of the first floor, it is stopped opposite the office and the necessary job tickets, etc., arranged. The car is immediately swung around on a combination truck and jack and pushed on to the H-beam tracks over the pits. The men are then free to work on it and if the car has been built any year after 1909 the stock spring will probably be found in the stock storage room of the plant. In case of an odd spring or an odd leaf it can be made in quick time in the shop.

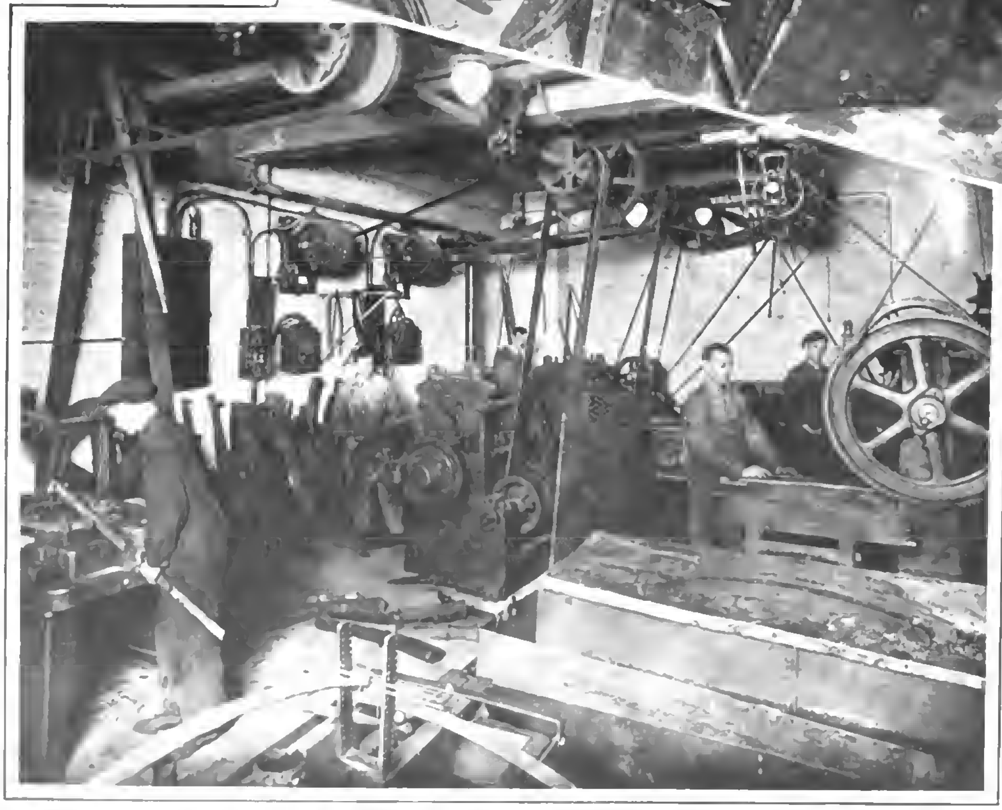
With the cars on the bay the workman has the spring at about shoulder height and is therefore able to accomplish the work in much handier style than if he were compelled to labor in a stooping position or lying on his back. This arrangement for the convenience of the workmen has its reflection in the time on a given job and also permits of much greater care in setting up bolts on spring clips and other

Perfection Spring Service Factory



Top, left—Heat treating furnaces and pyrometers used in the Perfection Co.'s New York plant. These furnaces are equipped and arranged to give the same heat treatments as are afforded the springs in the home plant of the company

Center—Heat treating baths employed in tempering the spring leaves made in the New York plant. An economical arrangement is secured by having the workmen between the furnaces and the heat-treating baths



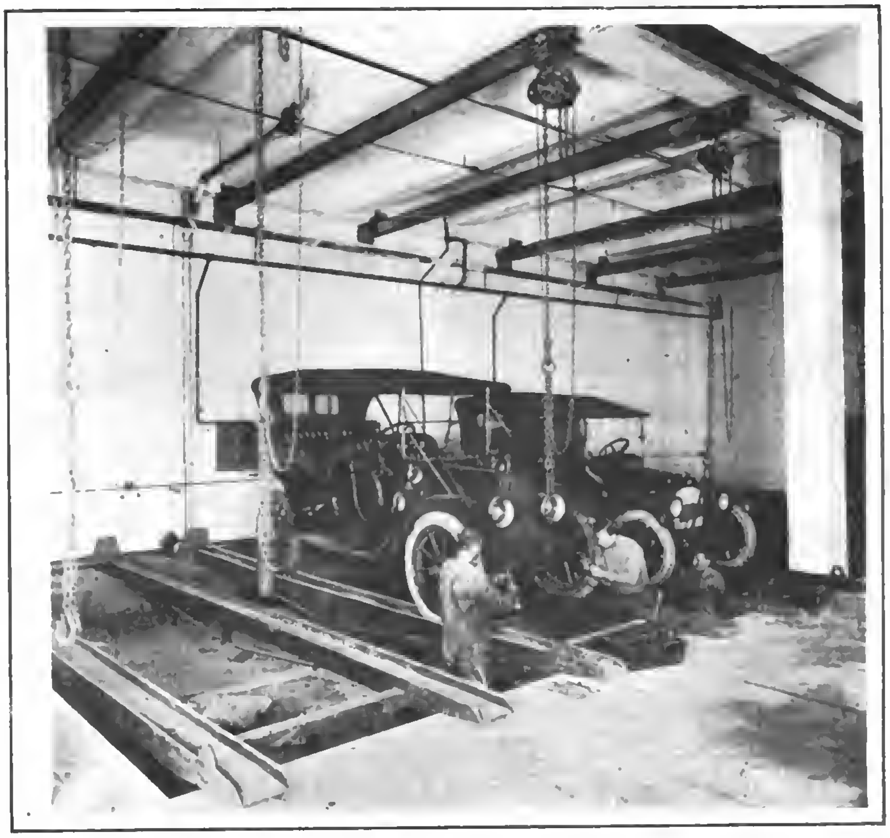
Bottom—Machine shop for turning out the finished springs. Note the individual motor drive to each machine. This machine shop is located in the same room with the heat-treating plants and the dipping baths, giving a full spring factory in one room, so that all kinds of spring work can be done parts which are very often located so inaccessibly that it is difficult to properly adjust them.

Chain Hoists Used

Above each of the bays supported by overhead I-beams are chain hoists. These are capable of lifting any of the cars which enter the shop and are graduated according to the size of the bay. The smallest bays have H-beam tracks which are 9¼ in. wide. The track beams for the large trucks are 30 in. in width and the overhead hoisting apparatus is graduated in much the same way. The tread distance from center to center on the touring car tracks is 56 in. and for the trucks it is 70 in. normally, although adjustments can be made, as stated, for variation of the tread.

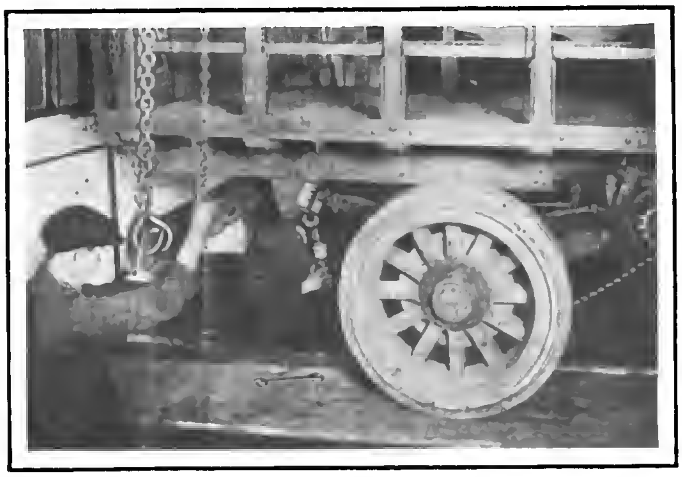
Shop Is 50 by 22

In order to take care of the trucks fitted with very high bodies the ceiling height of the first floor is 16 ft. and as the maximum truck height is close to 14 ft., this leaves 2 ft. for exceptional circumstances. The elevator is also of large size, the dimensions being 12½ by 27 ft. On the second floor the supports have been arranged especially to take care of the heavy loads of spring stock. The capacity of the floor is 250 lb. per square foot. The idea of placing stock on the second floor is that eventually when municipal improvements have been made this will be on a level with the elevated freight lines which have been planned for, making shipping and receiving stock very easy matters.



Passenger cars mounted on the bays awaiting the attention of the Perfection service men

One of the interesting parts of the layout is the shop. This is on the first floor behind the main room containing the bays. It occupies a space 50 ft. across and 22 ft. deep. At one end are two heat-treating furnaces and pyrometers fully equipped to provide the same delicacy of control as is used in the home plant of the Perfection company in Cleveland. The workmen are familiar with the heats used in the Cleveland plant so that a finished spring produced in New York has the same materials and the same heat treatment as it would have had it come from the home plant. Behind the heat-treating furnaces are the dipping baths so that a workman operates between the furnace and the bath, being free to take the materials from the furnace and immerse them immediately in the heat-treating oils. The machine necessary for shearing the spring material, grinding the leaves, wrapping the eyes and doing other necessary machine work in the process of manufacture are all operated by individual motors supplied by current taken from the public service lines. The fuel used in the furnaces is gas which is also piped into the building from the outside lines.



Bay arrangement permits men to work on the springs at eye level, thus improving speed and quality of work

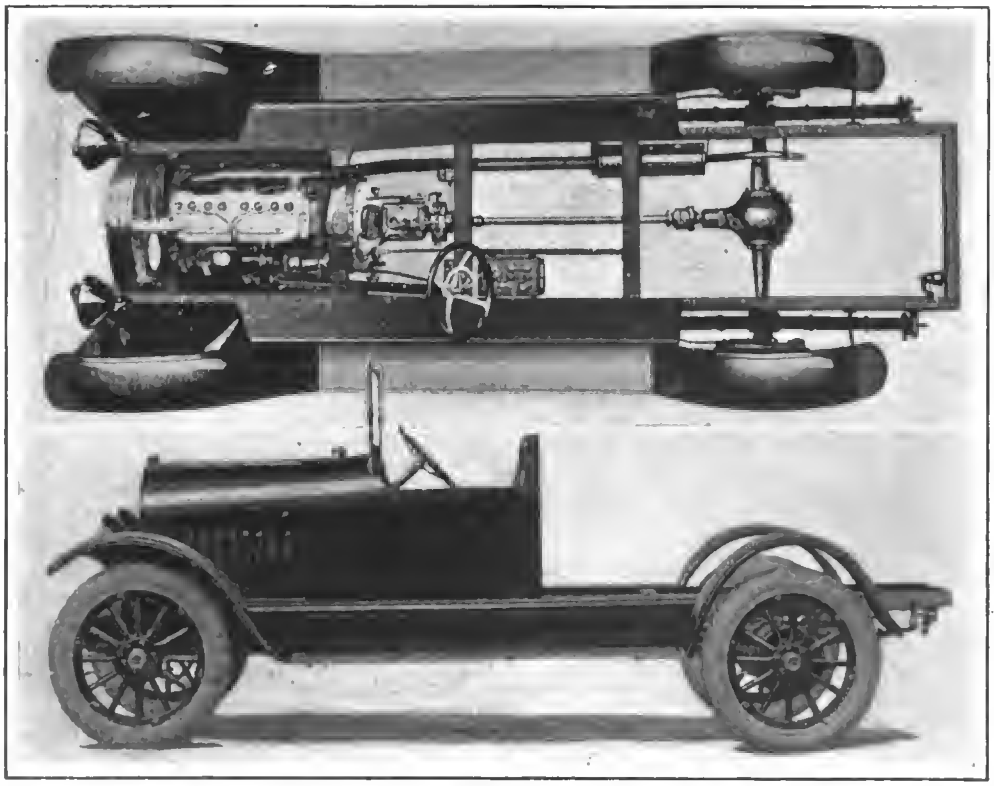
For spring testing there is a Tinius Olsen machine which is capable of handling the heaviest springs. Outside of the individual inspection given to each spring blade the entire spring can be inspected and tested on this machine.

Manufacture Springs

The manufacture of springs in this plant is a part of its economical operation. The men when not engaged in repair work are utilized as manufacturing hands and thus any springs which are running low in the stock room can be manufactured and stored against future demands. This gives an arrangement whereby there is no idleness of the hands while waiting for repair jobs to arrive and the owner or service station which comes in with a repair job does not have to pay for the unoccupied time of men. The New York plant is equipped with a full set of drawings of the springs used on different cars and is capable of making springs to the specifications shown in these drawings.

Educating Car Service Stations

With a plant of this kind it is the aim of the Perfection company to educate the service stations for different makes of cars to utilize its conveniences in their spring service work. It is thought that with the manufacturing and service ability of a large plant the necessity for the individual service station to maintain a large stock of springs is removed. Furthermore, instead of compelling the individual owner to purchase an entire new spring when he has broken but one leaf it will be possible to replace this leaf at a very low cost. In order to take care of the wants of the local car service stations a call-for-and-deliver service is being organized which will still further simplify spring matters for the local service station.



The new Jeffery Rapid-Service Wagon chassis. As illustrated in the side view it sells for $900

Two New Jeffery Trucks

Rapid-Service Wagon Is 1500-Lb. Type and the All-Purpose Truck a 3000-Lb.

TWO new truck chassis of smaller capacity than the Quads have been added to the commercial vehicle program of the Thos. B. Jeffery Co., Kenosha, Wis. Though these retain to a degree the quality of sturdiness that has characterized the four-wheel-drive type, the new designs are more conventional in their transmission layout. That is, they take the drive through the rear wheels only and steer on the forward wheels only, the combination of four-wheel-drive and four-wheel-steer not being considered necessary for the lighter vehicle.

The Rapid-Service Wagon

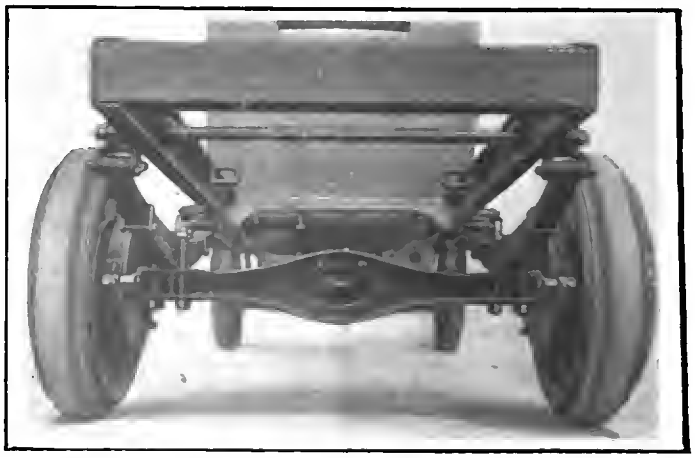
The lighter of the two new designs is known as the Jeffery Rapid-Service Wagon, and has a maximum capacity of 1500 lb. In general design it follows quite closely the four-cylinder passenger vehicle except for certain changes which are adapted to commercial practice. The chassis, which includes driver's seat, foredoors, hood and windshield, and Bijur two-unit starting and lighting, is sold for $900. A wide option of body styles is offered.

The heavier of the new models is called the Jeffery All-Purpose truck, and has a capacity of 3000 lb. This design is similar to that of the lighter one except for heavier and stouter construction. However, the final drive, instead of being of the spiral-bevel type employed in the Rapid-Service Wagon, is an internal gear system, and equipped with the M. & S. locking differential, Duplex speed governor and other features designed to adapt it particularly to its greater carrying capacity. The chassis alone, equipped with the Duplex governor in addition to the equipment mentioned for the lighter vehicle, is sold at $1,400. There is a wide choice of bodies, the flareboard express type adding only $75 to the original list price of the vehicle.

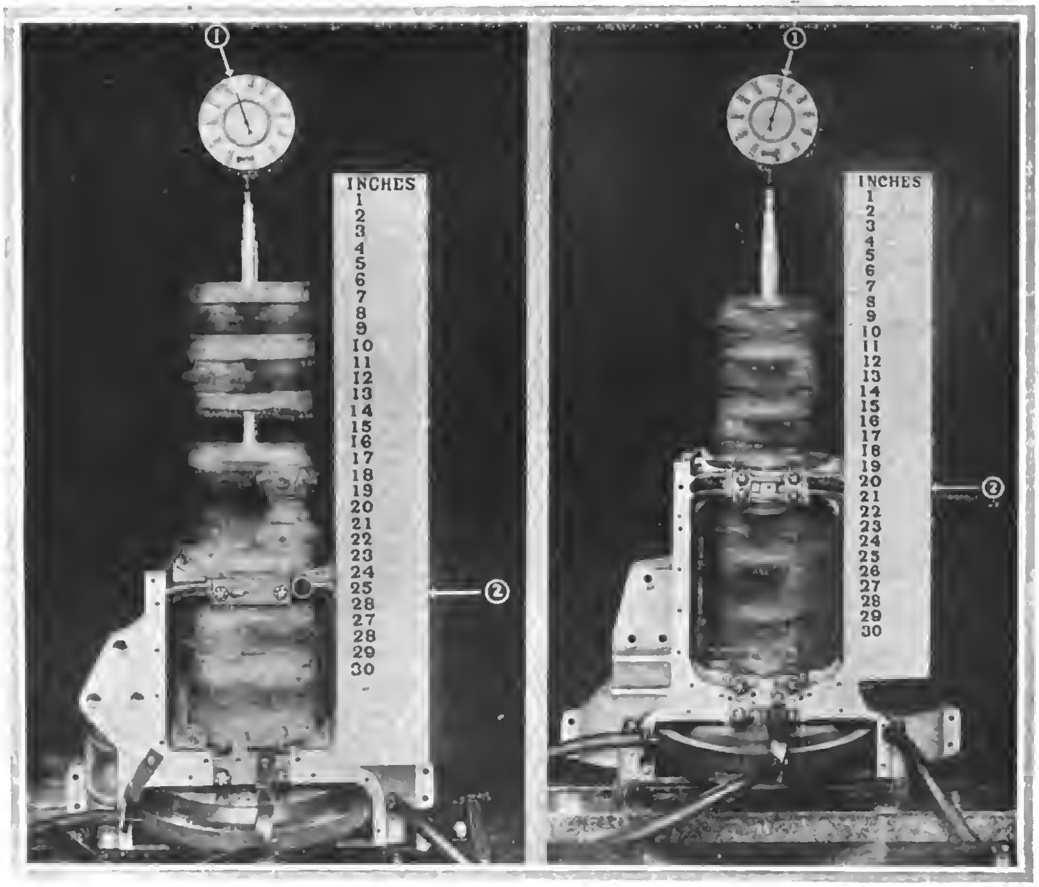
The Rapid-Service Wagon can best be described by noting the points in which it differs from the four-cylinder Jeffery passenger chassis. These differences are in the frame, the springs, and the strengthening of the rear axle, the three points at which the more rigorous demands of commercial vehicle operation necessitated a departure from passenger car Jeffery practice. The frame has been made very much heavier, the springs are semi-elliptic at the rear instead of three-quarter elliptic, and the rear axle housing is strengthened by a truss.

The detailed specifications include the four-cylinder block 3¾ by 5¼ motor, which is already familiar, Raybestos-faced dry plate clutch, roller bearings, three-speed gearset, shaft and spiral bevel with double Universal joint to a semi-floating axle, equipped with adjustable taper roller bearings. Tires are 35 by 4½ in. and the gear-ratio is 4½ to 1 on high.

The All-Purpose truck, which is the 1½-ton model, employs the same power plant as the lighter vehicle, except that the gearset is considerably heavier and stronger. The transmission of power to the rear axle is through a tubular propeller shaft instead of a solid one and the axle itself is the Celfor internal gear drive in which the weight of the load is carried on a dead axle, while the power transmission is through shafts and spur pinion to internal gears on the rear wheels. The axle shafts and the housing of the live axle are free from any suspended load. The frame and springs are very much heavier in this model than in the other, as in addition to the greater load capacity, the wheelbase is increased to 130 in. This makes it possible to give a body length of 110 in., as against the maximum body length of 80 in. in the Rapid-Service type. The rear wheels of the All-Purpose chassis are 34 by 5 with solid tires and 34 by 4½ pneumatics are used in front.



The Jeffery All-Purpose truck uses internal gear drive



Left—Hudson super-six shaft running true at 3500 r.p.m. Not bolted down and supported one-third of its length
Right—Conventional crankshaft revolving at 800 r.p.m. Upper bearings is vibrating so badly as to be indistinct. Shaft rigidly bolted down and supported half its length

Proving Crankshaft Rigidity

An Ingenious Rig Employed to Compare the Old and New Hudson Cranks

SOME interesting experiments recently conducted by the Hudson Motor Car Co. have been brought to our attention by E. V. Rippingille, assistant sales manager. These deal with the rigidity of the Hudson crankshaft resulting from the system of balancing employed.

Ingenious Methods Used

The accompanying illustrations show the ingenious method used for carrying on these experiments. The shaft was supported vertically so as to eliminate the possibility of bending due to overhang, as would be the case if it were supported in any but a vertical plane. Then, in order to eliminate any chance of torsional strain due to an auxiliary driving mechanism, the flywheel, with its face provided with teeth ordinarily used in connection with the starting motor, was converted into a turbine, several air nozzles being arranged to revolve it without actual mechanical connection. The weight of the shaft was taken on a hardened steel ball let into the end of the crankshaft.

Up to 3500 R.P.M.

The shaft was run up to 3500 r.p.m. with perfect safety and could have been run higher had the air pressure been enough to carry it at greater speed. There was practically no vibration, as the illustration shows, although the shaft is unsupported for 66 per cent of its length, as indicated by the scale which is mounted at the side.

In the case of the standard type of crankshaft, which was a unit taken from a standard Hudson 6-40 model, it was supported for 50 per cent of its length as shown. Although driven in the same manner as the super-six shaft, it was not deemed advisable to run it above 1100 r.p.m., the experimenters not daring to stay in its immediate vicinity above that speed, due to the vibration which manifested itself and which can be noticed fairly clearly in the photograph, which was taken at a rotative speed of 800 r.p.m. The case was subjected to considerable strain at 1100 r.p.m., and the upper bearing was vibrating so badly as to render it indistinct. At 800 r.p.m. this shaft swung about 1/16 in. off center.

Balancing Crankshafts

In connection with the balancing of crankshafts, Mr. Rippingille calls attention to the fact that the engineering fraternity has always talked about perfectly balanced shafts and symmetrical design, but no one ever subjected these shafts to a test on a balancing machine with the connecting-rod big ends bolted in place. The connecting-rod big end is a considerable mass of metal, and it is strictly a rotated mass that is a part of the crankshaft, for it must be taken into consideration when calculating the forces and momentum at any point.

Tests of this sort are valuable because they serve to show up a fact which is very little appreciated, namely the inherent possibilities of a crankshaft for vibration. Everyone knows that a reciprocating mass like a piston causes vibration and that the good belance of a six is due to the pistons acting against each other through the medium of the crankshaft. Properly to enable the piston forces to cancel out, however, the shaft itself must be perfectly stiff and true-running, otherwise the vibrations in the shaft will react upon the pistons and the resulting vibration will be far more violent in character than that due to the crankshaft alone.

Avoiding Vibration

In aviation engines even more than in automobile motors the avoidance of vibration is highly important, and the coming of the twelve cylinder for aeroplane work has drawn the attention of engineers all the world over to the troublesome problem of balancing a six-throw crankshaft. Any vibration in an aeroplane motor acts destructively upon the light framework or, putting it the other way about, absence of vibration allows weight in the framework to be saved. Thus it is probable that aviation engine crankshafts will undergo further development before settling down to a standard form and the Hudson type should have much to recommend it.

Convoy of White trucks passing through the shell-torn ruins of a village near Verdun

Joffre Praises Automobiles

Thanks Corps for Efficient Service in Verdun Battle When Railroads Failed

PARIS, April 15—The following communication of General Joffre to the officers and men of the Automobile Transport Corps of the Verdun army, testifies to the value of the work accomplished by this corps in the fighting around Verdun:

"Since the renewal of active operations in the Verdun district the automobile service has furnished a considerable effort in order to assure the transportation of troops and the carriage of ammunition and food. Thanks to the fine organization of the convoys on the one hand and the high sense of duty of the men on the other hand, this transportation has been carried out with the greatest regularity and in a remarkably orderly manner. The General in Chief expresses his highest satisfaction to the officers and men of the automobile service having taken part in these operations.

(Signed) "J. JOFFRE."

East of Verdun the German lines project into France in the form of a huge V, the point of the V being close to St. Mihiel, about 25 miles back of the Verdun fortress. With such a position the German long-range artillery could bombard not only the country parallel to the main French front, but a considerable portion at right-angles to it. From their point near St. Mihiel they could drop shells on the main railroad line from Paris to Nancy, in the neighborhood of Commercy, and in consequence for over a year have obliged the French to make a detour to the south over a single track winding line, where quick service is impossible.

No Railroad Service

These conditions doubtless weighed considerably with the military authorities when the attack on Verdun was decided. The preliminary was a systematic bombardment of all the railroad lines within range of German guns, leaving a French army of not less than 250,000 men entirely dependent on automobiles for movement, food and ammunition. This is the first time in the history of the war that a great army, while fighting desperately, has been deprived entirely of railroad service. In all other cases, and at all other points of the front at the present time, the railroad and the automobile work in conjunction, with a final distribution when necessary by hand or by light horse teams. It is valuable testimony to the efficient organization of the automobile service that it has been able, under the most difficult conditions, to keep the army reinforced and to supply it regularly with food and ammunition, thus making it possible for the troops to arrest the most powerful and determined attacks since the war began.

Alive with Motor Convoys

Members of the automobile corps returned from Verdun describe that district as being alive with motor convoys of every possible kind. Every type of automobile vehicle from powerful four-wheel drive and caterpillar tractors to motor bicycles is to be found on duty in this district. American trucks are very plentiful in the Verdun sector, Whites predominating, with also a large number of Packards. Fiat has supplied a large number and various French makes are represented.

All the rapid movements of troops are carried out by automobile, and it was owing to the rapidity with which the transportation-of-troops sections got to work in bringing up fresh men that the initial success of the Germans was arrested. Although all army trucks are fitted for the transportation of men in case of emergency, there is a special organization known as the T. P.—transport personnel—designed for this work. The vehicles used are either the original Paris buses or the same type of chassis with a special single-deck body. After taking the 1100 buses in service in Paris when war broke out, the De Dion Bouton and Schneider companies were ordered to continue making this type for the army, and all those which could be assembled by the bus company were immediately requisitioned.

Big Body Area of Buses

The great advantage of this type for troop transportation is the big body area in relation to the total area of the vehicle. The driver is over the motor, this being the only type in the army where the motor is not under a hood, and the frame members have lateral and rear extensions to allow of a body flush with the hub caps, and to give a big rear platform. Some of these vehicles have been in service since August, 1914, and are thus approaching the end of their second year of actual warfare. The later ones have the same chassis details but lighter and cheaper bodies. The substantial double roof with ventilating windows, also side and front glass windows, have been abolished; from the plain roof canvas sides with mica windows can be rolled down to attach to the side panels.

In operations such as those at Verdun the army has to undertake the removal of the civilian populations. Contrary to what might generally be supposed, the rural populations do not flee in terror at the sound of battle. Many of them are so unconcerned at the booming of the guns that they pay little attention to the recommendations to move to the rear, preferring to wait until a military order is given to evacuate the district. Then the army trucks have to come into service, for there are neither railroads nor horses; women, children, and invalids, together with such small hand baggage as it has been possible to save, are loaded into the trucks and taken to the nearest railroad station, from which they can be shipped to some point in the interior. This work, of course, is a considerable addition to the trucks' usual tasks.

Zeppelins Carry Four Six-Cylinder Engines

Details of Motor Equipment of Airship Brought Down in France by Automobile Gun

PARIS, April 14—The complete destruction of a German Zeppelin and its crew by the fire from a French automobile anti-aircraft gun has attracted attention to the role played by the automobile in the war against airships. Although the airship was brought down on Feb. 21, all the facts in connection with its destruction have only recently been made public. There had been considerable aerial activity in the Revigny district, north of Bar-le-Duc and south of Verdun, during Feb. 21. French aeroplanes attacked the invaders, and succeeded in bringing down one of the German machines, while two others dropped into their own lines apparently in a damaged condition.

Picked Up by Searchlights

The same evening about 8.30 o'clock the listening posts announced that two Zeppelins had crossed over the lines near St. Menehould and were working toward the south, evidently in the direction of Bar-le-Duc. Immediately the automobile searchlights were put into action, and two converging rays of light picked up the first of the two Zeppelins flying at a height of 6000 ft. The airship was heading directly toward Revigny station. The Zeppelin discovered, two 75 mm. guns mounted on automobile chassis got into action. In the absence of the superior officer, the two guns were commanded by an Adjutant who ordered incendiary shells to be fired. The first shot passed very close to the airship; the four following shots were placed around the Zeppelin; finally the sixth shot, fired by Gunner Pennetier, passed through the center of the airship from bottom to top. In a few minutes the aerial vessel was in flames, but no perceptible explosion took place. Very slowly the burning airship began to settle down, while pieces of the envelope became detached. After a while the rate of descent decreased and the crew could be seen throwing bombs and other heavy articles overboard, without however, any appreciable result. When at a height of 600 ft. from the ground one of the crew, an underofficer, threw himself overboard. Finally the airship reared and plunged to the earth; the carcass telescoped and the flames completed the destruction. Of the fourteen persons who remained aboard only one could be partially recognized by portions of his uniform. It was discovered that the airship was the L.Z. 77, in charge of Major Horn, of Fribourg. The Zeppelin carried four six-cylinder motors built by Maybach, of 7⅛ by 8⅝ in. bore and stroke, each one weighing 990 lb. The L.Z. 77 carried 1½ tons of bombs, varying in weight from 100 to 220 lb. each.

The automobile searchlights which contributed toward the destruction of the Zeppelin are 30 hp. touring car chassis carrying a searchlight of 24 in. diameter. Several types are in use, but the most common practice now is to have two motors, the smaller one at the rear driving the dynamo which supplies current for the searchlight. This simplifies the construction of the chassis and leaves the main motor free for its ordinary duties. The searchlight is mounted on the center of the chassis, the relative positions thus being: main motor in front under bonnet, searchlight behind driver, auxiliary motor and dynamo at rear. There is thus a radiator at each end of the chassis. In most cases the dynamo is driven by the main motor off the gearset; and on another type the searchlight is carried on a pneumatic tired trailer.

The anti-aircraft gun used for this work is the French 75 mm. field piece designed for high-angle fire and, when directed against Zeppelins, firing incendiary shells. The chassis is a modified 3-ton truck type built by both De Dion Bouton and Schneider, the motor in each case being a four-cylinder of 4.7 by 5.5 in bore and stroke. There is nothing special in motor and gearbox, and final drive is by internal gear. The gun is mounted on a revolving platform immediately above the rear axle, but when going into action the weight is all taken off the road wheels by means of six quick-acting hydraulic jacks. The load is not taken off the front wheels. There is a shield around the front of the gun and the motor is protected against rifle and machine gun fire by means of plating. Twin rubber tires are fitted on rear wheels and singles on the front. In all the latest models cast steel wheels are used in place of the original wood artillery wheels.

Studs Wore Off in 1000 Miles

In a communication by C. C. Hancock, published in the Forum May 4, the following statement was made:

"Two years ago I designed a runabout with live axle and without differential. I ran this 2700 miles and found the tire wear to be extremely rapid, the rubber studs being completely worn off the rear tires in less than 100 miles."

The latter figure was a typographical error, the correct number being 1000.

French 75 mm. anti aircraft gun on 3-ton chassis. Latest type has cast-steel wheels in place of wood

The FORVM

Another Hotchkiss Drive Effect

By H. D. Church,

Chief Engineer, Truck Division, Packard Motor Car Co.

THE writer has read with much interest the article by A. L. Clayden in THE AUTOMOBILE for April 20 in reference to brake action on trucks when Hotchkiss drive is used. The points brought up by Mr. Clayden are important ones, which should be called to the attention of truck designers.

The writer has done quite a bit of experimental work with the Hotchkiss drive on heavy trucks and ran into a condition in connection with hand brake operation which was not referred to in Mr. Clayden's article.

If in addition to choosing the proper eye center locations for the hand brake connecting-rod, as outlined in the article referred to, due consideration is not given to the location of the rear eye in reference to rotation of the entire rear axle casing around its center, due to spring deflection when the hand brake is applied, trouble may be experienced.

The writer has had experience with one design of this type where the brake was automatically applied harder, as soon as it took hold, by the bending of the rear springs, permitting the axle housing and, consequently, the hand brake carrier to rotate slightly around the axle center.

The brake would lock the wheels, and the resultant pull from the rotation of the hand brake support would increase the tension in the brake connections to a point where the hand brake could not be released until the brake had come to a standstill. With a foot brake on the rear wheels this condition, of course, would not exist, as the foot brake is not equipped with a ratchet lock.

The particular case referred to was, of course, an extreme one, but the point is one to be looked out for in the design of brake connections on a spring driven truck, as under severe brake application almost any Hotchkiss drive spring will deflect enough to permit a slight rotation of the axle casing or hand brake carrier around the center of the rear axle.

IN HEAVY TRUCKS USING HOTCHKISS DRIVE REAR SPRINGS SOMETIMES BEND WHEN BRAKE IS APPLIED, PERMITTING AXLE HOUSING AND BRAKE CARRIER TO ROTATE AROUND AXLE CENTER

Change Cycle by Fewer Parts and More Impulses

By James McIntosh

I NOTICE in THE AUTOMOBILE for April 20 an article under the caption Are Other Cycles Possible? J. E. Schipper has treated of several phases of the situation, notably the poor means of control in an automobile engine from an efficiency standpoint. The statement that a motor 20 per cent efficient at full throttle drops to 5 per cent at one-third throttle proves the control is defective and Mr. Schipper's question Are Other Cycles Possible? is, I consider, an admission that the present cycle is not a desirable one. In this I agree with him but have other reasons as to why a change may be advisable.

First, the more impulses per revolution the less each has to be controlled to get results, this to some extent is an answer as to the trend toward multiple cylinders. The result is a multiplicity of parts to regulate and adjust. More constant torque and better acceleration seem expensive adjuncts and the results as to efficiency plus complication show the article by Mr. Schipper is timely. While he offers no solution to the problem, there is one other phase that may be interesting, and the logical control is based on a well recognized and sound principle which I will use to furnish evidence for a change. The early steam engine was controlled by a throttle in the steam pipe and acted on the flow of steam from the boiler to the cylinder. Its function was to reduce the initial pressure to suit light loads and that in turn reduced the mean effective pressure.

Variable Cut-Off Control

The next improvement was a decided change in control with a correspondingly higher efficiency. The variable cut-off constant initial pressure method of controlling is an admitted advantage for variable loads and close regulation.

There is still another condition to be found in our largest transportation problems, both of which use the expansive means of control. The locomotive has a throttle to stop and start with, but the valve gear is so arranged that the cut-off is used to regulate the speed whether the train is a heavy freight or fast mail train. The steamship is also stopped and started by a throttle, but the cut-offs and ratio of expansion in the engine once adjusted decides the power with a boiler pressure and constant initial pressure and a vacuum maintained to a point considered most efficient. It is a well established fact a throttle is not used in the sense it is in an automobile except for small units or where intermittent service and simplicity are virtues. High initial pressures are desirable in a steam engine and no one will say the same applies to a gasoline engine to a lesser degree and back up the statement successfully.

I suggest the more impulses per revolution the less each has to be controlled to get results. This is not advice to add to the number of cylinders. We may get the same number of impulses with half the number of cylinders by making each double acting or by a change in the cycle to make each cylinder deliver twice the number of impulses not justified by a fashion.

Suppose I suggest a change in cycle first to reduce parts; and second to increase impulses per revolution or to get the name number of impulses with one-half the number of cylinders. As a means of control let me suggest a constant volume, constant initial pressure compression and a variable cut-off controlled by a volume of pure air in position to precede a charge of constant and correct mixture and delivering both where they can be most effective.

Let someone question the virtue and my ability to furnish the means and we may have a friendly debate of interest.

The History of the Pneumatic Tire—3

Discovery of Vulcanization by Goodyear in 1835—Hancock's English Patent of 1843—Parkes Discovers That Carbon Bisulphide Is a Satisfactory Solvent — Dietz and Tires

The History of the American Automobile Industry—30

By David Beecroft

AFTER many experiments and probably knowing of the use of sulphur for preventing adhesion, Goodyear discovered vulcanization in 1835 and carried it so far that he produced vulcanite as well. He did not, at this time, make any attempt to secure a patent, possibly expecting to rely upon secrecy. In 1842, he began producing rubber shoes and in that same year samples of his products reached England. There, Hancock, already working in rubber, discovered that the effect was produced by sulphur and secured a somewhat similar result by immersing his product in melted sulphur and then heating it to 302 deg. Fahr. His patent on this process bears the date of 1843. In this year, Parkes of England discovered that carbon bisulphide is a satisfactory solvent and he also vulcanized some products by sulphuric chloride.

In 1846, Hancock introduced the use of molds for forming rubber products. Goodyear secured a second patent in the United States in 1854, but infringements became so common that he was involved in constant fights for his rights, with the result that his patent expired in fourteen years, leaving him penniless and his family in want. He died about this time—July 1, 1860—but Congress, recognizing the work he had done, extended his patent for a number of years.

Dietz Makes First Rubber Tires

The first use of rubber for vehicle tires seems to have been that of Dietz, who, in 1835, patented a rubber cushion applied to the ordinary iron tire and covered with an iron ring or tire so as to get the elasticity without subjecting the rubber surface to the rocks of the road. This recognition of its value, following so closely upon the discovery of Goodyear, shows a wonderful perception of the needs for a shock absorbing tire. The next and even more wonderful, of which there is record, is the pneumatic tire patented by R. W. Thompson, an Englishman, Dec. 10, 1845, his patent number being 10,990, and also patented in the United States in 1847. This patent shows a flat iron tire of considerable width, on the wheel in the usual manner, to which a casing of leather is bolted. It describes and shows a single inner tube and also as many as nine inner tubes, which he explained could be inflated to different degrees, and which, it is quite evident, could have one of them punctured or deflated without seriously affecting the supporting ability of the tire, as a whole. His inner tubes were of several thicknesses of canvas covered "with rubber or gutta percha in solution," and vulcanized by exposure to the fumes of sulphur or by immersion in melting sulphur. He also suggested stuffing the tubes with hair, sponge, or elastic materials, so that in case of deflation the tire would still serve.

A Rubber Cushion

A further suggestion was that of a rubber cushion or liner between the leather case and the air tube or tubes, the original puncture strip. His leather casing was arranged to be laced or riveted along the sides, and the tread portion is shown in some cases provided with rivets or studs, substantially as are leather tire covers of the present day. He says a diameter of 4 or 5 in. is recommended for carriages, which were much heavier in those days than we now know them, and recommends inflation to a point that would permit the tire to flatten approximately one-third of its diameter on a smooth road. So thoroughly practical was the information given by him that one is forced to the decision that he had much experience in the use of these tires at that time, and was not a theoretical inventor, as too often proves true. Carriages fitted with his tires were offered for sale by one or more prominent London carriage houses and *The Scientific American* in 1847 mentioned a carriage equipped with rubber tires on the streets of New York in that year. These were quite probably Thompson's. His application to railroad cars, running on the broad, flat wooden rails of that day, which were about a foot wide by 6 in. thick, shows the wheels with tires fitted just as for road carriages, but the cars were equipped with centrally placed guide wheels which ran each side of a third rail between the regular rails. These guide wheels kept the cars on the track just as modern wheel flanges do.

In 1849, several Philadelphia papers mentioned carriage tires that were proposed to be made of gutta percha. These were doubtless to be of India rubber, it being quite common about that time to confuse the two products. No record of actual construction or use is at hand, however.

The Rostrum

Can Purchase Tire Caliper

EDITOR THE AUTOMOBILE:—Concerning tire inflation discussed March 9, and April 13, I would like to have the following information:

1—Is there a caliper made like that G. A. S. of Boston, Mass., mentions and if so, where can I get one?

2—I have a seven-passenger touring car which I drive a great deal riding alone, weight about 3200 lb., Hudson 6-40, keeping the front tires pumped to 70 lb. and rear 75 lb. When Sunday comes I have seven passengers, so if 70 and 75 respectively are right, how much more tire pressure do I need for the increased load?

3—Is there a chart or scale furnished by anyone that gives the air pressure you should carry in your tires according to the number of pounds or load that each wheel carries?

Yuba City, Cal. H. H. W.

—The tire caliper is made by the B. F. Goodrich Co., Akron, Ohio.

2—If you are using the 35 by 4½ tires you should have 85 front and 90 rear with the full passenger load.

3—This can be secured from any of the larger tire companies.

Haynes Six Makes 3460 R.P.M.

Editor THE AUTOMOBILE:—What is the maximum speed of the Haynes Light Six engine?

Oakland City, Ind. C. R.

—The Haynes Motor Car Co. states that on official tests the maximum speed obtained with the light six motor is 3460 r.p.m.

Ammeter in Gray & Davis Ford System

Editor THE AUTOMOBILE:—Kindly describe the proper installation of an ammeter on the Ford Gray & Davis starter system. Undoubtedly this is a very simple accomplishment but the particular ammeter I have in mind does not appear to be able to stand up under the load subjected to.

Earlville, N. Y. L. L. L.

—An ammeter may be connected into a Gray & Davis system for Ford cars by removing the green wire from the starting switch terminal nearest the battery and connecting this wire to one of the ammeter terminals. From the other ammeter terminal connect a No. 12 insulated wire to the same starting switch terminal.

To determine whether the ammeter is properly connected turn the lights on, engine at rest. Ammeter should indicate discharge amount used by the lights. If charge instead of discharge is shown reverse the wires at the ammeter.

Valve Timing of Lyons-Knight

Editor THE AUTOMOBILE:—Kindly give correct valve timing of the motors in the Lyons-Knight cars. Also bore, stroke, power curve and stock gear ratio.

2—Is the model D-3 Stromberg carbureter suitable for a Stutz motor?

Allston, Mass. S. D.

—The port opening and closing of the Lyons-Knight engine is as follows:

Exhaust opens 63 deg. before end of working stroke.
Exhaust closes 5 deg. before end of exhaust stroke.
Admission opens 5 deg. after beginning of suction stroke.
Admission closes 36 deg. after end of suction stroke.

The bore and stroke of this motor is 4½ by 5½, but no power curve is available.

2—It would be inadvisable to use the D-3 Stromberg carbureter with present-day grade of fuel as this is an old model not suitable to the heavy fuels of to-day.

Cast-Iron Pistons in 1915 Reo

Editor THE AUTOMOBILE:—What kind of pistons are used in the Reo 1915 six-cylinder model M 3.562 by 5.125?

2—The Hudson company claims an increase of 34 hp. making its horsepower 76 without increasing the size of cylinders. How do they get more power?

3—What is the difference between a valve-in-head motor and a Knight motor?

4—Does the National company manufacture its own motor?

Akron, Ohio. G. H.

1—The pistons used are cast iron.

2—The Hudson claim of increase in horsepower is due mainly to a reduction in the internal friction of the engine. They are also using an improved carbureter and have increased the efficiency of the valves.

3—The valve-in-head motor has ordinary valves which seat directly in the head of the cylinder with the stems projecting upward. The Knight motor is an entirely different construction, having two sleeves surrounding the piston with slots cut in the sleeves near the upper end. The sleeves are moved up and down over a small range by means of crankcase and the opening for intake and exhaust is obtained when the slots in the sleeves register, which they are arranged to do at the proper positions in the main piston stroke.

4—The National company manufactures its twelve-cylinder motor, but some of its sixes are made for the company by a firm of engine specialists.

Power Curves of Model 75 Overland

Editor THE AUTOMOBILE:—Will you kindly give power curve developed at different speeds on the 1916 Maxwell and also the model 75 Overland?

2—What is the advantage of a belt drive for generator?

3—What are the six leading cars in production at present?

Lincoln, Neb. C. L. H.

—The horsepower curve of the 1916 Maxwell is not available. That of the Overland 75 is given in Fig. 4.

2—Simplicity and cheapness. It is also silent.

3—Since a large number of the concerns keep their manufacturing schedules a secret THE AUTOMOBILE cannot publish information of this nature.

Explanation of Ford Ignition System

Editor THE AUTOMOBILE:—Kindly tell me all you can about the Ford magneto and the entire ignition system, including a Master vibrator; how the spark is made, etc.

2—Is the Ford a magneto as we understand the word?

Kansas City, Mo. J. K.

—It is impossible to give in this space a complete discussion of all the phases of Ford ignition. The Ford magneto which generates the electric current is the invention of Henry

Ford. It is an integral part of the engine consisting of two sections; one attached to and rotating with the flywheel and the other fastened to the cylinder casting. It eliminates a number of complicated parts as it has no brushes, no distributer, no moving wires or any parts to work loose. It revolves at the same speed as the motor. The magnets on the flywheel passing the stationary coil spools create an alternating low-tension electric current in coils of wire which are wound around spools fastened to the stationary part of the magneto. This current is carried from the coils to the magneto connecting wire leading to the coil box on the dash. The current generated by the magneto flows through the primary winding of the coils in the coil box on the dash to the commutator located at the front end of the engine just under the oil breather pipe, back through the frame of the motor to the magneto. This completes the primary surface or path of the magneto current. The high tension current induced into secondary winding of the coils is led to the spark plugs in the cylinders as their respective circuits are completed by the commutator.

2—Yes.

Power Curves of Four Overland Models

Editor THE AUTOMOBILE:—Kindly publish complete power curves of Overland models 75, 83D, 84 and 86.

New York City. J. F. W.

—The power curves of the four Overland models you request are published herewith. Model 86 in Fig. 1, 83-D in Fig. 2, 84 in Fig. 3 and 75 in Fig. 4.

Dash Gage for Rear Tank

Editor THE AUTOMOBILE:—Is there now on the market any mechanical device for indicating on the dash or cowl board just how much gasoline the driver has when the gasoline is carried in a tank in the rear? In other words, is there a dash indicator for rear gasoline tanks?

Flint, Mich. J. E. G.

—Yes, there are a number of cars which are regularly equipped with devices of this nature.

Why Fours Are Not V Types

Editor THE AUTOMOBILE:—Why are not four-cylinder motors built in the V type?

2—Please state disadvantages of this type of motor.

3—Would a motor of this design be more rigid than the regular four in a row?

Syracuse, N. Y. C. A. McV.

—Dividing 360 deg. by four, it is found that the crankshaft throws are 90 deg. apart. With this arrangement the cylinders can be advantageously set on a line and there is no reason for the V.

2—No marked disadvantages have been found except perhaps the added care necessary to have everything accessible.

3—Not necessarily so.

Buick and Chevrolet Not Connected

Editor THE AUTOMOBILE:—In THE AUTOMOBILE for April 27 mention is made by one of your correspondents of the McLaughlin-Buick car. What car is this and what does the name McLaughlin signify when used in connection with Buick?

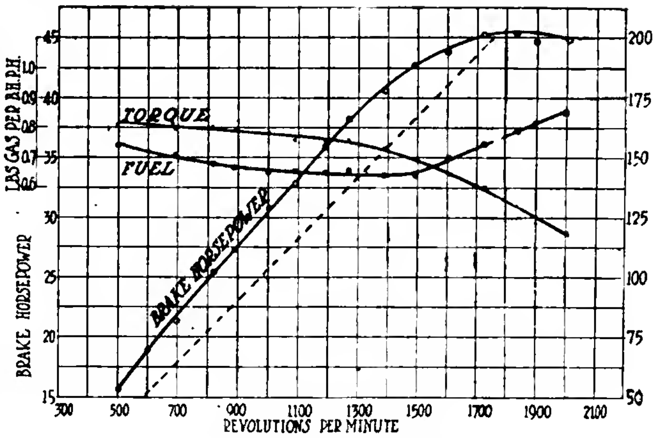
2—How did the name Buick originate?

3—Who designed 1916 Buick cars?

4—What connection if any, exists between the Buick and Chevrolet companies?

5—Were these cars designed by the same engineer?

6—The cylinder capacity and weights of the Buick D45 Six and the 1916 Studebaker Four are approximately the same. Which is the speedier car?



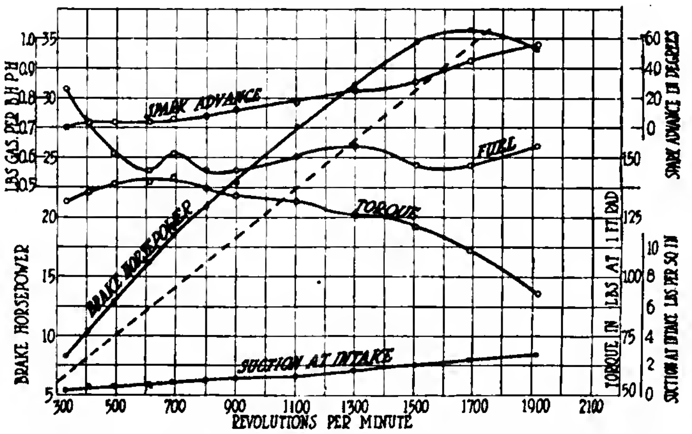


Fig. 1—Top, power, fuel and torque curves of the Overland model 86

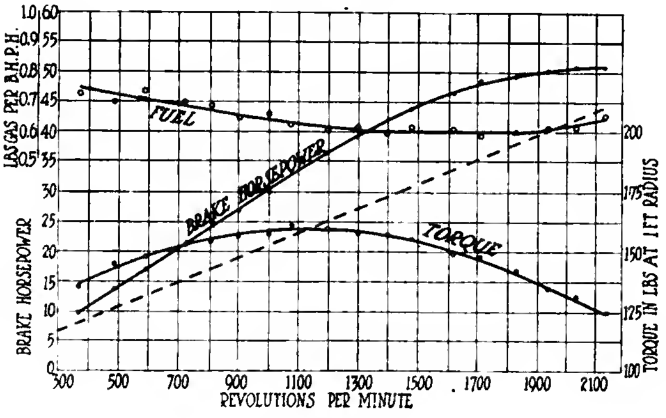
Fig. 2—Bottom, power, fuel and torque curves of the Overland model 83 D



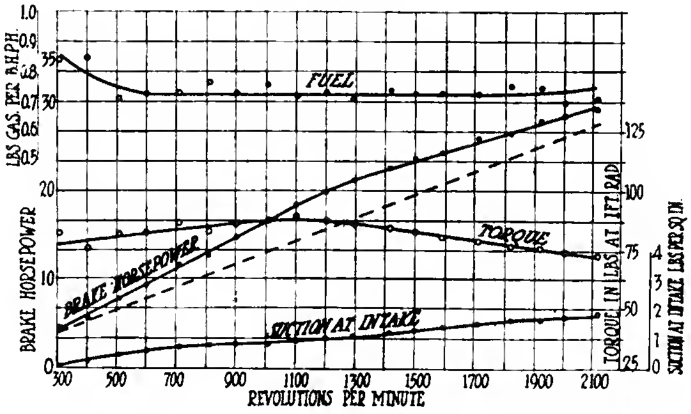


Fig. 3—Top, power, fuel and torque curves of the Overland model 84

Fig. 4—Bottom, power, fuel and torque curves of the Overland model 75

7—Why does running with a late spark tend to overheat a motor?

East Canaan, Conn. D. C. C.

—The McLaughlin-Buick car is the Buick car assembled in Canada by the McLaughlin Motor Car Co., Ltd., Oshawa, Ontario.

2—The Buick car takes its name from D. D. Buick, who was the founder and organizer of the Buick Motor Co., Flint, Mich.

3—The Buick company employs a large corps of engineers, and all of these men have a hand in designing new models, although Mr. Walter L. Marr, who is the chief engineer, assumes the responsibility for this work.

4—There is no connection whatever between the Buick company and the Chevrolet Motor Co.

5—No.

6—THE AUTOMOBILE has no record of any contest of speed between these two makes of car.

7—Overheating is due to a late spark because combustion takes place so late that the gases have not had opportunity to be cooled by expansion before the exhaust opens. The result is that the engine runs much hotter than it would if explosion occurred on upper dead center as it is supposed to do.

Lubricating System of Grant Six

Editor THE AUTOMOBILE:—Please describe and illustrate the oiling system of a 1915 Grant six. Give horsepower curve of this motor.

2—Are the valves of the Franklin motor placed in cages or directly in the cylinder head?

3—What kind of wood is used for the frame of this car?

Tipton, Ind. E. G. D.

—Illustrations of the lubricating system of the Grant six are given in Figs. 5 and 6. The method of oiling is along conventional lines, the oil being drawn through a strainer in the oil sump, forced through a sight feed on the dash and through two discharge pipes from this sight feed. One of the discharge pipes goes to the motor gears and the other to the rear end of the motor from where it is distributed to the oil troughs.

The illustration of the pump in Fig. 5 shows a novel arrangement in the form of an air chamber on the pump which allows a steady flow of oil.

2—The valves are placed in the cylinder head; are inclosed and mechanically operated.

3—The Franklin frame consists of three plies of second growth ash of equal thickness, being glued and screwed together and bound on the top and bottom by a thin strip of the same material to cover the joints. The wood is carefully selected for grain and is kiln dried and seasoned in the open air. A thorough painting treatment is used to protect the wood from moisture.

Austin 77 a Six-Cylinder

Editor THE AUTOMOBILE:—Kindly give me the bore and stroke, number of cylinders, wheelbase and horsepower of the Austin 77. Who is the nearest agent?

New York City. J. E.

—The Austin 77 had six cylinders, bore and stroke 4½ by 7 and a horsepower rating according to the S. A. E. formula of 48.6. The motor was T-head design with the cylinders cast separately. The wheelbase of the Austin 77 was 141 in. and the tire size 37 by 5.

THE AUTOMOBILE has no list of Austin agents. This can be secured from the Austin Automobile Co., Grand Rapids, Mich.

Information on Midland Car

Editor THE AUTOMOBILE:—Where was the Midland car made?

2—How many years did the company manufacture cars and at what price?

3—Where can I purchase parts of the Midland car?

4—What motor did they use and what size bore and stroke?

5—What speed could they make?

Lee, Ill. E. W.

—The Midland car was made by the Midland Motor Car Co., Moline, Ill.

2—This company manufactured at least from the year 1908 to the year 1913. The cars manufactured were in accordance with the following table:

1908-9-F	30-35 hp.	Roadster	$2,000
1908-9-G	30-35 hp.	Touring	2,250
1908-9-G-10	30-35 hp.	Touring	2,500
1908-9-F-9	30-35 hp.	Touring	2,250
1908-9-E	25-30 hp.	Touring	1,958
1910-G-10	40 hu.	Touring	2,250
1910-L	35 hp.	Runabout and touring	1,750
1911-L1-L2	40 hp.	Runabout	1,950
1911		Touring	2,000
1911		Torpedo-touring	2,100
1911-K	50 hp.	Touring	2,250
1912-O-6-60	60 hp.	(6 Cyl.) Roadster	3,000
1912-L-111	40 hp.	Roadster	1,900
1912-R	40 hp.	Touring	2,750
1912		Coupé	3,000
1913-W	40 hp.	Touring	2,100
1913-T-4-40	40 hp.	Roadster and touring	1,685
1913	40 hp.	Coupé	2,350
1913-T-6-50	50-60 hp.	Roadster	2,385
1913	38 hp.	Touring	2,450
1913	38 hp.	Coach	3,250

3—From the Maxwell Motor Co., Newcastle, Ind., or the Midland Motor Co., Moline, Ill.

4 and 5—THE AUTOMOBILE has no complete record of this information.

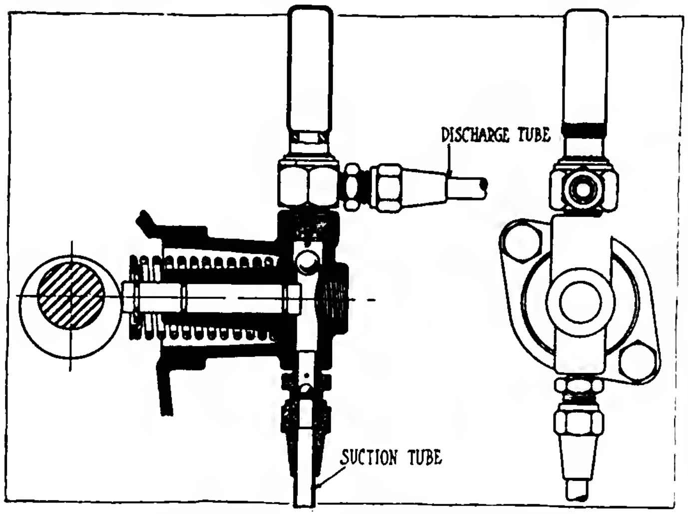

Fig. 5—Oil pump used in the Grant six, showing the air chamber which allows a steady flow of oil

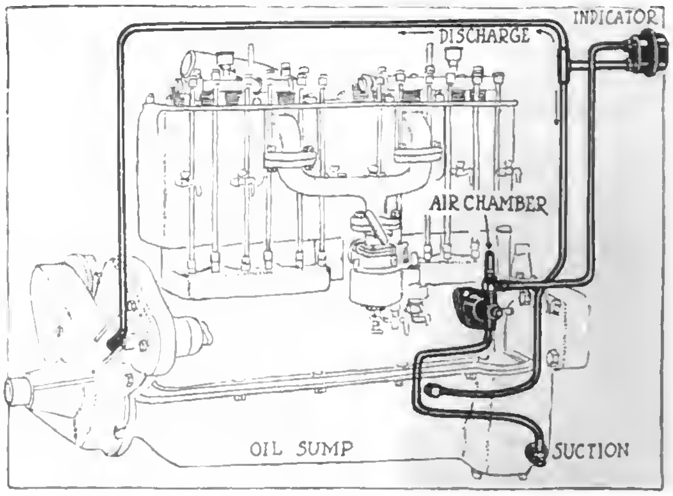

Fig. 6—Diagram of the lubricating system on the Grant six, showing the various leads

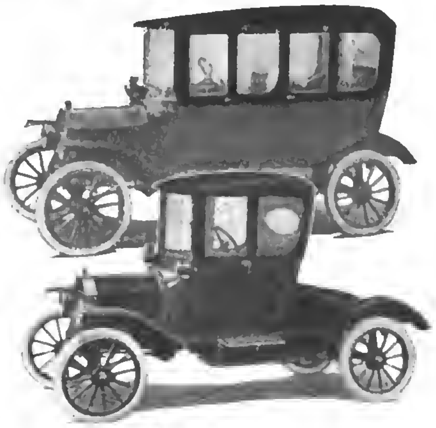
ACCESSORIES

Cassco Tire Pump

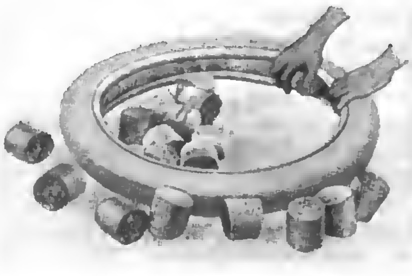
THIS pump, which is just being put on the market, is very compact, and the makers pride themselves upon the materials used and the workmanship employed in its construction. The cylinder and crankcase are of heat-treated cast iron accurately reamed and burnished. Pistons are of special aluminum alloy iron, and the piston guides are two parallel rods inserted in the lower surface of the piston and at right angles to its horizontal plane. These rods slide easily without play in two lugs, the holes being accurately machined. The lugs are integral with the base of the cylinder. This construction makes perfect alignment of the piston and cylinder walls certain, and prevents side play of the piston. This is a distinctive feature of the Cassco pump.

Piston rings are of special soft spring steel pressed and ground to size, each piston having three rings, thus preventing oil leaking into the tire and the consequent deleterious effect on the rubber. The crankshaft is of high-grade steel with a bearing on each side, thus avoiding overhanging loads. The connecting-rod is of special semi-steel and the gear shift is positive in action, automatically locking in both the engaged and disengaged positions. This prevents stripping the gears. Poppet type intake and exhaust valves of the same size are used, the intake being automatic in action, the air entering the cylinder the instant the piston begins its intake stroke. Gears are made with the stub form of tooth, and are accurately cut. The stroke of the pump is 1 in. and the bore 2½ in., giving a piston displacement of 5 cu. in. Lubrication is by splash and a felt lubricator which distributes oil to all working bearings.

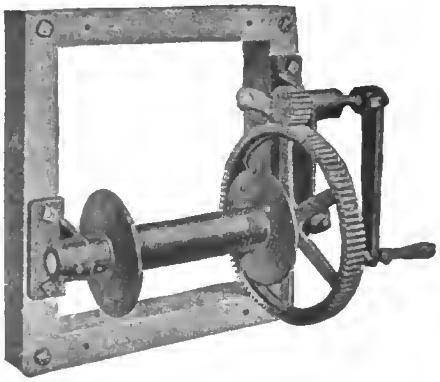
The pump may be easily installed by the car owner using a screwdriver and wrench, as special brackets and fittings are provided for installation. No machine work or shipping is required. Cassco pumps are now ready for Buick, Chandler, Chevrolet, Dodge, Ford, Hudson, Hupmobile, Maxwell, Overland, Reo the Fifth, Saxon and Studebaker cars. Complete with gage, hose and complete instructions for installing, the pump sells for $8.—Edward A. Cassidy Co., Inc., New York City.



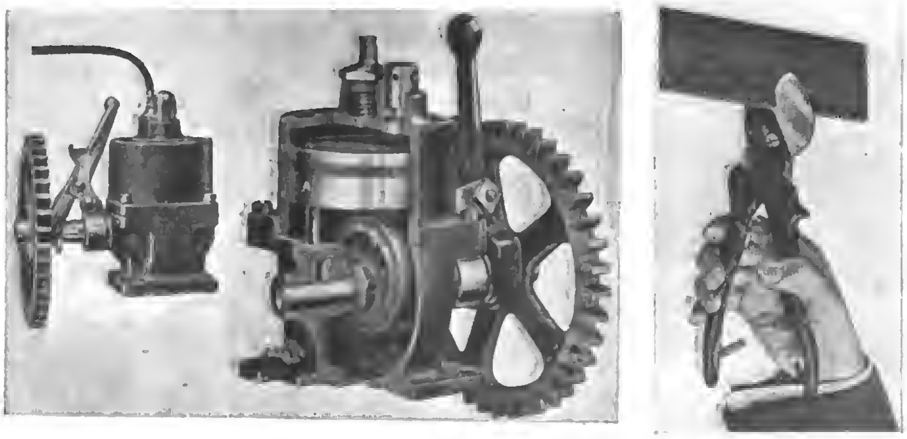
Ames sedan and coupé tops for Fords



National rubber tire filler



Erle single-drum hand hoist



Left—The new Cassco tire pump. Right—Multibestos brake lining cutters

Ames Detachable Bodies

The same general type of construction is used in the Ames sedan and coupé tops. Framing is of hard wood, roofs full slatted, padded and covered with enameled full grain muleskin leather, with blind welts, watershed moulding. The glass is 3/16 plate set in cushioned mouldings. Door lights are fitted with patent lifts, windshield is automatic hinged, rain vision, ventilating. The makers state that these tops make the Ford practically as snug and tight as a built-on top. Lining is of gray whipcord and a dome light is provided. All joints are so made that there is no squeak or rattle. Net weight of sedan top, 150 lb.; of coupé top, 100 lb. The sedan type lists at $97.50.—F. A. Ames Co., Inc., Owensboro, Ky.

Erie Hand Hoist

Two capacities of single-drum hoists are made, one of 900 lb. and one of 1200 lb. The frame is of pine. The former weighs 95 lb. and the latter, 140 lb. Price, type 220, $28; type 221, $36.—Erie Hoist Co., Erie, Pa.

Standard Brake Lining Cutters

This is a special tool of the shear type, designed especially for cutting brake lining, but useful also for cutting cable, wire or light sheet metal. The handles are long, give the requisite leverage and the blade is of hardened steel, easily removable for sharpening.—Standard Woven Fabric Co., Framingham, Mass.

Pedex Extension Pedals

The purpose of these pedals is to make it easier for women drivers to operate a car. They are made to fit any make of car and do not interfere with the operation of the regular pedals. Price, $5 per pair.—American Car Accessories Co., New York City.

National Tire Filler

This is a tire filler made up in short sections. The makers state that high grade rubber is cut into small particles and vulcanized together by a process that results in great resiliency. The sections fit the tires for which they are made accurately when the tires are pressed into

Left — Hood tire, showing the tread and cross sections. Right—International Half-Sole tire

place. Tools for the purpose are furnished free with a set of four fillings. Prices range from $13.50 per tire for 28 by 3 to $39 for 37 by 5½; Ford size, 30 by 3, $14; 30 by 3½, $18; 34 by 4, $25.50; 36 by 4½, $30.—National Rubber Filler Co., Midlothian, Tex.

Shi-Nup Enamel Cleanser

Shi-Nup is not a polish in the ordinary sense of the word, but a cleanser, according to the descriptions furnished by the manufacturer. It does not re-surface the part to which it is applied, nor leave a covering of wax, oil or grease. It contains no acids or combustibles. The manufacturer says it will restore the original luster of the finish. It is adapted to use on fenders, hoods and parts finished under heat treatment. A quart is said to be a large enough supply for a season. It is sold in quart cans at $1, and in pint cans at 50 cents per can.—Shi-Nup Corp., Yonkers, N. Y., manufacturer; Rose & Hibbard, Yonkers, N. Y., wholesale distributor.

Hood Tires

Hood tires are put out with the idea of producing the best possible wearing surface without regard to cost. The result is that, owing to the extra fabric plies, extra rubber quality and extra tread thickness, the cost is higher than that of the standard makes. One tire, however, made by the same concern under the brand name of Puritan is of standard construction throughout as to number of plies, strength of fabric and quality of rubber. It has, in addition, an extra thick tough resilient tread. This tire sells at the standard price. It is made with a gripper non-skid tread, which gives a good surface for slippery roads but is not as skid-proof as the regular Hood treads.

In order to maintain a standard compatible with the slightly higher price, the Hood tires are made with an extra ply of fabric, having on the small sizes one more and on the larger sizes two more plies than the ordinary type of tire. The fabric is of the highest quality of Egyptian staple woven to Hood specifications, and every roll is tested before using. The rubber is selected from the best grades of plantation and para. This is compounded only with sulphur.

The beads are locked in and so constructed that rim cutting is practically eliminated. The cushion and breaker strips are made extra wide, giving the tire extra strength and rendering it difficult to puncture. The tread is tough and extra thick, with a depressed arrow type tread made with arrow-shaped insertions having very sharp edges which hold the road by suction.

Although the first cost of these tires is higher than the standard tire because of the extra construction, the makers claim that the first cost is justified by the extra mileage and they state that during 1915 the adjustments made on tires which came back to the factory on the basis of 5000 miles was less than one-half of 1 per cent.—Hood Rubber Co., Watertown, Mass.

International Half-Sole Tires

These Half-Sole tires are a trademarked product, the manufacturer stating that they are built like the highest grade tires, with the exception of the bead, being really outer tires to go over worn tires. There are three to six plies of tire fabric solidly vulcanized together, a thick cushion of elastic rubber which protects the fabric from breaks and ruptures and the outside tread which is made of ½-in. or more of very tough live rubber. The use of these Half-Sole tires on worn shoes is said to double or treble the mileage obtained. They are made to fit any kind of tire, and the rim can be of any type. The Half-Soles carry a guarantee against puncture and the price is about half that of a new tire.—International Rubber Co., Denver, Col.

Singer Tire Retreading Machine

This machine is for stitching two old casings together to make one good casing. The outer one has the bead removed and then it is sewed in place with two rows of lock stitches. Price, $275 cash, or $100 down and $25 per month for eight months.—Singer Sewing Machine Co., New York City.

St. Albans Motor Rack

A motor may be clamped or bolted and in this rack turned to any position from right side up to upside down. The motor is secured to longitudinal rails which are adjustable as tc their distance apart. The frame holding the motor is rotated, through gearing, by a handwheel. There are twelve positions in which the motor may be held, and a stop, actuated by a pedal, is provided. The gearing is 6 to 1, so that even a heavy motor is easily handled. A removable drip pan at the bottom catches all oil and dirt. The stand is built of heavy angle steel and is so strong that a motor may be driven by belt from an overhead shaft while bolted in the frame. The side rails are so heavy that they can be drilled for bolts without unduly weakening them; the holes will be drilled by the makers if exact measurements or templets are suplied. In the absence of bolt holes the motor may be held by hand clamps. The largest size, model 400, will take any size of motor; the smallest is 30 in. long and the side rails are adjustable from 10 to 24 in. apart. Prices, model 100, $32.50; model 200, $35; model 300, $38.50; model 400, $42.50.—Foundry Motor Car & Mfg. Co., Inc., St. Albans, Vt.

Stock Car Performance

THERE are many in the industry who remember with pleasant recollection the days of stock car racing, just as there are a few whose remembrances are less inspiring, but one and all will join in admiring the perfomance of the Hudson in the Metropolitan Trophy 150-mile race. Of course, this chassis was carefully prepared; it was treated just as the amateur drivers in England treat the stock cars they use for the monthly afternoon of racing on Brooklands, but this did not alter the fact that the chassis was designed and built without any regard to its use in this way. Ira Vail's performance shows what splendid racing a field of good stock chassis could provide, and it will be interesting to observe whether the modern stock car is not capable of beating regularly the type of hybrid vehicle which commonly makes up the tail in the big speedway events. A good stock car gone over carefully to see that all the fits are correct is better as a speed machine than an old racing car which is wearing out. The maximum speed may not be quite so high, but the reliability is far greater and in modern automobile racing, on board, cement, brick and asphalt-surfaced speedways, it is reliability rather than sensational speed which most frequently figures as the determining factor in the order of finish of the participants. It is the old fable of the hare and the tortoise over again; the race is not always to the fleetest.

Oil and Metal

FROM an engineering viewpoint the racing at Sheepshead Bay last week proves two things. The first is that design has reached a point where it is restrained by strength of materials. The second is that the efficiency of lubrication required by racing engines on such speedways is far above any other need of the kind.

Simultaneously we see that ignition trouble, so prevalent last year, has been overcome completely. In all the racing on May 13 not a single spark plug was changed, except as a precaution, between races.

Toward the close of the 1916 season of racing it was noticed that broken connecting-rods were common. Fatigue of the metal was suggested as a possibility, as also was the notion that perhaps sections had been reduced too far in the effort to cut down reciprocating weight. Here, obviously, the metal available limits the lightness of the design.

Pistons Also Affected

We have, however, seen several piston failures which may not be explicable on the same supposition, and it is even possible that some of the connecting-rod failures are traceable to lubrication failure, rather than to anything else. If the frictional resistance of the piston increases suddenly in a motor running at 3000 r.p.m. the stresses on the piston itself, and on the connecting-rod may increase enormously. If, for example, the lubrication fails partially, so that the piston grows only a trifle tighter than normal, the pull on the connecting-rod at the instant of reversal of motion at the top of a stroke can be made much larger. It does not require a frozen piston to do damage in a very high speed engine; one that is merely rather tight is quite enough to put it out of the running.

Similarly with bearings. With the ball bearing crankshaft and with shafts on plain bearings there is rarely any trouble in the main bearings, but the lower ends of the connecting-rods are in a very different case. With a ball-bearing crank pressure lubrication for the lower ends is impossible. With a plain bearing crank the pressure and amount of oil supplied to the lower ends cannot be as great as in the main bearings. At the same time, it is the lower end bearings that have the most severe stresses to bear. Racing engines to-day are destroyed if the efficiency of the lubrication falls off, even for an instant. The avoidance of trouble is as much a matter of extreme care in preparing the car as it is a question of design. In an ordinary engine the lubrication provides a large factor of safety, whereas in a racing engine it has scarcely any factor of safety whatever. Of the leading cars on the speedways this season there is little difference in the power obtained, there is little difference in the weights, and the design in each case ranks very high indeed. Thus the success of one car or another is more than ever bound up in the treatment it receives. It is the supremely careful overhaul before the race compared with the hasty one that is going to make the difference between first place and collapse when the test comes.

France Bars Cars and Parts

Prohibits Importation of Chassis, Bodies, etc., from England and United States

Paris, May 15—*Special Cable*—Without the slightest warning, the French Government has prohibited the importation from the United States and England of automobile chassis, with or without motor or body, automobile coach work and other automobile parts.

The decree contains a clause authorizing the Ministers of Commerce and Agriculture to make exceptions and permit, under conditions to be determined by the Minister of Finance, the importation of particular articles. No official explanation has been made, but it was said that the new ruling undoubtedly had been put into effect with a view to procuring more space in vessels coming to French ports for supplies the Government needs.

N. A. C. C. to Conduct Educational Campaign on Credit Plan

New York City, May 17—In view of certain advertisements which have appeared relative to buying automobiles on the deferred payment plan and the use of the names of certain cars without authorization from the manufacturers, the National Automobile Chamber of Commerce at its directors' meeting on May 3, voted to institute a broad and vigorous campaign of education, not alone among publishers, but among members of the N. A. C. C., calling attention to the fact that widespread advertising of credit plans is detrimental to the industry; that members be encouraged to avoid adopting policies which may undermine the business and that they be encouraged to pursue those policies which can alone maintain and continue permanent success. The resolution is:

"Whereas, Certain influences are working and certain efforts are being made for the organization of plans which will have a disastrous undermining effect on the stability of the automobile industry, and

"Whereas, It is the opinion of this committee that injurious results will follow the adoption of these methods by any considerable number of automobile manufacturers, and

"Whereas, The methods of deferred payments under consideration are very objectionable from the factory standpoint, and are objectionable to a large degree from the dealers' standpoint, and have a disastrous effect on the purchasing public, which will unavoidably react injuriously, now therefore be it

"Resolved, That a broad and vigorous campaign of education be conducted by the National Automobile Chamber of Commerce, instructing and enlightening its membership along these lines and calling their attention to the fact that methods which on superficial consideration, seem to have merit, are in reality potent forces for destroying the foundation on which our industry has been builded, and that every effort be made to encourage the membership to avoid adopting policies which will undermine the stability of the industry and to encourage them to pursue and develop those policies which can alone maintain and continue permanent success."

Two Velie Worm-Drive Trucks

Moline, Ill., May 14—Two worm-drive trucks are now marketed by the Velie Motor Vehicle Co., this city. They are known as the models 25 and 26 and are rated respectively at 1½ to 2 tons and 3½ tons. In design both trucks are similar except in point of size. The motors are 4⅛ by 5¼ and 4½ by 5½ of Continental manufacture controlled positively by a gear-driven centrifugal governor. The radiator tubes are removable and the whole radiator assembly is mounted on springs to absorb the shocks.

Velie Biltwel trucks are completely equipped with top over driver's seat, seat and cushion, gas headlights and Prest-O-Lite tank, oil lamps and full set of tools. Later in the summer an additional model will be added.

$1,100,000 Miller Rubber Preferred Subscribed in 1 Hour

Cleveland, Ohio, May 16—A syndicate headed by Borton & Borton and including Hayden, Miller & Co., of this city, and Field, Richards & Co., for the Cincinnati market, yesterday offered $1,100,000 of the new Miller Rubber Co. preferred stock at 105. The offering was more than covered within an hour.

Of this issue there is to be authorized a total of $10,000,000, of which $2,000,000 is for immediate issue. Of the latter $600,000 is to be used in exchange to retire the present issue of $500,000 and the balance was reserved for subscription by shareholders and by officials of the company.

This offering, together with the recent Goodyear financing, makes a total of close to $20,000,000 of new rubber preferreds taken by the markets within the past week or so. Eliminating the stock taken in exchange for existing issues, there has been marketed approximately $12,000,000 of these securities. The spontaneous response of the investment public shows the high standing they have attained in the investment markets, both in Ohio and throughout the country.

80% Stock Dividend for Paige?

Increase of Capital to $2,000,000 Also Proposed—Meeting May 24

Detroit, Mich., May 11—At a meeting of the directors of the Paige-Detroit Motor Car Co., held here to-day, recommendations were made that a stock dividend of 80 per cent be declared, that the capital stock be increased from $1,000,000 to $2,000,000, and that the par value of the stock be reduced from $100 to $10. These recommendations will be submitted to the stockholders at a special meeting that has been called for May 24, and it is practically certain that they will be adopted.

May 30 Is Proposed Date

According to the plan formulated by the directors at this meeting, the 80 per cent stock dividend will be issued from $500,000 of the present authorized capital stock that has been held in the treasury. At the present time the outstanding capital stock is $500,000, and the stock dividend on this will represent stock of a par value of $400,000. It is proposed to pay for the additional stock to be issued by transferring from the surplus account to the capital account $400,000. Even after doing this, it is said that the accumulated surplus will still be in excess of $250,000. The Detroit Trust Co. is transfer agent, and it is proposed to issue the stock dividend to stockholders of record at the close of business May 30.

Second Dividend

The Paige company has enjoyed a rapid growth and has been a big earner for its stockholders for some time. It was originally formed in 1909, with a capital of $100,000, all subscribed. The present stock dividend is the second distribution within a year. On Aug. 2, 1915, a stock dividend of 100 per cent was distributed, the outstanding capital at that time being $250,000. For some time past the concern has paid regular monthly dividends of 5 per cent cash. The year following its formation, the Paige concern increased its authorized capital to $250,000, of which $136,000 was paid in, and in October, 1914, the balance of $114,000 par value of stock, which had been held in the treasury, was issued to the stockholders at par, raising the outstanding stock to $250,000. In June, 1915, the capital was increased to $1,000,000, half of which was left in the treasury.

To-day the stock was selling on the Detroit Stock Exchange with bid quotations at $860.

A Transcontinental Record

Baker Drives Cadillac 8 from Los Angeles to New York in 7½ Days

New York City, May 17—Shattering all previous automobile records by dashing across the continent in seven days, eleven hours and fifty-two minutes, E. G. Baker, accompanied by W. F. Sturm in a standard Cadillac eight, arrived here May 15.

The car left Los Angeles, Cal., at 12.01 on May 8, and, covering the distance of 3380.7 miles to this city, arrived at Broadway and Forty-second Street at 2.53 p. m. The original mileage, 3471, as given out by the Cadillac company, was an error.

The former record was eleven days, seven hours and fifteen minutes, made by Baker and Sturm in a Stutz last May. On that trip the distance covered was 3728.4 miles.

On both trips Baker was the only driver, getting only nineteen hours' sleep on the last trip.

Deplorable road conditions were encountered and much difficulty in getting through mud holes was also experienced. Baker states that he could have negotiated the distance in one day less but for the poor weather conditions and bad roads. Rain at Kansas City held him up practically one day. The hardest riding was through Missouri, where at one time the car was only able to make 10 miles in two hours.

567.2 Miles In 1 Day

The longest distance covered was 567.2 miles on the third day's run into Dodge City on May 11. The total for the three days was 1655.9 miles. This was an average of over 551 miles daily and an average of 20.9 miles for every hour of the twenty-four. In 1915 Baker went by way of Phoenix, Ariz., and El Paso, Tex., before heading northward through Texas into Kansas. Baker's mileage the first three days of last year's run was 1245.5, as compared to 1655.9 miles for the first three days this year.

Comparing this time with that of a railroad train, it is shown that the latter takes ninety hours between Los Angeles and New York City to cover a distance of 3240 miles and uses over twenty locomotives.

The roads in Arizona were so bad that most of the running was done in intermediate gear. A great deal of the running was also through mountains, where an altitude of 6500 ft. was reached at one time.

The only trouble which happened to the car was a leaky oil pipe which cost the transcontinentalists 2½ hr. This trouble occurred between Barstow and Needles. The hood of the car was not lifted during the trip.

On the last stretch homeward Baker determined to make up for lost time. His last dash of 1028 miles from St. Louis to New York City took him 37 hr. and 17 min.

Notwithstanding the low gear work through Missouri and Arizona, the car managed to make from 9 to 10 miles per gallon of gasoline and from 320 to 350 miles per gallon of oil.

Last night a testimonial dinner was given Baker and Sturm at the Hotel Astor, where they spoke of their experiences on the run. Baker stated at one time he drove 84 miles without going out of intermediate gear. Only thirteen tire changes were made. The worst was through the Mojave Desert, where the thermometer stood at 120 deg. There, five tire changes were made. The usual pressure of the tires had to be reduced 15 lb. on account of the heat.

The car was equipped with U. S. tires, Delco starting and lighting system, Stewart-Warner speedometer, A-C spark plugs and Kelsey wheels.

The following gives the runs between evening stopping stations:

Williams, Ariz.	553.5
Santa Fé	555.0
Dodge City	567.2
Kansas City	401.0
High Hill	216.0
Greenup, Ill.	210.0
Pittsburgh	493.0
New York City	385.0

The mileage of the route which Baker and Sturm followed is as follows:

Los Angeles to San Bernardino	63
To Barstow	79
To Needles	165.8
To Kingman, Ariz.	72
To Williams	138.5
To Flagstaff	34.8
To Albuquerque, N. M	381
To Santa Fe	66
To Las Vegas	72.9
To Raton	136.6
To Trinidad, Col.	25
To La Junta	94.2
To Syracuse, Kan.	114

Hudson Raises Prices $100

Detroit, Mich., May 13—On May 9 the Hudson Motor Car Co. advanced the price of its various models fitted to the Super-Six chassis by $100, but public announcement of this change was not made until to-day. The new price on the phaeton model and the two-passenger roadster is $1,475, while the four-passenger roadster type now sells for $1,525; the cabriolet at $1,775 and the sedan at $2,000. Greatly increased materials costs are responsible for the change.

$60,000,000 Merger Formed

Perlman Rim, Delco, Remy, Hyatt and New Departure Companies Included

New York City, May 12—A giant merger of five leading parts and accessory making concerns has been consummated in the name of the United Motors Corp., with 1,200,000 shares of stock of no par value. The capital involved is nearly $60,000,000 and the concerns merged are the newly organized Perlman Rim Corp., New York and Jackson, Mich.; Dayton Engineering Laboratories Co., Dayton, Ohio, maker of the Delco electric apparatus; Remy Electric Co., Anderson, Ind., and Detroit, maker of electric apparatus; Hyatt Roller Bearing Co., Newark, N. J., and Detroit, manufacturer of roller bearings, and the New Departure Mfg. Co., Bristol, Conn., maker of ball bearings. The new concern will be the holding company.

The company is incorporated under the laws of New York State. Each company in the merger will retain its identity and the management of each will remain in the same hands as heretofore. The board of directors of the parent company will consist of representatives of the management of the subsidiary concerns, as follows:

Directors Elected

For the first year the directorate will be composed of A. P. Sloane, Jr., Hyatt Roller Bearing Co.; E. A. Deeds, Dayton Engineering Laboratories Co.; DeWitt Page, New Departure Mfg. Co.; S. A. Fletcher, Remy Electric Co., and L. G. Kaufman, president of the Chatham & Phenix National Bank, with the following officers: A. P. Sloane, Jr., president; A. E. Deeds, vice-president; DeWitt Page, secretary and treasurer, and L. G. Kaufman, chairman of the finance committee.

W. C. Durant, president of the Chevrolet Motor Co. and a big factor in the General Motors interests, is one of the principal figures in the new accessory combine as well as the newly organized Perlman rim concern. It is understood that the Perlman concern enters the merger on the basis of two shares of the new stock for each share of Perlman rim stock.

The stock of the United Motors Corp. has been oversubscribed by the syndicate in the neighborhood of three times. The banking houses of issue are Dominick & Dominick, J. S. Bache & Co. and W. W. Laird of Wilmington, Del. Dominick & Dominick are managers of the syndicate of bankers underwriting the stock of the corporation.

Noronic Is Oversold to S. A. E.

All Cabins Full—Forty Names on Waiting List—Program of Papers

NEW YORK CITY, May 17—Advice has been received from Detroit that the steamship Noronic, on which the Society of Automobile Engineers will take its summer cruise June 12 to June 16, is oversold, there being already forty more applications than there are berths available. The papers committee is nearly ready to announce its program which includes a wide variety of subjects and promises to be the best the society has ever had.

An endeavor is being made to find accommodation on the boat for two simultaneous meetings so that papers on widely different subjects can be read at the same time. This will allow a much larger number of papers to be read and is expected to be much appreciated.

S. A. E. Standards Program

During the coming week there will be a number of meetings of divisions of the standards committee commencing May 22. On May 24 at 10 a. m. at the society's headquarters in New York the sub-committee on lamp standards appointed by the electrical equipment division will hold its first meeting under the chairmanship of W. E. McKechnie of the Cadillac Motor Car Co. On the same date the other sub-division dealing with starting motors and generators will meet in Detroit. The nomenclature division has a meeting in Detroit on May 25, when it is hoped to practically complete the work of its division so that a complete report can be presented to the summer meeting.

Other Meetings

The miscellaneous division meets in Detroit May 26, and the engine and transmission division in Detroit May 27, while the research division has a meeting at Indianapolis on May 29.

With respect to the meeting of the subcommittee on starting motors and generators, which is composed partly of members of the electrical equipment division; invitations have been issued to other engine makers and to manufacturers of starters and generators to attend this meeting and join in the discussion of the general possibilities.

Tire Division Appointed

The council of the S. A. E., by a mail vote, has decided to establish a tire and rim standards division to handle all matters concerning solid or pneumatic tires and rims. The membership will include representatives of all the solid tire and rim makers, and it is hoped to complete the personnel in time for a meeting to be held previous to the general meeting on the Noronic. This division will take over the truck standards division, a certain amount of work in the nearly complete state and expects also to proceed actively with the standardization of felloe-bands of pleasure car wheels, thus taking over the work of the pleasure car wheels division, which was discontinued some time ago.

Electric Vehicle Section of N. E. L. A. Meets May 22-26

CHICAGO, ILL., May 17—On Monday, May 22, the National Electric Light Assn. will commence its annual meeting, which lasts till May 26. It will be remembered that the Electric Vehicle Assn. recently amalgamated with the N. E. L. A., becoming the Electric Vehicle Section of that body, and this section will present to the meeting a number of interesting papers and reports.

The Papers

Prominent among the readers of papers are well-known S. A. E. members. William P. Kennedy, chairman of the S. A. E. truck standards division, will read a paper dealing with the ability of central stations in the promotion of the use of electric vehicles. E. P. Chalfant, another member of the S. A. E. standards committee, has a very interesting paper on the problems concerning electric passenger vehicles. He analyzes the respective fields of gas and electric cars in detail. F. E. Whitney has a paper analyzing truck troubles and their elimination. S. V. Norton of the B. F. Goodrich Co. is contributing a long paper on tires in relation to electric vehicle efficiency. P. D. Wagoner of the General Vehicle Co. submits some valuable data regarding the battery service system. Industrial truck application, drawing attention to the very wide field of this modern machine, is the subject of the paper by C. W. Squires, and Harry Salvat in a short paper calls attention to the opportunities which the electric car offers to garage owners.

Federal Use of Trucks

The largest document to be presented to the meeting is the report of the committee on Federal and municipal transportation. This discusses the public service uses of electric vehicles and illustrates a large number of trucks in municipal service of all kinds.

The report of the standards committee refers to the fact that the work of standardizing is being left, to a great extent, on the hands of the S. A. E., whose committee on electric vehicle standards consists mainly of members of the E. V. A.

Steel Standards for England

Automobile Engineers Establish Ten Standard Specifications As Official

LONDON, May 4—In December, 1914, a meeting was held by the Institution of Automobile Engineers and an invitation was issued to all those interested in the manufacture of steel as far as it concerns automobile engineering. At this meeting a paper was read by L. H. Pomeroy emphasizing, among other things, the need for a reduction in the number of steels then in use in automobile construction and also for a better understanding between automobile engineers and steel makers.

A good deal of interest was aroused among the steel manufacturers and stampers, and the outcome of the meeting was the appointment of a committee consisting of steel manufacturers, drop forgers and automobile engineers. As a result of less than twelve months' labor this committee has suggested a series of ten standard steel specifications for use in automobile construction, and these specifications have now been finally approved by the engineering standards committee of Great Britain and are being issued by that body.

A Paper Read

At the meeting of the Institution of Automobile Engineers held May 10, L. H. Pomeroy, who has acted as chairman of the committee mentioned above, read a paper dealing with these specifications, setting forth the reasons which led to the adoption of the particular steels chosen and specifying the uses to which each of the steels may be put. The British steel specifications will be published in THE AUTOMOBILE as soon as details are available.

Armored Trucks N. Y. S. A. E. Subject

NEW YORK CITY, May 17—The Armored Motor Truck will be the subject of the evening at a meeting of the Metropolitan Section of the Society of Automobile Engineers to-morrow night in the plant of the International Motor Co., West End Avenue and Sixty-fourth Street, this city. In connection with the meeting several armored cars will be shown and General Wood has appointed Captain Kilbourne of the general staff to represent the army.

S. A. E. in N. Y. Preparedness Parade

NEW YORY CITY, May 13—The Society of Automobile Engineers in this city was represented in to-day's Preparedness parade, in which over sixty trades and professions took part. The automobile engineers marched in section 8 of the engineering division of the parade together with the chemical, municipal and aeronautical engineers. The automobile engineers marched in two platoons led respectively by Herbert Chase and Leonard Kebler. This contingent was preceded, as were other contingents, by suitable standards bearing the words "Automobile Engineers." Among those who marched were: J. A. Anglada, A. C. Bergmann, J. R. Cautley, Herbert Chase, C. F. Clarkson, Ferdinand Jehle, Leonard Kebler, N. B. Pope and E. H. Stickles. Other automobile engineers who were assigned to other divisions in the parade were Howard Coffin, Prof. F. R. Hutton, H. M. Swetland, H. C. Wilson, Azel Ames and W. A. Roberts.

Mid-West Section Meets June 2

NEW YORK CITY, May 15—The second quarterly meeting of the Mid-West Section of the Society of Automobile Engineers will be held June 2 at the Chicago Automobile Club, Chicago, the meeting starting at 8 p. m. W. B. Stout of the Scripps-Booth Co. will present a chalk talk dealing with the relation of art to the automobile, and Henry Farrington of the Jeffery company will give data on motor trucks.

E. B. Blakeley, a mechanical engineer who has been experimenting with small stationary engines which are operated by combustion from compression only, will give a demonstration on how to develop power from any fuel.

Jewett To Address Detroit S. A. E.

DETROIT, MICH., May 13—D. McCall White, chairman of the Detroit section of the Society of Automobile Engineers, announces that the principal speaker at the next meeting of the section, which is to be held on May 17, will be H. M. Jewett, president of the Paige-Detroit Motor Car Co. Mr. Jewett's topic will be, "What Proportion of His Parts Should the Car Manufacturer Make?" Dealing with a most important phase of modern production, it is expected that a record attendance will be on hand.

Hambach Is Shakespeare Engineer

KALAMAZOO, MICH., May 12—Ernest Von Hambach, formerly with the Sunderman Safety Carburetor Corp., Newburgh, N. Y., is now in charge of the engineering department of the William Shakespeare Co., manufacturer of carbureters.

Brown Scripps-Booth Asst. Sales Mgr.

DETROIT, MICH., May 11—W. I. Brown, former supervisor of districts for Dodge Bros., has been appointed assistant sales manager of the Scripps-Booth Co., of which W. B. Stout was recently made sales manager.

Webber a Maxwell Vice-Pres.

6500 Cars a Month Being Built —Year's Output Is Estimated at Over 65,000

DETROIT, MICH., May 10—Orlando F. Webber, assistant general manager of the Maxwell Motor Co., has been elected a vice-president of the company in addition to retaining his previous connection. Mr. Webber has been a figure in the automobile industry since its inception and joined the Maxwell organization in April of last year.

The Maxwell company has declared its regular dividend of 1¾ per cent on the first preferred stock, but no action has been taken on the second preferred. Manufacture of Maxwells is running at the rate of about 6500 cars per month at the present time, and it is estimated that the production for the current fiscal year will be between 65,000 and 75,000 cars, as compared with 32,000 last year. About 300 cars per day are being turned out. Some $250,000 worth of improvements have been completed at the Detroit plants and an equal amount of money is to be spent at Newcastle, Ind., this fall. Sales are said to be running ahead of expectations, with dealers demanding about 15,000 more machines than they thought they would require when the schedules were made up last July. It is stated that about $5,000,000 will be earned this fiscal year, which closes July 31. This is sufficient for regular dividends upon the two preferred stock issues and about 27 per cent on the common.

30 per Cent of Military Cars in France Always Under Repair

PARIS, April 28—More than 30 per cent of the touring cars employed on military work are always under repair, according to a statement made by the Military Governor of Paris. This percentage, which is considerably higher than in any civilian service, is accounted for by the strenuous nature of military service, unnecessarily hard driving, and lack of attention. As a remedy, the authorities have ordered that all drivers shall be allowed a minimum of half a day each week to thoroughly clean, examine and execute minor repairs to their cars. In addition, officers must insist on cars being washed every day, and allow time for this work. It is forbidden for cars to operate away from macadamized or paved roads. When officers have to reach posts situated across country, they must go by car to the limit of the made roads and complete the journey on foot. The average speed on made roads must be kept down to 18 miles an hour. It is difficult to believe that this speed restriction will be observed on long trips over well made and uncongested roads. At suitable intervals all cars must be sent to the workshop to be examined and put in order. This must be done even if no other car is available as a replacement: it is better that the officers should be without a car for half a day rather than allow defects to accumulate until the vehicle is irreparable.

A Service Book Used

When cars are on detached service the officers using them are given a service book, on presentation of which at any army depot they are able to get supplies and repairs. This book constitutes a record of all work done on the car and enables cases of neglect to be traced to the responsible party. Officers on isolated service having the use of an automobile are under an obligation to keep the captain of the group to which the car belongs constantly informed as to the place in which it is garaged, thus allowing him to inspect it at intervals. This will prevent any officer using a car until it is ruined and then returning it to the group for a new machine.

Taylor with Allen Pressure Co.

NEW YORK CITY, May 16—H. W. Taylor, former general manager of the General Motors Co., has become general manager of the Allen Pressure System Co., this city. His headquarters will be at the offices of the company at 1926 Broadway.

McCutchen President Ross Co.

DETROIT, MICH., May 13—C. G. McCutchen, formerly president of the American Gear & Mfg. Co., Jackson, has been elected president of the Ross & Young Machine Co. Mr. Ross, who has been identified with the automobile industry for the last twelve years, will devote his efforts to the furtherance of the business of the Ross Automobile Co.

Skiles, Ohio Tube Co. Head, Dies

SHELBY, OHIO, May 11—G. M. Skiles, president of the Ohio Seamless Tube Co., this city, died in this city on May 4. He was one of the original owners and incorporators of the tube works. In 1908, when the plant was purchased from the United States Steel Corp., Mr. Skiles was instrumental in forming a new company, and selling the stock in the institution.

He was born at Stowstown, Pa., Feb. 25, 1852.

Individual Tractor Tests Tabooed

NEW YORK CITY, May 18—The National Tractor Manufacturers' Assn., of which J. B. Bartholomew of the Avery Co., Peoria, Ill., is president, has decided that individual non-competitive plowing demonstrations do not come within the province of its committee for demonstrations. This information is imparted in a resolution which was adopted late last month. The resolution follows:

Resolved: That the association approve and ratify the action of the committee on tractor demonstrations in the selection of places, dates and circuit, and its refusal to sanction or attend other demonstrations;

That the association holds that individual non-competitive plowing demonstrations do not come within the province of the committee;

That we will make no tractor plowing demonstrations at any County, District or State Fair in the United States, except each manufacturer may exhibit in the County Fair in the county where its factory is located;

That where competitive demonstrations are not under the auspices of the committee and made by individual purchasers, no member of the association will bear any part of the expense of, or have any salesman or expert at, any such demonstration.

Morehouse with Redden Truck

DETROIT, MICH., May 13—Jay E. Morehouse, who was special sales representative of the Maxwell Motor Co., and formerly general sales manager of the H. A. L. company, Cleveland, has been appointed sales manager of the Redden Motor Truck Co., with headquarters at 676 Woodward Avenue. The Redden company builds the Redden Truck-Maker, an attachment for the Ford chassis.

Two Assistants for Hawley

DETROIT, MICH., May 11—The Puritan Machine Co. recently appointed G. Jacob and R. V. Burrell as assistants to E. W. Hawley, service manager. These appointments were necessitated on account of the extraordinary growth in the service department of the company, due to the acquisition of orphan car companies.

Mendel Is Rex Ignition Manager

NEW YORK CITY, May 16—E. H. Mendel, formerly on the staff of the Splitdorf Electrical Co., has joined the Rex Ignition Mfg. Co. in the capacity of general manager. Mr. Mendel's headquarters will be in the New York office at Fifty-eighth Street and Eighth Avenue.

Fox Joins Wetmore-Quinn Co.

DETROIT, MICH., May 13—C. S. Fox, formerly director of service for the old Lozier Motor Co., has formed a connection with the Wetmore-Quinn Co., Detroit distributors for Paige-Detroit and Saxon cars.

Studebaker Boosts Production

16,952 Cars Sold in Quarter Ending March 31—5700 Dealers

DETROIT, MICH., May 13—Although the Studebaker Corp. established a new production record for the first quarter of this year, it is said that the present three months are certain to far surpass the previous period from the standpoint of production and sale of cars.

Sales of Studebaker cars for the first quarter ending March 31 were 16,952 machines, as compared with 9400 for the same period the previous year, an increase of 75 per cent, and this will be greatly outdone this quarter. The completion of the new $1,000,000 factory extensions will be a considerable factor in enabling the Studebaker concern to increase its output for the present quarter, and the easing up of the freight situation is expected to make it possible to ship all the cars that can be built.

With the largest selling organization in its history, numbering 5700 dealers, the problem of distributing this year's output will not assume any great difficulty.

Studebaker Corp. of Canada Formed

OTTAWA, ONT., May 16—The Studebaker Corp. of Canada has been incorporated here with a capital of $400,000.

Standard Steel Car Starts Building

PITTSBURGH, PA., May 15—The Standard Steel Car Co., this city, has broken ground for a new plant which will be over ½ mile long and 60 ft. wide. This is to be the assembly department and is to be without a single inside post or pillar through its whole length.

One of the buildings, heretofore used in another line of manufacture, has been transferred to the automobile department for the manufacture of axles. Contracts have also been let for two additional buildings, one of which is 280 ft. long and 60 ft. wide and four stories high, while the other is 320 ft. long, 60 ft. wide and two stories high.

Jeffery to Add Two Buildings

KENOSHA, WIS., May 13—The Thomas B. Jeffery Co., this city, will add two shop buildings to its plant at Kenosha, Wis., this summer. Plans for the new structures are being rushed to completion by a firm of Chicago architects. Work will be started first on a new foundry. This building will measure 125 by 600 ft., will be one story high and of reinforced concrete. The roof of the building will be so constructed as to make smoke and gases a negligible quantity inside. It will be built saw-tooth style, with the windows so arranged as to open automatically at intervals.

The other building planned by the Jeffery company will be five stories high and of concrete. It will be devoted exclusively to the manufacture of car bodies and will contain modern kilns for seasoning the lumber used. Jeffery manufactures its own bodies. The Jeffery company has 3080 men on its payroll, and this force will be increased soon. At present the Jeffery plant occupies 101 acres, of which 26 acres are under roof.

Grant Awards Plant Contract

CLEVELAND, OHIO, May 16—The general contract for the first factory unit of the new plant of the Grant Motor Car Co. to be erected in this city on a tract purchased last week was awarded yesterday to the Walther Engineering Co. The site, which is located at Colt and Kirby roads, is seven acres in area. The plans for the new factory structure, which were filled at the city hall yesterday, are by the W. S. Ferguson Co. Its estimated cost is $135,000.

Packard Acquires Krit Plant

DETROIT, MICH., May 12—The Packard Motor Car Co. has acquired the plant formerly occupied by the Krit Motor Car Co., which adjoins the Packard property on East Grand Boulevard. This plant has been vacant since the Krit concern failed some time ago, and the ground has a frontage of 300 ft. with a depth of 600 ft. The factory buildings are three- and two-story structures of brick. Packard has made no decision as to what it will do with the property,·but will probably be used for future expansion.

Standard Tube on Eight-Hour Schedule

TOLEDO, OHIO, May 12—The Standard Steel Tube Co. has reduced its working hours to eight per day, and has raised the wages of its 400 employees 20 per cent over what they are now receiving, this to take effect to-day. During the summer months the men will work forty-five hours per week, and beginning Sept. 1 and continuing through the fall and winter months, the total week's work will consist of forty-eight hours.

U. S. L. Make Additions to Plant

NEW YORK CITY, May 15—The United States Light & Heat Corp. will produce in the next twelve months considerably over 300,000 U. S. L. batteries. Additions are now being made to its plant at Niagara Falls to take care of this increased demand.

A Body Plant for Detroit

Springfield Body Co. Buys 29 Acres and Will Erect a Factory

Detroit, Mich., May 12—The Springfield Body Corp., at present located at Springfield, Mass., and manufacturer of convertible bodies, is soon to have a factory here. To-day a 29-acre tract of land was secured on Michigan Avenue, in the Springwells district of the city, and convenient to railroad lines. A modern fireproof factory is to be begun immediately, although details of the structure are not yet available.

Reo Buys 7 Acres More

Lansing, Mich., May 13—As an indication of the buildings and extension activities which the Reo Motor Car Co. has in contemplation, additional property has been acquired along the Grand Trunk railroad tracks adjacent to the Reo concern's main plants here. The tract is 7 acres in extent, and will provide room for greatly enlarged facilities, although no announcement as to what disposition will be made of the new property has yet been given out. This is the second large block of land that Reo has acquired within the last few months here.

8-Hr. Day for Garford Employees

Elyria, Ohio, May 13—Eight hundred employees of the Garford Mfg. Co., this city, went on an 8-hr. day schedule May 11, instead of the previous 10-hr. schedule. It is announced that time and a quarter will be paid for the ninth hour, time and a half for the tenth hour and double time over the former regular day's schedule. Employees working on piece work will receive a raise equivalent to 7½ per cent.

To Reopen Republic Rubber Plant

Youngstown, Ohio, May 11—T. L. Robinson, president of the Republic Rubber Co., Youngstown, makes the announcement that the plant will be reopened in a few days. The plant was closed down about two weeks ago by labor troubles. He claims that many of the employees are anxious to return to work. State mediators are trying to settle the differences.

Monroe Buys Land in Pontiac

Pontiac, Mich., May 13—In line with its proposed expansion, the Monroe Motor Co., at present located in Flint, but which will soon move to this city and occupy the factory buildings formerly used by the old Welch company, has purchased a plot of land having a 596-ft. frontage on Saginaw Street adjoining the former Welch plant property. This purchase will enable the Monroe company to put in sidetracks to its property from the D. G. H. & M. tracks at Foote Street and will provide for any later additions to plant.

Continental Buys 7 Acres

Muskegon, Mich., May 12—With a view to future expansion, the Continental Motors Co. has increased its real estate holdings here by buying a 7-acre tract on the lake front, which land is at present occupied by a lumber and fuel firm. This new land will give Continental plenty of room to spread out for some years to come.

Fisk Grants 8-Hr. Day

Chicopee Falls, Mass., May 13—The employees of the Fisk Rubber Co. have been granted an eight-hour day with five hours on Saturday. Time and a half will be given for overtime work. This comes as a result of a strike, started in March. The strikers will meet in the near future to decide on the company's proposition.

Hupp Joins Emerson Motors

Detroit, Mich., May 12—R. C. Hupp, who organized the original Hupp Motor Car Co., and later left it to head the R-C-H-Corp., and after the latter's failure organized the Monarch Motor Car Co., has become identified with the Emerson Motors Co., a Delaware corporation which proposes to manufacture a five-passenger car to sell at about $395. This concern will be located in the East.

Komp Elected Lansden President

New York City, May 15—F. S. Komp, formerly secretary and purchasing agent of the Lansden Co., this city, has been elected president and treasurer of the company, succeeding A. G. McLaughlin. W. R. Garton becomes vice-president and general sales manager and N. A. Burgess, secretary. Mr. Garton is also sales engineer, with offices at 299 Broadway, this city.

Somerville with Republic Truck

Alma, Mich., May 16—W. A. Somerville, who for some years was advertising manager of the Rapid Motor Truck Co., Pontiac, Mich., and who later held a like position with the Stromberg Motor Devices Co., Chicago, Ill., has been appointed advertising manager of the Republic Motor Truck Co.

M. & W. Co. Plans Concentration

Buys Tract of Land 500x400 Ft. Adjoining Present Plant

Detroit, Mich., May 12—Morgan & Wright, subsidiary of the United States Rubber Co., and large manufacturer of automobile tires, has taken a step looking to the concentration of the tire making operations of the concern here by the acquisition of a block of land on Jefferson Avenue with a frontage of 500 ft. and depth of 400 ft. This adjoins the present large factories of Morgan & Wright and was bought from the Michigan Steel Boat Co., whose factory buildings now occupy the site. The purchase price is not known, but real estate men here state that it has a value of $350,000. The tire manufacturing concern does not take possession of the property until January, 1917, by which time the boat manufacturer will have completed another plant.

Leather Firms in $1,500,000 Merger

Newark, N. J., May 11—Two of the oldest patent leather companies in this city have merged into the General Leather Co., with a capital of $1,500,000, to manufacture automobile and carriage leather. The concerns merged are E. S. Ward & Co., and the Hugh Smith Co. A large plant will be erected, starting next week, adjoining the Ward plant, and when finished, will employ 500 persons.

To Split Up Overland Shares

Toledo, Ohio, May 16—The Willys-Overland Co., this city, will shortly split up the common stock into shares of $25 par value, as reported in a previous issue of The Automobile. This will mean that instead of 210,000 shares of $100 par value, there will be outstanding 840,000 shares. According to information given out, the Secretary of State of Ohio has granted the company's application for the procedure, and the change will be made before July 1. The chief purpose of the quadrupling of the number of shares, without disturbing the amount of capital, will be to bring about a greater elasticity in the market for Overland stock.

Moreland Double Shift a Success

Los Angeles, Cal., May 12—The double shift system recently inaugurated at the Moreland Motor Truck Co. of this city in the machine and service departments is proving a great success, and the system is soon to be adopted throughout the entire factory.

7417 Cars and Trucks Exported in March—Valued at $8,636,118

Value of 1878 Trucks Totaled $4,909,179, While the 5539 Passenger Cars Were Worth $3,726,939—Gain of 539 Trucks and 3110 Passenger Cars

WASHINGTON, D. C., May 12—The popularity of American-built cars and trucks is growing all the time in foreign climes, as the latest government statistics vividly show. During the month of March last, according to figures compiled by the Bureau of Statistics, 1878 commercial cars, valued at $4,909,179, were shipped abroad, as against 1339 commercial cars, valued at $4,725,563, exported during the corresponding month of last year. The exports of passenger cars increased from 2429 cars, valued at $1,958,302, in March, 1915, to 5539 cars, valued at $3,726,939, in March last, while the exports of parts, not including engines and tires, increased from $762,386 to $1,858,247 during the same periods.

The figures for the nine months' period ended March show astounding increases in exports. It will amaze many to learn that during the nine months ended March, 1916, there were 38,795 passenger cars, valued at $29,261,446, exported to all parts of the globe, while during the same period of last year the exports totaled 11,563 cars, valued at $9,551,731. Exports of commercial cars also show a remarkable gain from 6313 cars, valued at $18,737,487, during the nine months ended March, 1915, to 16,345 cars, valued at $43,638,900, during the corresponding period of 1916. During these periods the exports of parts, not including engines and tires, rose in value from $4,116,608 to $16,823,607.

It is interesting to trace the different parts of the world to which these tremendous shipments of automobiles went during the periods under consideration. Of course, the warring nations in Europe are importing thousands of cars, but other sections of the world are also beginning to buy American-built cars at a rate that must be pleasing to every manufacturer who is looking into the foreign field.

Looking over the statistics, one finds that France imported 948 cars, valued at $2,405,437, from this country in March last, as against 460 cars, valued at $1,918,053, imported during the same month of last year. During the nine months' period these exports increased from 2896 cars, valued at $8,325,140, in 1915 to 5147 cars, valued at $13,203,663, in 1916.

The exports of cars to the United Kingdom fell off in March last as compared with the exports for the same month of last year, but during the nine months' period there was a big gain. In March a year ago 1566 cars, valued at $2,468,014, were exported to King George's islands, while in March last the number was 1367 and the value $1,711,672. During the nine months of 1916 no less than 16,107 cars, valued at $22,089,418, were shipped there, as against 6197 cars, valued at $8,915,029, exported during the same period of 1915.

Russia Buys More Cars

Russia, which is just beginning to figure in the export returns, bought twenty-eight cars, valued at $95,753, from this country in March last, while during the nine months ended March last the Czar's realm's purchases totaled 4596 cars, valued at $14,434,529. There are no figures for the comparative periods.

There were no exports of cars to Germany during any of the periods under consideration.

Denmark, in March last, came to the front with purchases of fifty-five cars, valued at $41,351, while during the nine months of 1916 the number was 524 and the value $356,256.

Forty-five cars, valued at $23,514, was the extent of Italy's importations from this country in March last, which is a considerable gain over the figures for the same month of last year, when the importations were twenty-three cars, valued at $13,273. A much larger gain is indicated in the nine months' figures, the exportations of cars increasing from sixty-five cars, valued at $48,385, in 1915 to 252 cars, valued at $169,658, in 1916.

The exportations of cars to countries designated as "other Europe" amounted to 410 cars, valued at $361,144, in March last, as compared with 431 cars, valued at $1,293,577, in March a year ago. During the nine months' period these exports fell from 1263 cars, valued at $3,594,223, in 1915 to 1350 cars, valued at $1,336,154, in 1916.

Canada's Big Gain

Canada bought 1016 American cars, valued at $751,457, in March last, while during the nine months' period of 1916 the purchases amounted to 5303 machines, the value of which was $3,785,265. This is a big increase over the figures for the same periods of last year, which were 345 cars, valued at $317,516, and 2072 cars, valued at $2,553,942.

South America continues to loom up strong as a buyer of American-built cars.

Exports of Automobiles, Trucks and Parts for March and 9 Previous Months

	March				Nine Months Ending March			
	1915		1916		1915		1916

	3,768	$6,683,865	7,417	$8,636,118	17,876	$28,289,218	55,140	$72,900,346

Here are some of the telling figures: Argentina bought 357 cars, valued at $185,099, in March last, and during the nine months' period of 1916 the purchases amounted to 2992 cars, valued at $1,384,959. Brazil imported forty cars in March, the value of which was $25,408; during the nine months the importations amounted to 184 cars, valued at $114,929. Chile took thirty-nine cars in March, valued at $27,352, and 579 cars, valued at $400,741, during the nine months, while Venezuela bought sixty-eight cars, valued at $41,567, in March and 369 cars, valued at $239,752, during the nine months. "Other South America" imported eighty-one cars, valued at $44,799, in March last, as against 205 cars, valued at $96,599, for all of South America in March a year ago. Under this same heading 413 cars, valued at $234,869, were shipped during the nine months of 1916, as against 808 cars, valued at $434,051, for the whole of South America during this period last year.

Tremendous gains have also been made in the exports of cars to British East Indies, British Oceania, West Indies and Bermuda, and "other Asia and Oceania."

The accompanying table shows the detailed figures for the periods under consideration.

Pennsylvania Vacuum Cup and Ebony Tread Prices Reduced

NEW YORK CITY, May 13—The Pennsylvania Rubber Co., Jeannette, Pa., has made public a reduced list on its Vacuum Cup and Ebony Tread tires effective May 15, stating that this is made possible by improved manufacturing methods available in its new plant and by increased production. The reduction, however, is not general with other tire companies, none of them expecting a reduction. To the contrary, several of them predict a rise in the near future in view of the higher cost of raw material. This is offset in part by the statement from another large concern that changes of any nature are not likely until Sept. 1.

The old and new prices of the Pennsylvania company follow:

Size	Vacuum Cup Old	Vacuum Cup New	Ebony Tread Old	Ebony Tread New
30 x 3	$16.60	$14.20	$12.45	$12.05
30 x 3½	21.05	18.75	17.65	15.65
32 x 3½	24.05	20.75	19.15	17.65
33 x 4	33.75	29.25	25.45	24.80
34 x 4	34.85	30.30	26.30	25.75
36 x 4½	48.95	43.40	36.95	36.90
37 x 5	58.30	52.75	46.95	44.80

The Vacuum Cup style is guaranteed for 6000 miles and the Ebony Tread style for 5000 miles. Prices of tubes remain unchanged.

Overland's Wage Schedule in Effect

TOLEDO, OHIO, May 13—The 20 per cent increase in wages and the 8-hr. day schedule at the plant of the Willys-Overland Co. became effective May 11. Nearly 18,000 factory employees are affected and $25,000 is added to the weekly payroll.

Abandon Gasoline Tax Idea

Munitions, Inheritance and Heavier Income Taxes Proposed

WASHINGTON, D. C., May 13—Following a conference between Secretary of the Treasury McAdoo, financial adviser of President Wilson, and Congressman Claude Kitchin, Democratic floor leader of the House, it was learned that a complete abandonment of the President's proposal to tax gasoline and other articles used in industry to raise money for preparedness was decided upon. The President himself has changed on this portion of his message to Congress and favors instead a munitions, inheritance and heavier income tax. Kitchin is reported to have told Secretary McAdoo he was pleased the President had decided to abandon the gasoline tax, as rural congressmen in particular are opposed to it.

It is reliably reported that the Federal Trade Commission will on June 1 make its report in connection with the investigation it has been making into the boosts in the price of gasoline. It is stated that the report will fix the responsibility for the increases.

Acme Wagon Builds Trucks

EMIGSVILLE, PA., May 12—A new commercial car has been placed on the market by the Acme Wagon Co., this city. At present the Emigsville plant is turning out the trucks in two sizes, ¾- and 1-ton capacities. The ¾-ton truck is equipped with a Wisconsin motor, Timken roller bearings, worm drive axle and heavy pneumatic tires. The 1-ton truck has a Continental motor, heavy-duty internal gear drive axle and solid rubber tires.

Both trucks have wide frames which bring the springs close to the wheels on the axle, reducing side sway and vibration and at the same time making it strong and durable. The bodies for the trucks will be made up special as to size and style to suit the purchaser and for the purposes intended. E. K. Emig is the president of the company.

Packard Gets Big Truck Order

DETROIT, MICH., May 15—The Packard Motor Car Co. made a record in filling an order for fifty-six 3-ton army trucks, received from the War Department at 3 p. m. Sunday. Immediately all available men were pressed into service, and by 7 p. m. the trucks were loaded on cars and only awaited final shipping instructions in order to be on their way to Fort Sam Houston at San Antonio, Tex. The order called for the fitting of the regulation army transfer bodies and painting them the standard olive drab that characterizes all army equipment of the kind. The Packard company had anticipated the order to the extent of having made a number of the bodies in advance, so that the trucks left Detroit with only the paint wet.

The Government pays Packard $186,425 for these trucks, and this is the third order received. Included in the order was a requirement that eighty-two able-bodied men be furnished. The trucks required two special trains, and on each train there must be one truckmaster, three assistants, one expert mechanic, one assistant mechanic, thirty-three drivers and two cooks. On reaching Fort Sam Houston all will be enlisted in the army.

Manufacturers Plan Employers' Union

NEW YORK CITY, May 17—One of the points brought out at the convention of the National Assn. of Manufacturers in session yesterday at the Hotel Astor, was the need of an association of all American employers of labor to represent capital and dealings with the American Federation of Labor. The great idea in this project is to reach a solution of the ever-recurring quarrels between capital and labor interests. The plan is at present only vaguely outlined, but includes a central bureau in which statistics and data on strikes and similar industrial matters will be maintained and which will employ experts in the study of industrial legislation.

The association also considered means of credit for foreign business and went on record in favor of the draft acceptance system as opposed to the open account.

Packard Prepares Aviation Field

DETROIT, MICH., May 16—Following the recent tests on the Sheepshead Bay track of the smaller of the new aeroplane motors developed by the Packard Motor Car Co., it is of interest to note that before long Packard will be able to test its aircraft motors on its own aviation field near Mt. Clemens, Mich. Work of removing trees, filling in low places, in general, grading and smoothing the field, is well under way. Practical tests of the first large aircraft motor manufactured by Packard, which, by the way, is considerably larger and more powerful than the one which was tested in a car at Sheepshead Bay, will take place early in July. These tests will be made with a Sloane aeroplane of the tractor type. The larger motor is said to develop 300 hp., has approximately 900 cu. in. piston displacement and is built exactly like the smaller motor, except on a larger scale.

Overland Sales Gain 174% for Year

Willys Re-Elected President—Other Officers Re-elected —900 Cars a Day

TOLEDO, OHIO, May 12—The regular annual meeting of the stockholders of the Willys-Overland Co. was held here recently, in conformity with the new by-laws adopted last fall which changed the fiscal year from closing June 30 to Dec. 31. Hereafter the annual meeting will be held the second Tuesday in May.

At this meeting all of the old officers were re-elected. John N. Willys was re-elected as president; H. T. Dunn, vice-president; H. L. Shepler, vice-president; Isaac Kinsey, vice-president; C. A. Earl, vice-president; Walter Stewart, treasurer, Royal R. Scott, secretary. The board of directors consists of these officials and James Kepperly and Rathbun Fuller.

One of the interesting features of the meeting was the report that Overland shipments for the twelve months ending April 30, this year, were 137,665 cars, as compared with 50,258 cars for the preceding year, an increase of 174 per cent. The largest single month of the twelve prior to April 30, 1916, was that in which 19,781 cars were shipped, as against 7005 for the largest month of the previous year.

But even with this striking increase, the Willys-Overland Co. had on hand May 1 orders for 11,301 cars, as compared with 4527 on order on May 1, 1915. The foreign business, in spite of the war, also has shown a great jump over a year ago. Total exports, all models, for the 1915 season were 2331 cars, whereas, up to May 1 this year, export sales totaled 9867 cars, with unfilled orders for 977 more. Had it not been for a lack of ocean shipping facilities, it is thought that this total could readily have been increased approximately 2000 more.

It is said that shipments are now averaging close to 900 cars a day, and that when the last of the new buildings now under construction is completed the output will be raised to 1000 cars daily.

The latest unit of the Overland group is a 500,000 sq. ft. structure that has just been completed. The building, known as No. 49, is five stories high and built of reinforced concrete throughout, and is one of the largest of the many Overland structures. The entire amount of space will be given over to the manufacture of closed cars, a branch of the business that has surprised the officials by its growth. The first and second floors will be used for final testing, the third for parts assembly, the fourth for painting and trimming of closed cars and the fifth for the making of tops and trimming. Seven hundred power sewing machines are installed here, and this is the only department, outside of the administration offices, where women will be employed. Some 800 will be at work in this department.

L. O. Gordon Mfg. Co. Formed

MUSKEGON, MICH., May 13—The L. O. Gordon Mfg. Co. has been organized here by J. V. Whitbeck, chief engineer of the Chandler Motor Car Co., Cleveland; C. A. Carey, purchasing agent of the same company, and L. O. Gordon, formerly engineer for the Muskegon Motor Specialties Co. The new concern intends to make camshafts and other motor specialties, and will have an employed force of 100. The city of Muskegon is to erect a $10,000 plant, 46 by 177 ft., for the new concern, and it is expected that deliveries will start on Sept. 1.

Thelma Motor Co. Reorganized

ECORSE, MICH., May 10—The Thelma Motor Co. has been reorganized, the capital increased, and the name of the firm changed to the Robinson Machine Co., which company will engage in the manufacture of motor parts. Al. Robinson will remain as president and manager of the new company. The manufacture of Thelma marine motors has practically been discontinued.

Corcoran-Victor Co. Formed

Cincinnati Lamp Cos., Merger Completed—Capital To Be $2,250,000

CINCINNATI, OHIO, May 13—The Corcoran-Victor Co., has been formed with a capital of $2,250,000, thus completing the merger outlined in THE AUTOMOBILE for April 16.

The merged companies will be under a single management and the new company will include the Corcoran Lamp Co., the Victor Lamp Co., and the Victor Auto Parts Co., all of this city. The stock of the new company consists of $750,000 preferred, of which $200,000 is retained in the treasury, and $1,500,000 common, some of which will be offered to the public. The five Corcoran brothers, T. J., who owned the Corcoran Lamp Co.; W. J. and E. B., who owned the Victor Lamp Co.; and J. L. and H. R., who owned the Victor Auto Parts Co., were paid in cash and stock in the new company.

Copper Prices Half Cent Higher

NEW YORK CITY, May 16—Electrolytic and lake copper went up ½ cent a pound to 30 cents last Wednesday. This market holds very firm, with an active domestic and foreign demand. Lead reached $7.50 per 100 lb., a 10-cent gain, while antimony dropped 2 cents to 34½ cents a pound. Rubber is still being maintained at a low level, both Para and Ceylon grades quoting at 71 cents a pound yesterday. Tin fluctuated this week, closing yesterday at $49 per 100 lb., a loss of 88 cents for the week.

Cottonseed oil dropped to $10.83 per barrel, at a loss of 12 cents, and linseed oil closed with a loss of 1 cent, the quotation being 73. The rest of the oils and lubricants and metals remained constant and steady.

Gasoline Prices Remain Unchanged—Another Fuel Substitute Announced

NEW YORK CITY, May 15—Gasoline prices along the Atlantic Coast remained unchanged last week. It is expected that the present quotations will stay at this level for some time. Sentiment in the trade indicates that crude oil quotations have about reached their highest level, although the belief that a decline is due has not gained any wide support. Oil interests expressed the opinion that the new production should prevent any further advances for some time to come, as they believe that the rise has been sufficient to cover growing consumption in large measure. It is recognized that the price of gasoline may rise, although crude quotations remain stationary, but it is said that until the price of crude goes up, the advance in gasoline will not be of large proportions.

Last month saw a decrease in new oil producing wells, the record for that month showing 94,938 barrels as against 152,020 in March. Wells to the number of 1580 were brought in as compared with 1383 in March.

One more fuel substitute has been announced, this one coming from Bloomfield, N. J. This is a white liquid and F. R. Blamey, a grain merchant, is the inventor. Mr. Blamey states that a teaspoonful of this liquid in 5 gal. of mixed kerosene and gasoline will form a practical fuel costing less than gasoline.

Out in Detroit the Reichenbach Laboratories Corp. has been formed with Lee Olwell, G. W. Durham, H. M. Reichenbach, Paul Weadock and H. D. Van Norman as directors. This corporation controls the Reichenbach patents for an automobile fuel system by reatomizing liquid fuel so that none reaches the cylinders in that form. It is said that a saving of some 50 per cent has been effected under test.

Demurrage of $5 a Car on New Haven

NEW YORK CITY, May 11—The New Haven Railroad has filed a new tariff with the Interstate Commerce Commission to be effective May 25, providing for a demurrage charge of $5 a car a day. This charge will be additional to the usual demurrage. This high fee has been deemed necessary because of the continued delay on the part of recipients of freight in taking their consignments from the cars.

Motor Stocks Show Strength

Overland and Chevrolet Reach New High Records—New Departure Up 27 Points

NEW YORK CITY, May 16—Exceptional strength and new high records featured the automobile and accessory securities on the local stock exchange last week. Expectation of large dividends and the healthy tone of the market were responsible for large gains in which Overland, General Motors, Chevrolet, Studebaker and New Departure figured prominently. New high records were made by Overland and Chevrolet. Overland rose to 270 on Saturday, going up 10 points for the day. The previous record was 268 last November. Overland stock has risen 30 points in three days. Chevrolet on Monday advanced to 228, a new high record. Studebaker common went up 8½ points to 141. Reports have it that Studebaker, during the first quarter of 1916, exclusive of its war order business, showed net income of approximately $2,500,000. New Departure rose to 217, a gain of 27 points, on the announcement that it was to be merged with four other accessory and parts makers into the United Motors Corp.

The United Motors Corp. stock, which was introduced to trading for the first time yesterday, sold at prices ranging from 66 to 74. It closed at 68½. According to Street reports, the stock was underwritten around 55.

General Motors showed considerable strength at 460, a gain of 35 points for the week and 9 points for the day. Apropos of the Studebaker common, sales for the day amounted to 16,000 shares. Maxwell common and first preferred each made good gains for the week, the first going up 3½ points and the latter 3⅛. Some disappointment was expressed in Wall Street circles over the failure of the directors of this company to declare a dividend on the second preferred stock at its meeting last Tuesday. Earnings of the company, it is stated, are running at the rate of approximately $5,000,000 net for the twelve months. On this basis the company is expected to show between 27 and 29 per cent earned on its outstanding common stock for the fiscal period.

On the Detroit Exchange Paige-Detroit, with its 175-point gain, was the feature. This company last week proposed declaring an 80-per cent dividend on its stock and also doubling its stock.

Alliance Tire Supt. Made Director

ALLIANCE, OHIO, May 12—W. H. Christensen, superintendent for the Alliance Rubber Co., this city, has been elected to the board of directors to fill the vacancy caused by the death of the late George C. Russell, who died in California, March 30. J. C. Shively succeeds Mr. Russell as president of the company. Milton Bejach is vice-president and general manager. The statement submitted to the directors and stockholders as of April 1 shows a 1500-per cent increase in business over the corresponding period of 1915. Tires and inner tubes are the chief lines of manufacture.

N. A. A. A. J. Holds Convention

New Standards of Business Practice Established and Reforms Instituted

HOT SPRINGS, VA., May 12—The National Assn. of Automobile Accessory Jobbers, a year old yesterday, closed its spring convention to-day after having instituted a number of reforms and set up a number of new standards for business practice.

The convention began Tuesday with committee meetings, which lasted Tuesday and Wednesday, and the general sessions were held Thursday and to-day, concluding at 1 o'clock this afternoon.

A number of additions were made to the list of jobbers that the association has prepared and several members were admitted to the organization. In order to carry out the reforms it has in mind, the association plans to employ an investigator, who will devote his time to securing necessary information. In the past Commissioner W. M. Webster has handled practically all of this detail, but with the growth of the association it is becoming too voluminous. The organization is in good financial condition, having $18,378.20 in the treasury.

Unethical Business Practices

The members were of the sentiment that it is not ethical business practice for a manufacturer to duplicate the product of another manufacturer who has spent money and effort in developing the product and building up a business in it. It was recognized that there are exceptional situations and that duplication may, in many cases, be legitimate, but the action of the association was aimed at piracy and guerilla warfare in business. The practice of cashing in on the advertising of the pioneer and doing no legitimate development or advertising was condemned.

The methods of manufacturers who send threatening letters to the trade in advance of any definite situation in patent litigation were condemned, and it was recommended to members that they do not follow this practice.

Advertising Problems

Advertising in the house organs of other manufacturers was considered unwise and injudicious and certain members said that they could see that harm came thereby to even the publisher of the house organ himself.

The sending of collect telegrams has in some quarters become an abuse, and the association recommended that the practice be restricted. Paying for these telegrams was said by one member to be nothing more than a cut in price.

Drawing parallels in advertising was construed as unethical business practice, and it was recommended that members avoid the use of any names in these comparisons. L. C. Reed of the Chamber of Commerce of the United States addressed the convention on the work of the organization he represents, and the jobbers voted to affiliate with the chamber.

Vice-President Joseph Bloch of the Gibson Co., Indianapolis, Ind., delivered an address on business practice.

A Credit Bureau

A credit adjustment bureau is to be established, the object of which will be to disseminate information regarding unsafe accounts.

Greater co-operation between the jobbers and the Motor and Accessory Manufacturers is to result from conferences which have been held and regarding which a report was made to the convention by President Sydney B. Dean, St. Paul.

The next convention is to be held in St. Louis the first week in October, and the dates probably will be Oct. 2, 3, 4 and 5. A committee was appointed to assist the retailing division of the trade in establishing better business methods and deriving greater profits from the retailing business. The chairman is H. R. Williams of the Gibson Co.

The traffic committee recommends a standardization of certain shipping packages, and plans to have parts and accessories entered in some freight classification, after which any rate adjustments will be taken up. At present the majority of accessory merchandise is classified as "Not Otherwise Specified."

Examinations for Special Agents

WASHINGTON, D. C., May 12—The date of examinations for special agents of the government to investigate the markets for motor vehicles in China, India, East Indies, Africa, and Australia has been set for May 19.

K. C. Dealers Find No Need for Used Car Auction Show

KANSAS CITY, MO., May 13—The Kansas City Motor Car Dealers' Assn. has abandoned its plans for holding an auction show for used cars—the committee appointed to investigate reporting that there was little occasion for such an event.

"The committee found that there is a comparatively small number of used cars in the city; that the advance in price and the scarcity of new cars have caused a stiffening of prices on the used cars, and that little could be gained by an auction and show," said Will Brace, president of the association.

Twelve Entries for Chicago

De Palma, Resta, Chandler, Johnson and Lewis on List for Derby

CHICAGO, ILL., May 16—*Special Telegram*—The class of the field for the Chicago Derby, June 10, has been heightened by the entry of DePalma, Resta and Oldfield to-day with DePalma's Mercedes, Resta's Peugeot and Oldfield's Delage. Three Crawfords also came in to be driven by Billy Chandler, Arthur Johnson and Dave Lewis. This brings the entry list up to twelve, and it is expected that before the entries close there will be in the neighborhood of forty cars named for the board track event.

If it is true that Barney Oldfield is to retire this year he will not go back to private life without having made an attempt to capture this race as a crowning glory and a fitting finish to a career which has been one of the most sensational in the annals of racing. Oldfield has announced his intention of accepting the challenge of David F. Reid, president of the Chicago Speedway Assn., who, as announced last week, has offered $1,000 to the driver who will break the world's 2-mile speedway record, with an additional $1,500 if better than 2 miles per minute.

$12,000 for Indianapolis Winner

INDIANAPOLIS, IND., May 15—Prize money totaling $30,000 in cash will be competed for at the coming race meet on the Indianapolis Speedway May 30. There will also be intermediate trophies added. The winner will receive $12,000; second, $6,000; third, $3,000; fourth, $2,000; fifth, $1,700; sixth, $1,400; seventh, $1,200; eighth, $1,000; ninth, $900, and tenth, $800.

Three Trophies

The trophies will be the Remy Grand Trophy and the Remy Grand Brassard, which will be awarded the driver of the car leading at 100 miles; the Prest-O-Lite Trophy, which will be awarded the driver leading at 200 miles, and the Wheeler-Schebler Cup, which will be awarded to the leader at the 250-mile post.

Six Events for Tacoma May 30

TACOMA, WASH., May 15—Six events are scheduled for the Decoration Day Tacoma Speedway race meet. Event No. 1 will be a 20-mile race for cars of 600-cu. in. displacement or under. First prize will be $75; second, $50; and third, $25. Event No. 2 is an outdoor automobile show and parade. Event No. 3 is a 10-mile race for cars of 230-cu. in. displacement or under. First prize is $50; second, $35; third, $15. Event No. 4 is a 30-mile race for cars of 600-cu. in. displacement or under. First prize is $125; second, $75 and third, $50. The other two events are a backing contest for women drivers and a women's exhibition driving contest for three laps of the track, approximately 6 miles.

For July 4 the Tacoma Speedway Assn. is arranging a program which will consist of one event for non-professional drivers, along the lines of the Chicago event on May 20. Besides this, there will be a match race between Ulysses Aubry, in a Tacoma-built car, and James Parsons of Seattle in a Stutz. This race will be put on in three heats, the first two being 35 miles each, and, if a third is necessary, it will be for 30 miles. The prize for this race will be $1,000.

For Aug. 5, there will be a 300-cu. in. race for 300 miles, with a purse of $10,000.

Two Trophy Races Scheduled for Twin City Track

MINNEAPOLIS, MINN., May 13—Entry blanks for the Memorial Day races at the Twin City Motor Speedway, Sanction No. 295, show two trophy races and altogether about $3,000 in purses. Motorcycle races are scheduled and an appearance of Ruth Law, woman aviator. The program is as follows:

No. 1. Class C, Div. V—Non-stock, 161-230 cu. in., 10 miles: $150, $75, $50, $25.

No. 2. Class C, Div. VI—Non-stock, 231-300 cu. in., 20 miles: $150, $75, $50, $25.

No. 3. Class E, Non-stock—Special, 10 miles, roadsters and touring cars, factory equipment, except tops, lamps, mud guards and windshields, for members M. S. A. A., *Daily News* troply, one year.

No. 4. Class D. Non-stock—Free-for-all, 50 miles: $1,000, $500, $200, $150, $100, $50.

No. 5. Class E, Non-stock—Special, Twin City racing cars, drivers and entrants, 10 miles. "Twin City" trophy, permanent when won third time by representative of same city.

No. 6. Non-stock—Free-for-all handicap, open to cars competing in one event of the day, 10 miles: $150, $75, $50, $25.

The management of the speedway is having the joints and rough spots rubbed down, and drivers who contested in the first race last year that have driven over the track this year find the concrete has weathered the winter well and that the course is in much better condition even than last fall.

Prices Are Lower

High prices that worked against a good attendance at the initial race, and which were criticized strongly, have been reduced. Fifty cents is general admission with bleacher seat. Automobiles will be parked free behind the stands with $1 charge for each occupant of cars parked in the circle inclosure and $1 for the car. Seats for the wire grandstand are $1 each, no charge for accompanied children under twelve.

Hupp Has School for Dealers

Most Practical Ways of Taking Care of All Adjustments to Be Taught

DETROIT, MICH., May 13—The Hupp Motor Car Co. has inaugurated a free educational course for Hupmobile dealers, service representatives and repairmen with the aim of informing them of the best and most practical ways of taking care of adjustments which necessarily come up in the use of an automobile. The course is in the nature of a correspondence school idea, and in the preparation of the plan, the Hupp concern has engaged the services of Claude Wadsworth, who originated, prepared and conducted the International Correspondence School Automobile shop course.

Eighteen instruction papers on automobile construction in general and Hupmobile construction in particular have been prepared by Mr. Wadsworth. The subjects to be taught cover every phase of car design, and will be presented in a concise form so they will be clear to the layman. Subjects to be dealt with cover: Automobile troubles; electric starting and lighting systems; ignition; carbureters; repair and adjustments; oxy-acetylene welding; automobile machine shop practice; automobile power plants; cooling and lubricating systems; clutch, control and change-speed mechanisms; tires; driving, assembly; factory work; materials; accessories; salesroom and garage management; data sheets, etc.

Twice during the year a series of questions will be sent to every student who enrolls and suitable prizes will be given those having the highest standing. In addition to the prizes offered, every man who passes the examination with 75 per cent or over will receive a certificate of efficiency from the Hupp company, which will serve as a recommendation for future employment.

Holds New York City Owners' License Bill Discriminatory

ALBANY, N. Y., May 16—Governor Whitman said to-night that he would not sign Assemblyman Kelly's bill, which would require every New York City owner of an automobile who operates his own car to take out an operator's license. Attorney General Woodbury told the Governor that the bill was unconstitutional. Its discrimination between persons, he said, amounted to a denial of the equal protection of the laws guaranteed by the Constitution. In his opinion Mr. Woodbury says:

"No owner of a motor vehicle whose residence is in New York City is permitted to operate or drive it unless he takes out a license. There being no restriction as to the place of operation, it would follow that he could not operate or drive it anywhere in the State without such a license, solely because of his place of residence. Upon the other hand, under the language of the act, any owner of a motor vehicle whose residence is outside of New York City may operate and drive it anywhere in the State, even in New York City, without a license, because no license is required of him.

"The right to operate and drive a car by its owner, with or without a license, is made to depend solely upon the owner's place of residence without regard to the place of operation. Thus people who are residents of New York City are discriminated against in the matter of this license requirement."

Reciprocity for New York and Canada

ALBANY, N. Y., May 13—Automobile license reciprocity between New York State and the Canadian province of Ontario will become effective within a few days as the result of the approval by the Ontario Cabinet to-day of the license exchange plan proposed to the provincial authorities some time ago.

Up to the present, New York automobilists have been obliged to take out an Ontario license before crossing the international boundary, and Ontario motorists were required to obtain a New York permit before they could bring their cars into the State.

Under the plan ratified by the provincial Cabinet to-day reciprocal rights to operate automobiles in each other's territory for a twenty-one-day period will be granted New York and Ontario motorists.

10,112 Cars in Quebec

MONTREAL, QUE., May 12—The returns prepared by the Automobile Bureau of the Provincial revenue for the year ending April 1, show that there were, up to that time 10,112 automobiles registered in the Province of Quebec. In past years nearly 75 per cent of the total number licensed were registered in the district of Montreal, but the figures for the past year indicate that the number of automobiles is much more evenly divided over the whole province than formerly.

Of the total of 10,000 in the province there are 8082 touring cars, 1055 run, abouts, 296 motorcycles, 132 limousines, 528 trucks, and nineteen surries. With the exception of eight propelled by steam and thirteen by electricity, all are driven by gasoline motors. In the districts of Montreal there are 4058 touring cars, six surries, 631 runabouts, 173 motorcycles, 121 limousines, and 425 trucks, most of the heavy commercial vehicles thus being employed in the city and district. Only one steam car and eight electric cars are operated, all the rest being gasoline driven.

Last year in the province there were 6825 passenger cars, 384 commercial cars, 205 motorcycles, and 137 dealers cars licensed, making a total of 7550, an increase of over 2500 motor vehicles in the year. There were over 70,000 cars in all the provinces of the Dominion. Ontario having five times as many cars as any other province. The figures for the last year just ended are not yet completed, but it is believed that the grand total of automobiles and motorcycles in the Dominion is not far short of 100,000 at present.

Expect 115,000 Registrations for Wisconsin This Year

MILWAUKEE, WIS., May 13—When the Secretary of State of Wisconsin issued license No. 79,790 on May 9, the total number of licenses issued during the year 1915 was equalled. Since then more than 4000 licenses have been issued, and by the end of May it is expected that the Wisconsin private owners' registry will have reached the 90,000 mark.

There seems to be no question that the 1916 registration will total 115,000, which would be approximately 35,000 in excess of 1915.

On March 1, the number issued was 21,000; on March 1, 1916, the number was 38,500. The figures for April 1 are: 1915, 30,000; 1916, 50,500. Thus it will be seen that during April alone, more than 25,000 cars were licensed. Dealer's licenses also show a large gain, the number issued on May 1 being 1745. The total revenue from automobile and cycle licenses for the first four months of 1916 was $406,557.

In 1912 the total registration of Wisconsin was 24,578. This number was passed on April 29, 1913. The 1913 total was 34,646, which figure was passed April 26, 1914. The 1914 total of 53,160 was passed April 26, 1915, and the 1915 total of 79,790 was passed May 9, 1916.

161,564 Registrations in Pennsylvania

YORK, PA., May 12—Revenue from automobile registration this year has passed the $1,700,000 mark and officials of the automobile division of the Pennsylvania State Highway Department believe that $2,000,000 will be reached. The total revenue for 1915 amounted to $1,665,276. The number of automobile registrations up to date are 161,564. It is believed that the total number will reach 250,000.

Robbins Pullman District Mgr.

DETROIT, MICH., May 10—P. L. Robbins, for two years connected with the sales department of the Paige-Detroit Motor Car Co., has been appointed district sales manager of the Pullman Motor Car Co., York, Pa., with headquarters in San Francisco.

Des Moines Business $12,000,000

$2,000,000 Average Stocks Carried by Car and Accessory Dealers

DES MOINES, IOWA, May 12—The annual volume of business done by the automobile trades industry of Des Moines is approximately $12,000,000, according to statistics compiled by the Des Moines Chamber of Commerce. The statistics show that the value of the average stocks carried by car and accessory dealers of the Iowa capital city is $2,000,000; the capitalization of the industry in Des Moines is $1,900,000; the number of men employed is 1000, and that the total of wages paid annually is $1,000,000.

The number of Des Moines concerns—corporations, companies, firms or individuals—engaged in the automobile industry is 111, and these are divided as follows: Cars, forty-three; accessories, thirty-seven; garages and repairs, twenty-one; oil, six; manufacturing, eleven. The classifications show some duplications, since some concerns are engaged in more than one line of business connected with the motor industry.

13,352 Cars Registered in California in April—171,755 in State

SAN FRANCISCO, CAL., May 3—The total number of cars registered in April was 13,352 against 8,321 for March. Five thousand and thirty-one more automobiles were registered in California during April than in March and the income to the State was $9,993.10 more.

The total receipts of the department to date are $1,857,492, and the total number of cars registered in California is 171,775.

Driver Liable for Damages

OMAHA, NEB., May 12—By a decision of the Nebraska supreme court, reversing that of the district court, the driver of a car concerned in an accident, who is at the time violating the provisions of the statutes, becomes liable for damages sustained by an innocent victim, even though such liability is not mentioned in the statutes.

The decision came in a case where a sixteen-year-old boy, driving his father's car at a reckless pace, collided with another machine, damaging it and injuring the driver.

Big Mileage by Maxwell Abroad

LONDON, ENGLAND, May 5—The performances of a Maxwell car in a series of mileage tests conducted recently at the Brooklands track near London during experiments with a new motor fuel were so satisfactory as to attract much attention. A mileage as high as 33.6 miles per gallon was obtained. Another test in which fuel of a different mixture was used resulted in a mileage of 32.8 miles. Hill climbing tests were made also. The purpose of the demonstrations was to determine the efficiency of Econo-mee, which is a mixture of a heavy grade vaporizing oil and ordinary gasoline.

Driving Without License Does Not Preclude Damage Claims

MILWAUKEE, WIS., May 14—Operating an automobile without a license does not preclude claims for damages in accident cases, according to the decision of the supreme court of Wisconsin in the suit of Eugene H. Derr against the Milwaukee road. Derr's car was struck by a train on Jan. 30, 1915. He was awarded $900 damages by a circuit court jury. The court in a memorandum found that Derr was illegally operating his car because he carried a 1914 license in 1915. This virtually set aside the verdict and Derr appealed to the supreme court, which says: "We find nothing in the statutes to indicate that the legislature intended to deprive a person who is injured while driving an unregistered car of the protection accorded to other travelers. To bar such an injured person from invoking his rights, it must appear that his violation of the law was a proximate cause of the injury." Judgment is ordered in favor of Mr. Derr as originally ordered by the jury.

4331 Cars in Denmark

COPENHAGEN, DENMARK, May 5—The number of automobiles in Denmark on Sept. 1, 1915, was 4331, with a combined horsepower of 35,229, as against 3430 machines at the corresponding period in 1914, with a total horsepower of 28,122. The first statistical information published by the Kingdom in regard to automobiles was in 1909, when there were only 682 machines in the country. Of the number of machines 3773 are for personal use. This number includes 1291 used for cab or omnibus service. Motor trucks number 558.

There were also on Sept. 1, 1915, 6347 motorcycles in use.

Twenty Pullman Cars Captured

YORK, PA., May 12—Word was received in this city several days ago that twenty touring cars, manufactured by the Pullman Motor Car Co., were on board a ship bound for Sweden which was captured by a man-of-war the other day. The steamer and crew were taken into port as a prize of war.

Track Race for Havana May 20

NEW YORK CITY, May 15—A race meet is scheduled for Havana, Cuba, on May 20 on a one-mile dirt track. Prizes will amount to $15,000.

Factory Miscellany

J and D Tire to Build—The J and D Tire & Rubber Co., Charlotte, N. C., will construct a two-story factory.

Oklahoma Tire Co. to Build—The South Western Tire Mfg. Co., recently incorporated in Oklahoma City, Okla., is planning to construct a plant which will cost about $200,000.

Akron to Build—The Akron Airless Tire Co. will construct a plant at Akron, Ohio, which will cost about $150,000.

To Make Signals—A plant for the manufacture of automatic automobile signaling devices will be equipped at Kansas City, Mo., by the Signalite Mfg. Co., recently incorporated.

Lancaster Tire to Enlarge Plant—The Lancaster Tire & Rubber Co., Lancaster, Ohio, will enlarge its plant. The estimated cost is $60,000.

Pearce Tire Plant Progressing—Work on the new plant of the Pearce Tire & Rubber Co., Ashtabula, Ohio, which is being erected at the foot of Benefit Street, is being rushed to completion. The factory will be two stories, 76 by 180 ft. The building will be absolutely fireproof, modern reinforced concrete, and faced with brick between the floors.

Detroit Crank Builds—The Detroit Auto Crank Co., Detroit, Mich., is to build a factory on Piquette Avenue.

Simplex Adds Foundry—The Simplex Automobile Co., New Brunswick, N. J., has awarded contracts for a new aluminum foundry.

Wis. Factory News—The Gas Traction Foundry Co., Minneapolis, Minn., is installing a 2-ton open-hearth furnace designed by David McLain, Goldsmith Building, Milwaukee, who recently started to make installations. The first is a 2-ton unit in the Sivyer Steel Casting Co., Milwaukee, a large producer of automobile castings for the manufacturing trade. The McLain furnace makes it possible to take five heats, or 10 tons, in 12 hr. The Sivyer company has made more than 200 heats in one month without relining or repairs of any kind.

The Gerlinger Steel Casting Co., West Allis, Milwaukee, a large producer of motor truck castings, is installing a 1½-ton Snyder electric steel furnace to replace a ½-ton unit installed for trial and demonstration purposes early this year. The experiment was so successful that a larger furnace has been found necessary to handle this class of business.

Vacuum Oil to Build—The Vacuum Oil Co. has purchased over 600 acres of ground at Lincoln Park, N. J., just opposite Philadelphia, and will build an oil refining plant, which, with piers, docks and trackage, is estimated to cost $3,000,000. The site was selected because of the large acreage, the condition of which is good, and because the Government is dredging that part of the Delaware River on which it is located. Three large tank ships are being built.

Capital Glass Begins Operations—The Capital Glass Co., Lansing, Mich., has begun operations here and will specialize in automobile glass.

Davis to Build—A. E. Davis, 258 East 138th Street, New York City, has drawn plans for a plant, 72 by 135 ft., to be used for the manufacture of automobile accessories. It will cost about $65,000.

American Trimming Co.'s Plant—Plans are being prepared for a five-story, 94 by 255-ft. factory for the American Auto Trimming Co., Berlin and Meldrum Street, Detroit, Mich. The estimated cost is $125,000.

McLean Tire Production Progressing—Officials of the McLean Tire & Rubber Co., Cleveland, Ohio, who are also officials of the M. & M. Co. of this city, said that the factory in East Liverpool has now been in operation two weeks and that the product is coming through in good shape. It is expected that the factory will be well up to capacity within a short time. W. B. Davis, in charge of the sales, has closed contracts with distributors in Detroit, Pittsburgh and some other important points and the distribution end of the business will soon be well organized.

The Automobile Calendar

ASSOCIATIONS

May 18—S. A. E. New York Section, May Meeting.

May 22-26—Chicago, Ill., N. E. L. A. Convention, Electric Veh. Section, Congress Hotel.

May 26-27—Del Monte, Cal., Meeting, Three Divisions of National Assn. of Automobile Accessory Jobbers.

June 12-16—S. A. E. Summer Trip on Great Lakes.

July 2-6—Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.

Dec. 2-9—Electricians' Countrywide Celebration.

CONTESTS

May 20—Chicago Non-Professional Speedway Race, Western Interclub Speedway Park.

May 30—Des Moines, Iowa, Iowa Derby, 20 miles; Des Moines Special, 10 miles.

May 30—Tacoma, Wash., 10, 20, and 30-Mile Races, Tacoma Speedway Assn.

May 30—Elmira, N. Y., Track Race, Elmira Auto & Motorcycle Racing Assn.

May 30—Indianapolis Speedway 300-Mile Rece.

May 30—Minneapolis, Minn., Speedway Race.

June 4—Sheepshead Bay Speedway, 30-mile Race, American Liberty Day Committee.

June 10—Chicago Speedway Race. International 300-Mile Race, Speedway Park, Speedway Park Assn.

June 16-17—Sheepshead Bay Speedway, 24-Hr. Race, Trade Racing Assn., New York City.

June 20—Galesburg, Ill., Track Race, 100 miles.

June 28—Des Moines, Iowa, Speedway Free-for-All, 300 Mile Race.

July—LaGrande, Ore., Track Race, LaGrande Motor Club.

July 4—Coeur d'Alene, Idaho, Race Meet, Hillier-Riegel Co.

July 4—Tacoma, Wash, Speedway Race, Tacoma Speedway Assn.

July 4—Minneapolis 300-Mile Speedway Race.

July 4—Sioux City Speedway Race.

July 15—Omaha, Neb., Speedway Race.

July 15—North Yakima, Wash., Track Race, Hillier-Riegel Co.

Aug. 5—Tacoma Speedway Race, Tacoma Speedway Assn.

Aug. 11-12—Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.

Aug. 12—Portland, Ore., Track Race, Hillier-Riegel Co.

Aug. 18-19—Elgin Road Race, Chicago Auto Club.

Sept. 4—Des Moines Speedway Invitation Race. Limited to six entries.

Sept. 4—Indianapolis Speedway Race.

Sept. 4-5—Spokane, Wash., Track Race, Inland Auto Assn.

Sept. 16—Providence Speedway Race.

Sept. 29—Trenton, N. J., Inter-State Fair. H. P. Murphy, Racing Sec.

Sept. 30—New York City, Sheepshead Bay Speedway Race.

Oct. 7—Philadelphia Speedway Race.

Oct. 7—Omaha Speedway Race.

Oct. 14—Chicago Speedway Race.

Oct. 19—Indianapolis, Ind., Race, Indianapolis Motor Speedway.

Nov.—Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

GOOD ROADS

May 14-20—Milwaukee, Wis., Sheridan Road Week to Complete Highway Connecting Milwaukee and Chicago.

May 25—Pennsylvania's Second Good Roads Day.

Sept. 6-7—St. Paul, Minn., Good Roads Congress, Auditorium.

MISCELLANEOUS

June 8—New York City, Orphans' Day Outing at Donnelly's Grove, College Point, L. I. Orphans' Automobile Day Outing Assn.

SHOWS

Sept. 2-9—Columbus, Ohio, Fall Show, Ohio State Fair, Columbus Automobile Show Co.

TRACTOR

July 17-21—Dallas, Tex., Tractor Demonstration.

July 24-28—Hutchinson, Kan., Tractor Demonstration.

July 31-Aug. 4—St. Louis, Mo., Tractor Demonstration.

Aug. 7-11—Fremont, Neb., Tractor Demonstration.

Aug. 14-18—Cedar Rapids, Iowa, Tractor Demonstration.

Aug. 21-25—Bloomington, Ill., Tractor Demonstration.

Aug. 28-Sept. 1—Indiana Tractor Demonstration.

Sept. 4-8—Madison, Wis., Tractor Demonstration.

Sept. 11-16—Milwaukee, Wis., Fall Show, Wisconsin State Fair, Milwaukee Automobile Dealers.

The Week in the Industry

Iowa News—N. B. Robbins leaves the Double Tread Tire Co., Des Moines, for Fort Sam Houston, Texas, where he is mechanical superintendent of the school of instruction for the government aviation corps which is training flyers for the army work in Mexico.

An Iowa branch of the Studebaker Corp., Detroit, has been established in Des Moines with temporary headquarters on the second floor of the Schee Building, Fifth and Court Avenue. H. A. Haskell is general manager and H. H. Brown is in charge of the office. Repairs to the number of 50,000 are on hand for service to Iowa-owned Studebakers. A five-story building with a floor capacity of 87,120 sq. ft. will be built for permanent headquarters and as an assembling plant in Iowa for Studebaker cars. Site options have been secured.

The Ford Motor Co., Detroit, has bought a site for a branch factory in Des Moines and plans for the construction work are now in progress. It will be located at Nineteenth Street and Grand Avenue, near the center of the city and on trackage. A frontage of 233 ft. on Grand Avenue is afforded. The building is to be six stories high and will have half a million feet of floor space with a show room on the first floor and a front of architectural beauty to face the avenue. A force of between 250 and 300 men will be employed and the $5 a day, profit-sharing wage plan of the mother factory will be in force. The Herring Motor Co., Iowa Ford distributor, will continue to occupy its present location in a fine, large building recently constructed.

California News Items—The Master Carburetor Co. of California, Los Angeles, out of which grew the Master Carburetor Corp. of Michigan, has been merged with the organization of the East. The scope of the Los Angeles house will remain practically unchanged. The local branch acts as Pacific Coast distributer, taking care of the trade as far east as Denver. C. G. Harness, who has been in charge of the affairs of the local house for the past year, remains as manager of the Los Angeles branch.

C. S. Anthony, Los Angeles, one of the pioneers of the automobile industry in California, has been appointed Southern California and Arizona distributer of the Signal truck. The commercial vehicle will be carried in conjunction with the Glide line which has been controlled by Anthony in California for the past year.

Trade Happenings

E. J. Bennett, Los Angeles, has been appointed sales manager of the Empire Motor Sales Co., Los Angeles. Bennett has been in the automobile field in Southern California for more than ten years. In 1905 he had the agency for the Wayne and Peerless and was located on Seventh and Broadway, which is the very heart of the business center of the city to-day.

The Stone-Pierce Dancy Motor Sales Co., 1911-13-15 West Seventh Street, Los Angeles, has taken over the Kelly-Springfield motor truck as distributor in Southern California and Arizona. In addition to the truck agency, the company operates a service station, and a feature of the garage is a set of lock stalls for the storage of privately owned touring cars. The keys to these lock stalls are turned over to the patrons, who know their cars will not be tampered with and that they will not be backed into by other cars in the garage.

New England Trade Items—An agency for the Scripps-Booth line has been placed at Springfield, Mass., with the Springfield Automobile Co.

C. W. Woodbury has been placed in charge of the new Packard annex for trucks and used cars at Providence, R. I.

T. F. Russell has taken the agency for the Inter-State line at Springfield, Mass.

The Gilson Auto Co., agent for the Mitchell at Portland, Me., has just moved into new salesrooms under the Lafayette Hotel, in the heart of the city.

W. C. Goodchild, for some years at the Metz factory, has been promoted to take charge of the Providence (R. I.) branch of the company.

G. Lawrence Ertz, for a long time at New Haven, has accepted a position with the Boston (Mass.) branch of the Locomobile Company, handling Riker trucks.

M. D. Stebbins has taken the Bell line for central Massachusetts, with headquarters at Springfield.

Pugh Brothers have taken the Bessemer truck line for Rhode Island, with headquarters at Providence.

The New England Whip Co., of Westfield, Mass., that has the New England distribution of Munroe cars, has opened salesrooms at Boston at 926 Commonwealth Avenue.

J. J. McCarthy, who looks after Lozier interests at Boston, Mass., has taken on the Ross car for that city.

F. H. Chapman, who has handled the Ford line in central Massachusetts for the past two years, has received word that the factory intends to make Springfield, Mass., a factory distributing center for that territory beginning next November. The company intends to erect a service station to take care of the business in the section for a radius of some miles. With the big Overland service station here it will make Springfield a big motor distributing center for small cars.

Northwest Items—The Chandler line of machines is again established in the State of Oregon; the Gerlinger Motor Car Co. has secured the agency for Portland, the State of Oregon and ten southern counties of State of Washington.

P. A. Berry has been appointed sales manager of the Premier Motor Car Co., Indianapolis, on the Pacific Coast and Hawaii, and will have offices in San Francisco. Mr. Berry was formerly sales manager of Pacific Car Co., Tacoma, Wash.

R. E. Pemberton, manager Northwest Auto Supply Company, Spokane, has secured the agency for the Empire line for the Inland Empire.

Lewiston Hardware Co., Lewiston, Idaho, has secured the agency for the Chevrolet line and opened a garage and service station.

William Gollehon and C. E. Moore of Colfax, Wash., have formed a partnership to handle the Overland and Willys-Knight lines in Whitman County.

Riouth & Johnson, Colville, Wash., have taken the agency for Saxon line.

The Portland Tire Store has opened in Portland, Ore., and will handle Blackstone tires. R. F. Strong is manager.

Marko Establishes N. Y. Branch.—The Marko Storage Battery Co., Bedford Avenue, Brooklyn, has opened a branch at 974 Eighth Avenue, New York, under the name Marko Storage Battery Depot of New York, Inc.

Brown with Scripps-Booth—W. I. Brown, former supervisor of districts for Dodge Bros., has been appointed assistant sales manager of the Scripps-Booth Co.

Takes on Metz in Owensboro—The Ames Motor Car Co., Owensboro, Ky., with A. Reis Meyer as sales manager, has been appointed distributor for the Metz 25 five-passenger touring car and roadster, for Kentucky and Southern Indiana.

Mr. Meyer will also have charge of the sales and distribution of the Ames motor car and motor car accessories.

1886 BROADWAY CORNER 62ND STREET

NEW YORK May 2, 1916.

Mr. Wm. Gray, Pres.,
Gray & Davis Company,
Boston, Mass.

My dear Mr. Gray:-

It is indeed pleasing to be able to advise you that since January 1st we have delivered over 500 new Chandler Cars equipped with the latest Gray & Davis Starting & Lighting device, and to the best of the writer's knowledge and belief, up to the present time we have not had one instance of complaint from the starting and lighting system as it is installed in our car, from any one of the 500 users, 95% of whom I would say drive their own cars, which means that expert attention is not given to the maintenance of the Gray & Davis units.

I consider this a most remarkable showing, and congratulate you on the wonderful progress you have made in developing a really fool proof starting and lighting system for motor cars.

Yours very truly,

BRADY-MURRAY MOTORS CORPN.,

Murray
Vice-Pres.

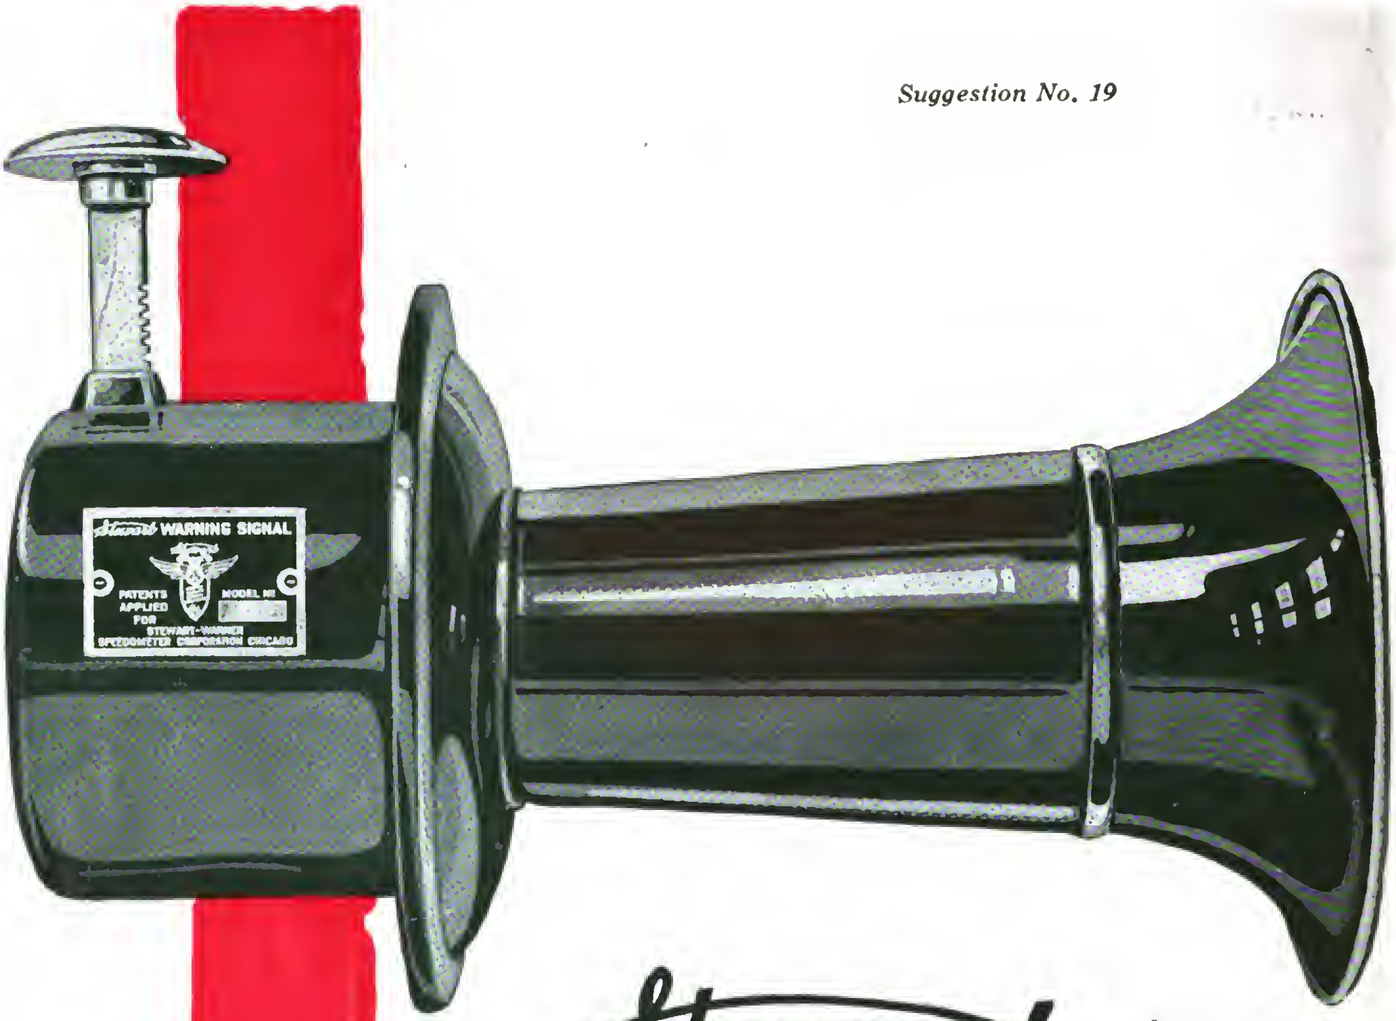
Suggestion No. 19



Stewart

$3.50

Warning Signal

Hand Operated

EVEN a weak little buzzer or an old time bulb horn sounds big and commanding when demonstrated indoors.

Motorists are demanding for their life's sake a signal that sounds sure safety out in the din of traffic.

So many thousands demanded this Stewart Safety last year that our production is doubled and the price lowered to $3.50.

Display this Stewart.

It sells itself.

Preparing for Hoosier Classic

Cars Late in Arriving at Track—The Three New Premiers in Detail—Frontenacs Form Featherweight Team with Their Aluminum Construction

By J. Edward Schipper

INDIANAPOLIS, IND., May 22—Ordinarily 8 days before the day of the race the speedway would be crowded with practising cars. This year, however, there is a difference, and it is only now that the cars are beginning to arrive at the scene of the great speed encounter.

Christiaens' Sunbeam and Barney Oldfield's Delage are, so far, the only cars actually on the track, and both of these are torn down while going through the final course of preparation for the 300-mile grind. The Sunbeam is the same car that ran in the Sheepshead Bay, N. Y., events of May 13, but it is now receiving some overhauling in order to remedy the weakness which put it out of the contest in New York. It will be remembered that this car was forced to abandon the race due to damage caused by the tachometer drive.

The tachometer is mounted on the end of the camshaft and the high speed caused a fracture of the aluminum case surrounding the end camshaft bearing, with a result that the oil ran out and a motor bearing seized. Christiaens has overcome this weakness, and prophecies that no little detail like that will again cause him to abandon the race.

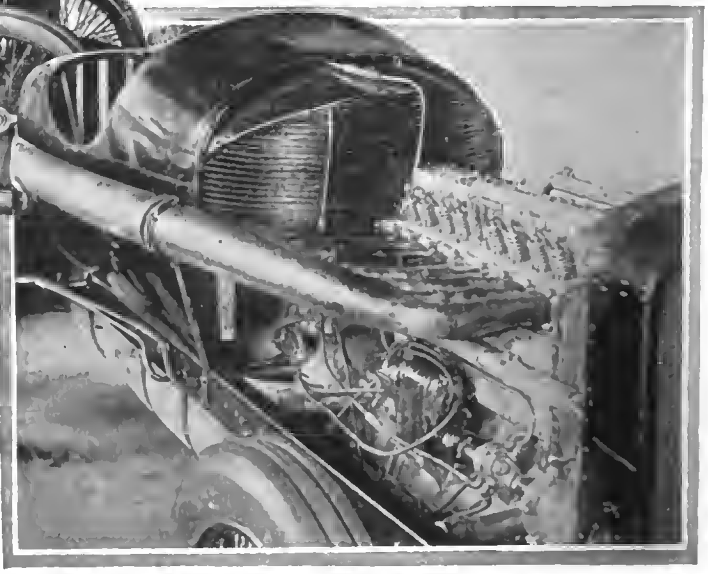
Oldfield's Delage is the same car that has been described previously. He is tuning it for the race and making the many little modifications that racing drivers are always sure to do between events. There are no essential details changed.

The Maxwell cars, of which there will be two, are just about due to arrive at the speedway, and these will immediately begin practice. It is felt by all the drivers who contested at New York that the personal element is going to enter this race much more than it did at Sheepshead Bay, and it will be necessary for all those who are going to drive to get out on the track as soon as possible in order to get an exact knowledge of the curves. On the 2-mile board saucer there was no shutting down on the curves. Here the turns will be coasted to a large extent. This means that the accelerative power of the cars is going to mean much to the drivers.

Probably the most interesting feature now in the vicinity of the track is taking place at the other end of town, in the factory of the Mais truck company. Here the new Premiers are being constructed and the Peugeots of Aitken and Merz being

View of the Frontenac showing typical racing stern to reduce wind resistance, the large exhaust pipe along the side and the gasoline tank below the frame



View of the right side of the Frontenac engine in the chassis. The exhaust header has eight individual openings from the valves. The view also shows the position of the main lubricant tank. This has copper fins in front to assist in cooling, and the draught is so arranged that all air going through the radiator must pass this tank

overhauled and fitted with new parts, wherever necessary.

The two Peugeots, as a matter of fact, are being fitted with Premier parts wherever they have been judged to be lacking in strength. The connecting-rods which have proved weak have been renewed and the oiling system completely overhauled. These are the main essentials; but, besides these, there have been a great many other refinements.

The three Frontenac entries for the Indianapolis grind are now completed and ready for their trials. Louis Chevrolet is the designer, and he has built three cars which are constructed more extensively of aluminum than any other motor vehicle yet to come before the public. Every conceivable unit or part of a unit that could be made of the material has a place in these Frontenacs, which as a result tip the scales at the surprisingly low weight of about 1750 lb.

Motor Nearly All Aluminum

The motor is almost all aluminum—cylinders, pistons, crankcase, intake manifold, camshaft cover and gear covers, water pump, oil pumps and other lesser parts are made of the metal—but this is not nearly all. The body, with its cigar-shaped stern, is a sheet aluminum affair; the main parts of the rear axle are cast from this light material, these being principally the gear housing and the brake flanges. Other aluminum parts are the clutch cone, transmission gearcase, pedal brackets, starting crank bracket and, last but not least, the long underpan.

A Real Test

Thus the Frontenacs will have to uphold the contentions of the aluminum exponents as no other cars in this year's speed contests will. On them will rest the proof of the value of the extensive use of the metal for severe service.

Chevrolet will drive one of the cars and Arthur and Gaston Chevrolet will be the pilots of the other two in the Indianapolis meet. Joseph Boyer is relief pilot.

Louis Chevrolet is chiefly responsible for the design. He fixes the horsepower of the new engine he is using at 135 to 140, resulting from a bore of 3.870 in. and a stroke of 6.375 in. He uses a compression of 105 lb. per square inch and has four valves per cylinder, inlets being 2 in. diameter and the exhausts 1¾ in. The camshaft is overhead and actuates the valves through rocker arms, the four for any one cylinder being inclosed by an aluminum plate that is individual for that particular set. Compensating springs are fitted to the valves so as to insure absolute following of the cams, even at very high speeds. Drive for the camshaft is attained by a vertical shaft at the front which is connected to camshaft and crankshaft by bevel gears, both upper and lower sets being completely housed with aluminum. The valve seats are cast in the aluminum cylinder block, and all four for one cylinder are in one piece—a new wrinkle, even for this newest of cylinder and valve constructions.

To insure the best possible cylinder casting the sides and ends of the waterjackets are open and aluminum plates are securely fastened to the openings to form the completed water space. Thus uniformity of the cooling area is attained at the same time and further lightness in the bargain.

Three ball bearings carry the crankshaft, and in order to get the center one in place the shaft is split into two parts securely bolted together by substantial steel bolts. The shaft is of large proportions with very large webs, so that vibration from this source should be almost nil. The pistons are of a special type that might be termed an umbrella form. The piston upper part, carrying two rings, extends down only a little over an inch and joins the portion containing the wristpin bosses through an extension of the inner center, and this part flares below the wristpin to make the lower skirt, which is drilled with holes to lighten it. Thus maximum cooling is attained with minimum weight and bearing surface.

Hollow steel connecting-rods of surprisingly light weight are also a part of these feather-weight cars. These are machined all over and balanced to a nicety that should be conducive of most excellent results. Four bolts hold each machined cap in place, and at the wristpin end there is provision for a steel pin to hold the wristpin in place and cause it to have its bearing in the bosses of the piston.

Special Oil Cooling

Chevrolet has given a great deal of thought to the oiling system and methods of cooling the lubricant. Directly in front of the dash is located a 12-gal. semicircular oil reservoir, the entire front of which is provided with copper cooling fins. The underpan of the engine and a metal shield below this tank completely trap the inrushing air that comes through the radiator and force it to pass over these fins in order to get out. Thus any air that enters the radiator must pass over the front of the oil tank before it can escape. This is really a forced-draft scheme and excellent results are expected from it. In connection with this tank arrangement two independent oil systems are fitted, so that should trouble

come to one the other will adequately take care of the requirements. Two gear pumps are driven by the magneto and water-pump shaft on the left. The oil is forced from the tank directly to the crankshaft bearings and some by-passes to the overhead camshaft at the front end. From the rear end of this unit the oil is led down to the oil sump at the bottom of the motor. From the crankshaft main bearings the oil is led through centrifugal rings on the shaft to the connecting-rod lower bearings, and the spray from these gets to the cylinder walls and wristpin bearings. In addition there is a pump at the mechanician's hand that forces oil directly from the tank to the bearings. One of the gear pumps takes its supply from the sump.

The motor is supported in the frame at four points on steel tubing and is entirely separate from the gearset, which is amidships on three points. This makes a very sturdy layout, allows the flywheel to be completely open, and reduces the weight. Drive is by the Hotchkiss method, using an open propeller shaft with two universals and semi-elliptic rear springs 45 in. long.

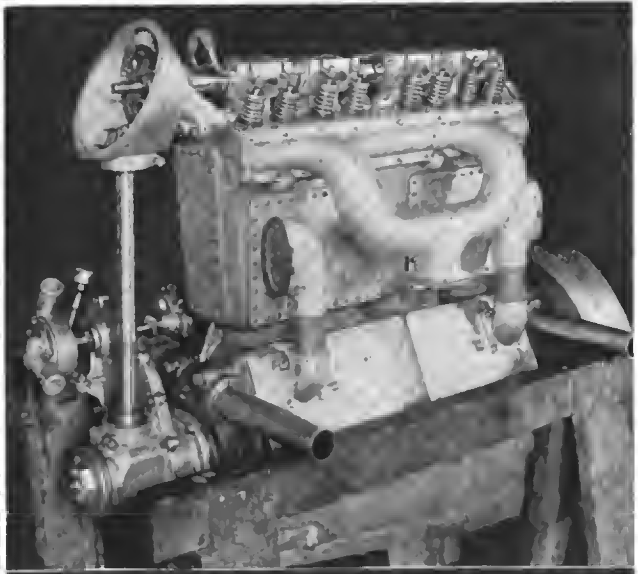
No differential is used in the axle, and Chevrolet has allowed himself some latitude in the matter of gear ratio. He has three sets of gears available for each car, these being 2¼ to 1, 2 1/3 to 1 and 2½ to 1. It depends upon the results obtained with each, when the cars are put on the track, to finally fix which will be employed in the races.

An unusual but very logical location has been given the gasoline tanks. Two long and narrow reservoirs are hung below the frame and alongside of the gearbox and driveshaft on either side. These will serve to distribute the weight and put more of it where it belongs, at the back end of the car, thus making it hold the track better at speed and undoubtedly affecting the pace at which the cars can take the turns. Putting this tank weight low, the center of gravity is brought down considerably. The piping is arranged so that either feeds the carbureter, and there are shut-off cocks from each running close to the mechanician's seat, with filler caps in the floor boards.

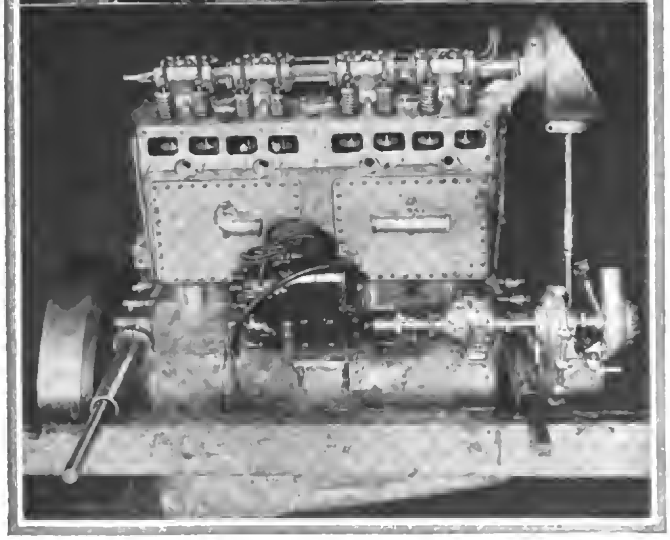
Chevrolet has undoubtedly designed a beautiful body. It has a graceful sweep and is shaped for the minimum of wind resistance, with a pointed tail, narrow radiator, and sloping without external obstructions to set up eddies. The curve of the underpan follows the same lines and makes the whole thing look like a big cigar. The wheelbase is 104 in.

Has Flexible Steering Wheel

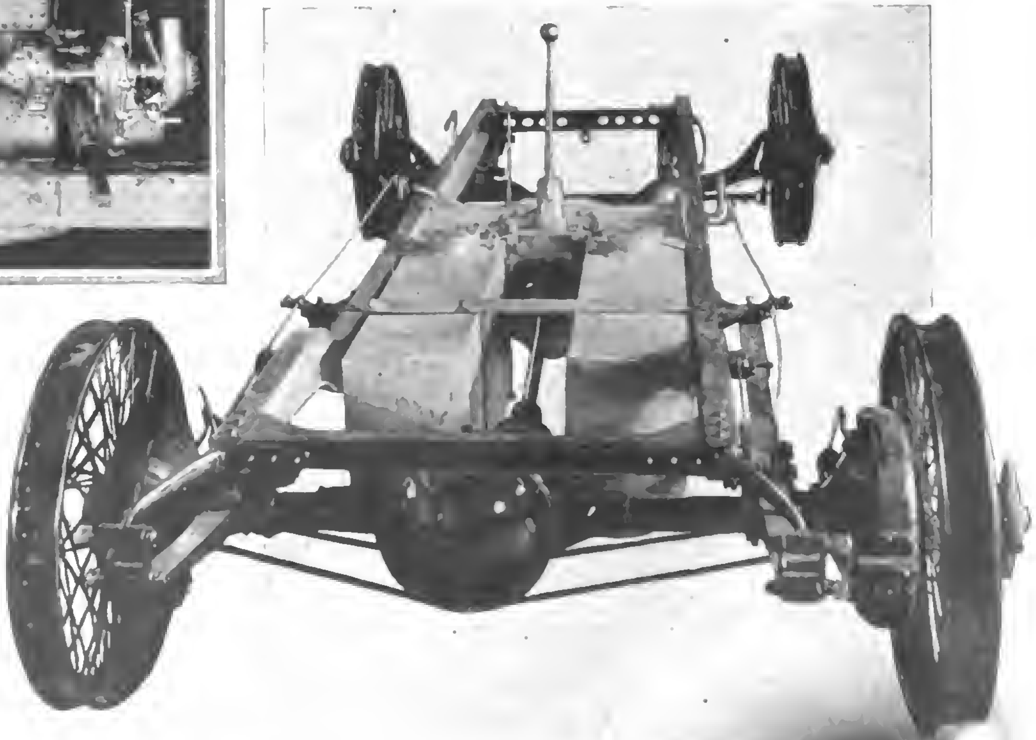
One very clever feature of the cars is the flexible steering wheel, if it might be called such. In racing, the driver gets much of the jarring and vibration of the track, this being transmitted to his hands and wrists through the steering wheel. To absorb this continuous jarring, the arms of the steering wheel spider are made up of three thin plates that have somewhat the same action as a leaf spring. Thus the



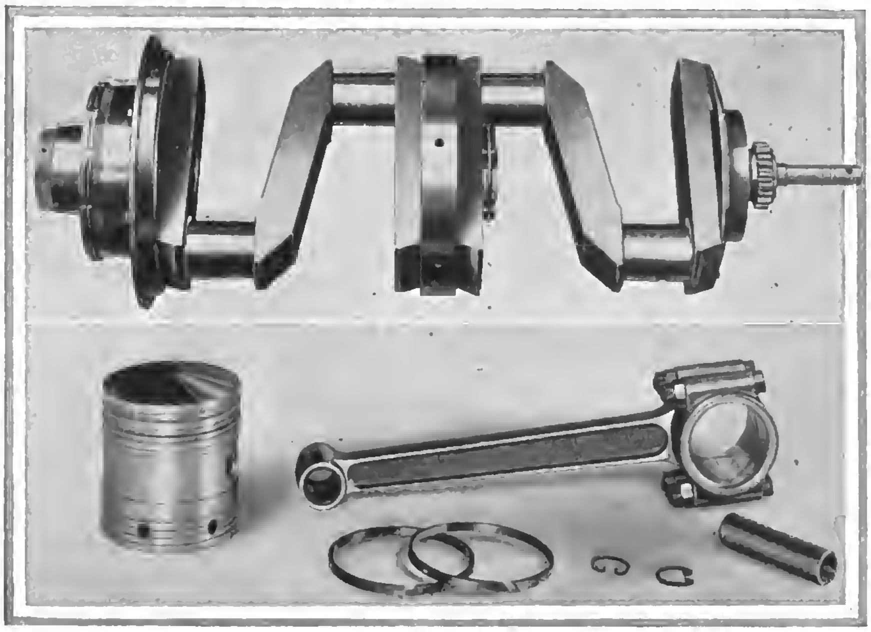
Above—Intake side of the aluminum engine in the Frontenacs. The water-jacket spaces are open, and covered by aluminum plates as seen. Note the aluminum breathers and bevel gear drive of the overhead camshaft by the vertical shaft at the front, the whole being inclosed



Below—Exhaust side of the aluminum Frontenac racing engine, having a bore of 870 by 6.375. There are four valves per cylinder



Right—View of the Frontenac chassis showing the disposition of the gasoline tanks on either side of the driveshaft and gearbox. This location brings the center of gravity down and distributes the weight better, insuring the car's hugging the track



Above—Two-piece crankshaft used in the new Premier racers. It is carried on four ball bearings, the rear bearing being double

Below—Piston and connecting-rod assembly of the new Premier racers. Although 2 lb. lighter than the Peugeot assembly, it is stated to be stronger

wheel can be moved a maximum of 1 in. up or down from its normal plane, and this ability to absorb shocks should result in less tiring of the driver's arms and wrists.

Some of the accessories and parts that have been incorporated in these Frontenacs are Bosch magnetos, Zenith carbureters, Rudge-Whitworth wire wheels, Gemmer steering gears, Goodrich Silvertown cord tires and K. L. G. air-cooled spark plugs.

The new Premier cars, of which there are three, have been built especially for this race. They have never yet been run even on the road, and will not be on the track for 2 or 3 days. The first week in February there was not even a drawing of the new cars in existence and, considering the time and the extraordinarily hard task of getting materials of a special nature through any of the war-order-crowded plants, an extraordinary amount of progress has been made. Two of the cars will be driven by Anderson and Rooney of Stutz fame and are about a day apart in construction, Anderson's car being in the lead in this respect. The third car will be piloted by Stillman.

The cars were designed by James L. Yarian, who has the title of engineer of the racing car department of the Premier Motor Corporation. In 3½ months the drawings have been worked out, the steel, which has all been ordered to special analysis, secured, the connecting-rods, crankshafts and various parts cut from solid billets of steel, and even the frames hand-made because the rolled sections could not be secured in the stock desired.

The design is a composite one, smacking somewhat of Peugeot, a little of Delage, and also with a suggestion of the Mercedes. The four cylinders are block-cast and have a bore of 3.66 and a stroke of 6.625 in., giving a displacement of 235 cu. in. The cylinder casting is probably one of the most complex ever made, as the waterjacket is only a sheet of metal 3/16 in. thick and does not touch the cylinders at any point except the top and bottom throughout the entire length of the casting.

Sixteen valves are used, and these are placed overhead, being driven by two overhead camshafts contained in separate aluminum housings. The intake valves are 1 15/16 in. and the exhaust 1 9/16 in., and each has a lift of ⅜ in. The valves are, like most of the other working parts throughout the car, of special steel, analysis and heat-treating specifications being the results of experiments by the designer.

The timing gears are pinned to the front end of the camshaft with a different number of holes in the gear and flange, thus giving a vernier style of adjustment. The camshaft is hollow and is carried on five bearings. The hollow through the camshaft acts as an oil lead, as will be described later.

Double springs are used on each valve, and there is provision made, by means of an enlarged section, to guard against the possibility of the valve dropping down into the cylinder in case of breakage. It takes a pressure of 150 lb. to operate the valve ⅜ in. against the spring pressure, which should be sufficient to guard against riding, even at the highest speeds.

No clearance adjustment is provided at the ends of the valve stems. The manner in which the adjustment is made is through the means of buttons. The valve tappets are hollow and in the ends of the tappets are inserted buttons which have a neck of sufficient length to guard against their falling out. The button nearest the proper size is selected and then filed to the correct clearance.

Although the reciprocating weights of the new motors are 2 lb. less than those of the Peugeots, the connecting-rods are stronger at the upper ends, the point where the rods in the Peugeot cars have failed once or twice. This result has been accomplished by using a differently shaped flange and a deeper web, although the basic I-beam section has still been maintained. The pistons are rendered stronger by the use of a supporting piece which is of cylindrical form, extending from the center of the piston head to the upper side of the wristpin.

The connecting-rod is cut away at the top of the wristpin and the aluminum supporting piece rests against the upper side of the wristpin with a bearing fit. This gives a solid column of support from the center of the top of the piston straight down to the lower connecting-rod bearing, through the support piece, the wristpin and connecting-rod.

Oiling Very Thorough

The oiling system has been particularly well worked out. The oil supply is carried under the seat, and amounts to 7 gal. It is fed to the crankcase under pressure, and then distributed by the force feed pump through five independent leads. Four of these are to the main bearings and the other enters the hollow camshaft at the rear and passes through it in a thick stream. There are leads drilled to each of the five camshaft bearings, and the shaft itself runs submerged in oil. The oil then passes out the front end of the camshaft and through a lead to the timing gears, which are supplied very liberally. A lead is also taken off to the water pump and magneto shaft bearing, the oil then passing back to the crankcase for recirculation.

The crankshaft is in two pieces and is carried on four ball bearings. The rear bearing is double, giving two single bearings for front and center.

The motor is mounted in a subframe which also contains the gearset. The subframe is mounted flexibly at three points, the front support being a single trunnion in the center of the cross-member, and the rear supports are ball and socket connections back of the gearbox, which is amidships.

Ball bearings are used throughout the three-speed gearset, the main gearset shaft extending through the driven member of the clutch and being connected to it by a squared section. The end of this shaft rests in the center of the flywheel. This fixes the alignment of the motor and gearset, and the whole flexible subframe could be swung as much as a foot out of line without affecting the drive.

Hotchkiss drive is used and a ratio of about three to one, with 35-in. wheels, will probably be fixed upon, although this is not certain as yet. The axle housings are swaged from solid steel tube under 40 tons' pressure.

All of the center housing of the differential is of aluminum, and the bearings used throughout the rear axle are ball. In fact, this type of bearing has been used liberally even for a racing machine. Each of the timing gears, for instance, has two ball bearings, and the pressure of a finger is sufficient to rotate the entire set.

A neat feature in the chassis is in the clutch. The cone is of steel, and behind it there is a fiber-to-steel clutch brake, the fiber being between two steel disks. Every detail of the car is special, and the only stock parts are the wheels and shock absorbers. The springs are semi-elliptic all around and the wheelbase is 106 in.

The magnetos used are Bosch, and the carbureters are Zeniths, with special ball bearing throttle connections.

Seven gallons of water are carried in the radiator, jackets and connections. The radiator is a square tube type made especially for this car by Fedders. It has a false front made up of a removable screen placed 3 in. in front of the radiator proper. The pump, being on the same shaft as the magneto, runs at magneto speed and is of the impeller type.

Gasoline is carried in a tank located in the aluminum tailpiece. The tank capacity is 29 gal., and it is calculated that, as the consumption will be a little better than 11 miles per gallon, the car will go through the race, if need be, without renewing the supply.

A Summary of Entries

The Peugeot to be driven by Charles Merz will have the motor as described and the old Grand Prix Peugeot chassis stiffened up and revamped by the Premier company.

The new Premier cars will be purchased by the Indianapolis Speedway Corporation and will be raced by them, with Anderson, Rooney and Stillman as drivers. These men are now working at the Mais plant on the cars.

Of the thirty cars entered for the Indianapolis race on Decoration Day, there are but two entirely new in every detail, these being the Premiers and the Frontenacs, already described. There are a few of which very little is known, the DuChesneau, the Richard, the Ogren and the Osteweg, had not appeared on the speedway at the time of writing, and no information concerning them has been given out. The two Maxwells which were described in THE AUTOMOBILE for May 11 are the same cars which competed in the speedway events last year, improved in detail during the winter by sundry small alterations.

The Peugeots are of the same type and have been subjected to various degrees of reconstruction. Parts which proved weak toward the end of the racing season of 1915 have been replaced. To take one instance, those belonging to the Indianapolis Motor Speedway Corp. have had fitted new connecting-rods of a slightly different section to the original Peugeot rod.

The Sunbeams are the same chassis which were competing last year, but instead of four-cylinder motors the engines now have six cylinders. The general design is almost exactly the same as that of the Peugeot.

The Duesenbergs have both of them sixteen-valve four-cylinder engines, but otherwise are similar to last year's cars. The general design of the engines with their horizontal valves is very much like the older pattern. Characteristic of the Duesenberg motor is the complete inclosure of all the valve mechanism, the appearance of the finished job being that of a rectangular metal box. The Crawfords also have Duesenberg motors.

The New Duesenbergs

The three new Duesenbergs which are being completed in the new quarters at Chicago look to be much speedier than any mount O'Donnell has had. Not only have they the sixteen valves which featured the new motor of last year, but the very light tubular connecting-rods and extraordinarily sturdy crankshaft make the new motors very powerful. In addition the cars are considerably lighter and will scale close to 1800 lb. The characteristic turtle back has given way to a pointed tail and a pointed nose is fitted.

There are two types of Delage, those driven by LeCain and Devigne being the 1914 Grand Prix cars described in THE AUTOMOBILE for March 23 and again briefly mentioned on May 11.

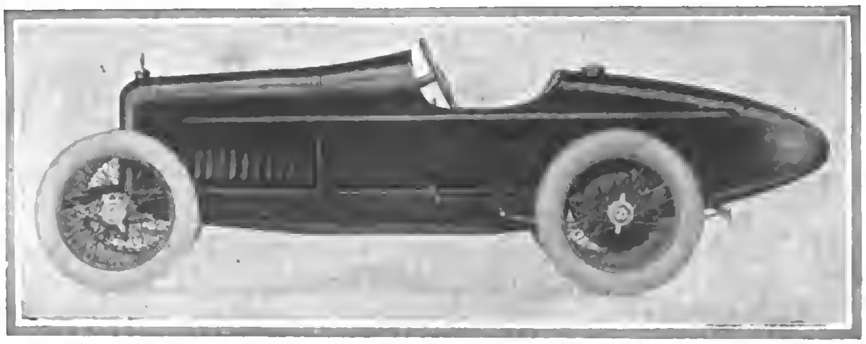
Oldfield has an earlier type with horizontal valves which is understood to be practically the same as last year.

The Erwins are special jobs with L-head engines, these being arranged with exhaust valves in the usual position, and overhead intake valves operated by pushrods and rockers.

There are two noticeable absentees: of these the most prominent is Ralph De Palma, who won the event last year, and it is also a disappointment that no Mercer team is to appear since this was rumored as possible some months ago. De Palma has been rebuilding the engine of his Mercedes and has had considerable difficulty in replacing the original parts since he can get nothing whatever from Germany.

The first International race at Indianapolis in 1911 was won by Ray Harroun in a Marmon, 74.59 m.p.h.; Joe Dawson in a National won in 1912, averge 78.70 m.p.h.; Jules Goux's Peugeot won in 1913, average 75.92 m.p.h., falling short of Dawson's speed. René Thomas in a Delage won in 1914, averaging 82.47 m.p.h. Last year DePalma and Dario Resta fought it out, with DePalma emerging victorious, with an average of 89.84 m.p.h. Goux and Thomas are fighting for France in the European war and can not race this year.

With the distance this year cut down to 300 instead of 500 miles, the contestants will go faster from the start and maintain a faster average all the way, it is believed, because they are saving 200 miles' wear on their cars. The Indianapolis speedway, which was the first in America, offers a thrilling race because the human equation plays such an important part. The track, being a brick paved oval 2½ miles around, has four high banked curves and two long straightaways. To encircle the track once a driver must change the position of his car eight times. At board tracks where the cars get in a saucer and stay there automatically, the driver's skill is not called into play so much as at Indianapolis, where every second may make a winner out of a trailer. Every race at Indianapolis has been full of exciting changes.



One of the team of three special Premier racers for the Indianapolis race

Power Lies in Valve Proportions

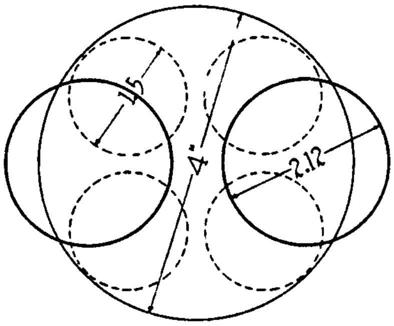
Difference Between Old and New Racing Cars Mainly Found in Valve Opening—Need for Large Valve Areas Controls Design

By A. Ludlow Clayden

TO SAY that the engineer responsible for a modern racing engine first designs his valve gear and then fits the rest of the engine to it is hardly too strong a statement. There is but one limitation imposed that is outside the control of the engineer, this being the 300 cu. in. piston displacement. Every two revolutions the engine may burn 300 cu. in. of gas if the designer can manage to persuade this amount to enter the cylinders.

Now the total power that can be developed by a gasoline engine depends upon the amount of gas it can burn, since each cubic foot of good mixture contains just about the same amount of heat. Therefore the engineer wants to get as many revolutions as possible per minute together with the largest possible percentage of charge into the cylinder on each suction stroke. It is no good to increase the speed if the valve area restricts the amount of gas that can pass in a given time. All other things being equal, the larger the valve area the faster can the engine be run without wire-drawing the charge, and this is why racing motor valves are the most important part of the design.

There is one other limitation in actual fact, as well as the 300 cu. in., this being the volume of the combustion space. To get the best compression ratio the total volume of the charge when compressed must not exceed about one-fifth of its uncompressed volume, which means that the total area into which valves can be put is definitely limited.



Corresponding sizes of two and four valves of equivalent area

Timing Not Important

To say that the timing of a racing engine is not important is almost a heresy, and the statement will no doubt be laughed at by many racing men, but it is none the less true. Given a certain engine, its power output may be varied considerably by altering the timing, but starting from the drafting board it is possible to lay out a variety of designs requiring different timing to give the best results. There is no secret timing applicable to all motors which always gives the best effects.

Let us look at the ideal timing. On the suction stroke the ideal is to have the biggest possible opening uncovered completely in no time at all at the top dead center and closed, also in no time at all, at the bottom dead center. For the exhaust stroke the ideal would be to take off the whole top of the cylinder *instantly* at the bottom dead center and put it on again at the top center. All valve gear and all timing is a compromise which gives some sort of approach to this ideal.

The intake valve timing to get the best effect is probably the most troublesome. Firstly, there is some exhaust pressure left in the cylinder at the closing of the exhaust valve, so the suction cannot begin till the piston is a little way down on its stroke. But the valve takes, and *must* take, a perceptible time to open; so it is usual to start the opening earlier in the stroke than real strong suction can begin. Suppose the intake valve opens at dead center, then no gas will pass through it till the piston has gone down an inch or so. As soon as the piston has descended enough to counteract the effect of the exhaust pressure left in the cylinder after the closing of the exhaust valve, the intake valve will be well open and ready to allow the suction to act strongly on the carbureter.

Therefore we have two courses open. One is to make the intake valve open quickly and start the opening late, 5 or 10 deg. after the top dead center, say. The other is to open the valve slowly, and commence the opening very early, even before the top dead center is reached on the exhaust stroke. Should the exhaust valve also be open at this time, only closing *after* the top dead center is passed, the exhaust will continue to travel out through the exhaust valve and little or none will be driven back through the intake valve into the carbureter manifold. This is called overlapping timing.

The intake valve will only be open a very small amount before the exhaust valve closes. Thus, the more rapid-acting the cam is, the later the valve can start to open, and the earlier it may close. So the problem before the engineer is to choose a happy mean. There are limits to the possible rapidity of valve movement, owing to the considerable force needed to open and close a valve in tiny fractions of a second, wherefore many designers prefer to use a slower opening and closing with a more widely spread timing.

Up to 1912 most of the European racing engines had the conventional two valves per cylinder, but that year and in the years following two-valve construction gave way to the four-valve design now most usual. This is not so much because four valves can provide a greater *total* area than two, but because four light, small valves can be opened and closed more rapidly than two of equivalent area which are essentially much heavier.

The weight of a valve head varies roughly in proportion with its area, and the area varies with the square of the diameter. Since the small valve does not require the same thickness of head as the large one, the weight increases actually more rapidly than the diameter squared. With a doubled diameter the weight is multiplied by four and then increased again by a substantial addition to the thickness of the head.

Forces Acting on Valve

To appreciate the forces acting on a valve assume the crankshaft speed is 3000 r.p.m., which, of course, means 1500 r.p.m. for the camshaft. Suppose the inlet valve starts to open 10 deg. after top dead center and remains open 25 deg. after bottom dead center, then it will be open for a total angular movement of the camshaft of 105 deg. During the first part of the opening, the valve is being accelerated from its seat. It is then decelerated, pauses for a tiny fraction of time, accelerates toward its seat and finally decelerates till it comes to rest on the seat.

With our assumed timing the acceleration period lasts for about a quarter of 105 deg., namely 26.5 deg., during which travel it will have been lifted half its total lift. At 1500 r.p.m. of the camshaft the angular speed is 900 deg. per second, so the acceleration period for the valve is 0.00294 sec.

Suppose half the lift is 0.2 in. and the weight of the valve 4 oz., then the force necessary to produce the acceleration, neglecting the spring pressure and the weight of the tappet, is 15.5 lb. in round figures. Add the weight of the tappet and half the weight of the spring plus the spring pressure and it will be at least doubled.

Furthermore, the spring has to do just the same work during the first half of the closing movement of the valve that the cam has to do in the first half of opening movement, thus a four-ounce valve if it is to follow the cam accurately at 3000 r.p.m. of the crankshaft may easily need a spring of considerable power.

Now assume the valve is double the diameter, which means four times the weight and more. Take the weight as being just 1 lb. and the force required increases to 62 lb., considering only the valve and neglecting the tappet, etc. Add the other masses and a spring giving a pressure of 120 lb. or so is the least that will be required.

Suppose the bore and stroke are 4 in. by 5 in., which is about right for a 300 cu. in. four-cylinder engine; and suppose that we allow a mean velocity of 200 ft. per second through the inlet valve, which is a normal velocity, then the area of inlet opening needed is approximately 3.15 sq. in. Allowing for the fact that the valve cannot be fully open for more than a small part of its period, we shall need at least 3.5 sq. in. of valve area.

Four Valves Need Half Spring Strength

Now a single valve of 3.5 sq. in. area will be 2.12 in. in diameter. Two valves to have the same total area, 3.5 sq. in., will have to be a shade under 1.5 in. in diameter each. The strength of spring required will be in proportion to the diameters squared as explained before, namely in the proportion 449 to 225, which means that the pressure throughout the valve mechanism will only be half the amount for the small valve that is necessary for the large one.

There is still another advantage in the lighter units. A very strong spring needs heavy wire and the rapidity of spring action is dependent upon the section to some extent. A heavy spring is bad, first, because of its weight, and second, because it is more sluggish in action than a spring of lighter section. Incidentally, it has been found that where a spring pressure of 80 lb. is required, faster action may be obtained by using two 40-lb. springs, one within the other, than by employing one spring of full 80-lb. strength.

The arguments applying to the inlet valves also apply to the exhausts, of course, though the need for size is a trifle less important.

Compactness a Feature

Taking another aspect of the case; suppose we start with a circle 4 in. in diameter and imagine this to be the top of the piston. On top of this draw two circles of 2.12 in. and also four circles each 1.5 in. This makes obvious the fact that two valves will necessitate a combustion head with a bulge on each side while the four valves will practically locate within the four-inch circle.

Instead of placing the valves with the stems vertical they are usually put at an angle of something near 45 deg. and this allows good water space all around each valve seat, while giving the necessary small combustion space. Also the combustion space thus becomes of a shape which approximates to a hemisphere, and that is the best shape from the viewpoint of thermal efficiency.

Many Arrangements Possible

There are many ways of arranging the four valves because, after the valves themselves have been designed, there remains the need for locating the parts to work them. Just as the weight of the valve is of paramount importance, so is the weight of the tappet or rocker to operate the valve. The least weight of valve-operating mechanism is got by following the Peugeot school of design, in which there are two camshafts contained in aluminum housings, mounted directly over each row of valves so that the axis of the valve stem passes through the center of the cam. In this design the cam is separated from the valve stem by a very short distance, just enough to allow for a short push rod to connect the cam with the valve that will have a long enough bearing in the case to prevent too much oil leakage.

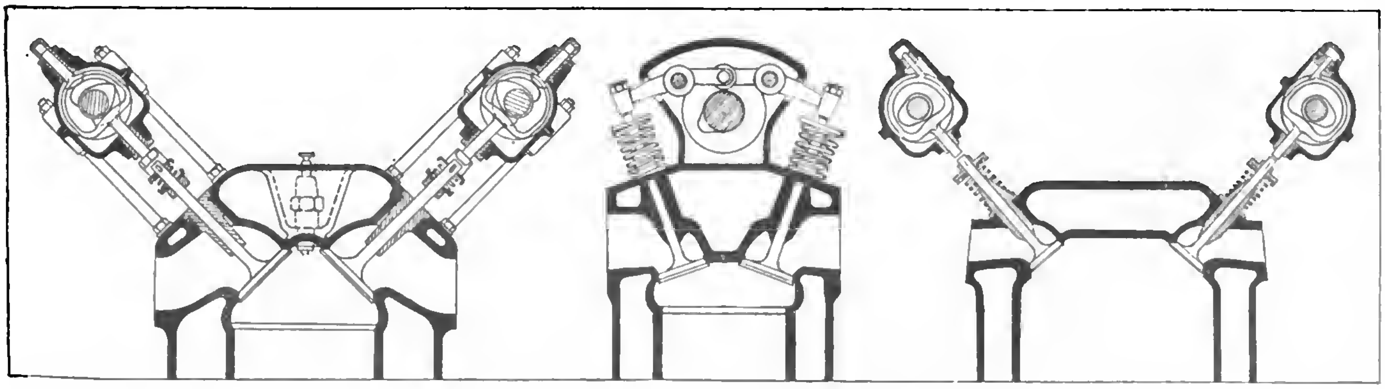
The drawback to this design is that the two camshafts with their necessary driving gears make for complication and, though the valve parts are kept low in weight, the total mass of the two camshafts, etc., is a consideration.

Rockers Give Same Results

Alternatively there is the older design developed by many different manufacturers of using one overhead camshaft placed centrally over the cylinders, the straight tappet rods of the Peugeot type being replaced by small rockers. This cuts down the complication and reduces the total weight, but the rockers are almost impossible to make so that their reciprocating mass is as small as the little push rod in the Peugeot. Results, however, show that practically the same power output is obtainable with either design. Prominent users of the rocker construction are Mercedes and Stutz-Wisconsin.

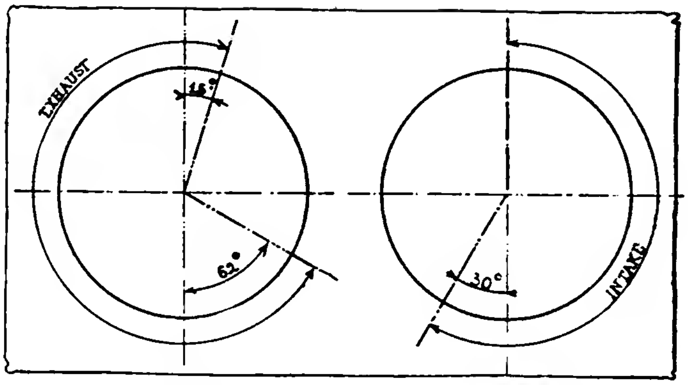
The old design where the camshaft was in the usual place in the crankcase and the valves operated by long push rods is impossible for racing to-day, as the long rods cannot be made light enough. It has been suggested that the action could be reversed and pull wires substituted for push rods, but the idea has never been tried and does not sound very promising.

Another school of design, which differs in detail though not in principle, is exemplified by the Duesenberg and the old Delage engines. Here the four valves are used just the



Left—The unique Delage mechanism whereby the cam closes the valve as well as opening it. Center—The Mercedes type of design with a single camshaft and rocker arms. Right—The Peugeot design, which is really the basis of all modern overhead valve engines same, but they are not set at 45 deg. in the head; instead they have the stems horizontal and open into a high, narrow combustion head, rather like the usual combustion space stood on end. For operating the valves there is a camshaft on each side of the crankcase and, in the Duesenberg motors, long rockers, set vertically, connect the cams with the ends of the valve stems. The old Delage had a different scheme. There were two camshafts in the crankcase, each operating four long push rods. On either side of the cylinder block was a rocker shaft, placed above the valves and running from end to end. On this shaft were rockers with three arms, of which one was lifted by the push rod while the other two pressed on the valve stems. Delage has since abandoned this design because the reciprocating weight of the push rods and rockers was too great, and the older Delage cars are therefore a sort of half step between the L head motor and the Peugeot type of overhead valve construction.

Though it has been described many times, the new Delage system cannot very well be omitted from a review of this character. Externally the present Delage racing engine looks very much like a Peugeot and the difference is all within the camshaft case. Each cam is surrounded by a stirrup, the cam pressing on one side to open the valve and on the other to close it, the stirrup being attached to the end of the valve stem through the medium of a very small but stiff spring which is in slight tension when the valve is shut. The idea is to eliminate the lag of the spring altogether and to shut the valve just as positively as it is opened, eliminating all lag.



Typical valve timing for a four-valve engine

The theory underlying the four-valve engine with overhead camshaft has been known and appreciated for very many years, and the reason why it is only recently that four-valve motors have been made is that the older racing cars gave so much trouble with other parts of the engine that the extra volumetric efficiency given by the four valves could not have been utilized without breaking up the rest of the motor. At present there is nothing in view that appears likely to displace the four-valve type after the fashion in which it has displaced the two-valve.

Boillot Killed in Aeroplane Battle

Race Driver, Attacked by Five German Flyers, Brings Down One

Georges Boillot, racing pilot, killed in battle

PARIS, FRANCE, May 21—Georges Boillot, winner of the French Grand Prix of 1912 and 1913, has been killed in a fight with five German aeroplanes, near Verdun, after bringing down one of the German machines before a bullet pierced his heart. Boillot, a second lieutenant, brought down his first German aeroplane on March 31, in Haute-Alsace and later won the cross of the Legion of Honor. He was 52 years old.

At the outbreak of the war he joined the Automobile Corps, and using his Grand Prix racing car, carried out many dangerous missions as driver for General Joffre. Later he entered the aviation service.

Boillot's first and only appearance in a race in the United States was on the Indianapolis Speedway, May 30, 1914, where he broke the 350-mile record, his time being 4:15:22.69. He was forced to drop out in the 352.5 mile, the next lap on account of a broken frame, finishing fourteenth in the race.

Boillot in a Peugeot will be remembered for his victory in the 1912 French Grand Prix when he won out after a struggle with the late David Bruce-Brown. In the 1913 event on the Amiens course, he dashed over the 569-mile course at the rate of more than 72 m.p.h., winning after a hard struggle with Goux in a Peugeot second.

Boillot gained renown throughout the French army as General Joffre's driver. His eagerness to gratify the General's desire for haste led him to take unnecessary risks. After one particularly narrow escape General Joffre announced his intention to make a change of drivers, not so much because of the danger to which he was subjected as because Boillot's daring swerves kept him awake. The General liked to sleep during his 100-mile dashes along the battle front. Boillot accordingly went to the aviation corps.

He was the airman who performed the service described in a recent official communication, as follows: "One of our pilots, in the course of a stirring flight, brought down an aviator, which fell between our lines at Suippes." It was nearly a week before the world learned that it was Georges Boillot who had accomplished this feat. At one time he was surrounded by a regiment of German soldiers, and escaped death by riding through them at high speed.

Georges Boillot was one of those rare beings who combine great engineering skill with a master hand at the wheel. He was the idol of the French racing fans and on practice mornings before a great race the crowds of villagers who always turn out in the chill gray of the morning, used invariably to cheer their favorite to the echo. Watching from a turn in the road, one could always hear the murmur of voices heralding the approach of the blue Peugeot even before the roar of its exhaust was audible.

Boillot was a personality which earned him friends everywhere and also gained for him universal respect. Strong both in mind and body, he had a vigor and vitality which permeated the whole atmosphere around him. When the next French Grand Prix takes place there will be no face worse missed and his absence will be keenly felt.

Ignition Most Reliable Part of Car

Proper Mechanical Layout of Ignition Gear Prevents Electrical Troubles — Two-Point Ignition Preferred for Racing—Four Valves Render Plug Accommodation Difficult

IT is commonly believed that in the two-spark magneto the spark at each one of the plugs is weakened by the fact that two instead of one have to be supplied. This is not true, as the electrical characteristics involved by the ratio of the high-tension to the low-tension winding are entirely different in the two instruments. In other words the two-spark magneto is not simply a single instrument with a double-distributer but, on the other hand, is primarily a different design, electrically as well as mechanically.

Mechanical Difficulties

It is in the mechanical side of the ignition system for racing cars that the greatest difficulties enter. Broadly speaking, there is no such thing as electrical trouble. Given the proper mechanical conditions and electricity will not fail to do its part. The high temperature at the spark plugs furnishes a good example of this. In operating the motor at the temperatures obtained in racing, the insulation and the electrodes are submitted to stresses that would never be reached under other conditions. The consequence is that in the long races we see plug failures.

Keeping Plugs Cool

There is only one way to keep the plugs cool and that is by proper waterjacketing. At the same time the wall supporting the screwed connection of the plug must be firm enough to endure the wedge action necessary in tightening the plug. This has been worked out in the cars of this year much better than in the past, and at the Sheepshead Bay track plug changes were very scarce. In the 300-mile event at Indianapolis there may be more of them on account of the greater distance. Nevertheless the troubles as a whole have been greatly reduced.

The difficulty in getting material has hampered the plug makers to a great degree. The Bosch company had its last plug stand at the Sheepshead Bay race. Owing to the fact that this concern can no longer secure the Steatite used in the insulation of its plugs further manufacture has had to await changes in conditions.

Four Sparks per Cylinder

One of the interesting ignition systems of the year from a mechanical standpoint is that used on Christiaens' Sunbeam. This is a six-cylinder car and ordinarily a magneto used with it would have to be driven at one and one-half engine speed in order to produce the three sparks per revolution necessary with the four-cycle, six-cylinder engine. The magneto on Christiaens' car produces four sparks per revolution and hence is driven at three-quarter engine speed.

This reduction of the armature shaft speed of the magneto by using a type which produces four sparks to the revolution is important in high-speed work. If the magneto is driven at a greater speed than that of the crankshaft it becomes the fastest moving part on the car. The armature shaft bearings are stressed to a much higher degree, not only due to the higher rate of travel, but also by the thrust of the step-up gearing. The result is that the bearing life on the armature shaft is apt to be shortened. This same effect has shown itself to be true on lighting generator shafts on passenger cars where they were operated at a higher speed than the crankshaft and is due to precisely the same causes.

The care in detail work on the ignition systems is even better now than ever before, although the ignition system has always been carefully watched on racing cars. The improvement is in the better location of the wires and the precaution against chafing or breaking. This is not as yet perfect, however, and there are some cars in which the wires are not as neatly tied down as they might be. That accidents can happen to even such things as high-tension leads to the plugs is shown by the fact that Eddie Rickenbacher had to stop in the Sheepshead Bay event on account of a broken lead.

Quick ignition being necessary, a large proportion of machines are using two-point ignition. It has been said that this phase is falling off, but if it is so, it is because combustion chambers themselves are now of more highly-concentrated volume, allowing a single spark to do the work much more rapidly than before and also, incidentally, four valves reduce the space permitted for plugs to such a degree that it is often only possible to fit one. In the Sheepshead Bay race, of the eighteen cars to start, seven were fitted with two-point ignition and the others with single plugs.

A Battery System's Performance

The hot spark at high speeds, which is the greatly-desired feature in racing, falls in well with the characteristics of the magneto; hence this has been supreme for the past few years. One exception has been noted, however, this year in which the battery-equipped Hudson went through to third position in the New York event without showing ignition trouble of any kind during the run.

Taken altogether, racing ignition has not changed in any material respect, but throughout the entire system there is a greater reliability. Plugs are lasting better because they are better cooled. Broken wires are fewer because they are fastened much more carefully and such things as broken magneto straps, etc., which used to be responsible for putting good cars out of a race, have been reduced until it can really be said that in the racing cars for the 1916 season the ignition is one of the most reliable parts of the car.

Automobiles and Trucks Break Mobilization Records

Aid in Assembling 10,000 Guardsmen in 2 Hr.

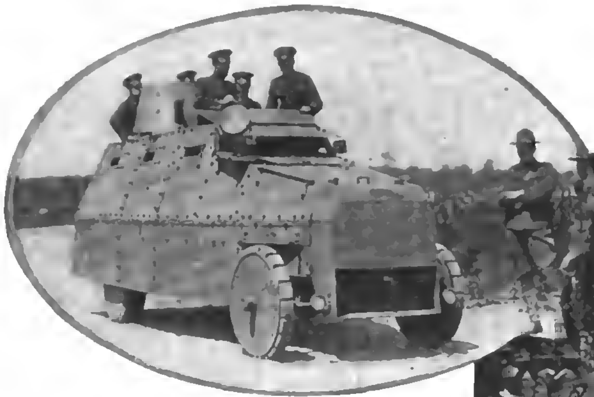
SHEEPSHEAD BAY MOTOR SPEEDWAY, May 21—Automobiles, armored cars and trucks played an important part in the mobilization of nearly 10,000 National Guardsmen for the opening of the military and naval tournament here to-day. Sixty civilian trucks and a number of passenger cars aided in transporting the men from the armories to the speedway.

A sham battle was held, the problem being the attack of a superior force on a smaller army covering the retreat of its main body. The coast artillery, Eighth and Ninth regiments, together with an armored battery, some engineers and signal corps men, defended one end of the inclosure and retired before the attacks of the infantry and field artillery units, aided by a troop of the First Cavalry. Sunday laws made the battle a silent one.

Attacking infantry advancing on the run across the speedway inclosure. Note the 2-ton Mack armored truck

Above—The Christie two-wheel, front-drive tractor, attached to a wagon type platform

Below—Transporting the troops. The drivers, being unused to convoy formation, were prone to pass each other, thus breaking the line



Above—The 2-ton Mack armored truck, which was a feature of the maneuvers, proving a formidable machine for either offensive or defensive work

The Jeffery quad service wagon. Like the armored truck, illustrated above, this belongs to the First Motor Battery of the N. G. N. Y.

The new Pierce-Arrow 2-ton tractor towing two of the twelve 1-ton Trailmobile trailers which it is designed to haul. This tractor has a cruising radius of 670 miles, owing to its large gasoline tank, and is to carry two machine guns, which can shoot over the tops of the trailers, mounted on the platform

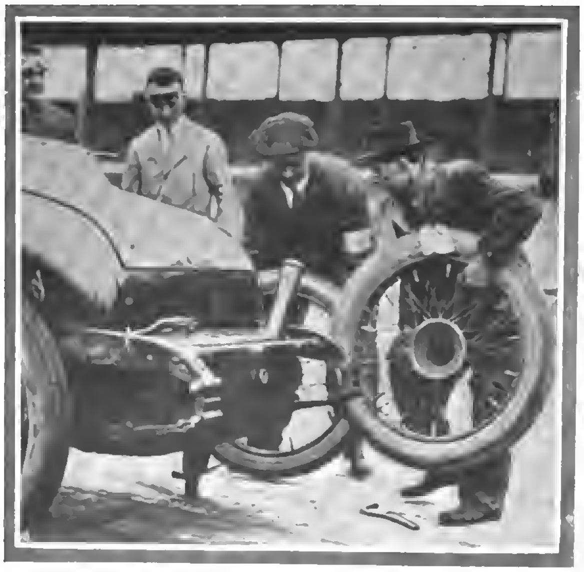
Start of the first heat of the amateurs' race at Chicago. This heat was won by W. A. Leet, who won the final

Mercer Winner in Amateur Race with 86.8 M.P.H.

W. A. Leet Covers 30 Miles in Final in 20:44.4—Same Car Wins Dealers' Race

Left—W. A. Leet, who won the amateurs' race. Right—Dr. R. R. Duff, who made a lap at over 94 m.p.h.

CHICAGO, ILL., May 21—William Leet in his red Mercer ground out each of the 30 miles in the final dash of the Western Inter-Club trophy race in 41.4 sec., taking the honors and silver cup in the first amateur race ever held on an American speedway. Leet, who drove under the colors of the Omaha Club, completed 15 circuits of the board oval in 20:44.4, his average being 86.8 m.p.h. He was about one-half lap ahead of his nearest competitor, Frank Warren, representing the Speedway Park Assn., who drove his Cadillac across the tape 1 min. 4 sec. behind the winner, while William Robbins, representing the South Shore Country Club, in a Mercer, finished third, being 27 sec. behind Warren. Frank Book, entered in the name of the Detroit Athletic Club and driving a Cadillac, was fourth and F. C. Sawyer, representing the Chicago Athletic Assn., fifth, their times being 23:04 and 23:14.2 respectively. The preliminary heats were run yesterday.



Changing a wheel on F. A. Sawyer's car

William Robbins led the field up to the end of the third lap with Dr. R. R. Duff less than a car length behind, Duff jumping into the lead in the fourth, and holding it until the end of the sixth when Leet took first position and held it until the finish. Duff and Leet drove a neck and neck race until the end of the eleventh when the former was forced to retire with a broken oil pump.

However, Dr. Duff's Mercer won an honor not scheduled in the program. After taking the lead in the fourth lap he went into the fifth with a spurt that was clocked at 1:16.2, or a speed of better than 94 m.p.h., the fastest time ever made by an amateur on the Chicago track.

With Al Schillo at the wheel, the same Mercer with which Leet won the amateur event, showed the way to the six other entrants in the 50-mile dealers' race, maintaining practically the same speed as in the first race of the afternoon. Schillo's time for the half century was 34:35.1, and his speed 86.7 m.p.h. The Cadillac finished second in the dealers' race as well as in the amateur race with Count de Constant losing to Schillo by a margin of only 45 sec. A. W. Bromstedt in a Mercer took third after he had challenged Schillo for the lead for 40 of the 50 miles. On the Twenty-first lap Bromstedt threw a right front tire in the back stretch and came into the pits on the rim. He lost a lap in making the tire change and was unable to recover it.

The sympathy of the crowd seemed to be with Ed. Schillo, brother of the victor, as he drove under a self-imposed handicap of one lap, stopping at the pits on the paced lap. His Mercer finished fourth.

Factors in Universal Joint Design*

American and European Constructions Show Great Variety—Rules for Determining Size—Protection and Lubrication Most Important

By A. Ludlow Clayden

THERE is hardly a part in an automobile that has more work to do and yet has less attention than a universal joint. It is liable to neglect, alike from the user of the car and the engineer responsible for the chassis layout. Usually made by specialists, the quality of material and workmanship in the average universal is of a high order of merit, but a little more attention given to the disposition of universals and to means for maintaining their lubrication would result in a higher chassis efficiency and a very greatly enhanced durability. The way in which the user has become accustomed to poor durability of universals may be noticed by appreciating one's own natural expectation that a car which has run 10,000 miles will have a good deal of slack and rattle in the transmission. It is not always so, but it is so often, and seeing that this undesirable slackness is neither necessary nor impossible of cure, it really is somewhat remarkable that we accept it so calmly.

Universals Highly Efficient

When properly proportioned to the work they have to do, and when properly lubricated, few parts of a machine are more efficient than a universal joint. This was shown by demonstration in tests made on a well known joint in the laboratory of the Mechanical Engineering Department, of the University of Kansas and, as these tests have been published already, there is no need to repeat the report on them in detail. The most important thing brought out by the tests was that the efficiency of the joints was near to 99 per cent for angular deflections up to 7 or 8 deg. It was also shown that the efficiency fell off more and more rapidly as the angle increased, but unfortunately the largest angle for which determinations were made seems to have been about 15 deg. In any case, however, it is obvious that the loss of power in a well lubricated universal is so small that it can be neglected.

Velocity Variation More Serious

Where a single universal is used to connect two shafts at an angle, if the first shaft runs at a steady and regular speed, the second shaft will run at a speed which varies during each revolution between maxima and minima, the values of these depending upon the angle of deflection. The change in the velocity of the driven shaft is very rapid, as it occurs during each quarter revolution, there are two maxima and two minima during each complete turn of the shaft. For determining the amount of variation the formula is

$$V_1 = V \cos \alpha$$

and

$$V_2 = \frac{V}{\cos \alpha}$$

where V = angular velocity of the driving shaft, V_1 and V_2 = the maximum and minimum angular velocities of the driven shaft, and α = the angle of intersection of the produced axes of the shafts. (See Fig. 1).

Now, it is obvious that a variation in velocity of a propeller shaft in a car having one universal only cannot take place without some curious reactions. At one end we have the inertia of the whole car as a moving mass tending to keep the road wheel turning at a constant velocity, and at the other end there is the flywheel of the motor. Obviously we could not accelerate and retard the road wheel, and so the whole car, twice during every revolution of the propeller shaft, even by a small amount, so it is to be assumed that the variation, which must take place somewhere, does so mainly on the flywheel.

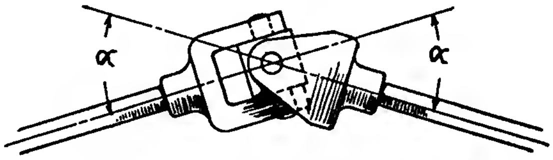


Fig. 1—Diagram to illustrate velocity ratio variation

Flywheel Fluctuations

Owing to the power of an internal combustion engine being made up from a series of explosions the flywheel has natural periodic fluctuations of its own and these will vary with the number of cylinders, the speed of the engine, the weight of the flywheel and the force of each explosion. With a four-cylinder motor the fluctuations would take place at the same rate as those due to the universal, in an eight at double that speed; so a four might have flywheel fluctuations that either coincided with or neutralized those due to the universal joint. That these fluctuations in speed are not so small that they can be neglected may be shown by quoting an actual value and, to take a low speed where variations have the greatest chance of being perceptible to the passengers in the car, we may assume a rate of revolution of 500 r.p.m. with

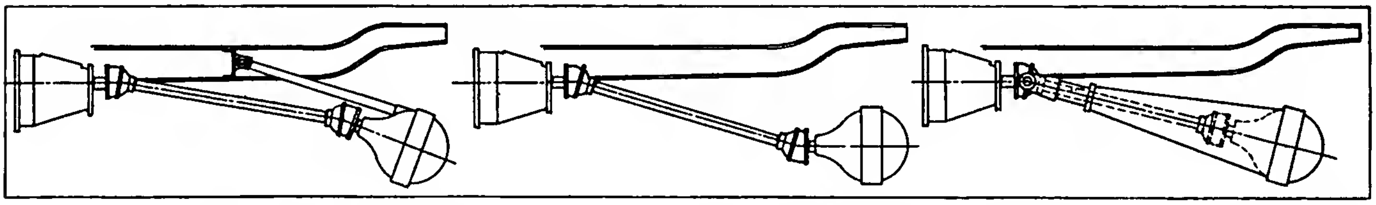

Fig. 2—Left—Layout for propeller shaft recommended by C. W. Spicer to divide angularity evenly between the two joints. Center—Layout obtained with Hotchkiss drive which bends both joints equally. Right—Layout with long torque rod which renders rear joint inoperative

---

*Paper read at Cleveland section S. A. E. meeting, May 19.

an angular deflection of 10 deg. At 500 r.p.m. there will be 1000 maxima and 1000 minima of velocity in the propeller shaft which means 1000 vibrations per minute or about 17 per second. At the maximum positions the driving effort on the teeth of the bevels will be heavy, and at the minima it will be light, and an alteration in tooth pressure at so slow a rate of change as 17 per second would be distinctly perceptible in the form of vibration.

With a steady speed of the driving shaft of 500 r.p.m. and an angle of joint of 10 deg. the maximum velocity of the driven shaft would be 508 and the minimum 492 r.p.m. equal to a variation of 16 r.p.m. each quarter revolution. Now a quarter revolution at 500 r.p.m. takes 0.03 sec., an acceleration at the rate of 16 r.p.m. in this short space of time is rapid, so the load imposed on the bevel teeth is quite large. Practice shows clearly enough that cars with single universals are satisfactory enough, so the velocity variation is not serious, but it is probable that the elimination of the variation would render very smooth and effortless low speed running on high gear somewhat easier of attainment.

Two Ways of Eliminating Variations

There are two ways of eliminating the velocity variation, and both have been used successfully in practice. If we use two joints, one at each end of the propeller shaft, and if these make equal angles, the propeller shaft will vary in velocity owing to the angularity of the front joint, but the back joint will neutralize this and the bevel pinion shaft will run as steadily as the flywheel, any fluctuations of the speed of the crankshaft being reproduced faithfully on the pinion without reference to the universals.

The angle between the gearshaft, to which the front universal is attached, and the propeller shaft must be equal to that between the propeller shaft and the bevel pinion shaft, and this can be arranged either by keeping the bevel shaft always parallel to the gearshaft or by dividing the angular displacement between the two universals equally. If we adopt the latter style we gain the advantage that the angular displacement of either joint is only half what it would otherwise have been, and the efficiency is therefore better by some small amount. It is also unquestionable that the divided angle design is simpler to carry out than the parallel motion scheme, as the former can be secured by the use of a single, simple torque rod, while the latter requires regular parallel motion linkage of some complication.

It may be pointed out, however, that the so-called Hotchkiss drive, where the axle is locked rigidly to the springs, keeps the bevel shaft very nearly parallel to the ground at all times and so it is perhaps simpler, from this viewpoint, to use the parallel arrangement than the divided angle. The emphatic point is that the usual sort of torque rod which is anchored to the frame close to the front universal is not good, as it merely prevents the rear joint from doing its fair share of work, it prevents the second joint from damping out the velocity variation and it lowers the efficiency by throwing all the angular deflection upon the forward joint. Fig. 2 shows the three designs side by side for comparison.

Bearing Loads Are Heavy

However, the efficiency of joints is so high and the velocity variations of fairly small importance compared with the difficulty of lubricating the universals properly and their liability to wear and to rattle. Proper layout will minimize wear, but it does not help lubrication and does not prevent the creation of that slackness which produces noise.

Originally universals were very crude affairs and were both unprotected and unprovided with any means for lubrication, but of late years some very elaborate designs have been worked out, and there are just a few cars in which the universals can be trusted to last as long as any other part. The secret of durability is twofold; first the universal must be large enough for the load and, secondly, it must be bathed in lubricant continuously.

If the bearing surfaces are too small the torque of the motor will be able to squeeze out the lubricant and it must not be forgotten that the torque of modern motors is very high indeed. There is no need to go into detail examples, but calculation will show that among cars of all nations the bearing pressures in the universals when torque is at its maximum may vary from a few hundred to several thousand pounds.

The pressure on the bearings of a universal may be found by the following formula:

$$\text{Pressure per square inch} = \frac{HP \times 33{,}000 \times 12}{D \times \pi \times A \times R}$$

Where D = effective diameter of joint in inches, A = area in square inches of the two bearings carried by one fork and R = the minimum number of revolutions of the shaft at which the horsepower in question can be transmitted.

The allowable amount of pressure ought not, in the opinion of many engineers, to be allowed to exceed 1000 lb. per square inch at the maximum torque which the engine is able to apply no low gear. However, 2000 lb. is often permitted and even double this pressure, but the durability of the joints naturally suffers. A joint large enough to keep the maximum pressure below 1000 lb. per square inch is not cumbersomely big for passenger car use; it costs more than a smaller joint, but the extra outlay is well recouped in the better durability.

Just to consider an assumed extreme case take an engine developing 70 b. hp. at 2100 r.p.m. Assume the low gear in the gearset is 3 to 1 and we get:

$$12{,}600 = P \times D \times A$$

Or, if P is 1000 lb. per square inch,

$$D \times A = 12.6$$

Thus if there are two pins each with an area of 1 sq. in., the mean diameter of the joint should be 6 in.; or 3 in. with pins twice the size.

These figures, rough as they may be, serve to show that the size of joint necessary to give a safe bearing pressure is not excessive.

Formula for Joint Size

It would be impossible to do more than guess at the safe maximum load, but the lower it is the longer the life of the joint, goes without saying; also the poorer the system of lubrication the lower should be the pressure. The fact that the joint does not revolve on its bearings, but merely oscillates slightly, makes lubrication more difficult and this fact must be allowed for.

A convenient form of the formula for determining the safe diameter for a universal, when the size of the pin bearings and the maximum pressure have been chosen, is:

$$D = \frac{HP}{R \times A} \times \frac{126.000}{P}$$

Or the same formula can, of course, be used to determine A when D is fixed by other considerations.

In America there have been such good universal joints made by specialists, that automobile engineers have given little attention to their design, but in Europe each automobile manufacturer makes his own joint, as this is a part of the chassis which has never been taken up by specialists with the solitary exception of the Timken representatives, who have shown some remarkable durability with a taper roller bearing construction. As a result, the European makers have been more concerned properly to protect and lubricate the universals, having nobody else upon whom to place the responsibility.

Lubrication Is Difficult Problem

When first the idea that a universal needed protection from mud arose, covers were made of leather. These were of little use, as the centrifugal force drove the grease through every pore, straps broke and mud had a rotting action, so the cover was soon destroyed. The next step was to use a pressed brass cover and to close the mouth of the case with a smaller leather cover which, in this case, was just a plain cylinder. From this point development led to the use of a cover pressed or spun into a hemispherical form, the opening necessary to allow free movement to the shaft being closed by a corresponding pressed hemisphere held up by a coil spring outside the shaft. It is the last named type of covering that is in greatest use to-day and is very satisfactory indeed if made properly.

For lubrication all the different forms of case were supposed to be packed with grease, and grease is still the most common lubricant for universals. A well designed joint will contain enough grease to suffice for from 3000 to 5000 miles of running under ordinary conditions. There is one particular point to be kept in mind here, this being the effect of centrifugal action on the lubricant. If the outer case is very large the grease may all be thrown to the ends and the universal then runs in a cavity at the center where no grease touches it. Thus the case ought to fit fairly close to the joint. Next, the diameter of the case should be sufficiently greater than that of the hole through which the shaft protrudes to allow for the retention of a fair quantity of grease, supposing the piece which closes the hole to be removed.

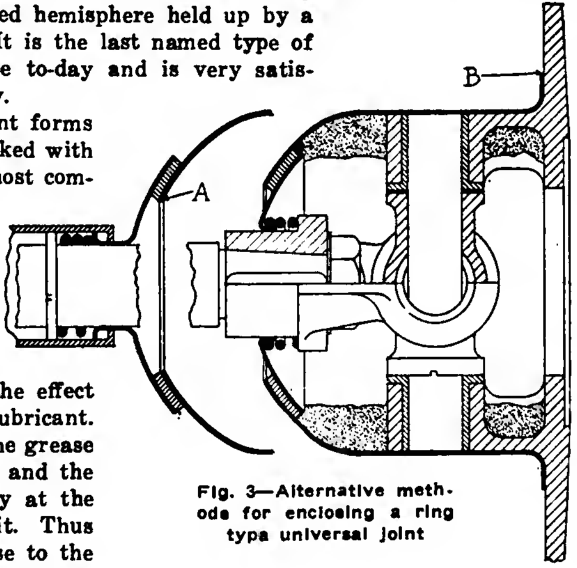

Fig. 3—Alternative methods for enclosing a ring type universal joint

If a joint casing is filled completely, centrifugal action will cause the middle part of the grease to be forced out through the joint between the case and the cover cap, however good the packing gland may be; the action is slow but sure. Thus the joint and case must be so proportioned and so arranged that the pins and their bushes are as close as possible to the outer circumference of the case and can be lubricated perfectly without the retention of grease at the very middle of the joint. In Fig. 3 is shown where the grease may reasonably be expected to remain. Even with these precautions in design the user should be careful not to use grease that is very hard because a certain amount of fluidity is needed to allow the lubricant to work its way into the pins.

Looking at Fig. 3 there might be reason to suppose that oil could be used, as there is no way for it to escape when the car is standing. However, most attempts to use oil have been disappointing because of the splashing that takes place. The usual way of arranging the cap is as shown at the left in Fig. 3. Presumably the oil is thrown against the inner surface of the cap, *A* Fig. 3, whence it is ejected past the packing. It seems thus that there are theoretical advantages to be claimed for inverting the usual arrangement and fitting the cap as shown on the right in Fig. 3, but even so it is to be doubted if oil would remain in the cover for long, and there would have to be some sort of a joint at *B* to allow the case to be assembled. This design has been used with success on several cars.

Experiments have been made with cases entirely independent of the joint itself and not revolving with it.

(To be continued)

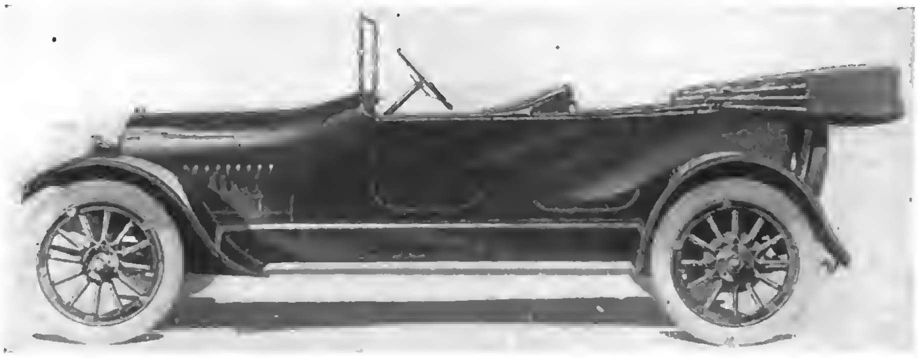
Cloverleaf Roadster Features Crow Line

One Chassis with Two Bodies— New Electric System Employed



Side view of the Crow five-passenger touring car for the 1917 season

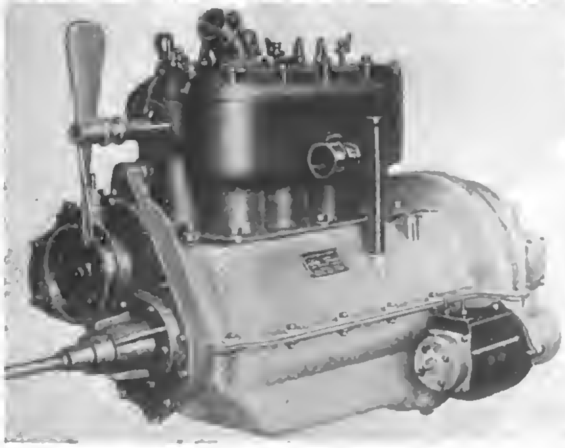
IN announcing the 1917 Crow cars, made by the Crow Motor Car Co., Elkhart, Ind., the important feature is the addition of a cloverleaf roadster, making two body models. Last year a coupé and sedan were listed but the cloverleaf is entirely new.

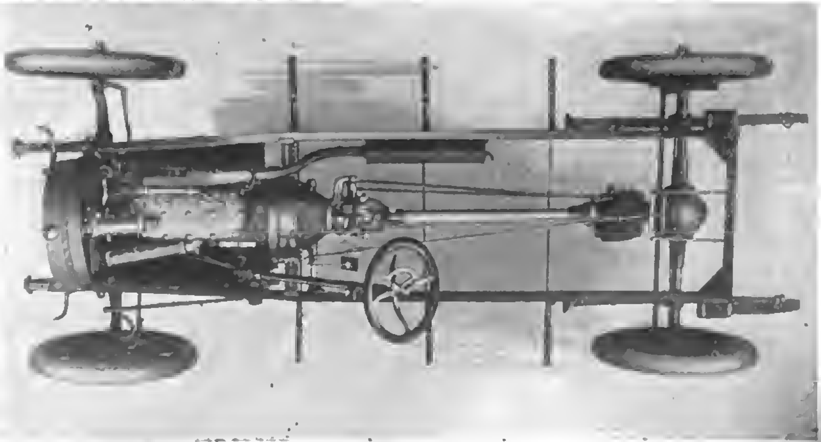
The five-passenger touring car has been improved in detail but still sells at $725 completely equipped, the cloverleaf selling for $795. Among the changes for this year is an alteration in the starting and lighting system which is now the Dyneto two-unit device in place of the system formerly used. A new body is employed to coincide with the tendencies of up-to-date streamline design. The body is built of white ash sawed into shape and not bent. It is covered with sheet metal and the braces are set into the wood at white heat.

Among the technical specifications is a detachable head four-cylinder L-head block motor 3½ bore and 5-in. stroke giving 34.9 hp. on the brake. Connecticut ignition is used, Zenith carbureter, dry-plate clutch and three-speed selective gearset on the floating rear axle.

A honeycomb type of radiator with an aeroplane style fan combine to give efficient cooling. Lubrication is by a combination pressure and splash system in which the main bearings are taken care of by pressure feed from the pump and the oil, after feeding the main bearings, flows to the splash troughs, from which the other bearing surfaces of the motor are lubricated. There is an oil indicator and filter also which form part of the lubricating system. The carbureter is a Zenith fitted with hot air supply.

The entire valve system is well worked out. The camshaft has integral cams and is made of a forging of low carbon steel 1 in. in diameter carried on three bearings. The front is 1¼ by 2 15/16. The center is 1.8595 by ¾ in., the rear is 2 9/16 by 1 in. The timing gears are helical in shape, cut to an angle to promote quietness and smooth running. The valves are 1⅜ in. in the clear and are located on the right side of the motor. The pushrods are flat-head type made of special case-hardened steel properly hardened and ground and adjustable by means of hardened adjusting screws and locknuts.





Top—The cloverleaf roadster which features the Crow line for 1917 and which is a new model that has just been introduced. Note the wire wheels and typical lines

Lower left—Three-quarter end view showing the motor used on the Crow 1917 car with its aeroplane type fan and compact layout of cylinders and crankcase casting

Lower right—Plan view of the Crow 1917 chassis showing motor mounting and layout of the drive members with the three-speed selective gearset mounted on the rear end of the propeller shaft adjacent to the rear axle

Roller Bearing Takes Thrust in Novel Way

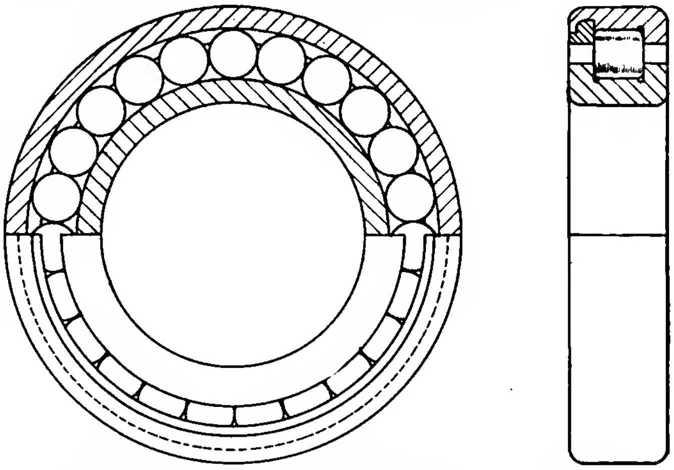
Acts as Parallel Roller for Journal Loads and as Self-Lubricating Plain Bearing Under Thrust—Intended Especially for Road Wheels

AXLE engineers have good reason to study bearing design closely, thus a new type produced by A. M. Laycock, chief engineer of the axle department of the Sheldon Axle & Spring Co., Wilkes-Barre, Pa., is deserving of more than passing interest. Mr. Laycock has had the opportunity of studying ball and roller bearings of all kinds in service, and has come to the conclusion that the latter type are well adapted for the wheel bearings of trucks. He has been using several well-known types with great satisfaction and is now making, and experimenting with, a design of his own.

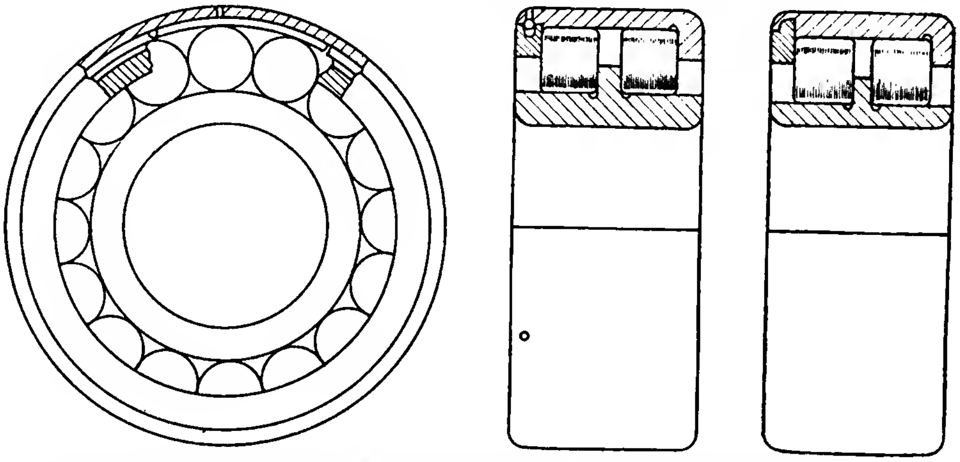
In this special bearing parallel rollers are used either with a cage for separating them or else with the race filled completely and the rollers touching each other. The rollers lie between flanges, and are finished off square at the ends, so that end pressure is taken on the ends of the rolls. Of course, this gives a purely sliding contact and so approximates to a plain thrust bearing, but it will be noticed in the illustrations that the rollers lie in a channel section race. This channel naturally is filled with oil, so that each roller entering the bottom part of the bearing passes through a bath of lubricant and the revolution of the roller spreads the oil well over the thrust surfaces.

Single and Double-Row Bearings

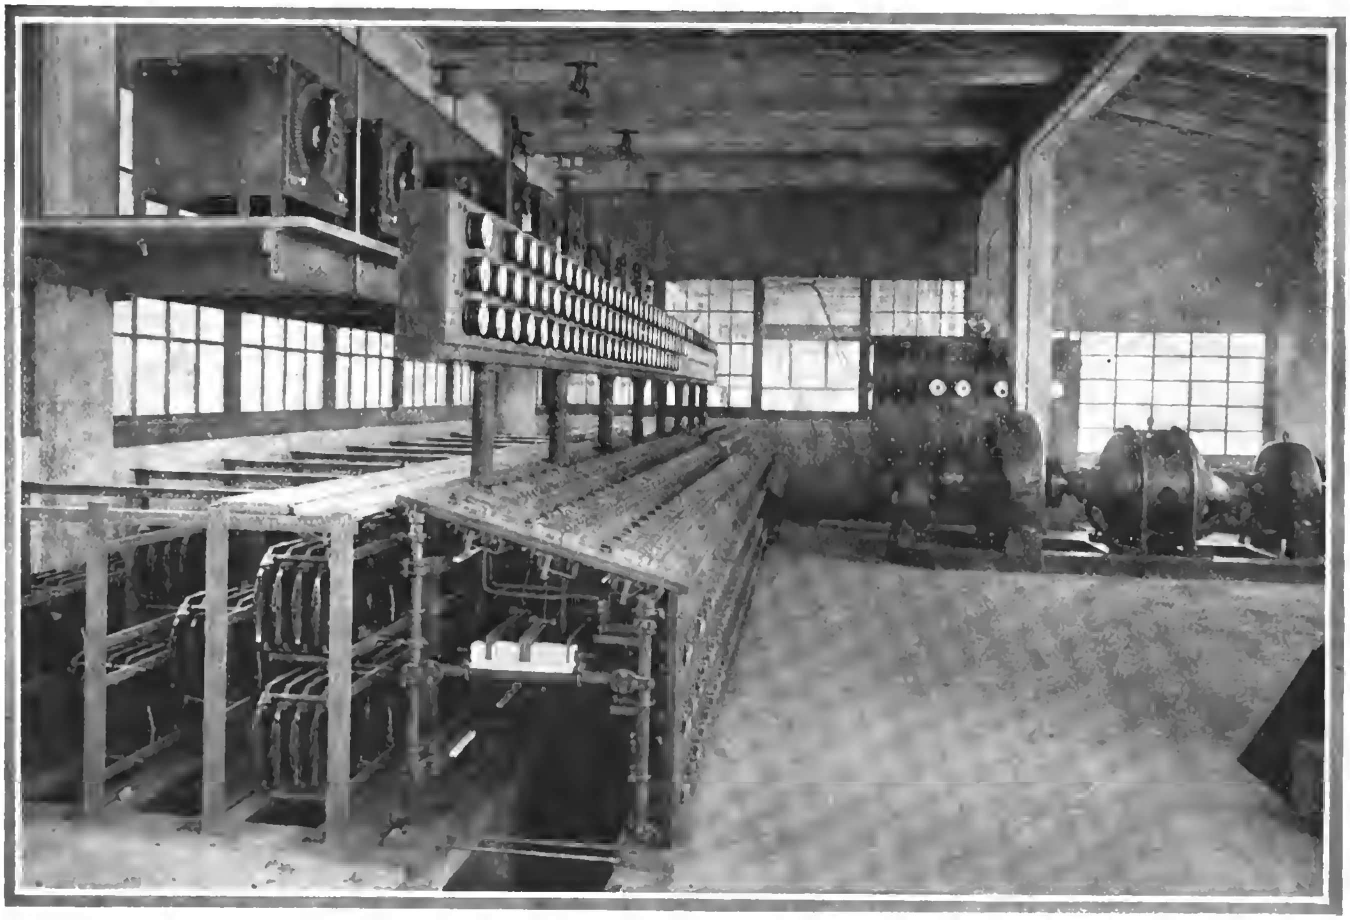
The experimental types now being made include both single and double row bearings, and several ways have been worked out for fitting them together. In the sections shown, the narrow, single row bearing has the outer race turned with a thin edge on one side. When the rollers have been put in the thrust ring is put in place and the thin edge is then rolled over by a burnishing tool. This same design is shown for one of the double row bearing sections, but the other has a different scheme. In the latter the loose thrust ring is grooved, as is the inner edge of the outer race. A sort of piston ring is pressed into the groove in the thrust race and this expands on the two grooves coming into register, so locking the parts together.



Laycock special single-row roller bearing. Note how the outer race is turned with a thin edge on one side and rolled over



The double-row bearing shown at the extreme right is similar to the single-row in its construction but the other uses a sort of piston ring pressed into the thrust race groove and this expands on the two grooves coming into register, locking the parts. Pressing the ring with the several pins similar to that illustrated, these pins being inserted through holes in the outer race, allows the bearing to be readily disassembled



Rheostats, desk control, motor generator set and switchboard in acid proof room of Prest-O-Lite storage battery plant

Prest-O-Lite Adds Charging Apparatus

Installation Includes Ninety-Six Independent Charging Circuits with Second Largest Desk Board Control in the World

IN connection with the program of the Prest-O-Lite Co., Inc., of Indianapolis, Ind., to manufacture storage batteries on a large scale an electrical charging apparatus having many new features has been installed. The installation provides ninety-six independent charging circuits controlled from a desk having sixteen slate sections by an operator who is in full view of every forming table on the main floor of the plant. The current supply has been carefully worked out with the idea in view of utilizing the discharge current from the batteries on the forming tables by passing it back through a booster generator where it is raised to the charging voltage and then used over again. The exact method by which this is accomplished is described later. Another of the striking features of this installation is the novel method of automatically disconnecting the incoming A. C. current, which is 4100 volts, and disconnecting the D. C. generators from their loads to prevent the discharge of the batteries back into the machines in the event of any great fluctuation in the A. C. voltage, overloading of the apparatus, or racing of the motor.

Control Equipment in Glass Room

The control desk by means of which the current is regulated for each of the ninety-six charging circuits is distinctly a new departure. It is said to be the second largest desk board installation of its kind in the world, one larger having been made up in this country for shipment to the Japanese government.

The entire control equipment is installed in a fume-proof glass room supplied with fresh air from an outside source. It is in this room that the operator works. It will be seen that while enjoying a full view of the entire floor in the forming department, by line of vision between the top of the benchboard and the bottom of the instrument frame, the entire apparatus is completely removed from the destructive acid fumes.

Underground Lead Cables Used

The current is carried from the control desk to the forming tables by lead cables in underground fiber conduit. The terminals at the tables are specially designed potheads, there being one, two and four conductors, according to the carrying capacity of the circuit and the location of the table. The potheads protrude through the floor which is constructed of acid-proof brick laid in asphaltum. The lines of batteries on charge are connected to the potheads during the forming process by means of flexible cable.

The incoming current is protected at the pole by a pole top switch, equipped with horn gap spark arresters, and an aluminum cell electrolytic lightning arrester located at the point of entrance to the building.

Among the New Automobile Books

Three Volumes Which Give Complete Information on the Design, Construction and Operation of Lathes, Modern Automobile Electric Systems and Car Repairing

INFORMATION of interest to the engineer, the repairman and garageman, and, last but not least, the automobile owner, is contained in the three books briefly reviewed herewith, these volumes being recently issued by the publisher, the Norman B. Henley Publishing Co. One of these works is a revised edition of Perrigo's book on lathe design, construction and operation, and bringing the subject matter up to date. The other two are by Pagé, one of them taking up the intricacies of the modern automobile electric system and describing the systems and detail and suggesting remedies for various troubles, and the other is a complete outline and description of the best shop methods, equipment and processes in automobile repair work.

Lathe Design, Construction and Operation. By Oscar E. Perrigo.—A new revised edition covering the subject suggested by the title up to date.

Lathe history and the relations of the lathe to manufacturing are given; also a description of the various devices for feeds and thread cutting mechanisms from early efforts in this direction to the present time. Lathe design is thoroughly discussed, including back gearing, driving cones, thread cutting gears, and all the essential elements of the modern lathe. The classification of lathes is taken up, giving the essential differences of the several types of lathes, including, as is usually understood, engine lathes, bench lathes, speed lathes, forge lathes, gap lathes, pulley lathes, forming lathes, multiple-spindle lathes, rapid-reduction lathes, precision lathes, turret lathes, special lathes, electrically driven lathes, etc. In addition to the complete exposition on construction and design, much practical matter on lathe installation, care and operation has been incorporated in the enlarged 1916 edition. All kinds of lathe attachments for drilling, milling, etc., are described and complete instructions are given to enable the novice machinist to grasp the art of lathe operation as well as the principles involved in design. A number of difficult machining operations are described at length and illustrated.

Large clear type and a clear style make this a desirable reference book. Published by Norman W. Henley Pub. Co., New York City, 400 pages 6 by 9; over 1800 illustrations, cloth binding, price $2.50.

Modern Starting, Lighting and Ignition Systems. By Victor Pagé.—A study of the construction and repair of up-to-date automobile electricity. In this work is included a full set of instructions for the repair and care of storage batteries, generators, regulating devices, starting motors, etc. The systems representing various classes of practice are described in detail and illustrated by complete diagrams showing the connections and the relations of the various parts of the assembly to each other. Data for the location of trouble in the various systems is given and there is also included a description of the various accessories which are operated from current supplied by the storage battery.

In the present state of uncertainty among non-technical owners and those not familiar with the principles of electricity this work should fill a useful purpose. Published by Norman W. Henley Pub. Co., New York City. Over 500 5½ by 8 pages with nearly 300 engravings and folding plates. Cloth binding, price $1.50.

Automobile Repairing Made Easy. By Victor W. Pagé.—Deals with shop methods, equipment and processes and is a complete treatise explaining approved methods of repairing all parts of all types of gasoline automobiles. This is a reference work for anyone engaged in the repairing of cars and outlines every process incidental to motor car restoration. Gives plans for workshop construction, suggestions for equipment, power needed, machinery and tools necessary to carry on business successfully. Tells how to overhaul and repair all parts of all automobiles. The information given is founded on practical experience, everything is explained so simply that motorists and students can acquire a full working knowledge of automobile repairing. Other works dealing with repairing cover only certain parts of the car—this work starts with the engine, then considers carburetion, ignition, cooling and lubrication systems. The clutch, change speed gearing and transmission system are considered in detail. Contains instructions for repairing all types of axles, steering gears and other chassis parts. Many tables, short cuts in figuring and rules of practice are given for the mechanic. Explains fully valve and magneto timing, tuning engines, systematic location of trouble, repair of ball and roller bearing, shop kinks, first aid to injured and a multitude of subjects of interest to all in the garage and repair business. All illustrations are especially made for this book, and are actual photographs or reproductions of engineering drawings.

Students as well as repairmen should find this a handy work as it is treated in a non-technical manner. Published by Norman W. Henley Pub. Co., New York City. Over 1000 pages 5 by 8 with 1000 specially-made engravings, cloth binding, price $3.

The new storage battery factory addition to the plant of the Prest-O-Lite Co., Inc., Indianapolis, Ind.

Paragraphs on Current Topics

By **Marius C. Krarup**

Motto: Radical Thought, Conservative Action.

More and more it becomes apparent that the automobile and motor industries are factors in all the big events of the moving world and near to the central forces in new developments. The automobile engineer who knows his book from A to Z, and also where its wisdom ends, is the most enviable of mankind for his opportunities.

* * *

If physicians had an S. A. E. and a live journal, there would be a public discussion on the human machine after 1300 Marathonian aspirants had struggled over 13 miles of roads and metropolitan streets, as they did last week in New York, only to be compelled at the end to yield first and second place to two durable Finns—two machines evolved abroad. Seventeen New York sporting editors, more or less, would then be enabled to make the welkin ring for a week or two with spirited argument on the proposition that the enduring human motor must be built up on a frugal diet from infancy, since nowhere in animal motordom the heavy eaters of meat make good for anything but spurts. Come on, physicians! Follow the lead of automobile engineers. Take your avocation in earnest and trust the public to reward the most capable. Remember, you should have a representative or two on a National Committee for Physical Preparedness. All are interested in the human motor.

* * *

Apropos of this watchword of the moment—Preparedness—which concerns the automobile industry so intimately, one national lesson is already written in luminous letters. A great sentimental sweep must precede every appeal to mere intelligence before the public gets deeply stirred. Every big business man probably knows this open secret intuitively. Every howling success is based upon it. The original Fordist inducement was the sentiment: "We, too, can be motorists," and the price did not stand in the way; neither was any detracting compromise offered in the type of the motor or in the possible speed; the sentiment was all there. There is money and results in sentiment well backed up. In almost any other country Preparedness would be considered a subject to be dealt with in commissions and committees first, and no statesman would venture to build up in advance a supporting sentiment on one glittering and abstract word. The American method, however, gets results in one-tenth of the time, and perhaps just as good ones. In some things we can guess as near right in a minute as in a month, and probably there is more guesswork in the biggest things than over-serious statesmen suspect. Hurrah for America! For sentiment first and specifications afterward. That makes things move.

* * *

F. P. A., celebrated jokesmith, initialist and manager of the "zink" for a New York daily, is tempted to give away his Jitnibus of Joy because a tire costs as much as a set of Hardy's books and produces less enjoyment. Just try it, brother, with one tire off and a set of Hardy's on board. Good rules work both ways.

* * *

"By learning a few rules and phrases every dolt now has a chance to become an efficiency expert and eventually an automobile owner," complains *Index of Contemporary Thought* gravely. Well, is not that a great step toward ability? Has anybody discovered a better method for improving dolts? They used to become dramatic critics or "flanneled oafs"; yet both the drama and tennis survive. Efficiency, too, can endure them.

* * *

Speculation on automobile design for coming years is more rife than ever, probably because most of recent changes have been inaugurated by prominent firms, making previous standards seem like mere commercial chaff that can be blown away by anybody whose wind is good. But commonly the speculation does not rise far above mechanical considerations of small complexity. Among repair shops in New York we find that a pretty industrial race is looked for between the spiral bevel gear and the worm drive, for ordinary cars. The reasoning, patched up from different sources, rounds up about as follows. It starts with a certain new fondness for the worm, coupled with objections to the sluggishness of worm-drive vehicles in the garage. Further, if this sluggishness or lack of coasting efficiency is remedied by trebling the diameter of the worm, the great gear reduction and the extra margin for road clearance are lost, and there are left only silence and relative immunity to wear (contingent upon careful lubrication); and these properties the spiral bevel and the worm have in common, though perhaps not in equal degree. It may then come to pass, where motors of more than 2000 r.p.m. are wanted, that the final drive will be taken by short shafts with universals to the wheels, or to internal gears in the wheels, while unsprung weight is reduced by hanging the spiral bevel gear or the worm gear in the vehicle frame. The rear wheels could then be dished or inclined, like front wheels, as may be advantageous with twin tires on crowned roads. But similar results—excepting the reduction of unsprung weight—could be secured with ordinary wheel drive by using the Renault or Mercedes compound rear drive (mainly used in trucks of these makes) comprising a special differential and double bevel gears, with spur gears, for further reduction of the ratio, to the inner ends of the wheel shafts. The demand for high-speed motors in conjunction with the desire for silent operation seems to lie at the bottom of these speculations which arrive at no definite conclusions but show the drift of ideas.

* * *

Suddenly there looms up from unexpected quarters—in this case from inventive but unindustrial Denmark—the proposition of an entirely new transmission system which may check all speculations about minor changes in design. A revolutionary plan, like Jakobsen's (described in THE AUTOMOBILE of May 11) might have the same reactionary effect, while its merits are being investigated, as that which followed, with regard to motor design, the acceptance of the Knight motor by the British Daimler company and lasted for a couple of years. With its suspended rear axle and brakes on the transmission only, the Jakobsen design reduces unsprung weight radically, while the independent spring action for each wheel almost promises speed and comfort on a corduroy road (if the wood is laid bias, as it ought to be, but seldom is). In examining the designer's drawing, it is noticed, however, that the movement of the cantilever spring, as planned, scarcely can be reconciled with that of the wheel spindle, so that we know for a certainty that this surprising mechanism so far exists on paper only. But its whole plan is so unusual and bold that one hopes to see the little slip remedied, as easily may be done by a shackle action, and the whole system entered among actual types of automobile design. It seems to solve, very largely, the knotty problem of cushioning the horizontal component of a road shock, for the driving wheels.

* * *

The current doctrine on unsprung weight claims a big share of attention in the possibilities referred to in preceding paragraphs. But there is something peculiar about this doctrine. It does not hold good under all conditions. Truck people find that tire wear depends on total weight and service conditions and that no special effect of unsprung weight can be traced. Many car owners hold that a heavy axle has no effect to spoil their comfort. Only with regard to light vehicles is there something akin to unanimity against unsprung weight. Now add the assumption that bad effects from excessive unsprung weight are mostly felt at moderate vehicle speeds—as is pretty well sustained in practice—and it becomes possible to get a nearer view of this important but tottering doctrine. First let it be admitted that tire inflation for light vehicles (say 60 pounds pressure under a body and load weight of 1000 pounds) is higher in proportion than that used with heavier vehicles (say 90 pounds under loads of 3000 pounds). Similarly, that the solid tire is more elastic for a light vehicle, which does not compress the rubber compound to its yield limit in advance of any shock, than for a truck. Now, comparing all reports, there is no difficulty about reconciling them. They all agree in this that the unsprung weight is most objectionable when it is not really unsprung; that is, when it is supported on actively elastic tires. One might say "re-actively elastic tires" to express the idea that at high speeds the elastic reaction of the tires gets small opportunity to spend itself against the unsprung weight and the vehicle springs above it. This is perhaps as far as one paragraph will take this subject. To go further with mere reasoning might challenge contradiction. Let it stand just like this for a while: Unsprung weight affects tire wear and comfort most at medium speeds—10 to 25 miles per hour—and when mounted upon tires of relatively powerful elasticity. Or, if a paradox is preferred: Unsprung weight is worst when not unsprung.

* * *

"Heads Up" and "Crossing at Corners" is the double title for three pages in the *American Magazine* recommending the disciplining of pedestrians and strict examinations for chauffeurs. F. U. Adams lends his name to the plan. With these safeguards and prompt revocation of driving licenses for transgression of traffic rules, he has convinced himself, vehicle speed can be given free up to 35 miles per hour for cities and higher for the country. Mr. Adams' theory is to scare everybody into an abnormal state of wide-awakeness, and the idea is borrowed, he says, from London and Paris. But the war has discouraged Americans from borrowing European ideas which in the end lead to a clash. And plain arithmetic persists in telling us that, in the traffic system which we shall adopt eventually, neither shall safety depend entirely upon the chauffeurs—which means reducing safety 50 per cent in advance—nor shall pedestrians be second-class traffic members, nor shall a costly army of traffic police be required for enforcing more or less arbitrary and injudicious rules. The automobile industry has managed to grow prosperous without embracing or subsidizing any measures savoring of subjugation for the general public—who in America are pedestrians one day and motorists the next—and can afford to continue on easy lines of evolution, cultivating by degrees a public opinion and public habits which eventually will solve the problem of securing both safety and freedom for all. On Adams' plan safety depends too much on others and too little on self.

Diesel Motors for Vehicle Work

THE question of forced fuel feed, rather than fuel feed by suction, and that of adapting the Diesel principle to automobile purposes are closely related, the object in both cases being the utilization of cheap fuels with full cylinder charges and a combustion—of excess lubricant as well as fuel—so complete as to forestall, in a great measure, the formation of carbon deposits. To combine these objects with the light weight and the highly sensitive throttle control required for automobile purposes represents a task which has engaged designers for a number of years and which the general fuel situation now renders more important than ever.

In practical familiarity with small Diesel engines Europe is ahead of America and it is therefore of more than ordinary interest to present the European view of the necessities and probabilities in the situation. The *Commercial Motor* of April 6 offers material of this nature in an article explaining the Diesel system on the assumption that the reader is not previously acquainted with it and suggesting the modification illustrated in the accompanying sectional view. The article explains in substance as follows:

Explanation of Diesel System

Little progress has as yet been made as to the development of the Diesel engine in making it suitable for installing in commercial vehicle chassis. The difficulties of design undoubtedly increase as the size of the engine decreases. The principle of working is as follows:

The engine is made in three forms, viz., as a four-stroke-cycle single-acting engine, as a two-stroke-cycle single acting, and as a two-stroke double-acting engine. An essential feature in the actual Diesel engine is that it requires, besides its own cylinders and pistons, an auxiliary air compressor capable of producing a pressure of up to 700 lb. per square inch. The principal difference between the Diesel cycle and the ordinary gasoline motor cycle is that air only is compressed in the cylinder instead of a mixture of air and fuel.

In the four-stroke Diesel engine there is an air inlet valve, a fuel valve, and exhaust valve worked by cams, and a valve for starting purposes.

First (down) Stroke.—The inlet valve is opened during the whole of the stroke, and the cylinder becomes filled with atmospheric air at atmospheric pressure.

Second Stroke.—The air valve is closed and the piston returns to the top of the cylinder compressing the air. The clearance is so proportioned that in ordinary working the pressure becomes about 500 lb. per square inch and the temperature of the air about 1000 deg. Fahr. Near the end of the stroke a quantity of fuel is injected through the fuel valve into the cylinder by means of a blast of compressed air supplied from the auxiliary air compressor. The construction of the fuel valve is such that the oil is divided into a spray of fine particles. These, coming into contact with the very hot air, ignite automatically, and combustion takes place, increasing the pressure in the cylinder.

Third (down) Stroke.—The fuel valve remains open for about one-tenth of the stroke. During this portion of the stroke the pressure remains practically constant, about 600 lb. per square inch. During the remainder of the stroke the products of combustion expand. This stroke is the working stroke.

Fourth Stroke.—The return of the piston (during which time the exhaust valve is open) drives out the burnt gases. After this the cylinder starts afresh.

The Two-Stroke Type

In the two-stroke engine, the cylinder head is similarly fitted with fuel valve and air valve for starting purposes, and with an air valve called a scavenging valve, but the exhaust valve is replaced by ports cast in the cylinder walls. In some makes of two-stroke engine, scavenging ports are also cast in the sides of the cylinder. The cycle of operations is then as follows:

When the piston is at the bottom of the stroke, the cylinder is full of air at atmospheric pressure, which air has just been admitted through the scavenging valve. During the up stroke the air is compressed to a high pressure, and attains a high temperature. At the top of the stroke, fuel is injected by the blast of air into the hot air within the cylinder, combustion takes place, and the gases expand, thus acting on the piston. When the piston has reached about six-sevenths of the down stroke, the piston commences to uncover the exhaust ports cast in the cylinder walls. The scavenger valve opens and air is admitted under low pressure, about 5 lb. per square inch, which blows out the burnt gases and fills the cylinder with air ready for the next compression stroke. Different arrangements are used by different makers for supplying the scavenging air, some makers using a separate air pump, other makers using a stepped or double piston.

In the double-acting engine the piston is attached to a piston rod which works through a gland and metallic packing at the bottom of the cylinder. A cycle of operations, similar in action to that described for the two-stroke engine, takes place at both ends of the cylinder.

Difficulties and Variations

From the foregoing descriptions it will be seen that various difficulties arise in the design of the Diesel engine. The engine requires to be stoutly designed, owing to the high pressure involved. The high temperatures attained make it necessary for careful attention to be given to the cooling of the various parts of the engine, and the air compressors necessary for supplying the air for starting purposes and for fuel injection, and the fuel valves themselves, all present difficulties which, although overcome in large engines, tend to put the Diesel engine at a great disadvantage when used for comparatively small powers.

Various makes of small-power, semi-Diesel engines have appeared which require no compressors for starting or injecting the fuel. These engines have a much lower compression than the purely Diesel engine, varying from about 120 lb. to 200 lb. per square inch, but they require blow-lamps to heat up the cylinder heads for starting purposes. On the cylinder head a bulb-shaped chamber is formed, which is heated by means of the blow-lamp. Into this chamber the air drawn into the cylinder is compressed. The temperature of the air is increased by the hot bulb and by the increase of the pressure. Fuel is injected into the cylinder by means of an oil pump, and the pressure due to the combustion of the fuel acts on the piston.

Example of Modified Diesel Motor

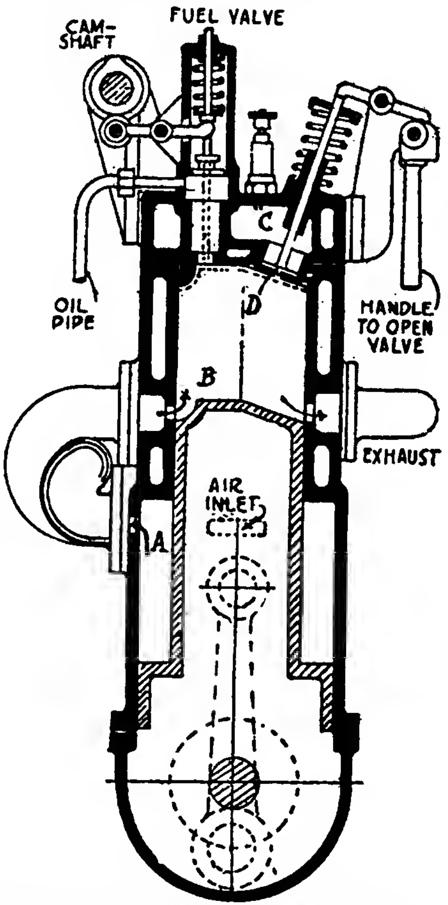
Various methods have been invented for reducing the compression in small motors intended to work on the Diesel cycle. One of these is illustrated herewith, showing a section through a two-stroke, two-cylinder motor having a stepped piston, the larger one acting as an air pump for scavenging.

By this particular method the invention is intended to provide a scheme by means of which the engine could be started as an ordinary gasoline engine by rotating the crankshaft. It is obvious that in an ordinary Diesel engine it would be impossible to turn the motor over the centers, owing to the high compression. Cast in the cylinder covers is a chamber *C* which can be put into communication with the working cylinder through the valve *D*. This chamber is used for burning gasoline supplied by an ordinary carbureter and incidentally for reducing the high compression, so that the motor may be started by rotating the crankshaft. A valve is introduced in connection with the inlet valve of the motor, which may allow it to draw either pure air or a mixture from the carbureter.

To start this particular engine, the valve *D* is opened, putting chamber *C* into communication with the cylinder. A mixture of air and gasoline is drawn into chamber *A* through the air inlet on the downstroke of the stepped piston. On the upstroke the gas is transferred into the upper part of cylinder *B* and is compressed into chamber *C*. It is ignited by means of a spark plug, and the combustion of the gas sets the engine in motion. Heavy oil is now injected into the cylinder through the fuel valve, the gasoline supply is cut off, and pure air is drawn into the cylinder. Valve *D* is shut and the spark plugs are also put out of action. Exhaust takes place through ports cast in the cylinder wall. The engine is now working on the pure Diesel system.

Such a scheme could probably be applied to the hot-bulb type of motor, so that a blow-lamp could be dispensed with. The motor would use gasoline as fuel until it was sufficiently hot for combustion to take place when oil was injected into the air in the cylinder. The gasoline supply could then be cut off. After so starting the motor could be run as a hot-bulb motor.

It seems probable that if an engine is developed suitable for use on commercial vehicle chassis, it will not run on the pure Diesel cycle, but some sort of engine will be developed that can be started as an ordinary gasoline engine and afterward changed over to run on the Diesel or the hot-bulb system, or some combination of these methods. After much experience, a solution of the problem may perhaps be found along these lines, and although the difficulties are much greater than appear at first sight, the proposition is far from hopeless, seeing that Diesel and semi-Diesel engines have been adapted to other branches of employment with success.



Suggested adaptation of Diesel motor to vehicle work

The FORVM

Fuel Consumption and Tire Wear without Differential

By George D. Bailey
Gearless Differential Co.

THE writer, with the assistance of several prominent engineers, among them W. H. Diefendorf, chief engineer, New Process Gear Corp., Syracuse, N. Y., and F. W. Hawes, consulting engineer, formerly chief engineer for the Cadillac Motor Car Co., Detroit, Mich., has spent about five years in perfecting an improved differential. During that time innumerable tests have been made covering differential action and also every known type of differential, and our experience is based on actual practice and not theory, which is as follows:

A car without a differential will never be a success because before differential action can take place, such as turning corners, one-half of the traction must be overcome before the turn can be made. The inner shaft has an overload of the resistance offered in overcoming the drag of the outer wheel so that it can slip and allow the car to make the turn.

This necessary slippage is divided about equally on both wheels when traction is equal, and is, of course, greater at the wheel with the least traction. This necessary slippage, by the way, is about 7 ft. 4 in., or nearly a complete revolution of a 30-in. wheel. Were traction made great enough, either by excessive load, spikes or cleats, it would be impossible to make a turn without some driving parts being broken or the motor being stalled. The differential could be dispensed with under certain conditions, but it would be absolutely necessary to increase the strength of all driving parts, which would, of course, necessitate more power, more weight, greater cost and unnecessary waste of fuel and tires.

We believe it should be plain to anyone that a car or truck having sufficient power and strong enough driving parts to be efficient without a differential has more power and heavier driving parts than are necessary with the differential.

Classified in Four Types

This differential proposition can be divided into four classes or types:

No differential.
Spur or bevel (balanced gear).
Spiral or worm (internal friction).
Bailey gearless (slow wheel drive).

The efficiency in differential action can be determined by the power required to equalize the difference of travel of the driving wheels. With no differential, having to overcome one-half of the traction, we will put the loss at 50 per cent. With the internal friction type, in order to be anywhere near efficient, prevent wheel spinning and give a semi-positive drive, this should be placed at not less than 25 per cent. The conventional gear type, owing to differential friction, about 12½ per cent. The slow wheel drive, due to an absolute free release of the faster wheel, 00 per cent.

It is generally assumed that the differential is necessary only for making turns. We have found that the aggregate of differential action is usually greater in the straightaway than in making turns. This is from the fact that practically all road surfaces are made up of miniature hills and hollows, and the wheel going into the hollow or over the hill is running ahead; consequently, there is almost constant differential action, so that any differential that consumes extra power, more fuel and excessive tire wear in turning, does the same thing to a certain extent in the straightaway.

We do not believe that the public will take kindly to the extra fuel consumption and tire wear in the no-differential job. Besides, we are quite sure that, even disregarding the greater power necessary, that the cost and weight will be actually more than with an efficient positive drive differential.

A perfect differential is one that has the virtues of no differential, namely, its positive drive, which means no wheel spinning, side-sway, etc., and will allow the outer wheel to run ahead freely. An efficient slow wheel drive type has identically this action and automatically performs every differential function.

> *A CAR WITHOUT A DIFFERENTIAL CAN NEVER BE A SUCCESS BECAUSE IN MAKING TURNS ONE-HALF THE TRACTION MUST BE OVERCOME BEFORE THE TURN CAN BE MADE—MANEUVERING AND TIRE WEAR*

Maneuvering a Factor in Eliminating Truck Differential

By L. C. Crilley

FOR several weeks I have been following with much interest the discussion of the advisibility of eliminating the differential for motor truck rear axles. Many ingenious and thoughtful arguments have been advanced both in advocation of this plan and against its practicability, but as yet no one seems to have mentioned a factor in the situation which seems to me of sufficient importance to warrant at least passing consideration. This is the tremendous amount of expense due to increased tire wear which the great amount of backing around necessary with commercial vehicles would cause if the differential were not used.

If you have ever paid much attention to the loading and unloading of motor trucks, especially the large and cumbersome vehicles used in hauling and other heavy freight work, you have doubtless been struck with the great amount of negotiation and manipulation required to place the machine in the proper position for loading or unloading. Perhaps it occurred to you at the time that this maneuvering as well as that required by traffic conditions must entail a considerable waste of fuel and lubricating oil as the engine is always kept running and its speed constantly changed; perhaps you have also pondered on the unnecessary tire wear as well as that upon mechanical parts of the machine. But when one realizes that these operations are gone through by each truck many times a day this waste and wear expense begins to assume astonishing proportions. Increasing this to the degree which would be caused by the elimination of the compensating action of the differential would seem to me exceedingly unwise.

The History of the Pneumatic Tire—4

Bradford's Tire Patent of 1868—Greene's Patent on Flat Rubber Strip on Iron Tire—Thompson's Solid Types—The Forerunner of the Modern Tire Chain

The History of the American Automobile Industry—31

By David Beecroft

CLOSE to the Goodyear patent of 1854, for vulcanizing, are the patents of Marcy, Nov. 7, 1854; Meyer, Feb. 28, 1854; Fostrick, in 1856, with De Wolfe and Eaton, in 1859. In 1850 Trotter took out a patent for the use of zinc hyposulphite as a vulcanizing medium, using no free sulphur. Little is heard of rubber tires, however, until 1868, when we find a patent issued to C. K. Bradford, claimed by some to be the first rubber tires in the United States. In the same year, Dec. 15, J. A. Greene patented a flat strip of rubber bolted to the iron tire by bolts passing through the felloe and having springs on their nutted ends to take up the bolt movement as the rubber strip compressed.

Thompson's Solid Tires

Thompson, in England, seems to have continued his tire experiments along the line of solid tires, having failed to find a market for his aerials. In 1868 we find road steamers, a sort of light traction engine, giving good service on both sides of the water, fitted with Thompson tires, those on the drivers being a foot wide and 5 in. thick. These tires were watched with considerable interest and a set that had run 1200 miles are reported to have shown no symptoms of deterioration or decay. The Edinburgh *Scotsman* of that year speaks very enthusiastically of them and says "the application of vulcanized India rubber to the tires of road steamers forms the greatest step ever made in the use of steam on the common roads." Another British publication reports the road grip as marvelous, the riding smooth, with no jar, and the machinery spared. These remarks are interesting because they show that the destructive effects of road vibration on machinery were appreciated even with the heavy and clumsy construction of that time, and it is probable that this destructive effect was even more noticeable than to-day, because of poorer materials.

Prototype of Tire Chain

In the *Scientific American* for Sept. 24, 1870, the Thompson solid tires were described as being mounted on a broad rim with flanges, but the interesting part of this description was that over this tire was an endless chain of steel plates, connected together at each side of the wheel. No rigid connection is made with the wheel, but this chain of plates was free to move around the tire "as they please without consulting each other." Clearly, this was the predecessor of the modern tire chain, and the fact that there was much question as to traction ability and freedom from slipping, in wet spots, very plainly indicates that the anti-slip abilities of such a chain could not have been overlooked at that time even if the principal thought was to protect the rubber. That this latter was not the principal thought must be evident to anyone accustomed to the use of rubber tires, and it was undoubtedly well known in those days that metal, more or less loosely attached to rubber, quickly destroyed it.

That rubber was coming rapidly into use is shown by a report of 10,000,000 lb. in 1870 and a belief that the supply was inexhaustible.

$1,050 for a Set of Tires

In April, 1871, we find a further statement regarding the Thompson tires, the weight of a 6-ft. tire being given as 600 lb., which, at 2 shillings per pound, would make a set cost $1,050 in gold. The set mentioned had made 260 journeys of 7 miles each way, being loaded on the one to ten average up-grade direction, a total of 1820 miles, and their outsides were slightly marked, but the insides smooth. "Clams" of metal were attached to prevent slipping when needed. This description would indicate that these broad, flat bands of rubber were not cemented in place, but simply retained by the rim flanges. That they did not continue in use, and so are not mentioned in later publications, seems to indicate that their cost was prohibitive.

Rubber Segment Tires

U. S. Patent to L. W. Cheever, in February, 1869, shows a D-shaped rubber mounted in a rim that seems to have been produced by planing or milling a groove in a thick iron tire, this groove being slightly dove-tailed. It was presumably cemented in place, and having a flat base, should have carried light loads very satisfactorily. In 1870 we find tires consisting of rubber segments mounted on metal plates which were mechanically fastened to the wheel, a method employed by inventors thirty or more years later. The year 1871 shows a spring tire brought out by J. H. Clapham.

The Rostrum

A Formula for Computing Pulling Power

EDITOR THE AUTOMOBILE:—As a subscriber, I ask your consideration of the following method for computing the relative pulling power of various machines in high gear.

Multiply the engine displacement by the gear ratio and we have the number of cubic inches of gas fired during two revolutions of the rear wheels. Multiply twice the diameter of the rear wheel by 3.1416 and divide this into the product obtained above, and we have the maximum number of cubic inches of gas that can be fired in propelling the car 1 in. forward. Now, if we have the weight of the car in pounds, move the decimal point three places to the left and divide it into the above result, and it will give the number of cubic inches of gas the motor expends to the 1000 lb. when working to its full capacity.

Or briefly, $\frac{\text{ratio} \times \text{disp.}}{n \times 2 \text{ r. w. diam.}} \div \frac{\text{weight}}{1000}$ = cubic inches to 1000 lb.

If this is computed for several different machines it seems that the results would show the comparative power of each machine. Of if preferred, it might be more fair to add the weight of a passenger load to that of each machine. Of course different motors vary, so will you please state what factors enter to make these results less accurate, also whether you think this method worth any consideration at all.

Also will you please give the following information:

1—What was the gear ratio of the Hudson super six that made the twenty-four hour record at Sheepshead Bay?

2—What is the weight of the Hudson super six ready for the road?

3—Kindly publish the power curve of the Oakland model 6-32 motor, or if this is not available state at how many revolutions per minute it reaches the peak of its power curve.

4—What is the weight of the Moon model 30 ready for the road?

Plattsburg, Mo. C. E. J.

—As a method of comparison the plan you suggest is quite interesting as it incorporates both the considerations of volumetric efficiency and fuel economy. Of course we do not know exactly to what extent the cylinder is filled in every revolution. Therefore the results you obtain will not be exactly accurate as they must be multiplied by the volumetric efficiency factor, but taken for different cars your figure would be very interesting.

1—The gear ratio used in this endurance test and with which the records were made was 3½ to 1 in place of the standard 4 5/11 to 1.

The reasons for the selection of this particular gear ratio may be summed up in a few words. The trials were made to prove endurance. Speed was purely a secondary factor, although it was naturally due to the power developed in proportion to car weight. The object in making these tests for endurance was to prove that the super six motor would last longer under the greatest possible strain than other cars. In other words, to clip some time off previous records. It does not take 76 hp. to propel the super six, having a total weight of 3500 lb. at 65 m.p.h. Only about 50 hp. would be necessary. If, therefore, it had used the 4 5/11 gear ratio, the speed would have been limited to about 68 m.p.h. The car speed would have been limited by motor speed, not by the insufficiency of power. But to propel this car at an average speed of 75 m.p.h., 76 hp. is absolutely necessary. The main object of the test was, therefore, to develop 76 hp. under actual running conditions for 100 miles. The Hudson company states that it was not to create records for speed that it made these attempts at record-breaking, but rather to prove the endurance of the super six motor.

2—The weights of the super six models, complete with wood wheels, tools, extra rim, oil, gasoline and water, are as follows:

Model	Lb.	Model	Lb.
Phaeton	3365	Cabriolet	3310
Roadster	3170	Limousine	3750
Touring sedan	3600	Town car	3660

The car complete with wood wheels, but without tools, extra rim, gasoline or water, weighs as follows:

Model	Lb.	Model	Lb.
Phaeton	3161	Cabriolet	3106
Roadster	2966	Limousine	3546
Touring sedan	3396	Town car	3456

3—The horsepower curve of the Oakland 6-32 is not available. Its peak is reached at 2650 r.p.m.

4—The weight of the Moon 6-30, as given by the manufacturer, is 2750 lb. ready for the road. This includes an extra casing.

Use of Two Storage Batteries

Editor THE AUTOMOBILE:—Would it be advisable to install a separate storage battery to be used exclusively for either lighting or starting the type 53 Cadillac car? Also advise how regulation of charging apparatus should be worked out, so that either battery would not become overcharged.

Huntington, Pa. F. B. P.

—A single battery can be used for both starting and lighting provided it is designed for the purpose. Regulation of the charging apparatus depends upon the type of generator and if you are buying a generator, this is generally incorporated with it.

Rebuilding 1908 Packard as Raceabout

EDITOR THE AUTOMOBILE:—The above illustrations, Fig 1, show what can be done with an ordinary stock chassis in the way of turning it into a raceabout. I have seen several inquiries in your magazine as to the advisability of making such a car and think, therefore, this might be of some interest to your readers.

The car is a 1908 Packard runabout. The main changes, such as the body, wire wheels and the dropped gas tank, are quite evident from the photographs. Otherwise about the only real change is the fitting of aluminum alloy pistons and a racing type Master carbureter.

I dropped the gas tank and put smaller wheels on the car to make it hold the road better and now, owing to the light body and the aluminum pistons I have gotten it up higher

Fig. 1—Two views and a glimpse of the instrument board of a 1908 Packard runabout converted into a raceabout by a reader

than 80 m.p.h. and it holds the road perfectly. It will also beat any car I have ever seen on hills.

The price of a job of this kind would, of course, vary, depending on how far it was carried out, but the body work and wire wheels would cost about $400. This includes dropping the steering wheel and gas tank.

New York City. J. B. T., Jr.

Aluminum Pistons for High Speeds

Editor The Automobile:—When using oversize tires is it necessary to change the speedometer gearing in order to obtain a correct reading?

2—Would it be advantageous to fit aluminum pistons to such cars as the Dodge, Overland, or cars having pistons of more than 3½-in. diameter?

3—Where does the Willys-Knight use Timken bearings?

4—In order to manufacture a motor embodying the Knight sleeve valves, what are the requisites as regards royalties on the invention?

5—What is the principle of the vaporizing plug manufactured by the Detroit Carbureter Co.?

Ponce, P. R. E. T.

—Yes.

2—If you desire to make extremely high speed it would be advantageous.

3—Both front and rear wheel bearings are Timken and also the differential end of the rear axle shaft.

4—This is a matter which must be arranged with the Knight & Kilbourne Patent Co., Chicago, Ill.

5—The vapor plug is so arranged as to admit additional air to the intake.

13% Use Valve-in-Head Motors

Editor The Automobile:—How many 1916 model cars use valve-in-head motors?

2—Is this type of motor gaining any favor in this country?

3—Are all racers valve-in-head?

4—How many makes of car motors are built in the U. S.?

Upland, Neb. H. D. L.

—The number of 1916 model cars using valve-in-head motors is twenty-three. This is 13 per cent of the number of chassis regularly listed.

2—This type is regaining its lost prominence. In 1910 18 per cent of the chassis had I-head motors. This gradually dropped until in the years of 1912 and 1913 it was down to 9 per cent. The lowest point was reached in 1914 when it was 6 per cent. It has been steadily increasing since, being 8.5 per cent in 1915 and 13 per cent for 1916.

3—No.

4—The number of car manufacturers making 1916 cars is about 125.

Various Gear Ratios for Blitzen Benz

Editor The Automobile:—What are the gear ratios of the Blitzen Benz recently purchased by H. S. Harkness?

2—How many speeds has this car?

3—How many cylinders?

4—What is the bore and stroke?

5—Does the Duesenberg company manufacture a passenger car or are its activities confined to racing?

6—What is the bore and stroke of the Duesenberg motor? Also the gear ratios?

Ithaca, N. Y. F. S. W., Jr.

—There are numerous gear ratios used on this car to accommodate it to the track upon which it is running.

2—Three speeds.

3—Four cylinders.

4—The bore is 185 mm. and the stroke 200 mm.

5—Other motors are also built.

6—The bore is 3¾ and the stroke 6¾. The gear ratio is different on the different Duesenberg cars, but is generally a little over 3 to 1.

Cadillac Switch Lock for Protection

Editor The Automobile:—For the benefit of all drivers of 1916 Cadillac cars tell us how one can start the motor if he should have his switch locked and forget his keys.

2—Publish name and address of some firm where I could get a book on the 1916 Cadillac Delco system.

3—Please explain the action of the timer on 1916 Cadillac.

4—If a twin six crankshaft is making 3000 r.p.m. how many sparks take place in that minute? Please explain.

5—What is meant by the tread of a machine?

6—If you had a tire without a size marked on it how would you proceed to tell the size?

7—How much clearance is there between head and top of the cylinder on the 1916 Cadillac?

Brooklyn, N. Y. H. B.

—Publishing this information would deprive all Cadillac drivers of the benefit of their switch locks.

2—The Cadillac instruction book goes into the adjustments of the Cadillac Delco system quite fully. Further information, however, can be obtained from the Dayton Engineering Laboratories Co., Dayton, Ohio.

3—The timer on the type 53 Cadillac is fitted with two sets of contact points connected in series, the object being to distribute over two sets of points the current which would otherwise pass through one set, which cuts down burning of the points and makes frequent adjustments unnecessary.

4—If a twin six crankshaft is making 3000 r.p.m. 18,000 sparks are being delivered in 1 min. This is readily explained by the fact that on any four-cycle engine there are half as many sparks per revolution as there are cylinders, for the simple reason that each cylinder is exploded every other revolution. Hence, since there are twelve cylinders, there are six sparks per revolution, and at 3000 r.p.m. there are 18,000 sparks per minute.

5—The tread of a car is the distance transversely from the center of the tire contacts on the left side to the center of the tire contacts on the right side. The standard tread of an automobile is 56 in.

6—Measure the interior diameter from the point where the two beads come together up to the inside of the top of the tire. This will give the small dimension. The large diameter is obtained by adding twice this dimension to the diameter across the inside of the beads.

7—The clearance between the piston heads and the top of the cylinders on the type 53 Cadillac when the engine is on the upper stroke is approximately ½ in.

Diagram of Starter on Cartercar

Editor THE AUTOMOBILE:—Kindly print diagram of the Jesco starter No. 3 used on the Cartercar.

Humphreys, Mo. E. H. R.

—The diagram you desire is published herewith in Fig. 2.

Wants Information on Floating Axles

Editor THE AUTOMOBILE:—What style axle is most used, full floating or floating? What is the difference between these two?

2—Have they ever been discussed or has a description been published in these columns giving advantages and disadvantages? What issue?

3—What kind is used on the model 80 Overland?

4—Give good way to clean carbon out of the motor?

5—How can the radiator be cleaned without hurting the motor?

6—Why is the carbureter placed so low on the model 80 Overland? Is it not best to have it high so as to get a short manifold?

7—What are the advantages of the single cast cylinders over block cast cylinders or vice versa? Are the single hard to keep in line when overhauled?

8—How can I get the most speed out of the model 80 Overland? What speed should this car make?

9—What model carbureter is used? Has it a two-speed adjustment on it? How is it turned if more speed is desired, up or down?

Bouton, Iowa. C. M.

—The full floating and floating axles are identical. There is no difference between them.

2—A full description of the different types of axle and their advantages was given in THE AUTOMOBILE for Sept. 9, 1915.

3—The Overland car uses a floating type of axle.

4—A good method of removing carbon from a motor is by the oxygen process with which it is burned out or by scraping after removing the valve caps.

5—As has often been stated in THE AUTOMOBILE, a radiator can be cleaned out by using a saturated solution of hot water and common washing soda.

6—Regarding your inquiry as to why the carbureter is placed so low on the 80 Overland, would state that this is a question of individual design which can best be answered by the Overland company. Some makers believe in placing the carbureter very low in order to be sure of adequate gasoline flow.

7—The advantages and disadvantages of cylinder arrangement are largely concerned with economical manufacture. There is no difference in the difficulty of lining up the cylinders whether they are block cast or singly cast.

8—THE AUTOMOBILE has no record of the maximum speed which can be obtained with a model 80 Overland. To get this to its maximum the valve timing should be altered to give an early exhaust opening. Aluminum pistons can be fitted and the gear ratio changed to nearer direct.

9—Several makes of carbureters were fitted to the model 80 Overland. The carbureter generally used had a hot air attachment and only one adjustment.

Car Harder to Start with Naphtha

Editor THE AUTOMOBILE:—Will naphtha injure the motor of an automobile, and is there any objection to using it? My neighbor drained the gasoline out of his car and put in a gallon of naphtha and it seemed to work all right and even seemed to have more power; it tests 52.

Moline, Ill. A. V. B.

—There is no definite distinction between gasoline and naphtha. If you are using 52 gravity fuel it will work out successfully, only it will be more difficult to start. There is more power in 52 fuel than there is in the 60 because it has more thermal units to the pound.

Correct Gearing for Warner Autometer

EDITOR THE AUTOMOBILE:—What is the correct number of teeth in road wheel gear and driven gear to give correct mileage and indicate correct speed at which the car is moving when using a Warner autometer, size of wheels being 37 by 4½?

Morenci, Mich. F. D. K.

—To insure correct indication of a Warner autometer under the conditions you mention the drive gear should have seventy-five teeth and the driven gear twenty-nine teeth, or the ratio should be equivalent.

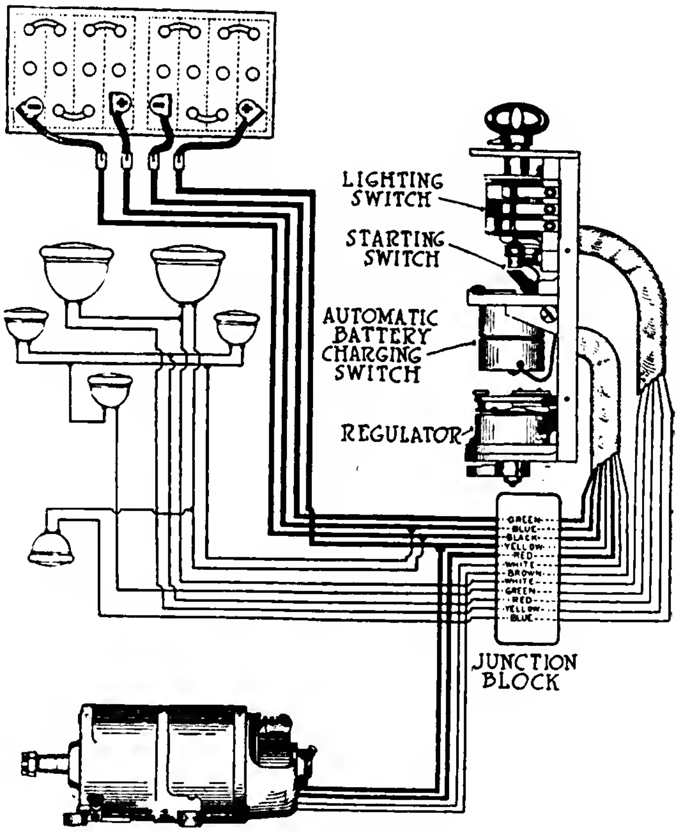


Fig. 2—Diagram of the Jesco starter No. 3 used on the Cartercar

ACCESSORIES

Truck Attachment for Fords

THIS is a truck unit for Ford cars which follows closely the scheme of attachment and drive that has been worked out in a number of instances. The auxiliary truck frame is arranged to slip over the regular Ford frame, and when in position the Ford rear axle becomes the jackshaft, driving sprockets being attached to the axle shafts in place of the regular Ford wheels. It is said to be a very easy matter to attach the unit and requires the drilling of only a few holes in the regular Ford frame in order to bolt the front end of the truck frame in place. Suspension of the truck frame from the auxiliary truck axle is by three-point platform construction, so arranged that the rear cross spring acts as an auxiliary when carrying a light load up to 500 lb. For loads above that amount the weight is transferred to the side springs. The frame has a 4-in. depth of channel with a 2½-in. channel width and is made of 3/16 in. pressed steel. Timken bearings are carried in the truck wheels and the drive is transmitted through Covert & Taylor chains.

The truck unit gives the Ford a rated capacity of 2000 lb., although it is said to be capable of a 50-per cent overload. The wheelbase is 135 in., and the rear wheels measure 32 by 4 in., being fitted with Firestone solid tires. The service brakes are on the rear wheel drums and are controlled by rods running forward, while the emergency brakes act upon the jackshaft. Substantial radius rods maintain proper alignment between driving sprockets and wheels, and the frame is substantially reinforced by diagonal cross pieces to assist the cross members. The unit is priced at $350, and where the Ford chassis is also furnished the total cost is $750.—Automobile Mfg. & Engineering Co., Detroit, Mich.

Water-Shed Windshield Paste

Water-Shed Paste is a compound applied to windshields to prevent water accumulating on the glass during stormy weather. A portion of the glass surface of a windshield may be rubbed with the paste and a cup of water thrown on it with the result that the glass will be free from drops or streaks of water where the paste was applied, while the surface near it ill be blurred. The paste is sold in tubes at 25 cents each.—C. O. Thomas Co., New York City.

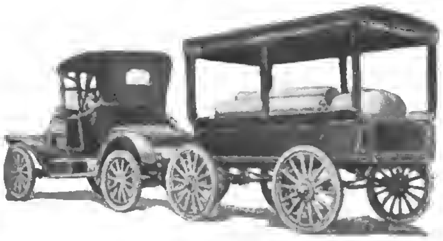
Trailmobile Trailer

This trailer is made in two capacities, 1250 and 1500 lb. The wheels, of wood with solid rubber tires, run on roller bearings; the front wheels are mounted on knuckles of the automobile type connected by a drag link with the drawbar, so that the steering is the same as that of the car that pulls the trailer. All springs are semi-elliptics. The maker states that a fully-loaded trailer can easily be moved by hand. 'Coupling fixtures are supplied for various types of rear end construction, and a special type is made for Fords. The smaller chassis has a loading space of from 39 to 42 in. wide and 85 to 95 in. long, according to body; wheelbase, 62 in.; wheels, wood, with 32 by 2 truck-type tires; weight, 530 lb.

The larger chassis specifications are: Loading space, 40 to 42 in. wide and 95 to 100 in. long; wheelbase, 62 in.; wheels, wood; tires, 32 by 2 front, 34 by 2½ rear; weight, 570 lb. Both have standard tread. A spring shock absorbing device in the coupling system takes up shocks due to sudden starting and stopping, running in and out of pitchholes and the like. Practically any type of body can be had, open or inclosed. Prices, $208 to $300, according to type of body. Chassis only, 1250 lb. capacity, $179; 1500 lb., $209.—Sechler & Co., Cincinnati, Ohio.

Low's 5-Min. Vulcanizer

This vulcanizer is simply a screw clamp with a three-arm spider on the end of the screw. The patch is of pure gum rubber and comes set into the concave side of the metal pan; a rim around the pan forms a shallow cup on the side opposite to the patch, and in this cup is a disk of cardboard impregnated with a chemical substance which causes it to burn without flame and with exactly the amount of heat required to vulcanize the patch. Thus the patch mold and the fuel are combined in a unit; the metal pan is thrown away when a patch has been applied. To apply a patch the metal pan is clamped on the tube, rubber side next to the tube, the cardboard disk is lighted and allowed to burn out and the job is finished in 5 min. The gum rubber is liquefied by the heat and runs to a feather edge all round, making a permanent repair. Long rents in a tube can be repaired by applying a row of patches with overlapping edges. Price, with twelve patches, $2; extra patches, $1 per dozen. —5-Minute Vulcanizer & Auto Supply Co., Kansas City, Mo.



Left — Trailmobile trailer. Right—Rear view of truck attachment for Fords which is illustrated below. Lower right — Low's 5-min. vulcanizer

The Differential

THE vigorous correspondence which has been taking place in the Forum proves the amount of thought that is being given to the improvement of the differential. Besides the letters published, we have received scores expressing interest and many which show that invention is active in this field. There are all sorts of alternatives to the standard form of differential and it seems likely there will soon be many more made public, which is another argument against the theory that the automobile has reached a stage of development nearing the final.

Transcontinental Racing

IN congratulating the Empire Company on the performance of its car in crossing the continent in record time, thus beating an almost equally remarkable record just made by a Cadillac, it is well to sound a note of warning. That these tests provide a magnificent demonstration of the strength of a car is undeniable. It would be hard to find any possible test in the world that means more, but sustained maximum possible speed on the road is not without its dangers to all road users. Thus it is to be hoped that the recent successful attempts will not set a fashion for records of this sort. If there are many such, it is only a matter of time before some less skillful driver overestimates his ability, or till some chance occurrence brings about disaster. Rather, if the public takes as much account of these demonstrations as it ought to do, such runs prove once more, if proof were needed, that there is everything in favor of stock car racing over a road course which can be properly cleared and guarded.

Picking a Winner

NEVER before has there been an Indianapolis race with so many possible winners in the field. Last year was thought to be difficult to forecast, but this year the result of next Tuesday's race is harder than ever to guess. There is a big field of cars which are known to be in good condition, with drivers of known ability. There are some newcomers who may prove as sensational as did the Stutz team last year; there is a less prominent "tail" of cars which have not a chance to win, barring the most extraordinary events.

Thus visitors to Indianapolis are assured of seeing an extremely fine race. It cannot be a walk-over for anyone and several can fall by the way still leaving sufficient first rank cars to make a magnificent struggle. Seldom if ever has there been a race which promised better from the spectacular viewpoint.

Horsepower Rating

ALL over the world where automobiles are used in any quantity, there is need for some sensible method of comparing their power. For taxation in some countries, for competition rating, for insurance rating and for many other reasons a good formula is needed.

A few years ago in England a highly scientific committee was appointed to work out an answer to the problem and they evolved a formula of great complexity. It gave good results but almost needed a sliderule and a book of logarithims to apply.

Now, there is no simpler rating than that of piston displacement, used universally for racing limitation of power. Different motors have different degrees of volumetric efficiency, but it is not difficult to pick out a definite volume and to say that an average engine ought to give one horsepower for this volume.

Somewhere between 5 and 7 cu. in. per horsepower is normal. It is a poor engine that will not give a horsepower for every 7 cu. in. and a good one that betters 5. Why cannot the S. A. E. and the N. A. C. C. give the world a lead by making America the first nation to adopt, and use, a sensible method of comparing the power of conventional cars?

The adoption by America of some simple method of rating which would be better than the obsolete A.L.A.M. formula would be likely to lead to an international system. At present England and America both use the same formula when they use any formula whatever. If America were to adopt the assumption that normal engine power could be represented by dividing the piston displacement by six, this would fit in well with the metric system, as 6 cu. in. is almost exactly 100 cu. cm. Thus an engine could be measured in either inches or millimeters and the power would work out almost the same.

Federal Reciprocity in Sight

Adamson Bill, Which Provides for a Single Car Tax, Favorably Reported

WASHINGTON, D. C., May 20—The Adamson bill, providing that no automobile owner licensed in one State, district or territory, shall be required to take out a license or pay an automobile tax of any kind in any other State, district or territory was ordered favorably reported to-day by the House Committee on Interstate and Foreign Commerce. It is expected the bill will be enacted into law within the next few weeks, as strong pressure is being brought to bear upon members to this end.

Maxwell to Share Profits

DETROIT, MICH., May 20—Employees of the Maxwell Motor Co. are to become beneficiaries of the company, in a profit-sharing system, which is to take the form of a substantial bonus at the end of the year.

Directors of the Maxwell company at a recent meeting gave approval to a resolution providing for inauguration of the bonus system at the end of the year. Details of the plan have not yet been announced, but it is understood the payments will be in the form of a specified amount to each employee.

Nones Elected Norma President

NEW YORK CITY, May 19—W. M. Nones has been elected president and treasurer of the Norma Co. of America. Mr. Nones was secretary-treasurer, as well as general manager.

Link Is Redden Consulting Engineer

DETROIT, MICH., May 19—Vincent Link, formerly chief engineer of the Universal Motor Truck Co., has been engaged as consulting engineer of the Redden Motor Truck Co.

Scripps-Booth Occupies Addition

DETROIT, MICH., May 22—The addition to the Scripps-Booth factory, which will enable the company to double production, was occupied for the first time to-day, having just been completed and equipped with the necessary machinery.

James Dugan has been promoted from the position of factory superintendent to production manager. T. M. Rude, who is in charge of follow-up work, has also been placed in charge of purchasing.

Oggel in Charge of Purchasing

KALAMAZOO, MICH., May 18—P. H. Oggel has taken charge of the purchasing department of the Fuller & Sons Mfg. Co., this city. G. W. Fuller is now connected with the sales department of that company.

The company has been running day and night since last October and will probably continue this schedule for the balance of the year. Two new buildings have been erected and plans are being made for further additions.

Winton Doubles Output

CLEVELAND, OHIO, May 22—The Winton Motor Car Co., this city, like the majority of other automobile manufacturers, is feeling the effects of the greatly increased demand. Having an output of from 1200 to 1500 cars per year the present indication is that at least 4000 of the two present models will have to be made to satisfy demands. Consequently, the plant is rushed to the limit of its capacity and the floorspace has been augmented by the erection of some large tents on an adjoining lot.

Decision in Spark Plug Suit

NEW YORK CITY, May 24—A. R. Mosler & Co. and the Benford Mfg. Co., are enjoined from selling their Ford plugs as now organized, according to a decision of Judge Hand in the U. S. district court, in the case of the Champion Spark Plug Co. against the two defendants, charging unfair competition in the sale of spark plugs resembling its model Champion X used on Ford cars.

In the case of the Mosler company which makes the Mosler Superior plug for Fords, this company will be enjoined from selling this plug unless it changes the color of the shell and bushing nut, and of the porcelain, so as to distinguish their appearance. The name Mosler must be retained, and in the case of plugs made for jobbers, the name of the jobber or some trade mark in letters other than red which shall be unlike Champion X.

The same decision applies to the Benford company, except that an injunction also stands against the use of the name Ford and the symbol Ford X on its plugs.

Eustis Joins Chevrolet Co.

NEW YORK CITY, May 23—After being motor truck editor of *The Evening Mail* for 5 years, John R. Eustis has resigned to become advertising manager of the Chevrolet Motor Co. Mr. Eustis was formerly automobile editor of the *Brooklyn Daily Eagle* and the New York *Globe*.

Hinkley to Direct Purchases

JACKSON, MICH., May 18—Burton C. Hinkley, former purchasing agent for the old Argo company, has been appointed director of purchasing for the Argo Motor Co.

A. A. A. Favors Single Car Tax

Advocates Adamson Bill at Annual Meeting—Dr. Rowe Elected President

WASHINGTON, D. C., May 20—At the annual meeting of the American Automobile Assn., held yesterday at the Hotel Willard, Dr. H. M. Rowe of Baltimore was elected president. Other officers are: Vice-Presidents, Ralph W. Smith, Colorado; P. J. Walker, California; H. J. Clark, Minnesota; Preston Belvin, Virginia; David Jameson, Pennsylvania; C. C. James, Ohio; treasurer, H. A. Bonnell, New Jersey; secretary, John N. Brooks, Connecticut. While the chairmen of the various boards have not been selected, it is understood the present chairmen will be continued in office.

The meeting was opened by President John A. Wilson, whose annual report was unanimously adopted by the 200 delegates in attendance.

Richard Kennerdell, chairman of the contest board, told of the work accomplished by this important committee and how motor competition had been kept on a high plane. George C. Diehl, chairman of the good roads committee presented a brief report on the work of the committee during the year and aroused much enthusiasm with his reference to the passage by Congress of a $75,000,000 good roads bill.

E. L. Ferguson, in the absence of David G. Joyce, chairman of the touring committee, explained the route and map work of that branch of the association during the past year. He pointed out that as a result of travel in this country last year 150,000 tourists invaded New York State, spending approximately $15,000,000. New Jersey, he said, fell behind in this respect, while New York and New England forged ahead. Between $16,000,000 and $35,000,000 was spent in New England.

The report of H. A. Bonnell, treasurer, showed the association to be in the best financial condition in its history. Richard H. Lee, chairman of the legislative board, told of the efforts that have been and are now being made to discourage motorists generally from joining so-called bargain organizations.

Resolutions were passed calling for uniform regulation for all types of vehicles and for single taxation for the automobile; for the abolition of fees required for drivers' licenses; for the reduction of the registration fee in States where a personal tax is levied to cover only the cost of such registration; for the passage of the so-called Adamson bill; and for equal rights for all vehicles on public highways.

Empire Four Sets New Record

Transcontinental Trip of 3485 Miles in 6 Days, 10 Hr. and 59 Min.

NEW YORK CITY, May 23—A new transcontinental record of 6 days, 10 hr. and 59 min. for a distance of 3485 miles has been set up by a stock Empire four, driven by Robert Hammond. The old record of 7 days, 11 hr. and 52 min. for a distance of 3380 miles was established the very day that Hammond and his Empire started out from San Francisco, this being May 17. When Baker and Sturm in the Cadillac eight reached this city after their record-breaking trip, they little thought that that record would be shattered in so short a time.

Hammond, who averaged 22½ m.p.h., followed the Lincoln Highway, starting at San Francisco, through Oakland, Truckee, Ogden, Cheyenne, Omaha, Clinton, Ill., Fort Wayne, Ind., Lima, Ohio, Pittsburgh, Philadelphia and New York City.

His longest run was between 'Frisco and Ogden, a distance of 917 miles, which was negotiated in 36 hr. He arrived at Omaha May 20, and after a run of 700 miles in 17 hr., reached Elkhart late Saturday evening, where he had his first rest of 10 hr.

At the start Hammond ran into a deep coat of snow on the roads over the Sierras, but overcame this obstacle by following a train through a snowshed for about 40 miles. Owing to this maneuver, he was able to make his long run to Ogden in 36 hr. Near Cheyenne, Wyo., the car hit a thank-you-ma'am at 45 m.p.h., and Harold Bell, the passenger, was thrown out, landing 25 ft. away with an injured arm. Hammond drove alone from there to Ft. Wayne, where he picked up Herbert Wasson, from the Empire factory.

2 M.P.H. at Canton

At Canton, Ohio, the previously good weather changed to rain squalls and the car crawled through the mud at 2 m.p.h. After colliding head-on near Pittsburgh with an automobilist who got in the way at the cost of a front wheel, the car was ditched in the Blue Ridge mountains. At this point the only tire-casing change necessary was made. Seventy punctures in all occurred during the trip. Gasoline consumption averaged 10 to 13 m.p.g. and a gal. of oil was used every 150 miles.

Hammond went the whole distance without touching the motor or spark plugs. He managed to avoid being arrested up to Newark, N. J., where he was stopped for reckless driving and fined $20. Threat of further police interference held him down to a slow pace all the way into New York, which he reached at 1.49 p. m. to-day.

Hammond, who will go after new records in the near future, will be remembered for his tour of the world in an automobile several years ago. He was the first to climb the Alps in a car and was one of the drivers of the New York to Paris race, which was won by the Thomas. One of his achievements was a drive of 3 days and 2 nights in an endurance contest on a dirt track. In that event he succeeded in going the full distance without leaving the car seat. In his latest transcontinental trip his sleep amounted to between 11 and 12 hr.

The following table gives the runs between the stopping stations:

San Francisco to Ogden	917
Cheyenne	317
Omaha	551
Elkhart	650
Ft. Wayne	64
Canton	222
New Oxford, Pa	293
Philadelphia	109
New York City	100

The mileage of the route followed is:

San Francisco to Truckee	252
To Reno	35
To Austin	188
To Ogden	442
To Lyman	124
To Cheyenne	354
To Fremont	516
To Omaha	35
To Jefferson	136
To Clinton	250
To Elkhart	264
To Ft. Wayne	64
To Lima	64
To Bucyrus	65
To Canton	93
To Pittsburgh	106
To Philadelphia	296
To New York City	100

The car was equipped with Horseshoe tires, Bales puncture pluggers, Prest-O-Lite tank, Stewart-Warner speedometer and vacuum feed, Rex spark plugs, Pyrene fire extinguishers and Auto-Lite electric system.

Strong Succeeds Collins as Buick General Sales Manager

FLINT, MICH., May 22—E. A. Strong, formerly manager of the Chicago branch of the Buick Motor Co., has been appointed general sales manager of the parent Buick organization to succeed R. H. Collins, resigned. Strong has been connected with the Buick organization since 1911, and previous to that was identified with the McCormick Harvesting Machine Co. and later with the International Harvester Co.

Strong's first connection with the Buick company was as branch manager at Buffalo. He held that position for a year and then was Indianapolis branch manager for 2 years, after which he went to Chicago. Collins does not officially relinquish his duty until the end of the company's fiscal year, Aug. 1, but it is understood that Strong will take up the active management soon. D. A. Burke, now in the sales department of the Buick company, succeeds Strong at Chicago.

Indiana S. A. E. Plan Preparedness

Howard E. Coffin to Address Meeting at Dinner Given by Section to Council

INDIANAPOLIS, IND., May 22—The Indiana section of the Society of the Automobile Engineers will give a dinner at 7.15 in the Claypool Hotel, Monday evening, May 29, to the members of the council of the Society. The chief discussion of the evening will be on Industrial Preparedness and Howard E. Coffin (vice-president the Hudson Motor Car Co.), chairman of the committee on production, organization, manufacture and standardization of the Naval Consulting Board, will be the chief speaker.

This banquet will mark the closing of the 1915-16 meetings of the Indiana section which have been most successful. Plates are $2.50 each and accommodations can be secured from R. H. Combs, of the Prest-O-Lite Co.

The occasion is of some importance, as it will mark the first address of Mr. Coffin to the automobile industry, since he took upon his shoulders the bulk of the work of the industrial preparedness scheme. Briefly, the desire of those responsible for the scheme is to put America in such a position that in the event of war she can avoid Europe's errors.

Program of Papers for S. A. E. Summer Meeting Is Complete

NEW YORK CITY, May 24—The program of papers for the summer meeting of the Society of Automobile Engineers, to be held on the steamship Noronic on the Great Lakes, June 12-16, has been completed and comprises reviews of twenty-one pertinent subjects, as follows:

Future Scientific Development of the Automobile—C. F. Kettering.
Large Single vs. Dual Tires for Truck Rear Wheels—W. H. Allen.
Farm Tractors—C. M. Eason.
Motors for Trucks and Tractors—H. L. Horning.
Refinements and Generalities in Truck Design—H. D. Church.
Truck Subject—B. B. Bachman.
The Differential and Its Substitutes—D. D. Ormsby.
Motor Fuels of the Next Decade—W. F. Rittman.
Kerosene vs. Gasoline in Standard Automobile Engines—Prof. E. Lucke.
Pressed Steel in Automobile Construction—E. A. Nelson.
Crystallization in Cold Drawn and Pressed Steel Parts—R. H. Sherry.
Dynamics of Vehicle Suspensions—Benj. Liebowitz.
Straight Side vs. Clincher Type Pneumatic Tires—J. E. Hale.
Bronze Alloys for Motor Cars—W. M. Corse.
High Speed Motors—A. P. Brush.
Possibilities of the Constant Pressure Cycle Engine—A. B. Browne and Herbert Chase.
Car Performance—Prof. D. L. Gallup.
Recent Aeroplane Engine Developments—Neil MacCoull.
The Automobile Engineer and Preparedness—Howard E. Coffin.
Mechanical Transport Mobilization—A. J. Slade.
Automobile Experience in the Great War—W. F. Bradley.

Conditions Determine to What Extent Car Builders Shall Make Parts

H. M. Jewett, Paige-Detroit President, Tells Detroit S. A. E. That There Is No Uniformity About the Question, Each Manufacturer Being Guided by His Experience

DETROIT, MICH., May 18—In answer to the questions: Should a car manufacturer make his parts, or should he assemble them, and if he should manufacture them, what proportion should he make and which should he buy? H. M. Jewett, president of the Paige-Detroit Motor Car Co., told the large attendance at to-night's regular monthly meeting of the Detroit Section of the Society of Automobile Engineers that it is all a case of the individual conditions with each company. Through the particular experiences and troubles each maker has encountered, each has his own ideas of what he should and should not buy from the parts makers, and there is no uniformity about it. One large producer may make some part that another concern equally big has always purchased from a parts manufacturer, and there are so many qualifying conditions that no rules can be laid down. It is a safe prediction, however, that each maker has good and sufficient reason for the policy he follows. There are reasons back of each move he makes.

D. McCall White in Chair

The meeting was the first under the régime of D. McCall White, Cadillac chief engineer, who was elected chairman of the section at the April meeting. In taking the chair for the first time, Mr. White praised the work of the retiring officers and bespoke the hearty co-operation of all in carrying on what has already been accomplished. Because all cannot avail themselves of the annual midsummer outing of the entire society, which this year takes the form of a lake trip, it has been decided to hold a family outing for the section on June 24 somewhere in the vicinity of Detroit.

That the subject of assembly versus manufacture is of great interest to manufacturers was evidenced from the fact that some of the leading factory representatives entered into the interesting discussion that followed Mr. Jewett's talk. Among the speakers were Alvan Macauley, Packard; C. T. Meyers, Timken; K. W. Zimmerschied, General Motors; G. W. Dunham; W. A. Brush; J. W. Wright, Golden, Belknap & Swartz; J. G. Vincent, Packard; T. P. Chase, King; E. V. Rippingille, Hudson, and others.

Each manufacturer can take his particular viewpoint on the subject of manufacture versus assembly from his own personal experience in the business, Mr. Jewett stated. He divided the subject into four parts: first, the manufacturer producing a high-priced car costing $3,000 or over, in limited quantities; second, the volume producer making 10,000 machines or more; third, the maker that is forced into the manufacture of certain parts through business necessity; fourth, the parts that are seldom manufactured by the automobile company.

Price the Main Factor

Taking up the first of these, naturally the high-priced cars are produced in limited quantities, and the result is that in order to get high price, the machine must have extreme individuality. The maker of that car must really make practically everything there is in it, for the purchaser of a high-priced car has to feel that he is getting the worth of his money. The automobile maker in that class can ill afford, according to Mr. Jewett, to buy axles, engines, bodies, frames, wheels, etc., from parts manufacturers, because the latter are producing parts for cars in volume business, and it would be very difficult, from a sales standpoint, to convince the car buyer that such parts are any better than the ones made for the volume producer. This is especially true because the volume producer is advertising that on account of his quantity he can buy cheaper, so naturally, with his limited output, the high-priced maker would have that argument to face.

Going to the second division—the volume producer—there is great opportunity for diversity of opinion here. It is a common supposition that a manufacturer producing over 10,000 units can make his parts cheaper, said Mr. Jewett, but he questioned if that is entirely true, mentioning some conflicting policies of big makers to show that all do not hold any unified view of the matter. He showed where Overland, for instance, buys certain parts; he cited some of the Buick company's units that are made outside its plants; he called attention to Studebaker's purchasing certain things; mentioned other plants in a very frank manner, and gave it as his opinion that conditions altered cases and that there were good reasons back of each policy.

Many of the accessory makers themselves are not making every part. They assemble too, Mr. Jewett explained. A great many of the axle companies to-day are buying the gears that go into their units; gearset makers do the same thing, buying gears and malleables and machining and assembling them.

But there are certain things that manufacturers very seldom make. Bearings are one. Usually these are patented processes, require intricate and costly machinery, and a car maker can go out and purchase a bearing from a firm making a specialty of this part and secure a better bearing and cheaper than it could be made by the car plant. This example holds good for a great many of the parts that are seldom made by the car factory. Steering gears are another thing seldom made by the car factory; frames might come under this class also.

The machinery often required for the making of certain parts would not be economical for a great many manufacturers of cars to install. Take, for instance, rear axle housings. A press to do this would be capable of such large production that unless the maker were a very large producer the press would lie idle practically three-quarters of the year, which is not economy.

Manufacturers have two ways of looking at the condition. One spends a great deal of money telling the public that he is an assembler; another that he makes everything in his cars.

As an illustration of peculiar conditions that are to be found in each individual plant, Mr. Jewett told of walking through a purely assembly plant one day and noticing that they were enamelling fenders. He asked why this was done, since no other part of the car was manufactured. The reply of the superintendent was that they could not get the fenders enamelled well enough outside. This suggests the thought as to why others are not enamelling them for the same reason. Very possibly those others that are not enamelling them are having very good success with fenders they buy already enamelled. That is the only answer, because if all were having trouble in getting deliveries on properly enamelled fenders, they would all have enamelling plants the same as this particular case.

This leads to a consideration of the manufacturer who is forced to make his parts. Wherever a maker makes his own parts there is a substantial reason why he spends his money in machinery, tools, equipment and material instead of buying the unit. According to Mr. Jewett, you will find generally that each part that a manufacturer produces himself results from not being able to get deliveries or a fair price from the parts maker or through not being able to get this part good enough. He may not wish to buy a standard motor because that engine may be used by several different makers of cars selling at various prices.

The amount of capital needed to make cars outright is another consideration.

Where the maker buys from a parts producer the latter's capital is being used in the business, and just as long as the car maker can buy those parts as good as he thinks they ought to be and at a right price, Mr. Jewett does not think any car maker is going to get into the the parts making business. However, the motor is the most logical thing to produce, it being the most important part of the car.

The Paige president paid tribute to the brains of the S.A.E. that have made possible the interchange of parts of standard design through standardization.

Opening the Discussion

In opening the discussion Mr. White commented that in one particular price class the reason why manufacturers make a great many of their parts is because of class individuality. Another is the refinement of workmanship. Special conditions of silence, durability and workmanship dictate the individual manufacture of special parts. Then there is the matter of quality of material, which the individual maker can insure if he makes his own parts.

The chairman said further that in another class, in quantity production, where they have to buy parts, they have trouble due to lack of material. Sometimes there is practically only one part maker making a particular thing, and these concerns may be so full of orders that they are incapable of producing parts having special refinements. There is also the matter of prices which certain parts makers charge. In making special things, parts concerns are often confronted with the lack of floor space, and sometimes for financial reasons they simply cannot afford to lay down the special equipment necessary.

Taking up the discussion, Mr. Zimmerschied said:

"I have been very much interested in Mr. Jewett's exposition of this subject, and I know that the engineers can profit greatly by it, because he has given us a business view of it; and if there is anything that most of us engineers need, it is a little glimpse of the business side once in a while. At the same time we like to draw pictures and look at diagrams and curves, and perhaps I can organize the thoughts I have in my mind if I draw such a chart.

	10,000 CARS	10,000 TO 30,000	30,000 TO 100,000	100,000 AND OVER
$ 3000	M			
$ 2000 TO $ 3000	Ma	Ma		
$ 1000 TO $ 2000	A	Ma	Ma	
$ 1000 AND UNDER	A	Am	M	M

Chart drawn by K. W. Zimmerschied

"To my mind, the automobile industry can be subdivided in two ways, a sort of dual classification. First, quantity, and second, price; something like the illustration. Quantities up to 10,000 cars, in the first class. From 10,000 to 30,000 is what you might call the medium quantity production. Thirty thousand to 100,000 cars is the fairly large production, and the 100,000 plus is the super-quantity production class, you might call it. Then down the other way we will start with $3,000 and up, $2,000 to $3,000, $1,000 to $2,000, and under $1,000. Now, we find, if we go to cross-section all this area, that we would not be able to fill in all these spaces, because the $3,000 class never rises above 10,000 a year; so we have a square for that class that never will get higher in production. However, the $2,000 to $3,000 class will run over here into the 10,000 to 30,000 per year. The $1,000 to $2,000 might run over into the 30,000 to 100,000, and in the $1,000 down we run out into the 100,000 plus. So that that covers practically the field of all our automobile endeavor.

"Now, if we plot the tendency toward the manufacture of his own parts, we would find, as Mr. Jewett has said, that in the $3,000 class, that is the maximum, because the manufacturer wants the extreme of individuality; so we will draw here a wedge, running to practically zero at the bottom, the thickness of that wedge at any point indicating the tendency toward manufacturing his own parts which the manufacturer in that class follows. And in the same way we find another wedge, running out this way, which would indicate the pull on the manufacturer to make his own parts, on account of quantity.

"Now, in any one of these squares, it is evident that the summation of these two tendencies, and these two bases, would be in the $3,000 class, to manufacture all the parts. We will see here, more than in this case of maximum production, a maximum cheapness to manufacture all the parts. We might find very largely the same tendency here, and a similar tendency toward assembly; so I will introduce two small a's. Maximum tendency to manufacture, but on account of this component, a small tendency toward assembly. Why? On account of these two, it is all assembly, small quantity, small price. They have not the capital, they have not the draw to manufacture the parts.

"Now, then, suppose a group of men are going to start manufacturing an automobile. They think it is a good field to go into, and they are going to market the product. Following the line of least resistance, they would start in some of these classes here to manufacture a conventional product, which has a steady market, buying most of their parts outside. In trying to sell that product, however, they find at the end of the second or third year that they are not getting along very fast, because they have not this individuality which sells. They have got a lot of parts, a lot of manufacturers, and they are very much like their neighbors' cars; so in order to gain an influential position in the industry, they have either the choice of going up in price and getting into the individualistic class there, or else going out the other way and getting a large volume, and larger profits, without necessarily sacrificing individuality. But you notice it is always a question of individuality, if you are going to establish, to attain a position in the business, an influential position.

"Now, on the position of the parts manufacturer, I think that we owe a great tribute to the parts manufacturers for a great many of our big advances. The old saying that 'necessity is the mother of invention' is not so true, to my mind, as that 'competition is the mother of invention.' "

Cleveland S. A. E. Talks Efficiency

A. L. Clayden Presents Paper on Universal Joints at Season's Closing Session

CLEVELAND, OHIO, May 20—Last night night in the ballroom of the Statler Hotel the Cleveland section of the Society of Automobile Engineers held their concluding meeting of the season.

A. Ludlow Clayden, chairman of the Standards Committee, talked extemporaneously on the subject of efficiency, pointing out that the effieciency of an automobile in the widest possible sense was liable to be neglected when considering the efficiency of parts of it. He drew attention to the fact that a motor bicycle weighs little more than the load it carries, whereas a touring car often weighs seven or eight times as much as its load. Mr. Clayden said that it was often assumed automobile development was nearly complete. With this view he wished to disagree entirely because if the automobile had been developed to the limit of the present style of construction it was still a very long way from the fulfillment of ideals.

There was a short discussion and later Mr. Clayden presented his paper on universal joints, reprinted on page 934.

Following the reading of the paper there was a good discussion in which several members recited their experiences with joints made from flexible material. It appeared the results so far have not been very encouraging.

Following the precedent established by the Cleveland section the meeting was preceded by a dinner at which about eighty members were present.

Pa. S. A. E. Holds First Picnic

PHILADELPHIA, PA., May 20—The Pennsylvania Section of the Society of Automobile Engineers held its first annual picnic to-day. Thirty members from all parts of the State attended the outing to Browns Mill, N. J., a drive of 35 miles. Canoe races, quoits, bowling and baseball were the main attractions of the day. J. W. Watson, president of the American Bronze Co., Berwyn, Pa., acted as chairman of the entertainment committee.

Auto Kamp Equipment Co.

SAGINAW, MICH., May 17—The Auto Kamp Equipment Co., has been organized with a capital stock of $15,000. Automobiles, trailers, and other vehicles and appliances will be bought, sold and manufactured. The incorporators are C. W. McClure, Harry E. Oppenheimer, Allen D. Jackson and W. O. Sustins.

U. S. Army Has Much to Learn About Motor Truck Preparedness

Metropolitan S. A. E. Hears Army Men and Transport Engineers on Lessons and Experiences of Warring Powers with Automobile and Motor Truck Branch of the Service

NEW YORK CITY, May 19—Armored cars and trucks were the chief topic of discussion at the May meeting of the Metropolitan section of the Society of Automobile Engineers held last evening at the service station of the International Motor Co. The subject of preparedness and the Automobile Reserve Corps was also discussed. About 100 were in attendance.

The United States has much to learn about motor truck preparedness from England, it developed from the addresses made by Captain Kilburn, who attended as the representative of Maj. Gen. Leonard Wood, commander of the department of the East, U. S. Army, and of Mr. Murden, who is in this country purchasing war material and who has had considerable practical experience with mechanical transport in the present war.

Showing the need for adequate preparation of motor transport equipment in times of peace, Captain Kilburn stated that the Mexican expedition of our army had been held up for 6 days because of the lack of motor trucks for the transport of troops and their supplies. He stated that had plentiful supplies of motor trucks been available the troops could have started in pursuit of Pancho Villa without delay and that by now the trouble would probably have been all over.

Segregation by Makes

According to Captain Kilburn, Captain Johnson, of the department of the East, who has been giving the subject of motor transport a great deal of study, has arrived at the conclusion that each division should be supplied with trucks of uniform make and that on account of the likelihood of our troops operating in rough country and also on account of the limited supporting capacity of our bridges and culverts the 1½-ton truck is regarded as the maximum size practicable.

That the new Automobile Reserve Corps law now in process of passage in Congress will permit the President to appoint any volunteer men or bodies of men to serve the army in case of need in the Quartermaster Department of the army was an interesting point brought out by Captain Kilburn, who also stated that this law would place no limits on numbers of such appointments.

Captain Kilburn emphasized the importance of organizing a large and efficient reserve of commercial vehicles available for service in case of war. He also urged the advisability of standardizing on given makes for each division. He stated that in the formation of the reserve corps, it was his opinion that the motor truck manufacturers must do the recruiting.

Value of Armored Trucks

Respecting armored trucks Captain Kilburn was sceptical as to their value inasmuch as they are dependent upon roads for operation and can very quickly be put out of action by well-directed artillery fire as they constitute excellent targets. He stated that up to the present such armored cars as have been experimented with in this country have been equipped with machine guns but that more effective work could be done with larger guns.

In connection with this he stated that it was planned to experiment with a 1-lb. automatic gun with a cushioning arrangement which absorbed practically all of the recoil.

In response to an inquiry concerning the standard of capacity set by the government, Captain Kilburn stated that it was possible that the maximum load of 1½ tons might be increased as a result of improved roads, bridges and culverts.

That Great Britain has found the 1½-ton truck too light; that it has determined that efforts to standardize detail design are undesirable and that a very effective motor reserve corps was in operation in that country before the war were the most interesting points brought out in a short talk by Mr. Murden.

In 1912 the British war office started to lay the ground work for a motor truck reserve. The War Office provisional subsidy provided that purchasers of such trucks were to receive a bounty of £70 per year—about $348—in return for their agreement to surrender their vehicles to the army in case of national emergency, and in the meantime to constantly carry a prescribed supply of spare parts on the trucks and to have them inspected by government inspectors at stated periods.

At the outbreak of the war, stated Mr. Murden, many thousands of these subsidy trucks were landed in France 48 hr. after the order of mobilization.

As to the segregation of makes into divisions, as proposed by Captain Kilburn, Mr. Murden stated that his government had not found this necessary, so long as individual convoys were made up of but one make, this being due largely to the subsidy standardization plan.

Going into the details of the subsidy plan, Mr. Murden stated that the subsidy agreement provided for reporting the trucks for duty at predetermined mobilization points on 24 hr. notice. It applies only to 3-ton trucks, 1½-ton types having been experimented with and discarded, inasmuch as army men loaded them with 3 tons anyway, and there was no apparent advantage in having the smaller capacity.

In respect to the tests, in response to an inquiry from one of his listeners, Mr. Murden stated that these cover a period of 1 month. Three days out of every week are spent on long and level runs, to test the ability of the trucks on sustained, heavy-duty service, the remaining 3 days on narrow, hilly, rough, soft and crooked roads. On all of these tests the trucks are fully loaded, the total weight being about 15,200 lb. One driver, a helper and a military observer accompany the truck.

The hood is locked at all times except for 15 min. each morning and 35 min. when gasoline and oil are being put in. Demerits are made for all excess time for repairs or adjustments, for defects and for failure to make the proper mileage. The trucks are equipped with governors set for 1100 r.p.m., and the speed limit is 16 m.p.h. Timed hill-climbs are made, and the temperature of the water at top and bottom noted. In the evening of each day 75 min. for work is allowed, with 1 demerit for each minute exceeded.

After 2000 miles have been covered, the governors are removed and the trucks are run at full speed for 3 hr. on Brooklands. The survivors of these tests are then taken down completely and each part minutely inspected for wear and defects in materials or workmanship.

Rear tires are dual 1050 by 140 mm. front tires being 1020 by 120 mm.

Urges Co-operation

Albert F. Masury, chief engineer of the International Motor Co. urged strongly that the S. A. E. appoint a committee to consult with the Motor Truck Club, explaining that the latter body had conducted some highly-illuminating experiments to show that the army's standard of 1½-ton capacity was too low, and that it had recommended that 5-tonners be used.

He then went on to tell about the battery of armored cars in various stages of completion which were drawn up on one side of the room in which the meeting was held, stating that they were to become the first armored motor battery of the National Guard of New York.

Mr. Masury also called attention to a new Mack 1½-ton transport truck fitted with the new Goodrich pneumatic truck tires on all wheels. These tires are of the low-pressure type, 38 by 5½ by 8. The three sizes refer to the three dimensions of the tire, namely, diameter, depth and width. They are straight-sided and on the rear have curved steel guards at the side to prevent excessive flattening if punctured and to protect the sides of the tire from chafing.

In line with the motion of Mr. Masury, it was voted to have the governing committee name a committee to assist the Motor Truck Club in its work and to study armored cars.

Studebaker Adds 68,000 Ft.

DETROIT, MICH., May 22—The announcement has just been made public from the Studebaker offices of the closing of an important property purchase, which will result in factory extensions and a still further increase in car production.

The new property which is located between Campau and Scotten Avenues, adjoins the Studebaker plant No. 3 on the north, and embraces 68,000 sq. ft. At present seventeen residences stand on this site, and the work of tearing down these houses will be begun immediately.

With the annexing of this property, the Studebaker plant No. 3 space will extend from Fort Street to Jefferson Avenue. The Studebaker factories now cover more than 150 acres of space—108 acres of actual floorspace—and employ over 7000 men.

Twin City Truck Makers Expand

MINNEAPOLIS, MINN., May 20—The Four Wheel Drive Mfg. Co., Minneapolis, and the Twin City Four Wheel Drive Co., St. Paul, are to begin making trucks under the J. L. Ware patents. The latter company is to occupy its new manufacturing plant at Cromwell and University Avenues next week. This company is capitalized at $500,000 and is headed by Mr. Ware. It is now manufacturing in cramped quarters.

The Minneapolis company, capitalized recently at $1,000,000, has bought the Nott Fire Engine Co. plant with 50,000 sq. ft., at Central and Eighteenth Avenues, Minneapolis, and in 90 days expects to turn out ten trucks a day, ranging from 2- to 4-ton. It reports a contract for 3000 trucks for delivery abroad in 2 years.

Ward Elected to Defense Society

DETROIT, MICH., May 18—Artemas Ward, Jr., president of the King Motor Car Co., Detroit, has been selected as a member of the National Committee of the American Defense Society. This consists of well known men.

Electric Interests Convene

Exhibition of Cars and Trucks —Study Quantity Production Opportunities

CHICAGO, ILL., May 22—The former Electric Vehicle Assn. of America, now the Electrical Vehicle Section of the National Electric Light Assn., held its first joint session with the parent body at the Auditorium and Congress hotels here this week. The sessions of the Electrical Vehicle section took place on Wednesday and Thursday simultaneously with the convention sessions. An exhibit was staged in the foyer and over a subflooring of the Auditorium theater. Several truck and passenger car makers and car equipment manufacturers of all kinds presented attractive booths. There were about sixty exhibits in all. The Walker Vehicle Co. of Chicago displayed a 1-ton chassis and a Walker balance drive exhibit unit opened to show the principle of motor inclosed in the rear axle housing driving through spur gears within the wheels. The General Vehicle Co., Inc., also showed a truck chassis. A chassis and a delivery car were in the booth of the Ward Motor Vehicle Co. Edison batteries were fitted in both. The only passenger car display was that of the Detroit Electric Co. which consisted of two handsomely appointed coupés.

Opportunity for Electrics

The present unusual opportunity for quantity production of electric passenger and commercial cars in competition with gasoline cars, due in a measure to the great strides in electric car perfection of the past 3 or 4 years, but especially to the now high and constantly soaring price of gasoline, was the subject upon which a majority of the section and committee reports and individual papers of the meetings were founded. In his paper on Electric Passenger Vehicle Problems and Activities, E. P. Chalfant summed up the reason for failure of the electric car manufacturers to establish themselves on a competitive plan with gasoline car makers as follows:

"The first reason is the failure of the manufacturers to properly educate the general public regarding the wonderful utility of the electric.

"The second reason is the failure of the central station to make it easy to own and operate the electric, by an adequate distribution of charging and boosting stations."

He makes the assertion that the gasoline car is but 5 per cent more efficient than the electric and attributes this 5 per cent to surplus with reference to power, radius, speed, energy and fuel.

"There was a time," said Mr. Chalfant, "when gasoline cost but 10 cents a gallon. About that same time it required about 10 hr. to recharge the cells of an electric, at an average of 8 cents per kilowatt-hour for current. Since then gasoline has advanced in most localities to a price above 30 cents a gallon and it is said to be on its way to 50, while electric juice has declined to an average of 5 cents per kilowatt-hour. To-day the constant potential charging system will bring the battery up to two-thirds of its capacity in 1½ hr.—a lunch time boost for instance—while a full charge requires but 3 hr. The ordinary charging station requires about 6 hr., and the motor generator set or the mercury arc rectifier installed in a private garage requires but little more.

The Cost of Power

The cost of power comparative between gasoline and electric cars was outlined by Mr. Chalfant as follows:

"Placing the daily mileage of each type at the conservative figure of 35 miles a day—1000 miles a month, statistics show that current for electrics averages $8.50 per month. Let us assume that a closed gasoline car, with six-cylinder motor of average power rating consumes gasoline at the rate of 8 m.p.g. at a cost of 30 cents per gallon and the expense for the month is $37.50, over four times the cost of current. Nor does it take into account the same proportionate expense for oils, greases and general repairs."

This argument was further strengthened in the paper given by William P. Kennedy on Central Station Promotion of Electric Vehicle Use. His plan embodies a battery service system added to the present power service and lighting service of central station organizations, the principal function of which would be to supply energy and maintain this type of energy consuming apparatus in working condition.

P. D. Wagoner's paper on Battery Service—A Unit in a Comprehensive Plan for the Successful Exploitation of the Electric Vehicle, detailed the use of duplicate batteries in commercial vehicles which is being successfully carried out in a large way in such cities as Hartford, Spokane, Boston, Baltimore, Harrisburg, San Francisco, Los Angeles, Worcester, Fall River and Wichita. The system, as now practised on the Geveco trucking system, calls for sale to the purchaser of a car less battery, the vehicle being supplied with a specially designed, detachable battery cradle. By the use of this interchangeable cradle the company furnishing power is enabled to exchange a discharged or partly discharged battery for a fully discharged one in from 2 to 5 min. The current used is sold by the mile, according to the size of the vehicle and amount of mileage used as recorded by the odometer.

The paper on Greater Garage Service, by Harry Salvat, was a plea for more unity than now exists between the electric car manufacturer and garage owner.

F. E. Whitney's paper on Electric Truck Troubles and Means Taken to Eliminate Them, was an outline of the various troubles brought to light in the early electric vehicles and the remedies devised to eliminate them.

Motor Castings Co. Organized

DETROIT, MICH., May 19—The Motor Castings Co. has recently been organized to manufacture cylinder castings only. The foundry is located on Hart Avenue near Mack Avenue, and the show room and general sales office has been opened at 997 Woodward Avenue. The officers of the company are J. D. Curry, president; E. H. Briggs, vice-president; W. T. Cullen, sales manager, and J. A. Lanigan, general manager.

Fisk Strike Ends

SPRINGFIELD, MASS., May 21—The striking machinists and tire workers of the Fisk Rubber Co., Chicopee Falls, Mass., have accepted the latest propositions made by the company. Twenty-six hundred men will return to work. An 8-hr. day will go into effect at once. Time and one-half will be paid for overtime, and double time for Sundays and holidays.

Hofer Goes to Ross Co.

DETROIT, MICH., May 22—Walter C. Hofer has resigned as special representative of the Lozier Motor Car Co. and has joined the Ross Automobile Co. as district manager of southwestern territory.

McCord Joins Bankers Commercial Corp.

NEW YORK CITY, May 22—D. C. McCord has resigned his position as manager of Harris Brothers Co., Detroit, Mich., to become general manager of the Bankers Commercial Corp., this city, which finances installment sales.

First Armored Car Driver Dies

De La Touloubre, Pioneer Race Driver, Was Crippled in Moroccan Campaign

PARIS, May 10—De La Touloubre, pioneer race driver and first man to take an armored car into battle, died at Paris this week, after having been partially paralyzed and dumb for 3 years. De La Touloubre was a prominent figure in all European road races from 1900 to 1908. An artillery captain in the French army, he had adopted the name of De La Touloubre for racing purposes only, his real name being Henri Genty. In the early days he was a member of the Darracq team together with Hemery and Wagner. He won his first important long-distance race on a Darracq light car in the Belgian Ardennes in 1904. Later he linked up with the Bayard-Clement team and had the late Albert Clement as one of his companion drivers.

De La Touloubre's most important work was the organization of an armored car corps of Panhards which took part in the Moroccan campaign of 1907 and following years. This is doubtless the first use ever made of armored cars in actual warfare. His armored cars were recognized to have rendered valuable service, but the campaign left him a physical wreck. While chasing the enemy the car he was driving fell down the El Kantara gorge. For a time De La Touloubre's life was in danger, but he recovered only to spend the last 3 years of his existence partially paralyzed and without the use of his voice. Before being lost to public view he published a book dealing with his armored car experiences in Morocco.

Copper Prices Lowered

NEW YORK CITY, May 23—A drop of three-quarter cents a pound in copper featured the materials markets last week. This metal declined to 29¼ cents yesterday. Lead and tin prices which are very elastic, declined 7½ and 50 cents, respectively. The market in general was steady with few changes.

Open-hearth steel dropped to $42 a ton. Interest in the steel trade last week centred mainly in the placing of contracts for war munitions. Domestic automobile makers are still making a large demand for steel. Last week a contract of 250,000 tons of blue annealed sheets of steel was received from one of the manufacturers.

Rubber demand is apathetic. Para is quoting at 68¼ cents a lb., while Ceylon is steady at 70. American manufacturers of automobiles consume 36.3 per cent of the world's annual production of crude rubber, according to statistics. Allowing an average of 42 lb. of crude rubber for an automobile's tire equipment and taking 2250 lb. for the ton measure, the amount of rubber required by American-made automobiles in 1916 will be approximately 69,000 tons, as compared with an estimated total production of 192,000 tons. The rubber requirements for American automobiles in 1906 of 1866 tons have grown by leaps and bounds to 68,805 tons.

To Oppose S. R. B. Reorganization

PHILADELPHIA, PA., May 20—A stockholders' protective committee has issued a letter asking for deposits of the Standard Roller Bearing Co. stock. The committee is composed of F. T. Aldridge, chairman; J. S. Stanton, F. P. Fiske and Merrill Bishop.

The letter says in part: "The immediate purpose of such deposits is to enable the committee to oppose in court or otherwise the proposed plan of reorganization set forth in the circular bearing date of April 21, 1916."

The committee objects to the terms of the reorganization plan including the five-year voting trust, and five-year option on $1,000,000 common stock at par. Deposits of stock before June 1 are requested by the committee with the Brooklyn Trust Co.

Argo Buys Plant Site

JACKSON, MICH., May 23—The Argo Motor Co. has completed a deal with the Briscoe Motor Corp., whereby it has purchased the property which Mr. Briscoe purchased last year, upon which was to be erected a new plant for the Briscoe company, also a number of workmen's homes. All told, about 120 acres of ground are involved in this transaction. President Mansell Hackett of the Argo company announced that a new Argo plant will be started at once, and when completed the Detroit Chassis Co., in which he is strongly interested, will be moved to Jackson. In addition to the new plant for the Argo company, a number of homes for workmen will be built.

Paige Features Securities

Rises 230 Points on Announcement of 80 Per Cent Dividend

New York City, May 24—Paige-Detroit featured the securities market last week with a rise of 230 points on the strength of the announcement that action would be taken by the company on an 80-per cent stock dividend. The market as a whole was unusually strong with Chevrolet, Miller Rubber, Packard, Reo Truck, and New Departure showing substantial gains. Chevrolet rose 15 points, Miller Rubber 45, Packard common 39, Reo Truck 7¼, and New Departure 60.

Chandler's New High

Chandler Motor has been an active participant in the recent advance in the automobile securities market and sold to a new high of 98.

United Stock Oversubscribed

Dominick & Dominick, syndicate managers of the United Motor Corp. financing, who have been receiving public subscriptions for that stock at $62 a share, report that the subscription, which closed last Saturday, was twice oversubscribed. Application will shortly be made to list the shares of this corporation on the local curb market. Subsequently application will be made to list the stock on the Stock Exchange. Two shares of United are offered for one of Perlman.

Rumors emanating from Wall Street state that the Willys-Overland Co. will pay in July a somewhat higher cash dividend and also an extra stock dividend on its common stock. The rate now being paid on the common is 6 per cent regular, although in 1915 an extra 5 per cent was paid in stock.

Torrington Co. to Distribute Splitdorf Electrical Co. Shares

Newark, N. J., May 19—The directors of the Torrington Co. have voted to distribute to the common stockholders the preferred and common shares of the Splitdorf Electrical Co. now held in the Torrington Co.'s treasury. There are 9800 shares of Splitdorf preferred and 14,000 common held, and each share of Torrington common will receive seven one-hundredths of a share of preferred and one-tenth of a share of common. Distribution will be made July 1.

Until recently there have been 28 per cent accumulated dividends on the Splitdorf preferred. A few weeks ago 7 per cent was paid; then came another 7 per cent, and by June 1 the 28 per cent will have been made up.

Frost Is Westcott Service Manager

Detroit, Mich., May 22—Allen H. Frost has resigned as factory manager of the Detroit Wire Spring Co., to become service manager of the Westcott Motor Car Co., Richmond, Ind. This corporation will move to Springfield, Ohio, next month.

Drivers Tune Up at Indianapolis

Aitken, Rickenbacher and Oldfield Make Fast Time in Practice Laps

Indianapolis, Ind., May 21—Although but five cars have been reeling off practice laps at the Indianapolis Speedway, a steady crowd of bleacherites are on hand every day. Yesterday, being Sunday, about 1800 turned out in spite of the weather and saw some fast time made by Johnny Aitken and Eddie Rickenbacher. Each of these drivers made the circuit in 1:34, or at over 95 m.p.h. Barney Oldfield sent his car around for a lap in just over 1:35, but on the succeeding lap had to be towed by Rickenbacher. Examination showed that his Delage had a broken valve rocker arm. This is now being repaired.

Rickenbacher had a little engine trouble to-day, but will be out again in the morning. The car he was driving yesterday was not his own but that of his team-mate, Pete Henderson, who is laid up temporarily with a slight illness.

Resta and Christiaens of Peugeot and Sunbeam fame are both repairing their motors, which suffered in the recent Sheepshead Bay event. One of the reasons that the drivers are so late getting to Indianapolis this year is because they had ample opportunity to try out their mounts in New York, and those who are not repairing their cars are resting

in the interval before the 300-mile event which takes place on Decoration Day.

Repeated attempts to get post entries in the race have brought forth an official announcement from Manager Myers of the speedway that under no conditions will post entries be permitted. This reply has been made to Ira Vail, who tried to get in with his Hudson; De Palma with his Mercedes; to the Brooklyn owners of the Adams Special and Olsen Special cars; the Super-six Hudson that Mulford tried to get in, and a car from Detroit.

Hyatt Service Managers Meet

DETROIT, MICH., May 20—Hyatt service managers from every city in the country where there is a Hyatt branch closed their first annual convention to-day at the offices of the Hyatt company in this city.

Those present at the sessions, which began 2 days ago, were: J. J. Hanrahan, Los Angeles, Cal., representing the three Hyatt branches on the coast; J. W. Hutchinson, Boston, Mass.; L. R. Remington, Chicago, Ill.; R. B. Campbell, Atlanta, Ga.; K. H. McQueen, Newark, N. J.; N. S. Swan, Minneapolis, Minn.; H. Jay, Detroit, together with Service Supervisor A. K. Hebner; R. C. Brower, recently appointed traveling supervisor; J. W. Taylor, assistant service supervisor, and A. W. Robbins, assistant service manager at Detroit.

Venice Plans 100-Mile Race

VENICE, CAL., May 16—Plans are under way for a 100 mile race on the Venice road race course limited to cars of 231 cu. in. and under. The date suggested for the proposed event is July 4.

Reliability Run For Trucks

SAN DIEGO, CAL., May 17—July 15 and 16 are the dates set aside for the Los Angeles to San Diego motor truck reliability tour being promoted by the Los Angeles truck dealers under A. A. A. sanction. The trucks are to carry California products on the run.

Invoke Bay State Blue Law

SPRINGFIELD, MASS., May 20—As a result of the legislature not passing the law to allow the sale of gasoline and tires, etc., on Sunday the police here have notified the garage men that they must obey the law. Under the law a motorist cannot buy gasoline, tires, etc., and if he runs short of fuel and has a couple of punctures and has no extra tubes he may be marooned in a garage all night. The only alternative would be to borrow a tube or some fuel from a passing motorist.

$13,500 to Champion Drivers

Goodrich Adds $10,000 to Bosch Prizes for Three Leaders

NEW YORK CITY, May 18—Thirteen thousand five hundred dollars will be distributed by the Contest Board of the American Automobile Assn., to the champion automobile racing driver and the next two to finish in the championship award table during 1916. In addition thereto there will be a $1,000 cup.

The champion automobile racer of America will be officially declared this year by the A. A. A. and he will be awarded the cup and $7,000; to driver scoring second position, $4,000 will be given; and third position will receive $2,500.

Back of this cash offer are the B. F. Goodrich Co., and the Bosch Magneto Co. The Goodrich company will give $10,000, divided into $5,000, $3,000 and $2,000; and the Bosch company, as announced last month, will give $3,500 divided into $2,000, $1,000 and $500 and a $1,000 cup.

The championship award will be made according to a points system evolved by the Contest Board. The first of the championship events was the Metropolitan Cup Race at the Sheepshead Bay Speedway on May 13, which was won by Rickenbacher in a Maxwell. The standing of the first five as a result of this race is as follows:

Driver	Car	Points
E. V. Rickenbacher	Maxwell	600
Jules Devigne	Delage	320
Ira Vail	Hudson	170
C. J. Devlin	Duesenberg	90
George Adams	Adams	55
Bert Watson	J. J. R.	35

The 300-mile race at Indianapolis on Decoration Day is the next championship race and after that comes the 300-mile race at the Chicago speedway on June 10 and the 150-mile race at Des Moines on June 26.

Saxon Makes 34 M. P. G. in Spokane Fuel Economy Run

SPOKANE, WASH., May 18—The first economy run ever staged by Spokane automobile dealers was the feature event of the second annual Spokane automobile show. Sixteen cars competed in five classes, all the entrants showing exceptional ability to go many miles on 1 gal. of gasoline.

Before starting each car was fitted with a special gasoline tank, which was filled with 3 gal. of gasoline, and every car made the 37.5 mile run on less than the 3 gal.

To the Saxon goes the honor of making the best showing. With a piston displacement of less than 100 cu. in., it used just a little more than 1 gal. of gasoline, the car traveling at the rate of 34 m.p.g.

In the next class the Maxwell was the winner, averaging 29.3 m.p.g. The Buick light six roadster led its field, averaging 26.6 m.p.g.

In division No. 6, the class in which there was the greatest number of entrants, the Reo four, driven by Herb Alderson, was the winner. It averaged 25.4 m.p.g.

C. A. Martin driving a Paige six roadster was a winner over the Studebaker in the large car class, averaging a little better than 16.5 m.p.g.

To Renew Desert Classic

LOS ANGELES, CAL., May 17—Interest in the revival of the Los Angeles-to-Phoenix Road Race is growing. Four entrees have been promised already, in case the desert classic is staged this fall and in each case, no reference has been made to prize money, indicating a sporting angle which was largely responsible for the success of the first desert races.

Vanderbilt and Grand Prize in Nov.

LOS ANGELES, CAL., May 22—The dates for the Vanderbilt Cup and International Grand Prize races at Santa Monica will be Nov. 16 and 18, respectively.

Yellowstone Park Tour July 20

DENVER, COL., May 18—The Yellowstone National Park Tour will start from Minneapolis, Minn., July 20. The tour will be to Yellowstone Park by way of Fargo, Bismarck, Dickinson, N. D., Medora, N. D., Miles City, Mont., Forsyth, Billings, Livingstone and Gardner. A hotel train on the Northern Pacific Railroad will follow the tour, supplying accommodations and carrying a complete repair shop.

Racers Used Magnalite Pistons

NEW YORK CITY, May 22—In the equipment table of the cars in the Sheepshead Bay race last week it was stated that the two Delage cars driven by Limberg and Devigne used steel pistons. These cars were equipped with Magnalite pistons made by the Walker M. Levett Co., New York City. Magnalium piston equipment was given for Lecain's Delage, Devlin's Duesenberg, Resta's Peugeot, Rickenbacher's and Henderson's Maxwells, Watson's J.J.R., the Adams Special, the two Crawfords and the two Erwin Forties. All these cars also used Magnalite pistons.

British Industries Fair in 1917

LONDON, May 20—The Board of Trade has decided to hold the British Industries Fair in London next year from Feb. 26 to March 9, inclusive. Participation in the fair will be confined to manufacturers.

Factory Miscellany

Ford to Add in London—The Ford Motor Co. will add to its factory in London, Ont. The estimated cost is $75,000.

Douglas & Rudd Doubles Capacity—The Douglas & Rudd Mfg. Co., Bronson, Mich., maker of automobile accessories, has let contracts for an addition to its plant that will more than double its capacity.

Ford Plant in Chicago—The Ford Motor Co., Chicago, Ill., has let the contract for an additional plant in connection with its assembling plant in that city, which will be 56 by 365 ft., two stories, and will cost $60,000.

Elizabeth Co. to Build—The Elizabeth Auto Body Co., Elizabeth, N. J., will erect a plant, 100 by 100 ft., on South Spring Street, and an engine room, 40 by 40 ft.

Begg Motor to Add—The Begg Motor Co., Vancouver, B. C., will have an addition built at its plant immediately at a cost of $15,000.

Standard Truck to Build—The Standard Motor Truck Co., Detroit, will build a three-story reinforced concrete factory, 130 by 153 ft., to cost $50,000.

Takes Over Top Dept.—The Auto Vehicle Parts Co., Cincinnati, Ohio, has made a deal with the Higgin Mfg. Co., Newport, Ky., to take over its carriage top trimming department. The business will be removed to Cincinnati as soon as arrangements can be made.

Inter-State to Enlarge—Tentative plans are being made by the Inter-State Motor Co., Muncie, Ind., to build an addition to the plant this summer, 800 by 50 ft., and two stories high. This will give the factory approximately 350,000 sq. ft. of floor space. Two large enameling ovens have recently been installed.

Wis. Factory News—The Federal Rubber Co., Chicopee Falls, Mass., has filed articles and a statement to do business in Wisconsin. Of the $10,000,000 capital, $2,000,000 is represented by Wisconsin holdings, consisting of the property of the Federal Rubber Mfg. Co., Milwaukee, which recently disposed of its business to the Fisk interests, as noted at the time. The Wisconsin corporation will be dissolved and lose its identity. As has already been stated, the main plant at Cudahy, Milwaukee County, will be nearly doubled in size during this year.

The Continental Motor Truck Co., Superior, which engaged in the manufacture of motor trucks more than a year ago, is preparing to spend $50,000 in the erection of a factory of its own. The moving spirit of the company is Dr. John G. Barnsdale, 618 Tower Avenue, who designed the car, which has been manufactured on a small scale. Under the enlarged facilities, the truck will be built in four sizes and a large production attained.

The Perfex Radiator Co., Racine, a large manufacturer of radiators for passenger cars, trucks and tractors, is preparing to build a plant of its own. Plans have been prepared for the first unit, to be 65 by 250 ft. in size, one story high, of fireproof construction, to be ready during mid-summer. The company has been occupying leased quarters for several years, but these have been outgrown. G. W. Bartlett is president.

Ohio Seamless Tube Adds—The Ohio Seamless Tube Co., Shelby, Ohio, has purchased a building site and has started the erection of an entirely new plant in addition to its present plant, for the manufacture of seamless cold drawn and hot finished tubes. This mill will have a capacity of 2000 tons per month. The combined capacity of all of the mills of the company, when completed, will be 4000 tons per month. This new plant will be in operation Dec. 1.

Tracy Adds to Plant—Additional apparatus has been recently installed at the motor testing plant of Joseph Tracy, including a late model high-speed Sprague electric dynamometer, two hydraulic brakes and a chassis testing machine of the rear wheel type.

The Automobile Calendar

ASSOCIATIONS

May 22-26—Chicago, Ill., N. E. L. A. Convention, Electric Veh. Section, Congress Hotel.
May 26-27—Del Monte, Cal., Meeting, Three Divisions of National Assn. of Automobile Accessory Jobbers.
June 12-16—S. A. E. Summer Trip on Great Lakes.
July 2-6—Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
Dec. 2-9—Electricians' Country-wide Celebration.

CONTESTS

May 30—Des Moines, Iowa, Iowa Derby, 20 miles; Des Moines Special, 10 miles.
May 30—Tacoma, Wash., 10, 20, and 30-Mile Races, Tacoma Speedway Assn.
May 30—Elmira, N. Y., Track Race, Elmira Auto & Motorcycle Racing Assn.
May 30—Indianapolis Speedway 300-Mile Race.
May 30 — Minneapolis, Minn., Speedway Race.
May 30—Newark, N. J., Track Race, Olympic Park Racing Assn.
June 4—Sheepshead Bay Speedway, 30-mile Race, American Liberty Day Committee.
June 10 — Chicago Speedway Race. International 300-Mile Race, Speedway Park, Speedway Park Assn.
June 16-17 — Sheepshead Bay Speedway, 24-Hr. Race, Trade Racing Assn., New York City.
June 20—Galesburg, Ill., Track Race, 100 miles.
June 28—Des Moines, Iowa, Speedway Free-for-All, 300 Mile Race.
July—LaGrande, Ore., Track Race, LaGrande Motor Club.
July 4—Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4—Tacoma, Wash, Speedway Race, Tacoma Speedway Assn.

Aug. 14-18—Cedar Rapids, Iowa, Tractor Demonstration.
Aug. 21-25—Bloomington, Ill., Tractor Demonstration.
Aug. 28-Sept. 1—Indiana Tractor Demonstration.
Sept. 4-8—Madison, Wis., Tractor Demonstration.
Sept. 11-16—Milwaukee, Wis., Fall Show, Wisconsin State Fair, Milwaukee Automobile Dealers.

The Week in the Industry

Trade Happenings

New York City Trade Items—The P. J. Durbam Co., 244 West Forty-ninth Street, has added the Willard storage battery service station to its equipment, in addition to its present work as official service representative for the Electric Auto-Lite Co., Toledo, Ohio, and Gray & Davis, Boston.

The Redden Motor Truck Co. has moved its office and showroom to the Locomobile Building, Sixty-first Street. C. A. Redden, president of the company, recently moved the general offices of the company to 676 Woodward Avenue, Detroit, and will divide his time between these two cities.

The organization of the Colonial Motors, Inc., which was recently formed by J. F. Plummer, former local Locomobile manager, to distribute the Liberty car, has been completed. Arnold Wood is vice-president, H. B. Van Loan is secretary and treasurer, J. L. Bailey is sales manager, and L. W. Beck is service manager.

Robert Lurie & Co., Metz distributor, is now located at 240 West Fifty-sixth Street. The wholesale department is to be placed in operation with W. L. Schmidt; formerly of the International Motor Truck Co., in charge.

Charles Rifenberg, who for a time managed the service station of the King Motor Co., will superintend the service station of the C. T. Silver Motor Co., Overland distributor in Bronx.

E. J. Stern has taken on the agency for the Palmer-Moore truck, with an office at 1777 Broadway.

W. J. Taylor has joined the C. H. Washburne Corp., Moline-Knight distributor, as sales manager and efficiency expert. Mr. Taylor entered the Overland company in 1914 as efficiency engineer. Last year he joined the C. T. Silver Motor Co. and continued on the same work.

The Glidden Motor & Supply Co. has leased the building at 604 West Forty-seventh Street and the Dayton Rubber Mfg. Co. has leased the store at 1764 Broadway.

Columbus News Items—The Buckeye Tire & Supply Co., 75 North Fourth Street, has been made central Ohio distributor for Portage tires and tubes.

The Willys-Overland Co. will take over the central Ohio agency for the Overland June 1 and operate a branch house in the Buckeye capital. The agency had been handled for eight years by O. G. Roberts & Co. The branch service house will remain at the former location of the Roberts Co., 933 East Gay Street. A salesroom will be opened in the downtown automobile section. The manager of the Columbus branch has not been announced.

The Times Square Automobile Co. has opened a store for parts and accessories in South High Street.

The F. L. Chase Co., 390 North High Street, has taken the central Ohio agency for the Mac kand Saurer trucks.

The C. N. Bowen Motor Sales Co., 138 East Spring Street has taken the central Ohio agency for the Lexington.

C. E. Barr, one of the best-known automobile salesmen in central Ohio, has been made general manager of the Central West Motor Car Co., 80 North Fourth Street, agent for the Oakland.

The Campbell-Gilchrist Rubber Co. is the name of a new concern at 15 North Fourth Street, to handle Pennsylvania tires in Central Ohio.

The dealers in electrics in Columbus have united in a campaign of advertising to boost the sale of electrics at this time. Those who are participating in the campaign are Michael Abel, agent for the Baker, Rauch & Lang; F. E. Avery & Son, agent for the Detroit, and the Standard Motor Car Co., agent for the Milburn Electric.

The Willys-Overland Co., which will establish a Columbus branch June 1, has taken a lease on a large salesroom at Fourth and Gay Streets, which lies in the heart of the automobile district. The service station will remain at 933 East Gay Street, where the O. G. Roberts Co., former agents in central Ohio, was located. Samuel Isaacs, formerly with the Roberts company, will be in charge of the Columbus branch.

Power Barley District Sales Mgr.—Jos. R. Power has severed his connection with the Anderson Electric Car Co., Detroit, Mich., to accept a position as district sales manager with the Barley Mfg. Co., Streator, Ill., manufacturer of the Roamer car.

L. C. Mulford, who for a number of years has been identified with the automobile industry and who for the past 2 years has been traveling representative for the Barley Mfg. Co., Streator, Ill., has taken over the distribution in central Illinois of the Halladay models and the Roamer, which are the products of the Barley company. He will have headquarters in Streator.

Detroit Changes—A. A. Lehr, formerly assistant purchasing agent for the General Motors Co., and at one time connected with the purchasing department of the Studebaker Corp., has been appointed sales manager of the American Distributing Co., Detroit.

E. J. Curren, formerly assistant sales manager of the King Motor Car Co. and also of the Paige-Detroit Motor Car Co., has joined the sales promotion division of the Regal Motor Car Co.

New England Trade Items—An agency for the Lexington Six has been placed in Boston, Mass., with the Standard Automobile Co., that has the Standard Eight.

The Henshaw Motor Co., that has eastern Massachusetts for Dodge Bros. cars, has just opened a sub-agency at Brockton, and it has also leased a larger building for its Worcester branch. The company is planning a larger service station at Boston.

M. A. Potter, until recently with the New England branch of the Firestone Tire & Rubber Co., at Boston, has been appointed Eastern manager for the Werner-Lenz Co., Chicago.

G. H. Schuster, who won the New York to Paris race with the Thomas some years ago and who was with the Pierce-Arrow factory, has gone to Boston to take charge of the Dodge Bros. service station there and at Worcester. He will be supervisor of the stations in eastern Massachusetts.

J. S. Downey, who was prominent in motor racing circles some years ago, has bought an interest in the Massachusetts Storage Warehouse Co.

G. S. Whelan, formerly manager of the Grant car agency at Boston, has been placed in charge of the Munroe car agency just opened at that city.

C. W. Flynn, for some time manager of the Stamford, Conn., branch of the Chevrolet, has accepted a position as sales manager of the Inter-State Motor Co., Boston.

Scott Joins H. & N Carburetor—The H & N Carburetor Co., 1790 Broadway, New York City, announces the appointment of J. Arthur Scott as manager of its Pacific Coast branch.

Mr. Scott, who is well known to the trade as an expert gas engine man, held a similar position to that of his new appointment with the Master Carburetor Co.

The new branch office will be located at 617 South Olive Street, Los Angeles.

The AUTOMOBILE

Resta Wins Sweepstakes

His Peugeot Covers 300-Mile Course on Indianapolis Speedway at 83.26 M.P.H. —D'Alene's Duesenberg Second at 83.15

Mulford's Peugeot Third and Christiaens' Sunbeam Is Fourth — Two Accidents

By J. Edward Schipper

DARIO RESTA, a native of Sunny Italy, and a citizen of the United States, flashes once more to the fore. To-day he added another jewel to his crown of speed by winning the 300-mile Indianapolis classic with his Peugeot. D'Alene, a Californian, driving a Duesenberg, took second place.

Resta's time was not as fast as that for the same distance of a year ago, when the race was 500 miles long, his average being 83.26 m.p.h. In 1915 Resta covered the distance at a speed of over 89 m.p.h.

Two accidents marred the afternoon. Tom Rooney, whose car blew a shoe on the back stretch, had his shoulder dislocated and his hip broken when his car rolled over. His mechanic, Jim McAllister, was badly bruised. Jack LeCain was injured more seriously when he also struck the retaining wall on the back stretch and sustained severe injuries. It is feared that his back may possibly be broken.

Good Generalship

The driving of Resta will be long remembered for the cool calculation displayed. He let the leaders who dashed to the front in the first few laps set the pace and then, when accidents had put them out, he continued to set a safe pace which was just sufficient to carry him across the finishing line by a little over 2 min. ahead of D'Alene. Resta only stopped once, when he changed his rear tires and put in gasoline and oil, the total time for this stop being 1 min. and 5 sec. It occurred in his sixth-ninth lap, and the time lost did not interfere with his lead.

Ten Cash Prizes

This year's purse includes ten positions. It totals $30,000 with $12,000 for first, $6,000 for second, $3,000 for third, fourth $2,000, fifth $1,700, sixth $1,400, seventh $1,200, eighth $1,000, ninth $900 and tenth $800.

At 12.30 the cars were lined up across the track in the order of start, which had been determined by the speeds made in the elimination trials. They were then sent around the track one at a time, while announcers introduced them to the crowd. After again getting into position the cars were paced a lap, led by Frank Smith in a white Premier, started and crossed the line for the beginning of the race almost on the tick of 1.30.

Around they circled, and almost immediately the parade of cars which had been four abreast began to string out in a line, so that, at the end of the first lap, the entire ellipse was doted with the flying speed creations.

Across the line they sped, with the cars that were to set the pace already in

THE WINNERS

Car	Driver	Time	M.P.H.	Prize
Peugeot	Resta	3:34:17	83.26	$12,000
Duesenberg	D'Alene	3:36:15	83.15	6,000
Peugeot	Mulford	3:37:56	82.6	3,000
Sunbeam	Christiaens	3:46:36	79.96	2,000
Delage	Oldfield	3:47:19	79.2	1,700
Maxwell	Henderson*	3:49:56	78.3	1,400
Premier	Wilcox	3:54:31	76.8	1,200
Crawford	Johnson	4:01:54	74.4	1,000
Crawford	Chandler	4:02:43	74.2	900
Osteweg	Haibe	4:03:10	74.0	800

*Rickenbacher driving at finish.

the lead. Eddie Rickenbacher in his Maxwell came first, followed by Aitken in a Peugeot and Resta in another Peugeot. Close behind came Anderson in a Premier, Rooney, his team-mate, in another, Merz in a Peugeot, Wilcox in another Premier, Arthur Chevrolet in a Frontenac and a scattered field trailing along behind.

Rickenbacher Leads

The second lap saw Rickenbacher opening a gap between himself and his pursuers. About 300 yards separated him from the nearer cars, foremost among whom were Aitken and Resta. The same order prevailed among the others except that Arthur Chevrolet had pulled up and was now in seventh place with his Frontenac. Merz was driving his Peugeot at a tremendous pace to force himself up among the leaders and was gradually gaining. At the end of the fifth lap Rickenbacher, who had now gained a lead of 1000 yd., lapped Johnson in his Crawford just in front of the stands, and a loud cheer went up, as the flying Maxwell began to pass car after car on the lap behind.

Aitken and Resta were running neck and neck at the end of the fifth lap and those in the pits and stands knew that it was not a question of driving, with these three leaders, so much as the ability to stand pace. The mass of steel that could endure the strain would win, as the pilots had even more power at their command then they could use, and it was not a matter of mere speed so much as of endurance and driving.

Rickenbacher Goes Out

Two cars rolled up to the pits in the sixth lap for spark plugs; these were Wilcox in the Premier and Gaston Chevrolet in the Frontenac. In both cases oil had passed the pistons and sooted the plugs. In the meantime, while these cars were at the pits, the procession was streaming by with Rickenbacher still far out in the lead until, at the end of the ninth lap, his white car dropped from the race, a broken steering knuckle rendering useless all the power and speed of driver and engine.

Ralph Mulford, whose Peugeot finished third in the 300-mile International Sweepstakes at Indianapolis

With Rickenbacher out, the lead passed to Aitken, and at the end of the twelfth lap he and Resta were closely grouped and a quarter of a lap ahead of Mulford in another Peugeot. The three Peugeots, the products of France, made the pace through many a mile with the others in an ever-lengthening string behind them.

Chandler had to bring his car to the pits in the eighth and again in the twelfth lap to renew the gasket on his gasoline tank. This bothered him all through the race and cost him a position up near the front in the early stages of the grind. Others also were beginning to pay visits to the pits by this time. Anderson had to change the plugs on his Premier in the fifteenth lap, and the Sunbeam, driven by Christiaens, came in for a new left rear tire in the sixteenth.

Resta snatched the lead from Aitken in the seventeenth lap, when Aitken stopped for 20 sec. to change his right rear wheel.

This made the order in the eighteenth lap: Resta first, Aitken second, Merz third and Henderson, in the Maxwell, fourth. D'Alene's Duesenberg was then running sixth and gradually working its way through the field.

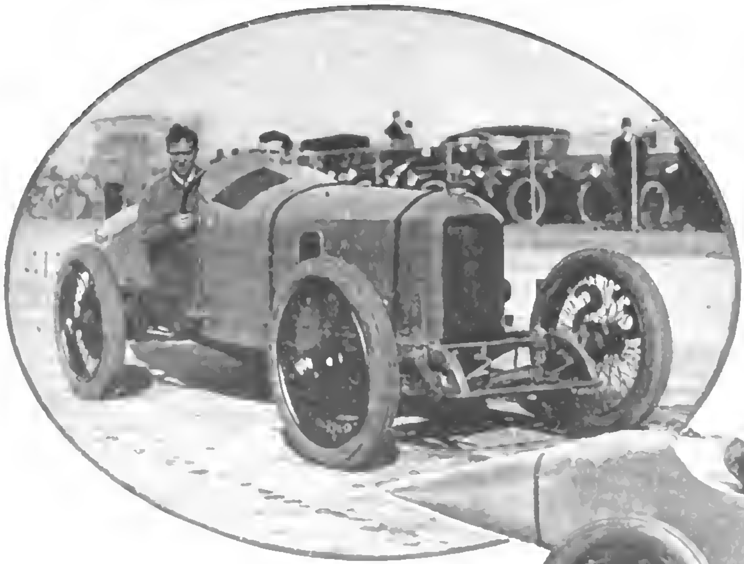
Aitken had to come in again in the twenty-fifth lap for another tire change. This was handled beautifully and he got away with a delay of but 22 sec. At the end of 50 miles, Aitken's two tire changes had left him in second place with Resta leading. Merz was a close third, Henderson fourth, Gaston Chevrolet fifth and D'Alene sixth.

A Steady Grind

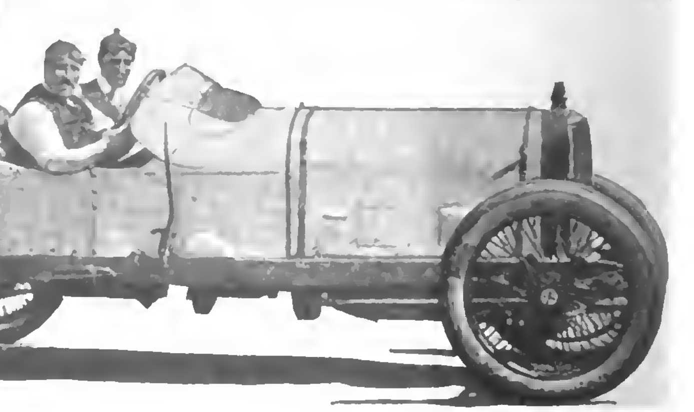
The race had now settled down to a steady grind. It was a question even at this stage, whether or not Resta would fail. If his car continued to run the way it was going, and he did not make a stop so that Aitken would catch him, the race was his. He was about a half lap in the lead at 75 miles with Gaston Chevrolet, who had been driving a game race, up in third position. D'Alene had now pushed his way to fourth and Henderson was fifth. The race all along the line was exceedingly close and a stop for a shoe meant the loss of position.

When the 100-mile stage was reached Resta still held his uncomfortable lead of half a lap. Aitken was still pursuing him and D'Alene had gained a firm hold on third position in one of the prettiest driving exhibitions seen for some time. Gaston Chevrolet was in fourth place and Henderson fifth. Ralph Mulford was working his way toward the front also, and now held sixth with Devigne seventh.

In the next 50 miles Ralph Mulford showed some of the best speed of the day.



Left — Dario Resta, winner of the Indianapolis 300-mile race, at the wheel of his Peugeot



Right—Joseph Christiaens in his Sunbeam, which he piloted to fourth place in the Indianapolis 300-mile speed battle

He passed D'Alene, Chevrolet and Henderson and put himself into third position by his fast sprint. Here he lay in wait for the leaders to break themselves up, Henderson being now fourth and D'Alene fifth. In the sixty-eighth lap, Aitken had to stop again. This time he changed plugs and the delay of just over a minute allowed the flying Resta to gain another mile and a half or more. Immediately after, however, Resta, on his sixty-ninth lap, had to stop for a right rear tire, gasoline and oil.

Aitken Succumbs

At the end of Aitken's sixty-ninth lap, the break came. Up to this time he always had a fighting chance, but a broken valve put him out of the running and left Resta safely up in front. Thus, at the end of the 200 miles Resta was far ahead, with Mulford second, Rickenbacher, who was now driving Henderson's Maxwell, in third place, D'Alene fourth, Anderson fifth and Christiaens sixth. The average for Resta at this time was 85.79 m.p.h., and he was driving very conservatively with 100 miles still to go.

A close fight for third position was now on. Resta held a substantial lead at the end of 225 miles, and Mulford seemed to have a firm grip on second place, but by forcing his car D'Alene passed Henderson and projected himself into third position. Anderson, who had been running fifth, went out with a broken rod in the seventy-fifth lap and that put Christiaens in his position.

Henderson's Maxwell, which finished in sixth position in the Indianapolis race, Rickenbacher driving, making fast time in a practice spin on the Hoosier speedway

John Aitken's Peugeot which made fast time up to the sixty-ninth lap of the race when a broken valve put him out of the running

D'Alene's Sprint

D'Alene, continuing his burst of speed, began to outdistance Mulford and, at the end of the 250 miles, was in second place. Mulford was then third with Christiaens fourth. Fifth place was held by Oldfield who had driven consistently throughout the entire race, and, as the leaders were eliminated, climbed higher and higher. Rickenbacher, in the Maxwell, was sixth, Haibe, in the Osteweg, seventh, Wilcox, in a Premier, eighth, Alley, in the Ogren, ninth and Johnson, in a Crawford, tenth.

This same order held at the end of the race, except that Wilcox succeeded in passing the Osteweg and Chandler in a Crawford managed to nose in ahead of Alley for seventh and ninth places respectively.

Resta flashed across the wire an easy winner. He had never really pushed his car during the race and the high safety factor under which he was working is shown by the fact that he only stopped once. His pit men had always kept him posted as to his lead since the early part of the race and he had never striven to put the lead up to more than enough to carry him through a safe winner.

The attendance at the race was estimated to total between 80,000 and 90,000, the usual proportion coming in their automobiles, while special trains to Indianapolis from Detroit, Chicago, Cleveland, New York and other large centers served their part in transporting speed-seeking motorists, near-motorists and members of the industry to the Hoosier saucer.

Arrangements at the track were excellent, the militia detachment guarding the course in accordance with the custom at previous Indianapolis classics keeping the best of order and preventing any untoward accidents to spectators.

Billy Chandler at the wheel of his Crawford Special, which captured ninth prize money in the Indianapolis race

Oldfield Breaks Record

Barney Oldfield, driving the front-drive Christie car, broke the lap record for Indianapolis speedway on May 28, when he covered the 2½-mile course at an average speed of 102.623 m.p.h. The previous record was made by Boillot, who was recently killed by German airmen while fighting in France. His time was 1:30.13. Oldfield covered the course in 1:27.70.

Pit Work Better Than in Other Recent Races

Tire Changes in Less Than 1 Min.—Pit Rules Rigidly Observed by All

INDIANAPOLIS, IND., May 30—On the whole the pit work was better than that shown at Sheepshead Bay, where it was somewhat ragged. At Indianapolis tires were changed in times that ranged between 20 and 40 sec., and there were very few that took over 1 min. At New York several of the changes occupied far longer than they should have done.

Some of the pits were in charge of ex-drivers who were thoroughly familiar with the work and saw to it that proper efficiency was shown in making changes or adjustments. The pit rules were rigidly adhered to by the attendants as well as the drivers and mechanics, and in no instance was there any tendency toward the infraction of the rule that allows only two men out of the pit at any time.

Tire inflations ranged on the average around 60 lb. Some of the drivers pump the tires to 100 lb. before starting the race, and then let the pressure down to the required amount. In this way any delay that may be caused by pumping is eliminated. The treads on the tires are not buffed off, as they have been on the faster tracks, because the centrifugal factor does not have to be reckoned with to such a degree. The tire changes are being made more often in all the races before the shoe blows. In that way it is possible to avoid limping around the track, and the danger of having a blowout on a bad turn, where there are a number of cars bunched, is averted.

The right rear shoe is, of course, the one most susceptible to wear and the left front is least in danger of giving out. There were no changes in the race of front lefts, although on more than one occasion the right front was blown. It is the tire that must be watched most carefully on this track. Eddie Rickenbacher blew a right front shoe in practice just before the race. The tire went over the roof on the grandstand and the car spun around three times before it was brought under control. If this had occurred in a race with the cars bunched the results would have been disastrous.

The 5-in. tires are hard to steer on this track and, although they wear better, are harder on the driver. In fact, the difference is so noticeable that only drivers of more than ordinarily powerful build would care to manage a car so equipped. The use of smaller tires in front than in rear is quite common here, as will be noticed from the equipment table, and the difference in ease of steering is quite noticeable with these smaller wheels. It may be that the gyroscopic action of the wheels has something to do with this. It seems quite possible that this is so, when it is remembered that the drivers could not manage cars equipped with disk wheels on this track at all.

Osteweg Makes Good Showing in Initial Race at Indianapolis

A Description of This Special Car—Details of Design of This Special Car Hitherto Unavailable

The Osteweg car is fitted with a Wisconsin power plant that has been developed very much along the lines of the Delage.

The engine is a four-cylinder, sixteen-valve design having a bore of 4 11-32 and a stroke of 5 in. The cylinder casting is vertical and the valves are carried on each side, operating horizontally. The motor as far as the camshaft layout is concerned is the same as a T-head job, as there are two shafts, one located on each side of the crankshaft. The camshafts are driven off the timing set at the front end of the motor.

The Valve Action

The cams actuate long vertical push rods, four of which are located on each side of the motor. Each push rod operates two valves simultaneously. The push rods on the right take care of the intake and those on the left the exhaust. The rods bear against Y-shaped rocker arms which are so curved as to transform the motion given to them in a vertical direction by the push rods to a horizontal motion. The vertical rods bear against the stems of the Y and at the end of each of the branches there is a bearing against the end of the valve stem. Thus each rocker arm takes care of the two intake or two exhaust valves for one cylinder.

Other than in the valve action there is nothing about the motor which would distinguish it greatly from any other power plant. The pistons are magnalite and the dimensions of the pistons, valves, etc., are not radical. The valves have a clear opening diameter of 1¾ in. and the lift is ⅜ in. In transmitting the motion to the valves the rods pass up through the casting which forms in one piece, the manifold header and valve cover plate.

The exhaust manifold is carried overhead, while the intake is on the side as indicated. The carbureter is carried on the right side of the engine, but the make is not fixed as it is desired to try out several at the track before deciding.

Three Main Bearings

Three main bearings are used on the crankshaft. These, unlike many of the racing cars, are plain babbitt lined bearings. The diameter of the crankshaft is 2 in. and the lengths of these bearings are 3¾ in. rear, 2½ in. front and 2 in. center.

Standard design is used through the remainder of the chassis. The clutch is a cone and the gearset provides three speeds. Tires are Silvertown cords, 33 by 5 in. Springs are semi-elliptic and are used in conjunction with a Hotchkiss drive.

Oil and gasoline are carried in the tail of the car. The capacity of the gasoline tank is 25 gal. and that of the oil tank 7 gal. The tail piece is tapered off in a streamlike style, but does not extend back with a very extreme taper. The contour of the rear deck is flat compared to some of the other racing cars and the wheelbase is short, being but 102 in.

Ignition is by Bosch magneto, there is one set of plugs and the car carries Hartford shock absorbers all around.

Summing Up the Truck Final Drive Situation

Reasons for Using Different Forms for Different Purposes—Origin and Special Qualities of Gear and Worm Axles

By A. Ludlow Clayden

IN the development of the automobile there have been several periods during which vehement discussion raged concerning some particular feature of construction. In the early days of the passenger car there were bitter arguments between the protagonists of the sliding gear type of change speed which is now universal and of the theoretically far superior epicyclic mechanism. There were arguments concerning the proper place to locate the engine, whether it should be under the hood or somewhere beneath the body, whether accessibility or body space was the most important quality.

More recently we have had the battle of the cylinders, 1 vs. 2, 2 vs. 4, 4 vs. 6, and so on, right up to the present time when 12 vs. 16 looms in the offing.

It is not so very great a time since it appeared problematic as to whether steam or gasoline was to be the automobile motive power.

Looking back over some of these arguments it is interesting to observe how sometimes theory has triumphed and many times commerce has overmastered theory. In the question of sliding vs. constant mesh gearing, the exponents of the former type had nothing whatever to support their construction except simplicity. Every theoretical argument favored some other type of gearing.

To look at the other side, theory condemned the kind of simplicity which used to be typified by exposed unlubricated timing gears, non-automatic carbureters, etc. In these respects theory has been vindicated absolutely.

Practicability the Keynote

To-day engineers have come to realize that nearly every engineering problem in connection with automobile design construction resolves itself into a matter of *practicability*. Where alternative construction presents itself it is almost invariably found that one has advantages not possessed by the other, but also must own to especial disadvantages. Sometimes for some conditions of service one idea will be the best, on other occasions it may be the other construction which will strike the happiest medium.

It is easy in looking back over years to see how prominent men have changed their opinions, have in many cases eaten their own words as increasing experience has shown the truth to be different from their anticipation, but it is always possible in such a review of former happenings to notice that those who made mistakes made them because they overlooked some vital factor.

To-day there are still in progress very many arguments, but none of them so all-absorbing as were the particular ones cited above. Still the argument which circles about the final drive of the commercial vehicle has reached a pitch where it is not far behind the older controversies.

Conscious that I am treading upon dangerous ground, I propose briefly to review the developments of different types of truck axles, prefacing these remarks with the statement that there is no form of final drive for either a truck or a passenger car which is not a compromise. There is no form that does not possess disadvantages as well as advantages, and just as with everything else, a new sphere of action for the product demands a fresh examination of the whole subject to see how the balance of advantage and disadvantage may best be struck.

Early Forms of Drive

Again let us step back a few years to the time when all automobiles were, with very few exceptions, chain-driven. In those days we were still using extremely crude cars. The exposed timing gears above mentioned were still in vogue. Noise troubled us not at all and efficiency but little, therefore devices were adopted and used without protection and without special provision for lubrication.

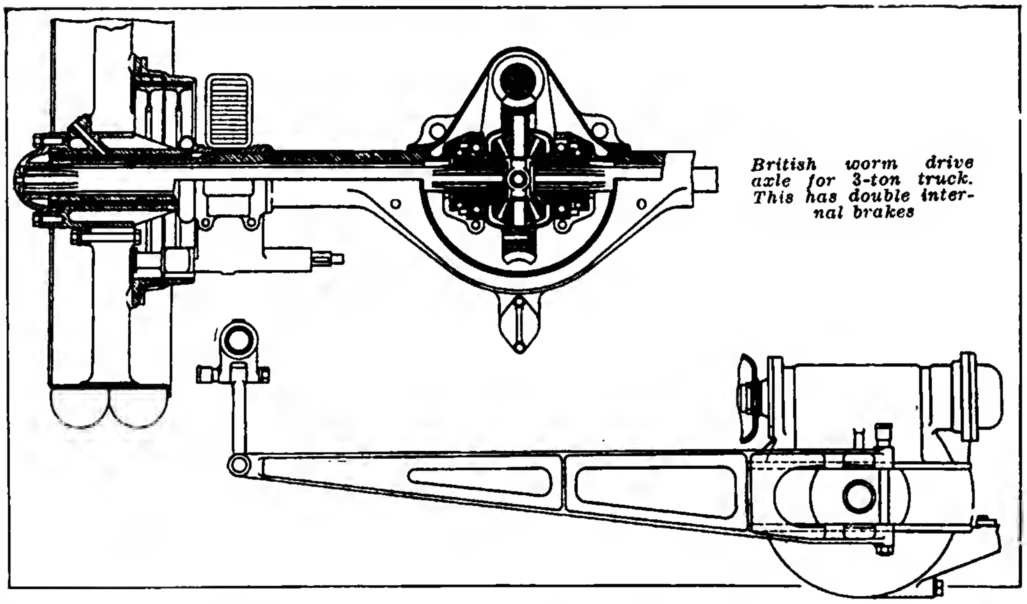
In considering the final drive, it must be remembered that a chain in those days was vastly inferior to the chain of to-day. The art of chain making was then in its infancy. The materials available were not of the same quality, and chain manufacturers were often unable to judge which was the best material to use, lacking almost all the experience they now possess. This situation created two schools of engineer: one adhered to the chain, improved it, devised cases and means for automatic lubrication; the other seeing that the chain run dry was in a way unsatisfactory, turned to some totally different types of mechanism; whereby the propeller shaft and live axle transmission was created. Once discovered, the live axle was cheaper than a chain drive with proper inclosure, and it required a little less attention, although the attention demanded by a properly protected chain is very small indeed.

Meanwhile, the commercial vehicle was developing. The earlier types, patterned upon the passenger car chassis, adopted the exposed chain drive. When the live axle was developed with the passenger machine, there were two things to prevent its adoption on a heavy vehicle; one was that it was impossible to house a bevel gear giving a sufficient reduction in an axle case of practical size, and the other was that the earlier live axles on passenger cars gave frequent trouble through lack of strength arising from the lack of experience of the designer.

Improvements in Chains

Chains all the time were being improved. The good chain or, alternatively, practical methods for inclosing the chain, arrived too late to compete seriously with the live axle for passenger cars. But they did not arrive too late to retard the development of live axles for commercial vehicles. In 1906, or thereabouts, chains were giving excellent service in commercial work, although they had been almost completely abandoned for passenger cars.

There is no question that a well-made chain running on well cut sprockets is an efficient method of transmitting power, and it is unfortunate from the chain viewpoint that a poorly-made chain on badly cut sprockets is still fairly efficient and will operate with moderate satisfaction. Had it been *essential* to make a chain well and mount it properly, had it been *impossible* to "get away" with a poor chain layout, this form of drive could never have been attacked on the score of noise or lack of durability when inclosed.

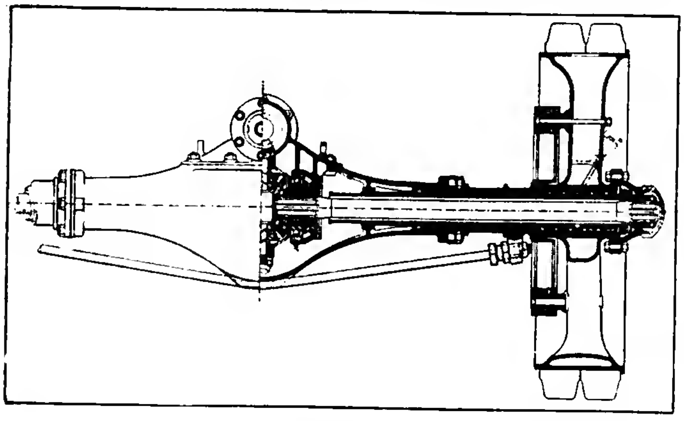


British worm drive axle for 3-ton truck. This has double internal brakes

The Internal Gear

The live axle took France and Germany by storm, so the French and German engineers turned at once to the development of something other than a chain drive when they started to make heavy vehicles. There is no need to recapitulate all the steps. Many different kinds of mechanism were tried, but the German Daimler company took up the already known principle of the internal gear drive and developed it so that it was very reliable. The same mistake was made as had been made with the chain, namely, the ring gear and pinion were run exposed and unprotected, so the transmission rapidly became noisy and it wore out with moderate rapidity. Still at that time the German Daimler company knew more about materials than any other automobile firm in the world, and for this reason their axle was able to give excellent service. It did not take long for other firms to see how greatly the Daimler axle could be improved by arranging for the inclosing and lubrication of the pinion and ring gear. The details have been worked out by many different firms in Europe and in America. There are all kinds of designs just as there are all kinds of automobiles. Some are elaborate, with the utmost regard paid to the perfection of every detail. Others are much simpler and sometimes less durable and less efficient.

Returning to the historical view, the noise created by the worn, unprotected Daimler axles had its effect in England and elsewhere. The British engineers preferred not to follow the lead of the continental men, that is to say, instead of taking the original Daimler axle and making the few necessary improvements, they commenced to evolve an entirely different sort of inclosed commercial vehicle axle. This produced a type rare in America but widely used in Europe to-day. This is the *double reduction axle* wherein a propellor shaft drives a bevel gear which operates a differential. This is mounted above the main driveshaft in an axle case, and from the differential the drive to the wheels passes through two pairs of spur gears, one on each side of the differential. The principle is another form of the internal gear, only instead of using pinions and a ring gear, two spur gears are used located in the center of the axle. The internal gear type has the weight carried on a dead axle and the power transmitted through a differential and driveshaft affixed to the dead axle. The double reduction type is essentially of live axle design, the weight being borne by the casing which incloses all the gearing.



A worm gear axle of British construction very like the London omnibus axle

The internal gear and the double reduction types of axle are alternative ways of doing precisely the same thing.

Taking some of the comparative points, the internal gear axle can be made to provide a somewhat greater road clearance at the center and probably, if the standard of engineering is equal, it should be a trifle lighter, owing to the fact that the rotating driving members turn at higher speed and therefore can be made smaller.

On the other hand, to take the question of brakes, it is immediately obvious that it is easier to accommodate wide internal brakes on the road wheels with a double reduction type of axle than with the internal gear drive, because of the space which must necessarily be occupied by the ring gear.

One could easily proceed along this line of analysis, going into very great detail, but sufficient has been said to show the choice between two forms is a question for the individual engineer. Some little thing in connection with the problem before him may cause him to decide in favor of one type more than the other. It may be that he requires an exceptional ground clearance or some other factor may be uppermost in his mind.

The Worm Gear Arrives

Nearly simultaneous with the above developments, we see the arrival of the worm gear. Owing to the noisiness of the early London omnibuses, both chain and internal gear driven, public clamor became so insistent that police regulations were adopted in which Scotland Yard was empowered to withdraw from service any omnibus which in the opinion of their inspectors was excessively noisy, requiring the car to be examined by their agents before again allowing it to run. Under these regulations enormous financial loss to the omnibus companies resulted owing to the difficulty of maintaining traffic. Matters finally reached so acute a point that any form of drive promising quietness was considered. One of the early English trucks, the Dennis, had for some years been worm driven and several of the omnibus companies replaced the final drive system on some of their omnibuses with Dennis worm drive axles. Whatever faults were dedeveloped that of noisiness, the most important of all, was eliminated and after trial the worm drive was adopted as the standard London omnibus final drive. Used by the omnibus companies, care naturally was taken in lubrication, gears were examined, bearings adjusted when necessary. Run under these conditions it soon became obvious that a worm drive would last for 30,000 or more miles, and it was argued that, despite the careful attention, bus service was particularly arduous in one respect, owing to the enormous amount of starting and stopping. Nearly simultaneously noise in the gearset was eliminated by means of a peculiar type of silent-chain jaw-clutch transmission. The modern London omnibus is thus a peculiar combination of all the elements wherein elimination of noise has been the dominating object.

With the enormous demand of the omnibus companies for ultra-quiet chassis, the British truck industry equipped itself to supply such vehicles and gradually developed the various peculiar elements to a high state of efficiency. It was, of course, natural that the same chassis should be utilized for freight haulage, especially since the road conditions in England do not demand the same ruggedness of chassis construction required in America.

Some Disadvantages

With the development of the worm for heavy passenger and freight haulage, it was quite natural that the silentness and smoothness of the worm should attract pleasure car designers and many British builders adopted the worm drive for their pleasure cars. The difficulty of obtaining clearance with the underslung worm and the necessity of placing an inconvenient tunnel in the floor boards of the rear seats with the overhung type, together with such engineering difficulties as were encountered by car builders improperly equipped to build good worm drives, caused some firms to return to bevel gears.

For reasons which need not be gone into here, the development in design of the commercial vehicle in America was much slower than its European development. The European truck industry was almost grown up when the American industry was in its infancy. Thus, at the time when the chain drive had given way to the internal gear in continental Europe, and to the worm or double reduction axle in England, it remained supreme in America. This means that when the American industry gave serious attention to the design of commercial vehicles, it found three distinct types of axles, each in a high state of development, from which to choose as an alternative to the chain, and, just as their European colleagues had done before them, the American engineers plunged for the new idea instead of taking the chain drive and giving it a proper chance by making it properly and applying it in accordance with correct principles.

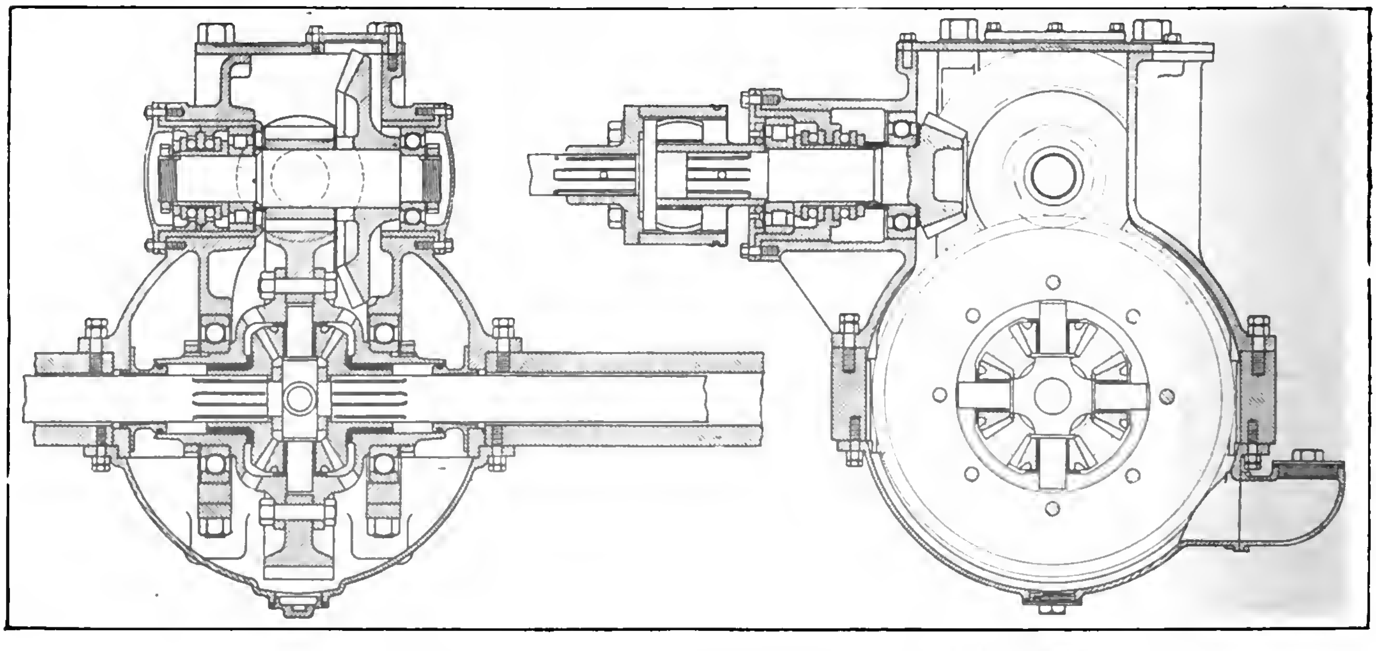
The Double-Reduction Axle

It is curious that the double-reduction axle is not used by more manufacturers in America to-day. Probably the explanation is psychological. Certain engineers thought they would be wisest if they were guided by the experiments of France or Germany, and studying their field, naturally it appeared that the internal gear drive was the predominant type. Others looked particularly to England, and these naturally received the impression that the worm gear or the double reduction axle was the best. Excellent arrangements were made by American firms with those who had developed the worm in England, so that, from the start of real activity in the commercial car field, American makers have been able to buy thoroughly good worm gears.

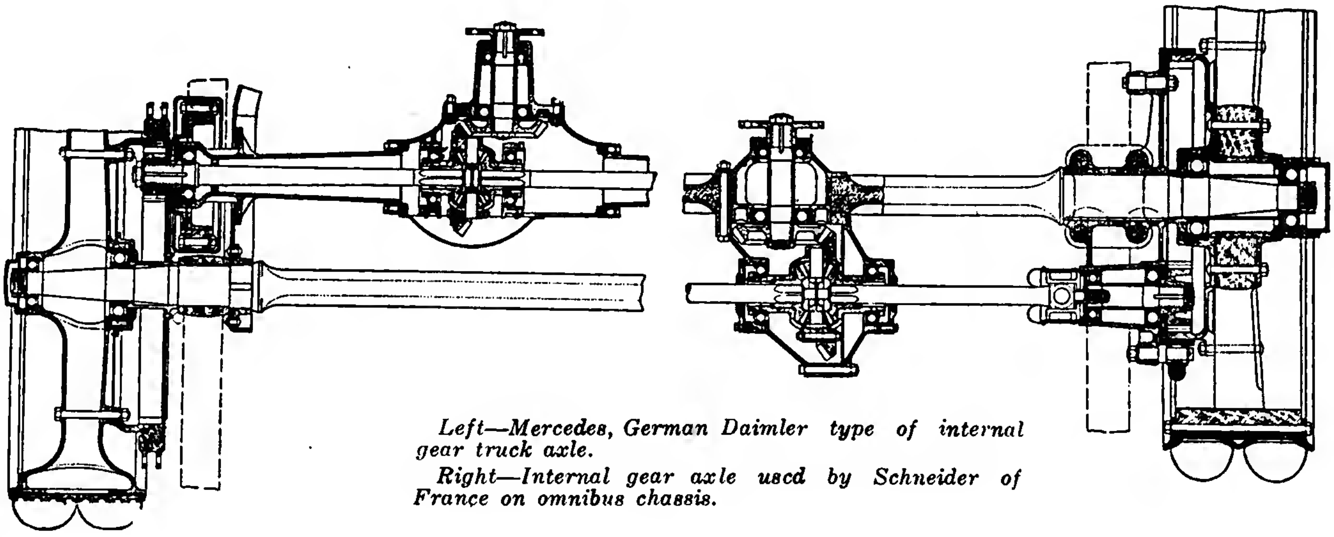
In this connection it is interesting to observe that the tendency in this country has been for the worm to be adopted for heavy vehicles and the internal gear axle for lighter types. The reason why the worm was taken up for the heavier machines when the point of discarding the chain had been reached was two-fold. Firstly, it so happened that the Pierce-Arrow company, owing to certain affiliations, was looking to *England* for the results of experience in commercial vehicles at that time. Secondly, it happened that the London omnibus was a 3-ton machine, so the enormous amount of data collected was a very direct value in applying the worm to a heavy truck.

Summing up: the worm axle has the advantages of permanent quietness, of oil bath lubrication for every part, and of every facility in brake application and design.

The introduction of the internal gear final drive unquestionably antedated the manufacture of commercial vehicles in the United States; thus it was the readiest idea to adopt at the time designers began to give serious thought to the problem of replacing the chain with shaft drive in truck use. Furthermore, live axles on passenger cars were still none too strong, and so the dead axle feature of the type was very attractive. It is also claimed with complete justification that



A typical British double reduction axle approved under the war subsidy scheme



Left—Mercedes, German Daimler type of internal gear truck axle.

Right—Internal gear axle used by Schneider of France on omnibus chassis.

ignorant adjustment or improper lubrication can do little harm to anything except easily renewable parts.

No Ultimate Form

The question as to what form of final drive will be eventually triumphant appears to be unimportant, since it will be settled by the law of supply and demand. Supply and demand for certain specialized qualities, i. e., quietness, brought the worm gear into existence as a factor in truck construction via the London omnibus. The law of supply and demand for other qualities brought the internal gear axle for light trucks on the American market—elimination of chain troubles. When, and as long as, worm axles and internal gear axles can be produced at about the same price, they will both continue in existence.

It is far from improbable that we shall see the introduction of the double-reduction design to America, for it has special points to recommend it. *None of the three types was chosen or will be chosen for its theoretical perfection.* Each came into existence because it seemed to certain engineers to be the best way of answering certain conditions and these conditions varied a little with the locality. They were different in England from what they were in Germany; different in America from what they are in Europe.

Thus, in the final analysis, it is well to remember that all engineering is a compromise. If it were possible to incorporate *all* the advantages of any unit in *one* special construction, it would be foolish for engineers to consider any other type whatever.

It is no more likely there will be a single, ultimate form of final drive than that there will be a single, ultimate design of engine.

Time-Saving in Assembling Chalmers Wheels

IN a factory that moves at top speed in every department, efficiency experts find that it pays to accelerate on the small jobs.

At the factory of the Chalmers Motor Co., Detroit, Mich., the method of placing the rims and tires on the wheels is an admirable illustration of time-saving. Four men in this department assemble wheels, tires and rims for an output running over 125 cars per day, everything possible being done to expedite the work and to make things convenient for the men performing it.

Separate racks contain the rims, wheels and tires with deflated tubes. The man at the left of the illustration operates a device which springs the rim open so that the tire can be placed in position. He then locks the rim and passes the job on to the next man. The tire is inflated and again passes to another man who places the rim on the wheel. The nuts holding the demountable rims in position are put on with the aid of a compressed-air wrench.

Industrial Preparedness

Howard Coffin Tells S. A. E. Reasons for Scheme—Part to Be Played by Automobile Industry Has Huge Importance

INDIANAPOLIS, IND., May 29—One of the most impressive of the race-time functions at Indianapolis was the preparedness dinner given by the Indiana section of the Society of Automobile Engineers at the Claypool Hotel Monday night. Howard Coffin, chairman of the Committee on Industrial Preparedness, a sub-division of the Naval Consulting Board, was the principal speaker.

The meeting was presided over by F. E. Moscovics, chairman of the Indiana section of the S. A. E.

S. A. E. to Have Important Rôle

Probably of the greatest interest to the automobile industry was the explanation by Mr. Coffin of why the Society of Automobile Engineers was not invited to join actively in the work of the industrial committee. He explained that this was due to the much more intimate part that the S. A. E. would be called upon to perform in handling the questions of motor transportation, which are of the first magnitude under present conditions of warfare. He stated that under pending legislation, particularly the Chamberlain bill, it is very well possible that the members of the S. A. E. will be organized into a highly-efficient transport group which will take care of the movements of motor trucks and passenger cars in army service.

Mr. Coffin's speech follows in part:

I have been asked to talk to you about preparedness, but I am going to deal with a kind of preparedness about which we have heard little. To most of us the word brings visions of marching soldiers and of battle-ships in fighting trim. We are all of us thrilled by sound of drum and fife, and interested in the saber-clanking kind of preparedness. This sort of thing appeals to our imagination and is in line with all the war stories we have read since we were children.

It is a matter of our common knowledge that we are not a militaristic nation. Saber-clanking is not in our line and never will be for any great length of time. It should be clear to us, therefore, that if we are to adopt any policy of preparedness—and expect it to be a consistent policy which can be maintained through the years of peace, as it must be if we are ever to be fitted to defend this country when war threatens—that policy must be one in keeping with the traditions and ideals of this nation.

It is this kind of preparedness about which I wish to talk to you. This *industrial preparedness is basic preparedness.* Two years of observation of the European war has taught us organized industry is the foundation upon which we must rest any and every plan for our military preparedness for defense.

Between 80 and 90 per cent of the manufacturing and producing resources of the European countries are engaged in the making of supplies for their armies. In the event that we are so unfortunate as to become involved in an argument with any first-class foreign power, an equal percentage of our manufacturing equipment will be needed in this same service.

Industrial preparedness is strictly in keeping with the natural tendencies and abilities of our people. It is the

Preparedness dinner given by the Indiana section of the S. A. E. at the Hotel Claypool in Indianapolis on May 29 cheapest form of preparedness. We already have the investments in plants, in tools, in machinery—and more important still, our investment in skilled workers. A soldier may be made in a year—it takes many years to make a toolmaker.

As I have said, we have all this equipment in our hands—but it is unorganized and uneducated for national services. All of us in this audience know that we cannot expect any big manufacturing plant to change over in less than one year's time from its usual commercial line, to a product with which its manufacturing departments have had no previous experience. And yet that is exactly what at least 80 per cent of our plants would be called upon to do in case of a real war.

In England the situation should be of particular interest to us for two reasons: Firstly her traditions, conditions and governmental methods are more nearly parallel our own. Secondly her policies—again probably paralleling our own under similar conditions—afford us a glaring example of what best not to do.

No record of skilled labor was available—and thousands upon thousands of skilled workers have been wasted at the front who would have been worth their weight in gold in the factories at home.

In the meanwhile some interesting things were happening in Germany. I cannot better illustrate than by quoting a true story told me by an eye witness. There is one big manufacturing plant in Germany well known to you all. A telegram announcing the declaration of war was received at 2 o'clock in the afternoon.

Bells rang throughout the plant and the men past their pay windows, receiving slips of paper which carried their instructions. One per cent of them left the plant at once on the way to their concentration points; others proceeded to the storerooms in which were kept the gages, jigs and tools for use in the production of that material of war for which that great plant, through careful prearrangement, was to be held responsible. Others of the workmen left at once to report as experts in matters of ignition on aeroplanes and motor vehicles.

The machinery scarcely even stopped. A few hours at most in shifting jigs and changing setups and the change from the commercial product to the war product had been made.

Here, in this simple story we find the meat of true preparedness. In this story we have illustrated the kind of preparedness which really appeals to us as of practical utility.

The United States has manufacturing facilities twice as great as those of any other nation. None can compete with us in this respect. It is this vast industrial resource that the Naval Consulting Board seeks to develop. This is a non-partisan body and among its sub-committees is that on industrial preparedness. This committee has spread beyond the confines of its original scope and, realizing the importance of industry in war, has set about to organize it so that it will be available instantly in time of need.

Mr. Coffin mentioned several striking examples of unpreparedness among the nations and contrasted them with conditions that existed in Germany just before the opening of the war. He stated that Germany had sixty thousand machine guns before the war. At the rate of manufacture in England after the war had run 6 months it would have taken 30 years to catch up with Germany, even neglecting the daily output in that country.

Example after example showing the astonishingly sudden change to chaotic conditions in our own and other nations after the opening of the war were mentioned by Mr. Coffin. He told how concerns were forced into bankruptcy due to rejected munitions and misfit parts.

The great work of the industrial preparedness committee in listing the different manufacturing concerns and determining just what work each would be fitted to do was one of the important parts of Mr. Coffin's talk. Every plant that has tool equipment is included in this and the scope of the plan covers every industry, every machine and every man as well as the plant itself. Those plants which do not fall into the scheme would be stripped of men in time of war.

In pointing out the great necessity of the assistance of the S. A. E., Mr. Coffin mentioned that in the United States in January, 1916, there were 2,400,000 cars as compared to 800,000 in the rest of the world. In this connection he also spoke of the immense value of the proposed road system on which $150,000,000 will be spent in the next five years.

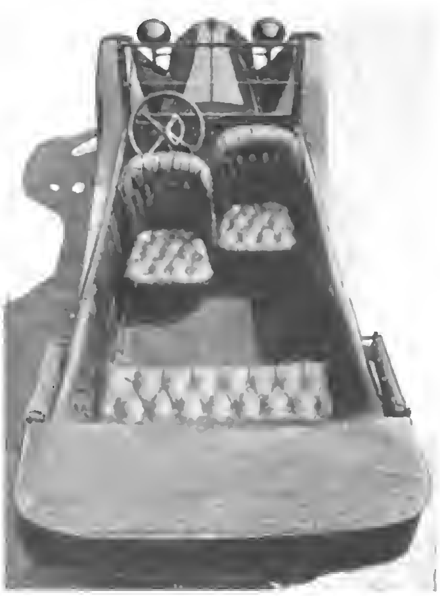
A brief review of the pending acts in the Legislature was given by Mr. Coffin, who announced himself as favoring very strongly the Chamberlain bill, which goes deeply into the measure of preparedness and clears the way for several steps which have heretofore been impossible on account of adverse laws. He stated that he believed this bill would become a law within 30 days. The creation of a $20,000,000 nitrate plant was also touched upon as an immediate need. The aim of the entire movement is to place the industries of this country upon a footing where they will be able to shift from a peace to a war basis without confusion in 30 days.

About 350 engineers and members of the industry and important clubs attended, and Mr. Coffin's speech was applauded with intense enthusiasm by the audience that had spent nearly 2 hr. in close attention.

Formula for Making Curing Acid

Nearly all repairmen will be interested in knowing the formula for making curing acid, as it is often inconvenient to have to obtain this acid from the manufacturers of the repair materials. The formula is as follows, according to directions given by the Goodyear Tire & Rubber Co., Akron, Ohio: Add 1.7 fluid oz. (5 centilitres) of sulphur chloride (S_2CL_2) to 1 gal. (3.79 liters) of carbon tetrachloride (CCL_4).

Studebaker Fits Flexible Seating



As an indication of what can be done in the way of pleasing and useful body construction even where a large output is the rule, the Studebaker body with its individual and movable front seats which is being fitted to the four- and six-cylinder chassis made by the Studebaker Corp. stands out strongly. It is surprising how useful such an arrangement is, for not only can each front passenger enjoy extreme riding comfort but the car may be utilized in a very sociable way by lifting these seats from their sockets in the car floor and turning them around. This feature lends itself admirably to picnics and camping expeditions, for the chairs can also be made to do duty on the ground as well. Not only are the seats removable, but they are adjustable as to leg room by moving them forward or back within a wide range.

Four-Cycle Engine—Two-Stroke Effect

Novel Design Gives Impulse Every Down Stroke in Each Cylinder—Piston Valves Employed

THERE have been very few attempts to design gasoline engines which will give an impulse every revolution in each cylinder, excepting two-stroke motors. The Strickland engine is a novel effort in this direction and possesses several points of interest. The system is explained almost completely by the illustrations.

First, there is a two-diameter piston, and the cylinder has the usual combustion space at the top. Midway of the cylinder length there is an annular space left when the piston is at the top dead center, and this forms a secondary combustion chamber. The idea is somewhat similar to the two-cycle wherein the lower part of the piston is used as a pump, but in this case both upper and lower parts are working pistons.

The action is as follows: As the piston descends under the impulse of a charge in the upper combustion chamber the lower part of the piston is drawing in gas from the carbureter.

On the reversal at the bottom of the stroke the upper piston commences its exhaust stroke and the lower part rises on the compression stroke.

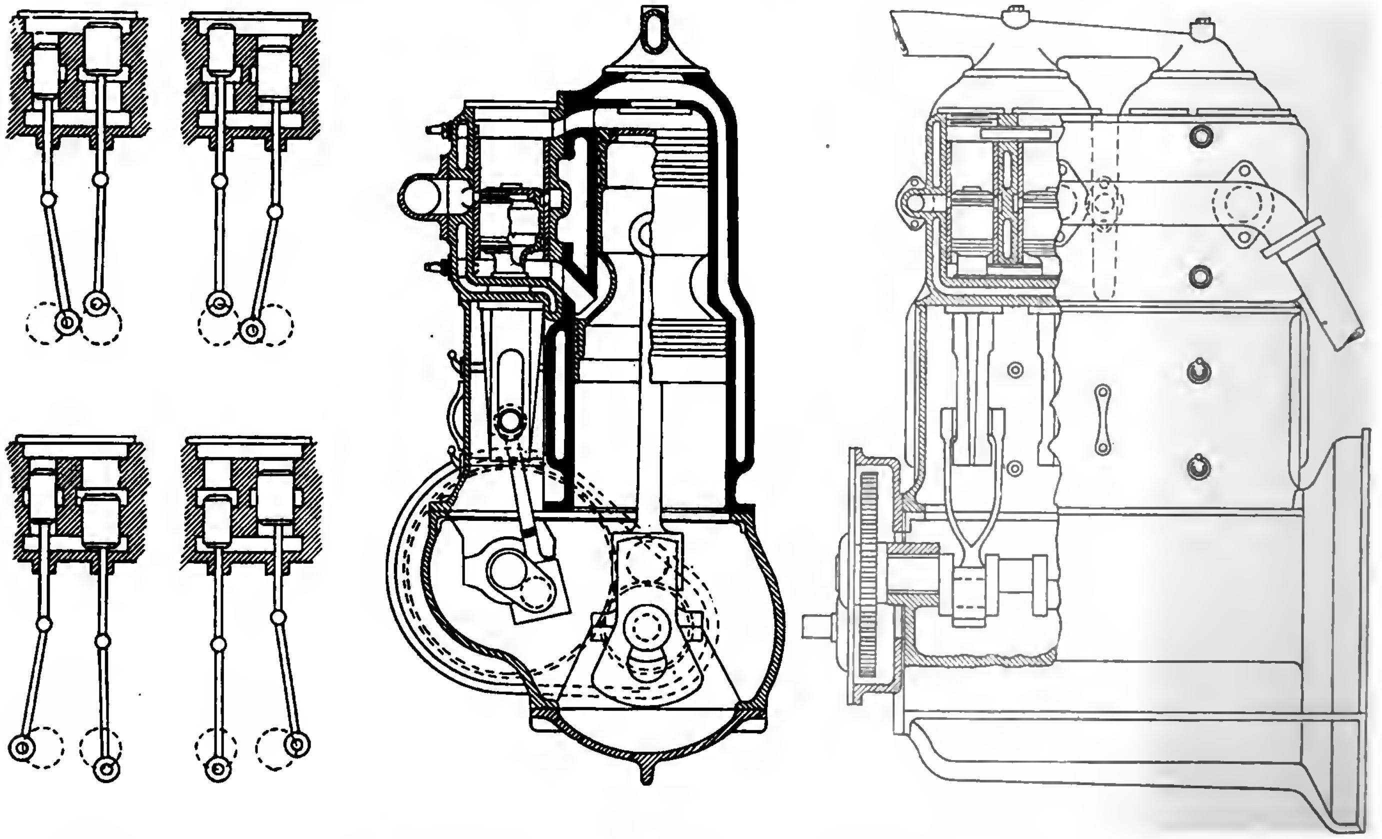
In the next stroke firing and expansion take place in the lower part and intake on the upper piston.

For the last stroke the upper part is compressing while the lower is exhausting.

Obviously it would need somewhat complicated mechanism to control the intake and exhaust with poppet valves, as two separate sets would be required, so the inventor has very ingeniously arranged a single pair of double-acting piston valves to control both the upper and the lower cycles. These are shown on the left of the engine in the illustration. Intake and exhaust take place through the two ports shown in the middle of each valve piston stroke. When the piston controlling the exhaust or intake is at the bottom of its stroke it uncovers the port so as to connect it with the upper combustion space. When the valve piston is at the top of a stroke, the same middle port is put into communication with the lower combustion space. There is a second crankshaft for operating the valves, this being driven by gear from the main crankshaft.

The exhaust parts are large enough to let off exhaust pressure quickly by the number of ports inserted in the circumference of the bushing. The inlet bushing has a lesser number of ports which are narrow and long and are gradually opened up in area as the main piston approaches the middle of the suction stroke, at which point occurs the greatest inrush of mixture.

During the exhaust stroke of the upper piston area the crank of the exhaust valve is moving across the lower dead center, during the suction stroke the exhaust piston is traveling upward in the bushing, during the compression stroke the crank of the exhaust valve is traveling across the upper dead center, and during the explosion stroke the exhaust valve or piston is traveling down a little in advance of the main piston.



Strickland double-acting, four-stroke engine. The successive positions of the two piston valves which control both the upper and lower combustion spaces are shown at the left to let the charge off before this piston arrives at the lower end of the stroke.

In like manner the inlet valve, which is adjacent to the exhaust, is going through similar operations in relation to the intake stroke of the main piston.

As the cycles of operation are plainly set forth in the diagram it is also seen and understood that each piston valve is alternately supplying and exhausting gas to the upper and lower area from the common inlet and exhaust passage or port located between the combustion chamber at the middle of the bushing.

The inlet valve is at the farthest point of travel during the explosion, thereby bringing all the rings on it into action to guard against leakage to the supply chamber.

The inlet valve and the main piston are also guarded against leakage to the opposite side by a vented groove between the inner set of rings.

The inventor lays particular stress on two points in connection with his design. The first is that the effect of the piston valves is to extend the indicator diagram, thus making for increased thermal efficiency. The reason for this is that the piston valves are near the top of their stroke during suction and descend during the firing stroke (and *vice versa* for the lower combustion space), thus having the effect of making the cylinder bigger during the expansion stroke than it is during the suction stroke. This follows the principle of the Atkinson cycle.

The other claim is, of course, that the space occupied is much smaller for a given power output than for a four-stroke engine of equivalent power. According to the drawings made for the two-cylinder design, the length is 0.7 the length of a four-cylinder engine of conventional design with equivalent piston displacement.

The inventor also points out that the weight of the double pistons is not excessive. Allowing for the weight of the connecting-rods, it is claimed that the compound pistons with their two rods weigh 35 per cent less than four pistons and four rods to give equivalent power with single action.

Testing for the Flash Point of Oils

THE Flash Point of Oils is the title of technical paper 49 of Petroleum Technology 10 issued by the Department of the Interior, Bureau of Mines, Washington, D. C. The paper goes into a consideration of the different methods of testing for flash point and in the conclusions makes the following statement:

Two Accurate Testers

"The most accurate tester and the tester that most nearly reproduces actual working conditions should be adopted for official tests. If all of the above factors be considered, it is believed that these two testers, the Abel-Pensky and the Pensky-Martens, as modified by the Bureau of Mines most nearly meet the desired conditions.

"The Bureau of Mines flash testers have been officially adopted by the National Fire Protection Assn. and the Independent Petroleum Marketers' Assn. of the United States.

The important factors to be considered in the construction and manipulation of an instrument for determining the flash point of an oil may be cited as follows:

1—The conditions under which the test vapors are generated should be as like as possible for the conditions found in practice.

2—Corrections should be made for variations from the normal barometric pressure.

3—The shape and dimensions of the cup should be definite.

4—The size, shape, depth of immersion and exposed part of the thermometer should be definite and the thermometer should always be calibrated. The thermometer should be calibrated when immersed to the collar, 60 mm. from its lower end.

5—The oil should never be exposed for any length of time at temperatures greatly higher or lower than the normal temperature.

6—The rate of heating on testing should be constant and at the rate of about 1 deg. C. per minute for lamp oils and 3 deg. to 5 deg. C. per minute for oils with a high flash point.

7—The oil being tested should be uniformly stirred during the test.

8—The test flame should be of definite size; it should be exposed at a fixed distance above the surface of the oil and for a definite length of time.

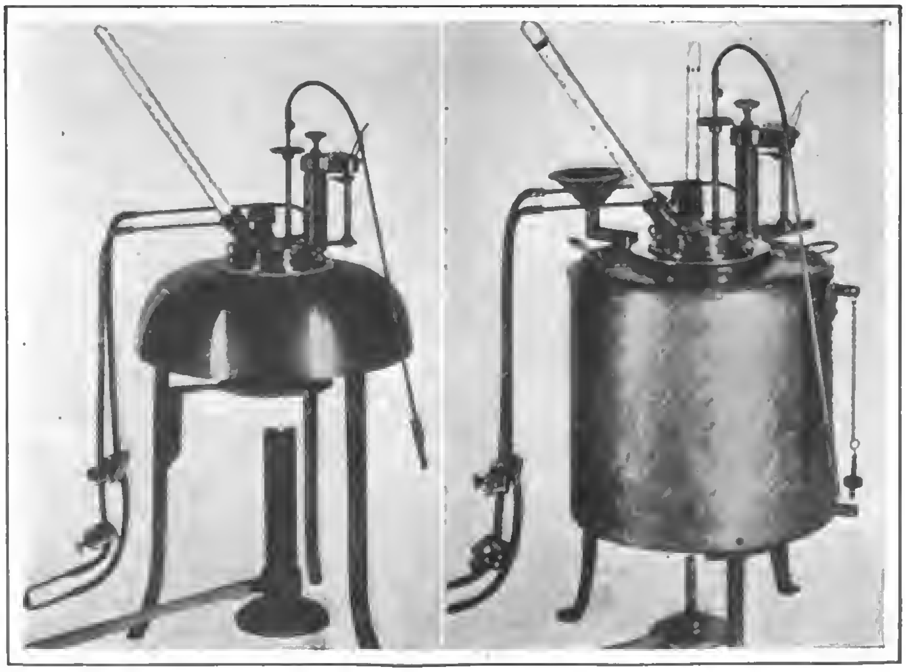
9—All water should be removed from the oil prior to testing.

10—In general testing, so far as possible, the personal equation of operators should be eliminated, and the manipulation of the tester made entirely mechanical and automatic.

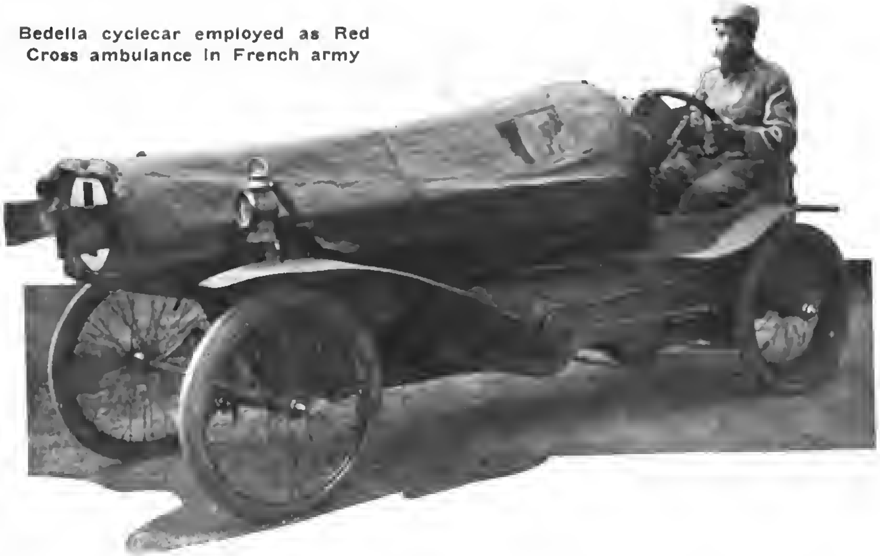
The booklet goes into an analysis of the different kinds of testing instruments, showing the defects of each classification and the manner in which tests should be made in each.

No attempt has been made in this paper to place a relative value on any of the conditions determining a fire hazard but the paper does describe attempts to definitely establish a method of determining a particular thing—the flashpoint —as one factor in the conditions governing the danger.

A requirement that an oil shall have the highest practicable flashpoint, as such a requirement tends to reduce the fire hazard to a minimum and is praiseworthy and humane. But to require too high a flashpoint may, in the case of a lamp oil, impair the burning qualities of the oil and also work a hardship on the refiner.



Abel-Pensky and the Pensky-Martens testers as modified by the Bureau of Mines



Bedelia cyclecar employed as Red Cross ambulance in French army

Cyclecars for Ambulances

Bedelias Reach Inaccessible Places—Propose Taylor System for Munitions Works

PARIS, May 5—Cyclecars are now being made use of in the French army as an auxiliary to the Red Cross service. The regulation automobile ambulance carrying four men lying are unable, owing to their size and weight, to get close to the first aid dressing stations. Thus wounded men have to be first brought to the rear on stretchers before they can be placed in the automobile ambulances. Experiments which have been carried out in the Soissons district with Bedelia twin-cylinder air-cooled cyclecars show that these machines can travel as far forward as the stretcher men can penetrate, and that they can bring wounded cases back much quicker than it is possible to do it by hand. As there is no fear of a machine getting into a position from which it cannot be extricated by a few willing helpers, the driver of a cyclecar does not hesitate to go forward where a motor ambulance driver would hold back.

One Man Carried

The machines are twin tandem seaters, with the motor in front and the driver at the rear. Only one wounded man is carried at a time. The stretcher is placed on the top of the body and attached to it by coil springs, so as to give additional comfort, the wounded man having his head toward the rear and his feet over the motor. When weather conditions require, he can be completely covered with a canvas top mounted on a rigid frame.

In the Vosges mountain district motorcycles and sidecars are made use of for bringing in wounded men from places inaccessible to the big automobile ambulances. On these mountain passes it is often necessary to travel over mule tracks where there is not sufficient width for an automobile and where the soft earth would not carry their weight. The motorcycles do this work efficiently. Although not an easy matter, means have been found to place a stretcher on the side car so as to handle serious cases.

To Increase Outputs

With a view to an increase of the output of all munition factories, the French artillery and munitions department has issued a circular showing how improvements can be made. These suggested reforms interest the automobile industry, for all the automobile factories of France are occupied on war material.

It is suggested that the Taylor system should be adopted as extensively as possible. This system is well known to French automobile manufacturers; when first attempts were made to adopt it, a few years ago, it met with opposition from the workers. Arrangements are now being made to place foreign labor at the disposal of the factories. It is suggested that this should be taken advantage of as fully as possible and that female labor should be employed. In certain special cases where new contracts are being given in France, one of the clauses is that no native labor shall be employed. No source of labor must be neglected, and every effort must be made to see that each man is doing the work for which he is best suited. If a man with military obligations cannot be employed to the best of his powers, he should be returned for active service in the army.

No automobile factories were able to produce forged shells until the war had been in progress for a considerable time. The installation of underground trolleys, endless traveling bands and light automobiles for moving shells from one part of the building to another, is also recommended as a saving of labor. In a large number of factories apprenticeship classes have been formed. While it is not expected that these will turn out highly skilled workers, the movement is to be recommended.

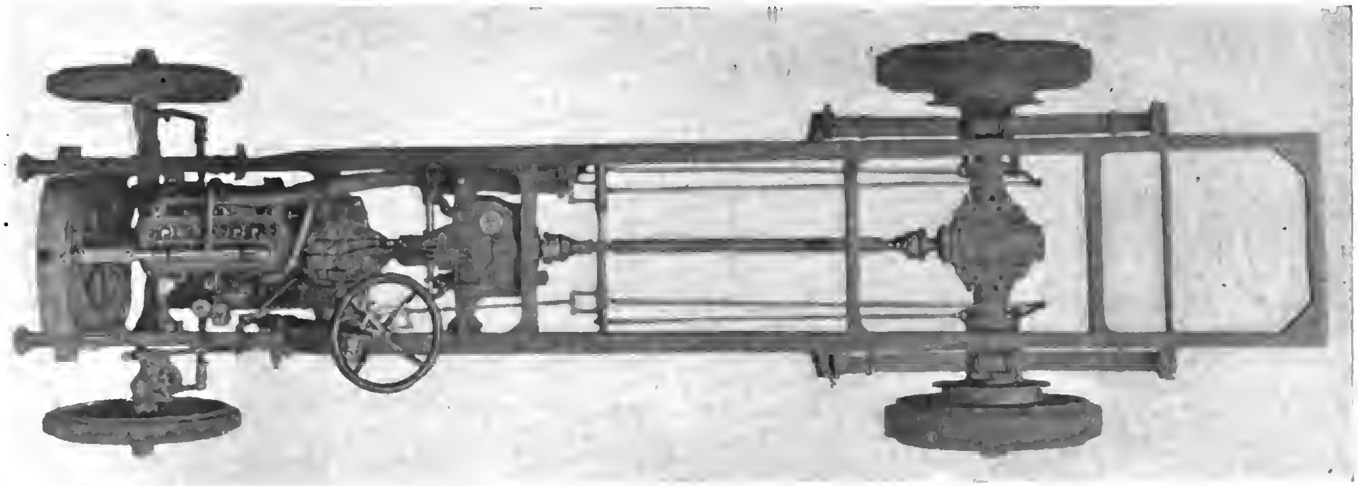
Kissel Brings Out New Two-Tonner



Plan of Kissel Two-Tonner chassis, showing the simplicity of the design and the substantial character of the various units

New Model Has a Four-Cylinder Block Motor 4¼ by 5½—Four-Speed Gearbox and Worm Drive Features

THE Kissel Two-Tonner recently announced by the Kissel Motor Car Co., Hartford, Wis., incorporates a number of improvements in design and construction over the preceding model of the same capacity, and the chassis sells for $1,875, or a reduction of $235. Specifications of the new model follow closely those of the previous 2-ton machine, the truck being a worm-drive, left-steer machine.

36.75 Hp. at 1200 R p.m.

A four-cylinder block cast motor of 4¼ in. bore and 5½ in. stroke and built in the Kissel factory is used, and is claimed to develop a brake test horsepower of 36.75 at 1200 r.p.m. The formula rating is 28.9 hp. The power plant drives through a leather-faced cone clutch, fitted with adjustable springs to insure gradual engagement with the flywheel, a four-speed selective gearbox, double Spicer universal and shaft to the worm and wheel rear axle.

The gray iron crankcase casting is divided on a line 2 in. below the crankshaft center, and is designed to insure great resistance to strains of all kinds. The crankshaft is drop-forged from 40 per cent carbon steel, and is suspended in three bearings constructed of babbitt poured into a steel skeleton. The camshaft, also suspended in reinforced babbitt bearings, is an integral forging. Wristpins are of 1⅛ in. diameter and are made of Shelby steel tubing, hardened and ground, working in Non-Gran bearings in the connecting-rods.

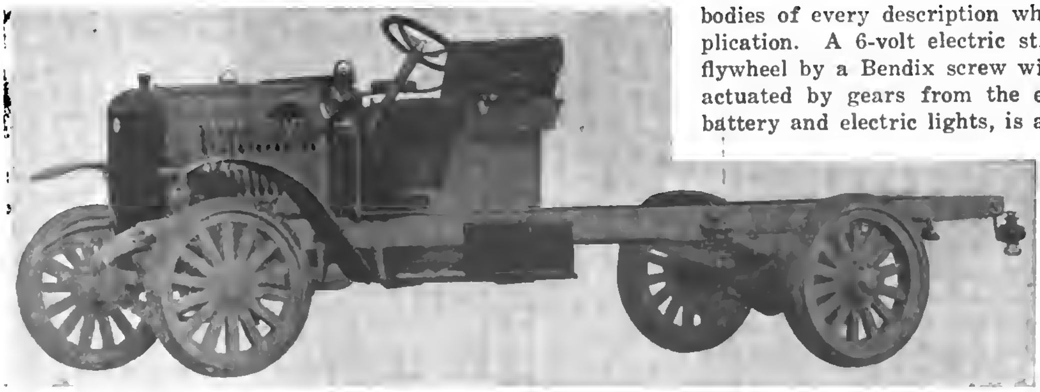
The motor is oiled by a splash system in combination with a positive action gear pump which forces oil through tubes to troughs under each of the connecting-rods. The carbureter is manufactured in accordance with Kissel design by Stromberg, and receives fuel from a Stewart-Warner vacuum tank which is attached to the motor.

The radiator is of the square tube type hung in a spring-suspended cradle designed to prevent weave and vibration on the radiator when traveling over rough roads. Cooling is by centrifugal pump circulation, with a water capacity of 5 gal. Maximum speeds are automatically regulated by a governor on the motor, which allows a maximum engine speed of 1295 r.p.m., permitting the truck to travel 14 m.p.h. on direct drive, 16 on fourth, 8 on second, and 4 on low. The wheelbase is 144 in. and the sizes of the solid rubber tires in the standard equipment are 34 by 3½ in. front and 36 by 6 in. rear.

The frame is of pressed steel 6 in. deep, ¼ in. gage, 34 in. wide and is suspended on semi-elliptical alloy steel springs measuring 38 by 2½ in. front and 54 by 3 rear.

Timken axles are used, the rear axle being floating with worm drive inclosed in a steel-cast housing. A turning radius of 25 ft. is obtained.

A standard stake body, painted Kissel blue with black chassis is furnished for $150 additional, or special bodies with increased wheelbase or length of frame upon specification. The factory has on file drawings and prices for special bodies of every description which may be secured upon application. A 6-volt electric starting motor driven from the flywheel by a Bendix screw with a 6-volt lighting generator actuated by gears from the engine, complete with storage battery and electric lights, is also offered at $150 additional.



The new Kissel Two-Tonner chassis selling for $1,875. Standard equipment includes two oil lamps, tail lamp, horn, jack, complete set of tools and steel channel bumper. Stake body is $150 extra

Adjustable Fulcrum for Cantilever Springs

Theory and Practical Solution for Springs of Variable Flexibility from the Point of View Rejecting Automatic Adjustment

DESIGN, construction and theory of the North system for varying the flexibility of cantilever springs are set forth and discussed in *The Automobile Engineer* for May, the views which led North to work out the system being first explained. With reference to practical results it is the reviewer's total impression that the subject which is here debated may be formulated in two simple questions: (1) If the anchored end of a cantilever spring is 30 inches long and the axle end is 24 inches long, or in similar proportions, can a considerable change in the flexibility of such a spring be effected by an adjustment which makes the anchored end 24 inches long and the free end 30 inches long, and will there be any unacceptable stresses due to adjustment for maximum flexibility? (2) Is the proposed mechanical arrangement for effecting such an adjustment adequate and acceptable?

The main points in the presentation of the subject are given in the following:

Objects and Requirements of the Construction

While the need for adjustability of the suspension is not great in large and heavy cars, where the load variation is relatively small, the increase of average comfort which results from adjustability of the suspension is very great in light touring cars, which may weigh only one ton and may carry loads varying from 200 to 1500 pounds.

It is useful to have an adjustment of sufficient range to cover the variation in weight of different styles of body mounted upon the same kind of chassis, and such an adjustment also meets the requirements for a vehicle which is used as a sporting car in the country, in which case stiffer springs than standard are needed, and also as a town car, for which purpose a very flexible springing is more suitable.

An adjustable spring should not weigh more than a non-adjustable spring of a capacity equal to its maximum. This is important to keep the total weight of the car down and practically excludes any device which stiffens a spring by clamping a portion of it down. Such a spring must either be very heavy or else it is overstressed when the work is severe. Similarly, it should be impossible to overstress material by incorrect adjustment.

Against Automatic Adjustment

Experience has shown, and theoretical considerations also indicate, that a spring which automatically becomes stiffer when the load is increased is not on the average as comfortable to ride on as the ordinary type. For instance, if the dead load deflection of a spring is 4½ inches, this may be momentarily increased to 7 inches or reduced to 2½ inches at high speeds. With a progressively-resisting spring, such a deflection of 7 inches would be reduced while the rebound would be increased, and the comfort would be lessened, the spring being evidently incapable of differentiating between an addition to the dead load and a brickbat lying in the track of the wheels.

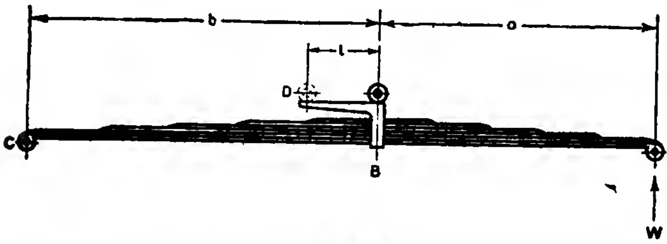


Fig. 1—Diagram of North cantilever spring with adjustable fulcrum

The following passage is quoted verbatim:

"For certain classes of vehicles in which the variations in loading are frequent and extreme, and where the driver cannot be expected to be continually adjusting the suspension, a 'compound' spring is of real advantage. Heavy motor lorries running on solid tyres form the best example of this class. The springs on a lorry have to absorb a great many of the small shocks set up by minor road inequalities, but in the case of a pleasure car these are smoothed out by the pneumatic tyres. These small shocks, causing small displacements of the axles, can be efficiently dealt with by a 'compound' spring, as the stiffness is approximately constant for movements of limited amplitude. At the same time it must be distinctly understood that even on a motor lorry a 'compound' spring will not give such smooth running as an ordinary spring of the correct stiffness for the particular load that happens to be on the vehicle at the time."

[These passages give the usually accepted argument against springs having a decreasing rate of flexibility with increasing deflection, and therefore the main argument for electing to vary the flexibility by adjustment. It may be shown, however, that this argument loses in force if suitable rebound checks are employed and the range of action for the spring is fairly ample. This opposite view, on the subject of springs with variable flexibility, will be briefly presented and illustrated another week.—M. C. K.]

The North adjustable cantilever spring has a uniform stiffness over the whole range of its deflection with a given setting. By a simple operation, taking a few seconds only, the stiffness can be altered to any desired degree within the limits provided for; and these can be for touring cars 1.8 to 1 or even 2 to 1.

The mathematical demonstration runs as follows, comment by the reviewer being inserted in brackets:

For a spring having a given number of leaves of equal thickness and stepped off evenly to the ends, the deflection of one end under a given load applied at the end is proportional to the cube of its length, therefore denoting the length *AB* by a and length *BC* by b; and, assuming that the deflection of the portion *AB* under a load W applied at *A* is x, then the deflection of the portion *BC* under a load W applied at *C* would be $x \left(\frac{b}{a}\right)^3$. It will be observed that we are now considering the spring as two separate portions, and this must be borne in mind throughout. Any alteration in the position of the fulcrum makes no difference to the deflection under load of the portion *AB*.

[This assumption seems unsafe. The portion *AB* does not exist separately when the fulcrum is moved from vertically above *B* toward *D*. The arrangement provides a new mechanical condition in which the fact that a point directly above *B* WAS a fulcrum is of no consequence. Also, to CONSIDER the spring as two separate portions does not justify mathematical deductions for a spring that IS NOT in two separate portions. Further, as is done in the rest of the demonstration, to figure the reaction at *C* from the load-action at *A*, calculate the deflection which this reaction WOULD cause at *C* if *C* could move (downward), and then from this supposed deflection assume that the bending movement of *CB* which is possible MUST cause such an additional deflection at *A* as would be caused if the deflection of *C* were real, does not seem like self-evident mathematical reasoning (though it

When the adjustment is set for the heaviest load, the fulcrum is on the center line of the clip, and the behavior is that of an ordinary cantilever spring. The thickness, width and number of leaves are calculated for this position, and the maximum stress for any other setting cannot exceed the maximum calculated for the "stiff" position. The requirement is therefore met that the spring shall be no heavier than a non-adjustable spring for the same maximum load.

By providing bumpers, the second requirement is met; namely, that the spring cannot be overstressed by incorrect adjustment.

Below there is given a mathematical investigation of the properties of the system, the latter being represented diagrammatically in Fig. 1. The width of the clip is, however, disregarded, this causing an error of 1½ to 2 per cent only for a clip of small width, as shown, and springs of the preferred length.

Most Suitable Length of Springs

With regard to the length of the spring and the relative lengths of its two portions, it is noted that so long as the proportions in these dimensions are the same the variations produced by adjustment will be identical. In the example calculated below, AB is 24 inches and BC 30, and a displacement of the fulcrum of 6 inches gives an increase of deflection of 80 per cent. Similarly a displacement of the fulcrum of 3 inches would give 80 per cent of variation in flexibility if AB were 12 inches long and BC 15 inches long. Such a shorter spring could be made to do the same work as the longer one, but would have thinner leaves and a great many more of them, since the weight of the short spring would have to be the same as for a longer one (to do the same work without increased fiber stress) and, the leaves being so thin, the spring eyes would be weak and liable to fracture. Moreover, it is more expensive to work up, say, 20 thin and short leaves than 5 leaves twice as thick and long and of the same width. Other objections to very short springs are that, for the same initial camber, the curvature of the short spring when unloaded must be much sharper, and the horizontal displacement of the rear eye, as it is deflected, is much greater. This means a larger angular movement and wear of pins and bushes as well as troubles in using the springs for taking braking or driving thrusts. Particularly for an adjustable spring there is an objection to the very short springs in that the fulcrum would be situated in an inaccessible position behind the wheel.

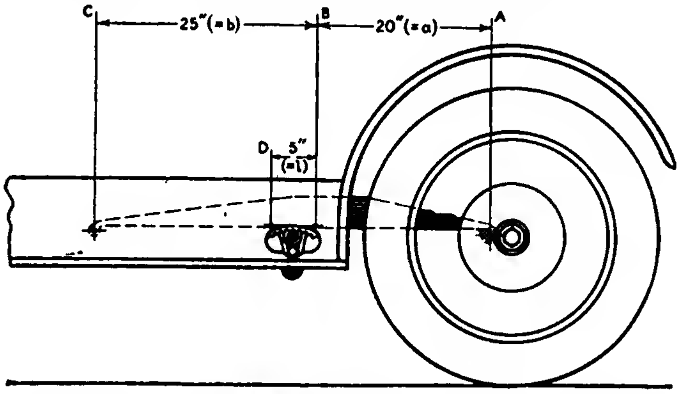

Fig. 2—General arrangement of construction shown in Figs. 3 and 4

The main objection to very long springs is that the displacement of the fulcrum for a given variation in stiffness would be increased, making the adjustment device heavy and clumsy. On general grounds, a very low spring is either unnecessarily heavy or must consist of a few thick leaves.

As small cars do not require much shorter springs than a large car, if equal deflections and equal comfort are to be obtained, the proportions of the adjustment device can be almost alike for all.

---

may be approximately correct in practice), but is on the contrary a fine example of *petitio principii*, or reasoning in a circle, against which all logicians and authorities on mathematics have warned us.]

A load W applied at A causes a deflection x of the portion AB. When the fulcrum is at B, the load W at A sets up a vertical reaction at C equal to $W\frac{AB}{BC}$ or $W\frac{a}{b}$.

The deflection of the portion BC under this reaction is

$$\frac{W\frac{a}{b}}{W}\cdot x\left(\frac{b}{a}\right)^3=\frac{a}{b}\cdot x\left(\frac{b}{a}\right)^3=x\left(\frac{b}{a}\right)^2$$

Now, the deflection of the portion CB does not manifest itself as an upward movement of point C, but as an angular displacement of the clip round the fulcrum at B.

This causes an upward displacement of point A additional to that caused by the deflection of the portion AB.

The upward displacement of A due to deflection of portion CB is [objected to, above]:

$$\text{(deflection of } CB \text{ at } C)\ x\frac{a}{b}=x\left(\frac{b}{a}\right)^2\cdot\frac{a}{b}=x\frac{b}{a}.$$

The total deflection of the spring for a load W applied at A is therefore:

$$x+x\frac{b}{a}=x\left(1+\frac{b}{a}\right)$$

Behavior of Spring Adjusted to Higher Flexibility

Let D indicate the new position of the fulcrum (Fig. 1), and let this point be at a distance l from B.

Then for a load W applied at A the deflection of the portion AB is the same as before [objected to, above], *i.e.* $= x$.

But the reaction at C is changed owing to the altered position of the fulcrum. Taking moments about the new fulcrum point [which, however is a new kind of fulcrum, when flexions of the beam are the main consideration] we get:

$$\text{Reaction at } C=W\frac{AD}{DC}=W\frac{a+l}{b-l}$$

Hence the deflection of portion CB measured at C will be

$$\frac{W\frac{a+l}{b-l}}{W}\cdot x\left(\frac{b}{a}\right)^3=x\frac{a+l}{b-l}\cdot\left(\frac{b}{a}\right)^3$$

And the upward displacement of A due to deflection of portion CB

$$=x\frac{a+l}{b-l}\cdot\left(\frac{b}{a}\right)^3\cdot\frac{a+l}{b-l}$$

And total deflection of spring

$$=x\left(1+\frac{(a+l)^2}{(b-l)^2}\left(\frac{b}{a}\right)^3\right)$$

And the ratio of the deflections for the two settings

$$=\frac{1+\frac{b}{a}}{1+\frac{(a+l)^2}{(b-l)^2}\cdot\left(\frac{b}{a}\right)^3}$$

Example in Figures

Taking an actual example, let us suppose a spring in which $a=24$ inches, $b=30$ inches, $l=6$ inches (in the position of greatest flexibility). Then the ratio of the least and greatest deflections will be:

$$\frac{1+\frac{30}{24}}{1+\left(\frac{30}{24}\right)^2\cdot\left(\frac{30}{24}\right)^3}=\frac{2.25}{1+\left(\frac{30}{24}\right)^5}=\frac{2.25}{4.052}$$

that is, the deflection for a given load when the adjustment is set for maximum flexibility is 1.8 times that obtained with the adjustment at its stiffest.

[There follows in the original a similar mathematical demonstration with regard to the stresses at the two settings, but it rests on the same assumptions as are employed above and is therefore here omitted, so much more as it seems evident in advance that the stresses in the lengthened free end of the spring must be lowered, and also that the reactions from them upon the shortened anchored end cannot be much greater than those to which the short free end is exposed at the stiffest setting].

An almost infinite number of methods can be used for effecting a displacement of the fulcrum. One of the first designs was based on the arrangement indicated in Fig. 1. A roller turning on ball bearings formed the fulcrum of the spring, and the pin on which the roller turned was carried in a bracket with a longitudinal slot on each side of the spring leaves. The pin was formed with knuckle teeth at each end, and these engaged with rack teeth cast on the upper side of the slots. By applying a box spanner to the hexagon end of the pin it could be rotated and moved along the racks. A spring-loaded clip was provided to prevent accidental displacement of the pin when the load was momentarily removed from the spring, and pads, suitably lubricated, were arranged to take the lateral forces acting on the spring. But this arrangement was costly and had a clumsy appearance.

The final design is illustrated in Figs. 3 and 4, while Fig. 5 shows the actual adjustment mechanism provided for a Straker-Squire ambulance used by the London Asylums Board. Fig. 4, it will be noticed, shows the dimensions of only 20 and 25 inches for the two portions of the cantilever spring and a displacement of 5 inches. A quadrant A is clipped to the spring by setscrews or wedges and is gripped by the two grooved lugs B and C, the latter being integral with shackle pin D, which passes through B and also through the shackle E, which turns on a trunnion F. The curved rails of the quadrant are struck with F for center.

The forward end of the spring is anchored to the frame, and when the shackle E is in an oblique position the horizontal component of the diagonal reaction along DF appears as a thrust or pull, as the case may be, along the lower leaf of the spring. The virtual center about which the spring may be said to turn is situated at the point where DF prolonged meets the neutral axis of the bottom leaf of the spring, which is assumed to be flat in the mean position. Thus when GH=5 inches the displacement of the fulcrum is 5 inches between the two extremes.

In order to prevent the clips from slipping along the quadrant, they are drawn together by the nut I, which when tightened up forces the clip B along the pin.

As a safeguard against forgetfulness, a collar J is screwed and pinned to D immediately behind the nut I, so that if the driver omits to tighten up the latter nor harm can be done since the nut and the clip B cannot slack more than 1/32 of an inch.

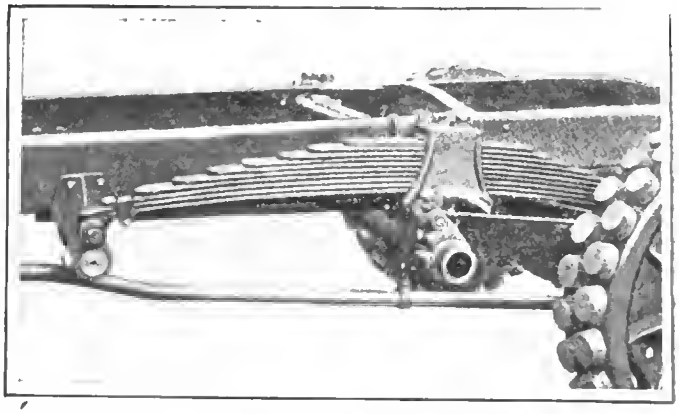

Fig. 5—North spring applied to ambulance chassis

When adjusting the spring a special spanner K is used. It has keyways broached in it, and these engage with the castellated exterior of the nut I, which is slacked back half a turn or so. The spanner is then pushed further in, disengaging itself from the nut. A series of teeth cut on the boss of the spanner then engage with internal teeth cut in the edge of the stamping L, which it attached to the quadrant casting, and forms a dust cover for the curved guide strips.

The boss of the spanner then acts as a pinion engaging a rack, and, since a leverage of about 4 to 1 is provided, a spanner 11 inches long is amply sufficient to move the clips along the quadrant, even when the springs are carrying a load of 1,600 to 1,700 pounds.

After moving the clips to the desired position the spanner is withdrawn from the rack, and is engaged with the nut again; this is tightened up, and the spanner then withdrawn completely.

The design here described is a slight improvement on the design illustrated in Fig 5. Here a long lever acting directly on the link was used to adjust the spring, a construction which would be inadmissible on a touring car, owing to the position of the running boards.

The springs fitted to the Asylums Board ambulance were designed to take a maximum load of 2,800 pounds, which is, of course, very much more than the springs of the average touring car have to carry. The design in Figs. 3 and 4 is for a medium weight five-seated car, and the drawings are to scale. The springs are calculated for a load of 1,700 pounds maximum, and have an adjustment ratio of 1.8 to 1.

Paragraphs on Current Topics

Motorized is Mobilized. Which accounts for the legend that Paris taxicabs saved the Marne. They didn't, but they contributed.

* * *

"Americans think through their interests," said the late Professor Gunter, not quite in reproof. Such thinking is more reliable and to the point, when it is finally pooled from all sides, than academic idealism in behalf of the supposed interests of all. With this preface, the automobile industry can afford to admit, if so disposed, that Preparedness on land, and largely by motor power, looks more attractive and necessary than a navy just big enough to get decisively licked under adverse conditions; and nothing bigger or better has been proposed. The best logic for all is on the same side as the interests of the automobile industry.

* * *

To repeat and amplify: A great invincible navy for an empire of islands and colonies, which can keep it busy and modern. But for this continental republic, mainly a motorized army and navy staff of 100,000 officers and engineers, all of them practical and working scientists; a motorized people of gunners and mechanics owning a fair share of the soil and civilization for which they may be asked to fight. Fifty more paragraphs on these lines would make a program for a self-supporting, profitable and efficient preparedness made to measure for Uncle Sam, but unfortunately common opinion accepts more readily the hackneyed idea which sums up the requirements as "a few more battle cruisers and super-dreadnoughts, more aeroplanes, more soldiers, more militia, more coast defense ordnance, more summer training in bivouac, more industrial organization for rapid production of munitions and ammunition." This amateurish hodge-podge of good and bad spells militarism without efficiency, bluff without a punch behind it, cost without returns. Automobile manufacturers, the best trained all-around thinkers in the world of to-day, can lend their voices to something far better, by organized effort, and the incidental advantages for the industry should not close their mouths in modesty, considering especially that those who are licensed to speak most loudly on the subject, with the megaphone voice of the daily press, have less special competence.

* * *

Frank Crane, D.D., of the New York *Globe*, has found 72 unfamiliar words, more or less closely related to automobiles, and he presents them to his public in wonderment, and for wonderment. Will somebody be kind enough to send him one of the many automobile glossaries, for reviewing? He is short 3000 or 4000 perfectly good words in his accounts. If he is clever, he can then discourse upon the hollowness of the knowledge which is familiar with even all of these words, but not with the things and the laws which they represent. Wordless engineering is a fascinating theme which still awaits a sympathetic and capable interpreter, though it peeps out from unmentioned shapes, dimensions, proportions, dispositions and omissions in every manufactured thing of complex mechanical organization.

* * *

As soon as the rear drive is placed in the frame of the chassis, on some plan such as De Dion's, Jakobsen's or Christie's, the allowable 6-inch amplitude of spring deflection, for touring cars, is suddenly doubled without raising the height of seats—even if a plain axle remains to connect the wheels—and the main industrial hindrance to improvement of spring suspensions is removed. Some car owners remove this hindrance more nonchalantly by disregarding it when fitting auxiliary spring appliances; in all of which there is any moral that one chooses to deduce from it.

* * *

Were a little unknown experimenter to produce an aeroplane of modest dimensions, equipped with a motor of no extraordinary power, reliability or lightness, and his unpretentious craft could fly no faster than 50 m.p.h. in calm weather but could start from the ground at a standstill or with a five foot run, could start from a ship without the aid of a catapult, and could hover in the air over any given spot of the earth, or could come near doing this, it would not be guilty of breaking any laws of man or nature, but it would be the greatest and most sensational and epoch-making thing that has yet appeared in aeronautics, aerostatics or aerodynamics. On the other hand it would not have the shadow of a chance for competing and winning in the great contest for aeroplanes which is to take place in this country in September and for which valuable prizes and trophies are offered. The event is framed to stimulate progress on obvious and imitative lines only. And, for a beginning, this may be the part of wisdom. But soon better may be done, for aviation motors and automobile motors are converging more and more toward the same ideal, automobile builders are becoming interested in aviation, and, this done, it should not take them long to discover that there is room for systematic experimentation with some of the fundamentals in aviation. Then for real progress and contests bearing on those points in design which are not yet popularized and do not take care of themselves.

* * *

We are intent on selling cars to ourselves just now and glory in the hustling activities of the dealers, but the deeper current of thought is a resolve to make and sell cars and motor trucks to the world at large ever hereafter, and all leaders have realized that, to reach this pinnacle of commercial accomplishment, we must create an unshakable foundation for our industrial advantages. Dr. Fleming has stirred England to appreciate the need of organizing science to co-operate with industry and of ceasing to rely on foreign research work. On a similar plan, since the automobile industry roots deeply and broadly in the scientific work concerned with the production of its raw materials, the American automobile industry could afford to take in hand a hundred vigorous and promising young chaps and give them the most thorough scientific and practical schooling in all sorts of knowledge ultimately bearing on design, construction, production and world-marketing of motor vehicles and agricultural tractors. Supposing it cost $200,000 per year for seven years! The world will probably stand that long, and the cost would come back whether the acquired knowledge would have to be bought from its new possessors at the market price or not.

* * *

In Italy, automobiles are now prohibited from approaching within several miles of the Swiss frontier. In this manner the frontier itself can be watched and guarded most effectively. Here an analogy suggests itself in connection with the expansion of professional work which will be necessary to strengthen the hold of American industry in the markets of the world. Such work should be singularly free from deception and trickery. If we guarded the approaches to our professions, by insisting on cultural requirements extending back to boyhood and wholly of record, not only crimes *à la* Dr. Waite and the similar ones which escape detection but also multitudes of minor slips from grace, would be less liable to occur. Preparatory education in set forms sifts out the unsafe characters and protects the public and employers better than mere final examinations and diplomas.

* * *

As to that mooted distinction between invention and new construction, there is a new version: Inventors create inducements for departing from current practice, while constructors create new inducements for adhering to it. In either case, full knowledge of current practice would seem to be at a premium.

* * *

A national subscription to defray the cost of advertising Electric Lighting is under way, the medium proposed being the Statue of Liberty in New York's harbor. An excellent and business-like plan! A huge new companion statue, in steel and armored cement, representing the "Internal Combustion Motor Moving the World" might also be in order; with self-starter accessory conspicuously displayed on the pedestal.

Factors in Universal Joint Design*

Part II

Type with Independent Case Worked Well in Experiments but Was Clumsy and Awkward To Assemble—A Review of European Designs—Future Possibilities

By A. Ludlow Clayden

**Paper read at Cleveland section S.A.E. meeting, May 19.*

IN independent case designs the case was supplied with oil from the gearset and the mouth of the case was closed by a leather tube having a slip ring which was a free fit on the shaft. The device worked very well, but it was clumsy, heavy and very awkward in assembly. There was also some trouble to insure sufficient oil without permitting the passage of too much. A modification which resulted in considerable improvement was to abandon the oil feed from the gearbox and substitute a copper pipe leading to an oil cup on the side of the chassis frame. This provided an easy way to charge the case with oil, but the user of the car still had no way of telling whether he was putting in enough till it began to overflow.

Some European Types

It is perhaps interesting to examine some of the typical European joint designs very briefly.

One of the most difficult types of universal to make so that it will be satisfactory under all conditions, is that which includes a sliding joint. Probably the originators of the combined universal and telescopic coupling were the DeDion company who were compelled to use a joint of this nature in connection with their axle. The old DeDion cars had the transmission and differential in a unit which was attached to the rear of the frame. The wheels were carried on a tubular axle which was slightly dropped, and the drive from the sprung differential to the wheels was made by a pair of short propeller shafts with universal joints at each end. For this purpose the familiar type of cylindrical outer casing was used, this having two deep grooves internally: The shaft had a cross pin on which were fitted square nuts of phosphor bronze, free to turn on the pin and with the tops rounded. There is a fundamental difficulty in lubricating this type of joint with grease, this being the pumping action which tends to pull the lubricant outward. The difficulty can be overcome by careful inclosure and a great many ingenious devices have been evolved with this end in view.

Another drawback to a joint of this design is the double wearing surface. There is opportunity for looseness to develop between the sliding nuts and the outer case, while wear also takes place on the pin and on the bore of the nut which bears against the pin. This gives no trouble, however, if the parts are made of the right material and if the mounting is such that the telescopic action is not excessive.

An alternative design which is very greatly used both in America and abroad is the spline coupling where one end of the propeller shaft is splined and the fork of the universal joint at that end grooved to correspond. This makes a very good telescopic joint if there is ample length of bearing but,

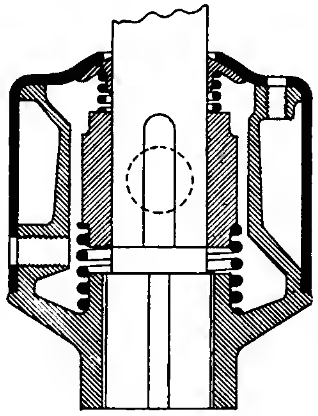

Fig. 10—A neat method for inclosing a joint of the De Dion pattern

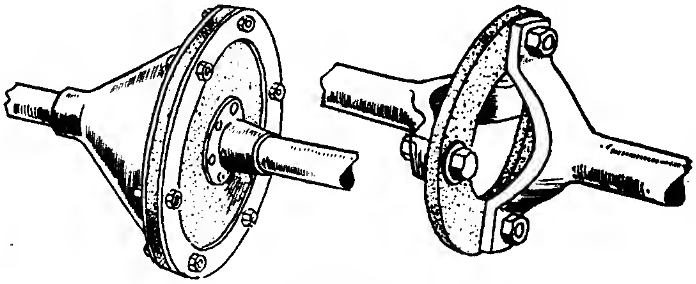

Fig. 12—Two varieties of leather coupling. Left—The original which stressed the leather highly, and Right—The modern design in which there is only direct tension on the leather

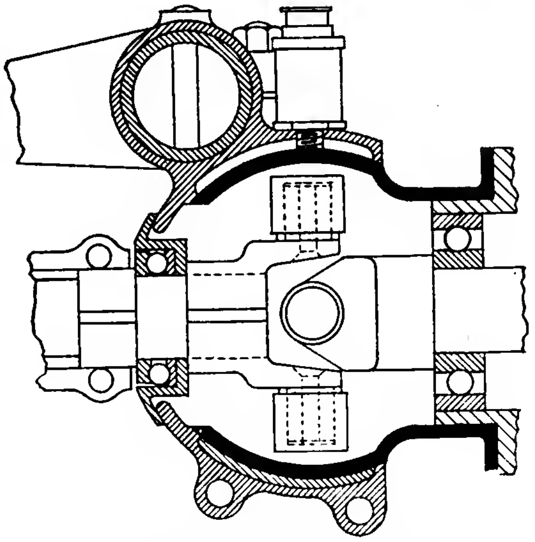

Fig. 11—A typical ball joint inclosure at the front end of a torque tube

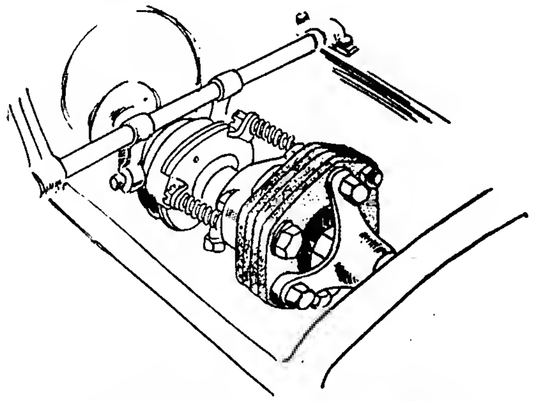

Fig. 13—Leather joint used on the Jeffery car between the clutch and gearbox

owing to the necessarily small radius, it requires no calculation to show that the pressure on the surface is very high. If ample length is not provided it will be impossible to retain grease between the splines and as soon as the lubricant is squeezed out wear will be very rapid.

At the present time there seems every reason to believe that the Hotchkiss drive will shortly be conventional practice and attention may be drawn to the fact that a rear spring which is normally nearly flat provides the ideal form for Hotchkiss drive from the viewpoint of universal joints; since with a flat spring the fore and aft movement of the rear axle will be at a minimum. There are some designs in which the amount of slide on the universal joint from one extreme of spring motion to the other is less than half an inch. This means that in ordinary running the movement is so slight as to be almost negligible.

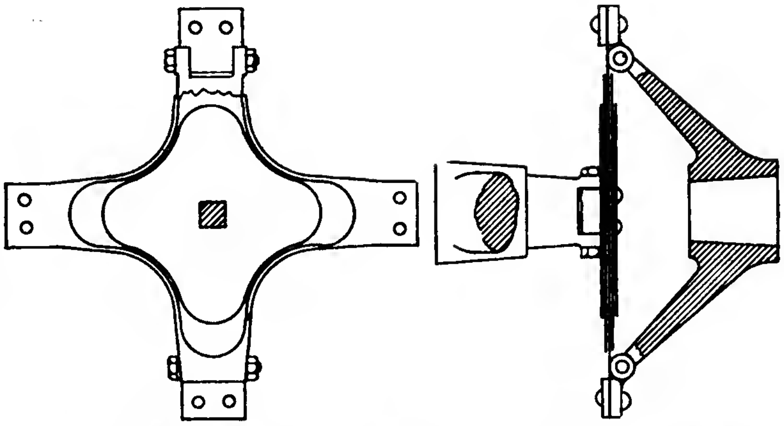

Fig. 14—Patented design for a universal joint made entirely of spring steel. The center leaf with shackled end takes all the drive, the other plates being added to stiffen the whole

A rather curious type of telescopic joints, shown in Fig. 4, has been used considerably on British commercial vehicles with better durability than the DeDion type of sliding joint. This consists of a small pinion on the end of the propeller shaft having the tops of the teeth cut to a curve with the center of the pinion as radius. The teeth slide in grooves cut in a cylinder case which is attached to the final drive pinion just like the outer part of the DeDion joint. It is claimed that this design allows a larger area with less weight, and it also eliminates the necessity for the cross pin used to carry the nuts in the DeDion joint.

A very different type of combined universal and sliding joint which is still used on the Lanchester car is the simplest of all. In this the end of the propeller shaft carries a block of steel about 3 in. square in end elevation. The block is about 1¼ in. wide and the edges are all curved. On the gear shaft is a steel cup of square section into which the block on the end of the propeller shaft fits snugly. Unless very carefully made it is almost impossible to eliminate rattle from this type of joint but, as made by the Lanchester company, it has been very successful and has been adhered to by that concern for nearly 10 years. See Fig. 5.

There have been many freak universal joints, some of which possess special merit. One, used by several British firms, notably the Rover company, is illustrated in Fig. 6. As will be seen, there are two flat forks and connection between them is made by a steel ball with two grooves cut in at right angles. This same joint was used in one instance for driving an overhead camshaft, where its facility for being taken apart is advantageous. It is a joint permitting very neat inclosure but it is rather difficult to keep down the bearing pressures without using large and heavy parts in its construction.

In Fig. 7 is shown a joint which has been used by the Wolseley company for some 7 or 8 years. The outer ring is split transversely and each of the pins is bushed. Thin grease or heavy oil can be supplied through a screw in the outer case and it will be noticed that the universal ring is integral with the cap. A more usual construction for what is commonly called a ring joint, is shown in Fig. 8, this being typical of a great many continental designs. Here the ring is split in a horizontal plane and it is not usual to find this type of ring made integral with any part of the inclosure.

With Stationary Cover

Fig. 9 shows the inclosing scheme adopted for a well-known British car which is an example of the stationary type of cover. This differs somewhat from the stationary case described previously, in that the brass cone seen on the propeller shaft is fixed to the latter and there is no connection between it and the stationary brass case inclosing the joint. The purpose of the part on the propeller shaft is to protect the opening to the main case. This eliminates the necessity for a slip ring on the propeller shaft and has worked out very well in practice, the cone protecting the opening into the main case sufficiently to exclude practically all dirt and water.

Fig. 10 shows a rather ingenious way of inclosing a DeDion type of telescopic joint. This idea has been developed in many different ways, the illustration being taken from a drawing of a British light car.

The Need of Compromise

The consideration of universal joints, and their inclosure, shows up the need for compromise so often found in automobile construction. From the viewpoint of the universal joint there is no better inclosure than is provided by a torque tube with a single joint at the front end of the propeller shaft contained within a spherical housing formed on the end of the torque tube and set into a corresponding socket on the back of the gearbox. A construction of this sort, as Fig. 11, allows copious lubrication from the gearset and, in practice, appears to insure an almost everlasting universal if all the details are carried out well.

Against this design, however, we have the velocity variations caused by the action of a single joint, and we also have the weight and cost of the torque tube construction. At present it appears that the simplicity and lightness of the Hotchkiss drive, or at least of a double jointed shaft with a light torque stay, more than outweigh the better protection of the torque tube. There is no easy way of lubricating universals on an open type shaft except by periodical grease packing. Thus it is up to automobile designers to choose joints of such a size that they will not be overloaded and will contain a good supply of lubricant. Picking the smallest size of joint that the manufacturer will guarantee for the car is poor policy, as it means poor durability in any case and very poor service indeed if the owner of the car neglects to grease up frequently; and he usually neglects the universals more than any other point on the chassis.

Future of Flexible Material

A type of joint which has tempted inventors for ten years and more is that in which there is no bearing; no working surface whatever. Instead of a joint a sheet or ring of flexible material is employed, the natural elasticity of the substance being used to give the necessary movement.

The most common coupling of this sort is the leather disk so often used for driving magnetos or other engine accessories. Leather ring couplings like Fig. 12 are commonly used between the clutch and the gearset in European designs, and on some American cars, notably the Jeffery, Fig. 13, and they have been tried for the propeller shaft. There is at present no American car with propeller shaft joints of this character, but there were several on the European market just before the war.

The heaviest service to which leather ring joints have ever been put is on the omnibuses in London. Owing to variations in the load the universals on an omnibus see heavy service and the noise of a worn pin joint is very objectionable. At first the leather joints seemed to be ideal. They lasted for a good many thousand miles, were cheap and more easy to replace and were always quite quiet. However, the latest advices from London are that the leather is being abandoned in favor of joints with ball bearing or roller bearing pins, as these appear to last forever without wear, maintaining the quietness of leather without the need for periodical renewal.

This is on very heavy service though, and it seems possible that we have not yet heard the last of flexible ring joints for passenger car transmission. Leather rings will take all the drive a passenger car engine can supply, and their drawback is mainly their liability to deterioration by the action of grease and water which slowly rot the material. To overcome this difficulty, disks are now being made of oilproof and waterproof substances like woven asbestos, and the trials are very encouraging, though it is early yet for predictions.

Yet another style which has never been developed to the full in actual practice is the joint which uses spring steel instead of leather or fabric. Such joints usually consist of a series of very thin spring steel rings clipped together and mounted exactly like a leather ring. In this form they have proved excellent for clutch couplings, but are probably no better than leather while being considerably more costly. Also a good large leather joint will permit sufficient end displacement to allow for clutch withdrawal without the provision of a metallic sliding joint, while the spring steel ring will hardly do this.

There have been several patents taken out for special designs using thin steel leaves to give freedom both axially and angularly, some of them appearing very promising on paper, but it is only hard service that can decide their merits and, if they are developed, it is likely to be in the future.

The purpose of this discussion is not to suggest that the universals we have to-day are other than excellent for their purpose. On the contrary, considering how bad universal joints were a short time ago and how little trouble they give in a modern car; and still more, considering the price at which they are sold, the modern joint of proprietary make is usually wonderfully good.

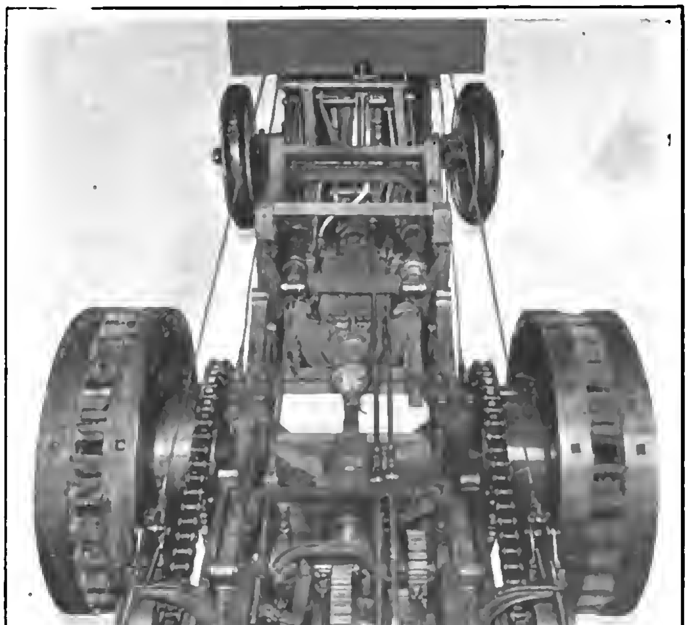
Like all other parts of an automobile, however, there is no reason to suppose that we shall *never* have anything better, and this brief examination of the subject will have served its purpose if it draws attention to some of the problems connected with the provision of an efficient, silent, and durable universal construction that will maintain itself without attention from the driver of the vehicle. It appears to the author that the American automobile engineer owes a great debt of gratitude to the specialists who have taken upon themselves the task of caring for a part of the chassis which has been quite troublesome to foreign engineers.

The Bulkley-Rider Road Locomotive

LOS ANGELES, CAL., May 27—The Bulkley-Rider Tractor Corp., this city, has perfected the Bulkley-Rider Road Locomotive, the tractor which the engineers of the corporation have been working on for more than 3 years.

The tractor is equipped with a 90-hp. Wisconsin motor. There is a first transmission and a reduction transmission, which is the foundation of the tractor. The road locomotive has six speeds forward, and when running in the unreduced high gear, has a speed of 20 m.p.h. When running in the reduced low, there is a total leverage of 96 to 1. Easy riding is secured by a double set of springs. The chassis springs are entirely independent of the load springs. All road shocks are provided for by these load springs and a pair of plungers which act as shock absorbers for all jars coming from the rear caused by ruts in the road. A winch is fitted which will pull a 28,000-lb. load on a cable at the speed of 70 ft. per min. With this equipment, the tractor can pull out of any hole or up the side of the steepest bank, pulling the load after it.

The tractor has a patent hydraulic jack which supports two extra wheels equipped with metal pedal pads. By releasing this jack, these wheels drop into place and the tractor becomes a four-wheel-drive machine.



Chassis of Bulkley-Rider Road Locomotive. Note strong construction

For service where the roads are fair or boulevards prevail, these extra wheels are not included in the equipment, but the regular wheels are equipped with patented paddle wheel rims which are detachable. When the tractor is to run on boulevards this metal paddle wheel is removed and replaced with the solid rubber tire.

The first of these Road Locomotives was built for the Yuma Consolidated Mines, Quartzsite, Ariz., and was recently accepted by officers of the company upon the showing made in its official trial trip which was for the purpose of demonstrating its pulling powers and general efficiency. This trip was from the harbor to the center of the city, a distance of 23 miles, a load of 45 tons being hauled with trailers. The entire trip was made in 2 hr. and 22 min.

It is claimed that this tractor will be of great service for military purposes as it is built for traveling over all sorts of ground and under all conditions and its weight is well distributed.

The FORVM

Engine Utilizes Principle of Gradual Combustion

A CONSTRUCTION APPROACHING THE DIESEL ENGINE BUT SUITABLE FOR AUTOMOBILE PURPOSES AND EMPLOYING TO A DEGREE THE PRINCIPLE OF THE NAVAL GUN

By James McIntosh

THE more I read J. E. Schipper's article on "Are Other Cycles Possible?" and notably in regard to the variable cutoff constant pressure means of control so am I convinced you agree with my theory; in fact, you so closely conform and the import of my patent claims seems to be in accord with your views that I have decided to disclose one phase that is covered but not hinted at in my specification, but well within the scope of my basic principle. Claim No. 2 of Patent No. 1,113,456 has this clause, "a valve" (broad term) "*for admitting air to the passage in position to precede a charge of mixture*, means for varying the quantity of air admitted." You will notice the "a valve" is not patentable as a valve or is the "means," as both are as old as the hills, but the function they perform is new. As to the italicized quotation there is no question as to what is meant. As to its application as a means of control, let us see what that means. I do not specify as to what volume the air must be, and the fact my claims refer to a means for varying the quantity of air I intend to use it as a means of control. Suppose I decide to call it a Volume Ratio control and decide to control the air only, and let that volume—be it large or small—determine what the charge is to be, let us consider pure air has no energy due to ignition and that a volume of mixture expands due to ignition 4 to 1, also that an equal volume of air and mixture at the point of contact has half that value, or 2 to 1. Assume that the total volume taken into the crankcase or pumping chamber is constant and at low speeds the volumetric filling will be more complete, this will tend to aid matters for light loads and also be beneficial in presenting pre-ignition with full loads.

Suppose I admit a 90 per cent volume of air (in position, etc.), the charge of mixture must be 10 per cent; again if the air be 10 per cent the mixture is 90 per cent. To better illustrate my point, I will assume 50 per cent of pure air is in position to precede a 50 per cent volume of constant mixture and at the point where the two volumes come in contact there is a 5 and 5 per cent combination.

Assuming Fig. 1, to represent the combustion chamber and three layers with values, as above cited, the correct mixture and compression to be ideal for firing and the 10 per cent combination is too lean to ignite at the compression used we may expect after the mixture fires the rise in pressure and temperature will cause a second firing or we may assume there is a graded or tapering energy charge that will fire as the column heat and pressure rises, due to the correct mixture located at the spark plug. This is what I anticipate regardless of the volumes used. How far that eliminates initial shock due to a homogeneous charge fired instantly is very evident. As a means of control, assuming clean cut volumes, let us assume, say, three ratios:

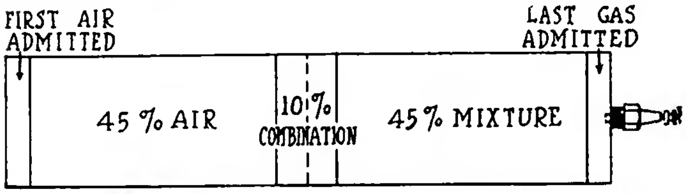


Fig. 1—Diagram of combustion chamber with layers of air, constant mixture and a mingling of the two

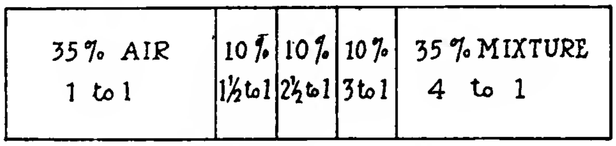

Fig. 2—With five layers of mixture, to fire in succession

%		%	%		%	%		%
90	of air......	90	10	of air......	10	50	of air......	50
10	of mixture..	40	90	of mixture..	360	50	of mixture..	200
100		130	100		370	100		250

As a matter of interest let us take the 50 per cent and 50 per cent fired progressively in two distinct explosions:

%		%	%		%
45	air............	45	45	air............	45
10	compression....	10	10	compression....	20
45	mixture........	180	45	mixture........	180
100		235	100		245

Again assume five layers as below and the first to fire the second, second the third, third the fourth and the fifth to retain its volume only.

First	Second	Third	Final Volume
35- 35	35- 35	35- 35	35- 35
10- 10	10- 10	10- 10	10- 15
10- 10	10- 10	10- 25	10- 25
10- 10	10- 30	10- 30	10- 30
35-140	35-140	35-140	35-140
100-205	100-225	100-240	100-245

This condition may be expected in action, although I do not care to predict just how many distinct impulses occur. I prefer to assume there is a gradual increase in pressure which will eliminate initial shocks on a crankpin and the increase in volume will act as a follow-up, the piston effect resolving into a flatted peak on an indicator diagram and approaching that of an engine using a constant pressure cycle and similar in action to that of a Diesel engine where the fuel is injected and time elapses before the full charge is utilized. In this respect I approach the Diesel, which is far removed from automobile engine practice, using a homogeneous charge with high initial pressures and bearings to absorb same and at a time when the crankpin is not in a position to get the full benefit. How near this conforms to theory may also be of interest, in a modern rifle or naval gun where they use slow burning cordite in blocks too big for instantaneous combustion and yet fire an energy that if fired along automobile engine lines would simply burst the gun before the projectile got started.

The History of the Pneumatic Tire—5

An Attempt at Wheel Elasticity in 1875—A D-Shaped Solid Rubber Tire — Pioneer Carriage and Bicycle Types — The Carmont Solid Clincher Tire Patent

The History of the American Automobile Industry—32

By David Beecroft

PROGRESS in tires was not rapid for some years, doubtless because the panic of 1873 made the purchasers feel poor; but in 1874 A. Wietlisbach of Newark, N. J., brought out a rubber tubing tire held to the rim by wire passing through the hole. A similar device using a right-and-left threaded turnbuckle on the wire ends was proposed by George Selden, but his patent application was abandoned. A disk wheel composed of two sheets of steel artistically perforated for lightness and bolted together at the felloe gripping a tire of rubber of circular or rectangular section, as preferred, was patented by L. W. Coe in 1872.

The circular section came into use on bicycles about this time or shortly after in England, and was quickly transferred to America, where it remained in use until displaced by the pneumatic tire about 1890.

In January, 1875, an attempt at wheel elasticity was made by the Rubber Cushioned Axle Co., which brought out its wheel in which the bearing box was set in a cushion of rubber inside the hub, and continued this on the market as late as 1880. Many similar attempts have been since made, but the results are not satisfactory because of the leverage to which the hub is exposed and the increased service that the small amount of rubber at this point is obliged to give.

A D-Shaped Solid Tire

In 1883 a D-shaped solid rubber tire was shown in an American publication as a British product, with the edges of the rim turned inward slightly to grip the widened base of the tire. It closely resembled the Cheever tire of 1869, but was of greater depth. In March, 1884, Peter Gendron of Toledo, Ohio, patented his baby-carriage tire, which consisted of a soft tread and hard base of rubber set into the rim and held there by having the edges rolled inward.

A cycle-wheeled buggy with rubber tires was shown at a British bicycle show in February, 1886, thus indicating that the rubber tire was beginning to find commercial use.

An Early Bicycle Type

About 1883 or 1884 the Star bicycle, built in Smithville, N. J., with sandy roads all around its factory, was fitted with a rubber tire of considerable width, but to save weight and cost the rubber depth was not very great and the center was slightly higher than the sides. This tire, like other bicycle tires of that date, was cemented into the rim and not wired or clinched.

About this time, 1884, Charles E. Duryea applied for a patent on a velocipede and included in this application what seems to be the first of the afterward well-known clincher tire. This device was not permitted to be covered by the claims on the vehicle itself, and so was stricken out of the case and no new application filed for lack of funds. The patent was issued on Feb. 15, 1887, and shows a rubber tire of greater diameter than the rim width, hollow and open on the base. The rim was made with inturned edges which entered grooves formed between the tire beads and the body portion, and thus held the tire in place. The open base permitted accurate molding, so that any desired thickness could be given the tire with the assurance that it would be equally thick all around.

A Tubular Cushion with Wire

Soon after, a patent to E. C. Otto shows a tubular cushion tire secured by a wire passed through the central hole. This tube was made rather long so as to put the rubber under compression, and the wire was corrugated so as to insure a constant pressure of the tire against the rim. This form of tire has never been real successful, because the holding wire was so far above the rim that it worked or moved under the action of the tire and eventually chafed and cut its way through. It has seemed necessary that the holding wires should be below the top of the rim so that they might be undisturbed and therefore not destroy the rubber.

A Modification with Steel Jacket

A modification was a wired method patented in this same year, in which the round rubber cord or tire was held in place by a sheet steel jacket, which jacket had ears that extended radially alongside the felloe, and were provided with slots and pins, by which they were held to the felloe, but permitted movement as the rubber under the jacket compressed. This construction was very impractical and did not appear on the market.

The Rostrum

Why Wire Wheel Hubs Are Offset

EDITOR THE AUTOMOBILE:—Kindly give me full explanation of the principle involved in the manufacture of the wire wheel that necessitates the offsetting of the hub on the outside of the hub as now practiced by the wheel manufacturers. Is this done for looks only or is there a principle of angle levers that makes the construction more solid?

Atlanta, Ga. P. F. L'E.

—The reason for offsetting the hub of the wire wheel is to permit the use of the standard tread in conjunction with a wide base for the spokes. If you imagine a section through the wheel each pair of spokes form a triangle with the width of the hub as the base and the rigidity of the wheel is increased by increasing the width of the hub. If the spokes made equal angles with the hub on the same width of base so that the tire came central with respect to the hub the tread of the car would be increased by fitting such wheels in place of the ordinary wheels.

Another reason for using wire wheels of the offset type is to bring the plane of the tire closer to the plane of the steering knuckle so that even if special axles were designed for wire wheel cars there would still be an advantage in the use of offset construction.

Cause of Popping in Carbureter

Editor THE AUTOMOBILE:—What causes the popping in a carbureter when the mixture is too thin? Is it because of overlap in the exhaust and inlet valve, so that there is a free passage from the carbureter to the burning gases in the exhaust manifold? Would it stop popping to turn back the camshaft one or two teeth so that the valves no longer overlap?

North Cohasset, Mass. H. W. H.

—Popping in the carbureter if the mixture is too thin is not caused by overlap. The speed with which a mixture of gasoline and air burns when ignited depends upon the richness. A weak mixture can be ignited by an electric spark but will burn very slowly, thus at the end of the firing stroke the mixture if very lean will still be alight. It can remain lit throughout the exhaust stroke so that when the inlet valve opens for the next suction there is still burning gas inside the cylinder. This flame immediately flashes back through the manifold into the carbureter.

Information on 1913 Buick 30

Editor THE AUTOMOBILE:—What is the weight of the 1913 Buick model 30?

2—What is the wheelbase of this model and miles per gallon of gasoline claimed?

3—The gasoline tank is 15 in. deep, 38 in. long and 46 in. in circumference. Can you tell me how to find out how much gas there is in there with a rule? For example, when the rule measures 6 in. there is 5 gal.; 11 in., 10 gal., etc.

Haverhill, Mass. J. B.

—The shipping weight of the model 30 was 2750 lb., this weight, of course, being exclusive of water, gasoline, spare tire and passenger load.

2—The wheelbase of this car is 108 in.

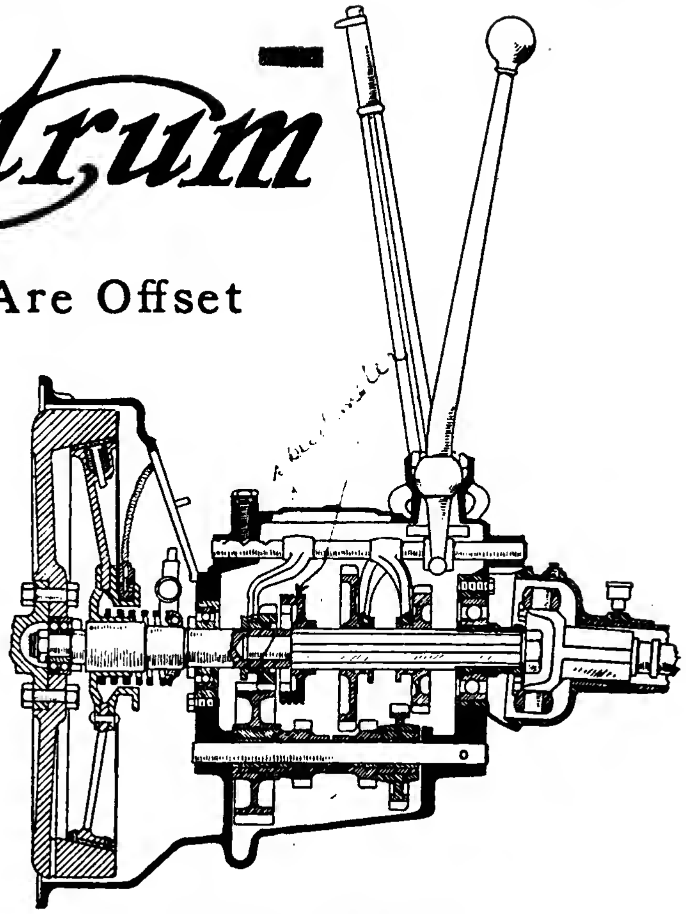

Fig. 1—Section through Dodge gearbox assembly

3—The easiest way to make a gage for the round gasoline tanks used on these cars is to take a stick 24 in. long, and mark off the first 15 in. into ten equal spaces, 1½ in. apart, beginning with the end of the stick. These marks, when numbered from the end of the stick upward, will then indicate the following amounts of gasoline in the tank:

Div.	Gals.	Div.	Gals.
1	1.3	6	15.6
2	3.5	7	18.7
3	6.3	8	21.5
4	9.3	9	23.7
5	12.5	10	25.0

Ammeter Not Advisable on Dodge

Editor THE AUTOMOBILE:—Kindly publish the power curve of the engine used in the Dodge car.

2—What is this car geared on first, second, third and reverse?

3—Publish diagram of electric starting and lighting.

4—Publish diagram of ignition.

5—Show drawing of transmission.

6—How could an ammeter be applied to this car?

Newark, N. J. E. C. McC.

—The power curve of the Dodge car is not available. The peak of the curve is given by the manufacturers at 2000 r.p.m. at which point the engine develops 35 hp.

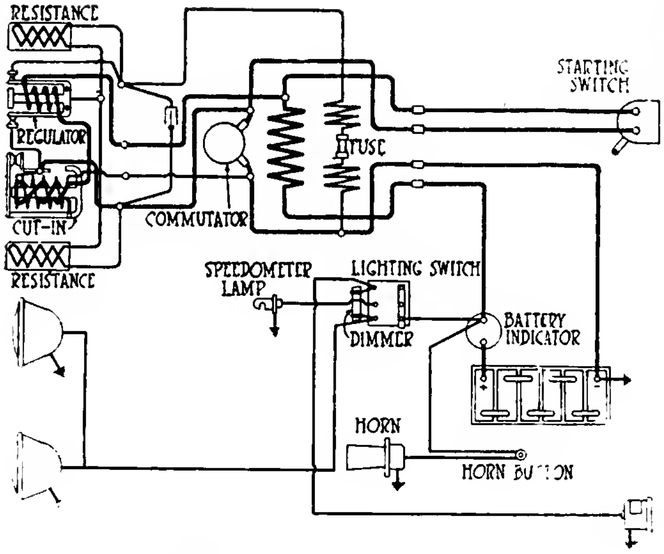
2—The standard gear ratio on high is 3.615 to 1, the driving pinion having thirteen teeth and the driven gear forty-seven teeth. On intermediate the gear ratio is 6.93 to 1 and on low and reverse 16.87 to 1.

3—A wiring diagram and a diagram of circuits are given in Figs. 3 and 2, respectively.

4—Answered under question 3.

5—The transmission is illustrated in Fig. 1.

6—The Dodge company states that it does not advise the



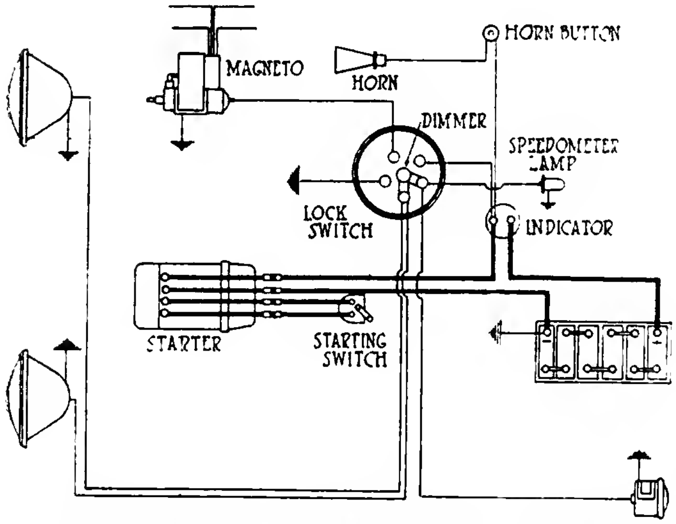


Fig. 2—Above—Diagram of electric circuits on Dodge car
Fig. 3—Below—Wiring diagram of electric system on Dodge

installation of an ammeter on the car as in starting the starter uses about 200 amp. An ammeter installed in the main line would necessitate the use of a shunt winding to prevent it from being burned out the first time the starter was used.

Fitting Magneto to Rambler 45

Editor The Automobile:—Could a high-tension magneto be put on a Rambler model 45 so as to do away with the timer driven by the cam gears and the vibrating coils? If so, what make would be advisable?

2—Would a new carbureter and vacuum system be of any advantage on this car?

3—What power will it develop at 1000 r.p.m.?

4—What speed will the car attain when in good working order? It has 37 by 5-in. wheels.

5—If rebuilt into a truck what would be its maximum capacity?

Thomasboro, Ill. F. Bros.

—A high-tension magneto could be satisfactorily used on a model 45 and we see no reason why any standard make could not be used satisfactorily.

2—We do not believe that a new carbureter would result in a great deal of improvement in the running of the car, but, on the other hand, would suggest repairing the old one as the carbureter with which the car is equipped at present is no doubt the one which was originally placed on the car when it left the factory. Therefore, it has been tested out with this particular motor. The vacuum system is, of course, an advantage in the securing of an even-running motor. The expense of placing it on a model 45 would be considerable, however, as the tank would have to be designed differently and located in a different place, it now being under the seat.

3—This engine develops 45 hp. and 32 hp. at approximately 1000 r.p.m.

4—When the motor is working satisfactorily the car should show a speed of approximately 45 m.p.h.

5—The maximum load that it would be safe to carry would be 1500 lb.

Changing Mitchell S to Fast Roadster

Editor The Automobile:—I have a Mitchell six, model S, that is equipped with a toy tonneau body. What is the gear ratio of each speed of this car?

2—Brake horsepower of the motor?

3—What is the maximum speed of the motor and at what speed does it develop the most power?

4—What is the valve timing?

5—Approximate car speed when new?

6—Is the regrinding of the cylinders and the fitting of new aluminum pistons in a motor of this type and age advisable?

7—I want to fit a speedster body to this car. What suggestions would you make in order to get more speed out of it?

8—Would increasing the compression, timing valves differently, or changing the gear ratio be advisable?

New York City. P. C. D.

—The gear ratios are as follows:

Third speed—direct.
Second speed—1.547 to 1.
Third speed—2.750 to 1.
Reverse—3.850 to 1.

2—The brake horsepower is 43.

3—The greatest power is developed at 1200 r.p.m.

4—Inlet opens 15 deg. past top center, closes 20 deg. past bottom center. Exhaust opens 35 deg. before bottom center and closes 10 deg. after top center.

5—The approximate car speed when new is 55 m.p.h.

6—Yes.

7—Should you decide to fit new pistons, raise the compression to 75 or 80 lb., change axle ratio to 2¼ or 3 to 1, close intake 35 deg. instead of 20, open exhaust at 45 deg. instead of 35.

8—Yes.

Adjusting Oldsmobile 27 Carbureter

Editor The Automobile:—Please publish instructions for adjusting the carbureter furnished as standard equipment on the Oldsmobile Autocrat model 27.

Waynesboro, Pa. J. E. O.

—The carbureter is of the Oldsmobile type, especially designed to meet the requirements of the motor. There are only two adjustments to be made under any circumstances—on the needle valve, affecting the flow of gasoline, and on the auxiliary air valve, controlling the admission of the auxiliary air supply. The constricted passage up the center is known as the venturi tube and supplies sufficient air to mix with the proper quantity of gasoline when starting the motor, and for low speeds. At increased speeds the auxiliary valve operates to supply more air to mix with the increased flow of gasoline which is turned on as the throttle is opened.

To describe these features in detail, attention is called first to the throttle and needle valve mechanism. The throttle lever on the steering column, and the accelerator on the foot board operate a butterfly valve known as the throttle. The throttle valve shaft extends clear through the neck of the carbureter and ends in a fixed cam which works directly on the needle valve, opening and closing it as the throttle opens and closes. Just below the fixed cam is an adjusting nut for the control of the opening or closing of the hole in the needle valve. Turn to the right to decrease, and to the left to increase the flow of gasoline. The throttle is prevented from closing completely by an adjusting thumb-screw on the throttle lever at the carbureter. By adjusting the screw the motor may be throttled down as low as desirable.

The auxiliary air supply, as stated, is furnished by the auxiliary air valve. The valve proper and the spring which regulates it are connected by a lever provided by an ingenious contrivance which may be described as a graduating fulcrum. By this method the single coil spring is used at varying degrees of tension automatically and according to the varying requirements of the motor. At moderate speeds the spring is sensitive and permits the valve to supply additional air at the slightest impulse, while at increased speeds the spring tension is correspondingly increased to compensate for the greater suction of the motor at higher speeds.

A drain cock is provided at the bottom of the carbureter to permit occasional cleaning of the float chamber; in doing this, it is necessary to shut off the main supply valve in the gasoline line. Afterward, flood a little gasoline through, to insure a good flushing, by opening the supply valve.

The Oldsmobile carbureter is waterjacketed so that it may be piped with warm water from the cooling system, to provide a higher temperature in the interior of the carbureter as an aid to the vaporization of the gasoline and the maximum expansion of the gas so formed.

On the lower end of the auxiliary valve stem is a lever which locks the valve shut. This is called the air cut-off and is for ease in starting the motor, i.e., through shutting off all the air except that which is supplied through the venturi tube, a rich mixture is assured.

Tire Cost Chart Issued by Goodyear

Editor THE AUTOMOBILE:—Some time ago one of the tire companies published a chart by which it is possible to figure the cost per mile, knowing the amount paid for the tire and the distance it has run. Would you kindly illustrate this chart?

Brooklyn, N. Y. L. M. H.

—The chart you describe was published by the Goodyear Tire & Rubber Co. It is illustrated in Fig. 4. Placing a straight edge across the chart with one side at the tire mileage and the other at the initial tire cost, the reading on the center column B will give the cost per mile.

Resetting Ford Magnets Usually Recharging

Editor THE AUTOMOBILE:—Is there such a thing as setting the magnets up on a Ford?

2—If so, what does this work consist of?

3—Do all Fords have a certain point on the spark sector (when using the magneto for ignition) where it does not give good ignition?

4—If not all, what is the cause and the remedy for such trouble?

5—As spark plugs will often spark when unscrewed from the cylinders, isn't there some known amount of resistance that could be placed between the points of the plug to equal the pressure of a common motor such as, for example, a piece of notepaper?

6—How can it be told that the magnets in any ignition system are in good condition?

7—Will they show up well at low speed and not at high?

Olmstead, N. D. E. F. F.

—Setting the magnetos up on a Ford generally refers to recharging the magnets.

2—This work consists in recharging by means of special coils.

3—The Ford magneto should give good ignition throughout the entire range of advance.

4—The probabilities are that if firing is weak at one point on the center that the trouble is not in the ignition but in carburetion. If the spark is good at one point there is no reason why it should not be good at a more advanced or retarded point.

5—A known amount of resistance may be placed between the points of the plugs to equal the pressure in a motor. This has never been worked out, however, in terms of thickness of paper so far as THE AUTOMOBILE has any record.

6—When the magnets of a magneto are in good condition good sparks will be given at low speeds.

7—If they give good sparks at low speed they certainly should give at least as good at high.

Knock Probably Due to Carbon

Editor THE AUTOMOBILE:—Will you kindly explain what a spark knock is, how it is caused, and how to remedy it? I have a 1916 Overland which has been run less than 5000 miles and has developed quite a decided knock when accelerating or on hard pulls. The local garagemen say it is a spark knock but cannot be remedied.

Detroit, Mich. G. H. S.

—If the charge is exploded before the piston has quite reached the top of the compression stroke it may produce a knock. Thus if you advance the spark when the engine is running slowly the advanced spark can cause the explosion to take place too quickly.

In the case you mention the knock is almost certainly due to carbon in the cylinders or on the piston heads. A spark knock can always be cured by retarding the spark but if the knock has developed only recently it is absolute proof that it is due to carbon.

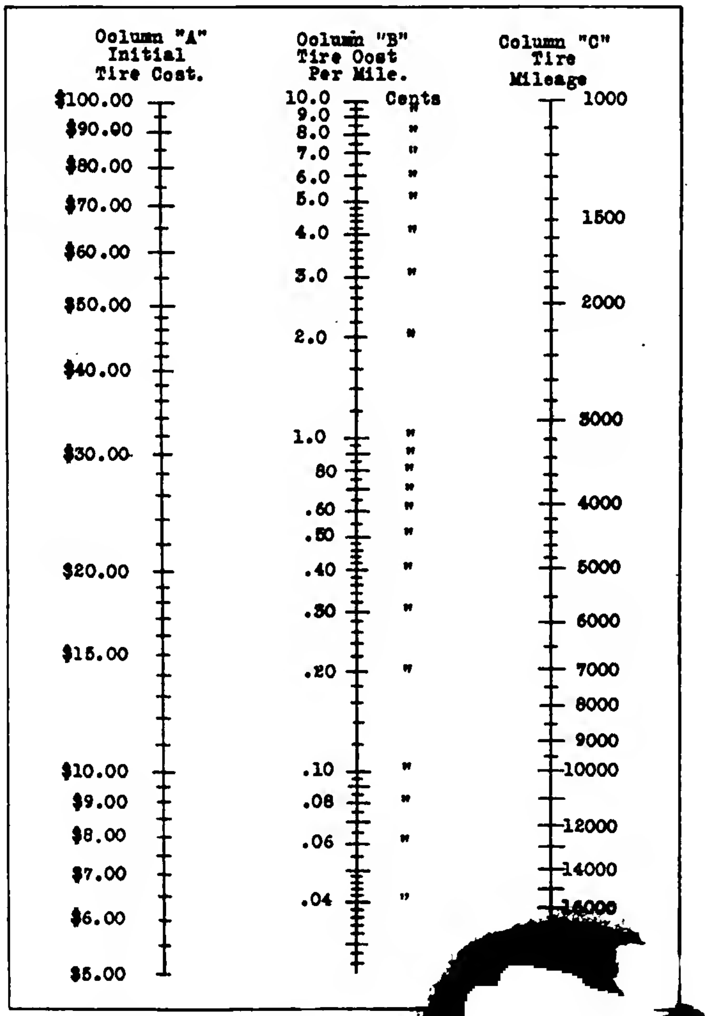

Fig. 4—Tire cost chart published by Go

ACCESSORIES

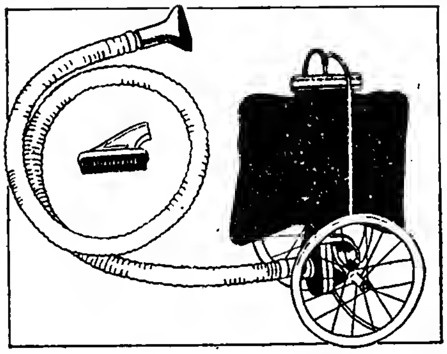
Warner Prairie Schooner

THE equipment of this camping trailer comprises a folding tent of heavy waterproof khaki duck, two folding Pullman beds, 4 by 6 ft., with non-sag springs, including two mattresses, compartment curtains for each bed, an ice chest, a folding table and a folding camp stove. There is also room in the box of the trailer for steamer trunks, blanket rolls, camping supplies, etc., when the tent and beds are folded. The trailer with equipment weighs about 750 lb. and is built to carry 1500 lb. Fitted with pneumatic tires, its speed capacity is 50 m.p.h. and with solid tires 15 m.p.h.

The trailer is built on automobile lines and is highly finished to harmonize with the car and the trailer tongue is adjustable so that the box of the trailer is always level, irrespective of the make of car to which it is attached. The tent used when opened is 7½ by 14 ft., the eight legs supporting the beds and the tent being adjustable so that the beds can be made level on uneven ground. The beds are 4 ft. above the ground, the trailer body forming the floor of the tent. Stakes and guy ropes are included. The entire outfit can be opened and arranged in 10 min. by one man. In 20 min. the equipment can be removed from the Prairie Schooner which can then be used as a commercial trailer. With 30 by 3-in. pneumatic tires the Prairie Schooner sells for $200 f.o.b. Beloit, Wis. With solid tires it is $175 f.o.b. Beloit.—Warner Mfg. Co., Beloit, Wis.

Sterling Utility Cleaner

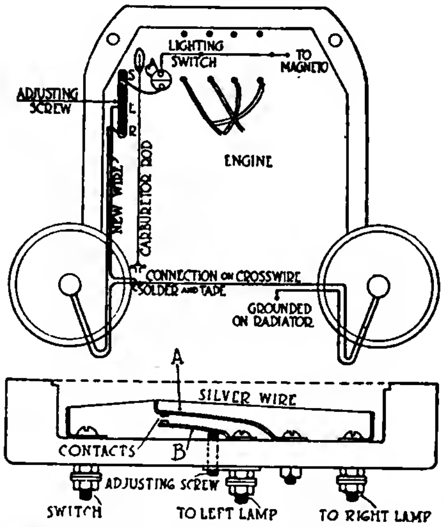
The Sterling is a small portable vacuum cleaner mounted on light rubber tired wire wheels and fills the need for such a cleaner for car upholstery and for other purposes around the sales-room or garage, besides being a suction machine it can be converted into a blower in 30 sec. by removing the bag and inserting the hose in its place. The complete outfit weighs 15 lb. and includes a cast aluminum fan 20 ft. of flexible cord, 8 ft. of 1½ in. hose for suction and blowing, specially designed toothed nozzle, brush for cushions, etc. Price $29.50.—Sterling Sales Co., Chicago, Ill.



Sterling utility vacuum cleaner

Van Sicklen Headlight Concentrator

This device for Ford cars is designed to furnish a bright headlight when the car is traveling slowly, and this is done by cutting out one bulb and sending the full voltage to the other when the speed drops below 15 m.p.h. It is merely an automatic switch of small size, which is mounted on the front of the dash. When the voltage of the magneto drops to 9 volts, the device short-circuits one lamp, the full voltage passing through the other. This voltage is sufficient to give full brilliancy. Above 15 m.p.h. current passes through both lamps and the voltage is sufficient to give a good light in both. A fine silver wire is strung between two terminals of the device, one running to the switch and the other to the right lamp. This wire holds down the flat spring *A* which is in contact with the shorter spring *B* as long as the silver wire is cool and unexpanded. This holds for speeds below 15 m.p.h., when all the current which passes through the switch terminal flows through the springs mentioned into the left headlight. Above this speed, the current passing through the wire is sufficient to heat it until it slackens enough to allow spring *A* to move away from *B*, thus breaking the circuit, so that the right lamp is no longer shorted, and the voltage of the magneto now passes through both headlights in series.—Van Sicklen Co., Elgin, Ill.



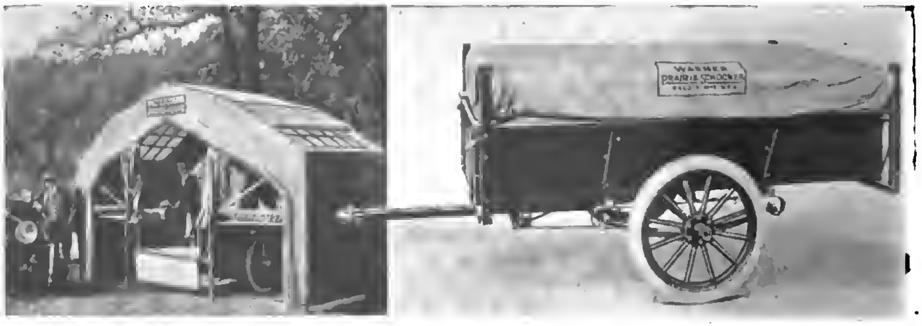
Van Sicklen headlight concentrator for Ford cars

H$_2$O Vaporizer

This vaporizer, which was described and illustrated on page 864 of THE AUTOMOBILE for May 11, under the name of the Weco vaporizer, is designed to supply a small quantity of steam to the motor with the fuel mixture, a 2½-qt. copper tank being located on the exhaust pipe where the heat from the exhaust heats the water. A small tube leads the steam to the intake manifold above the carbureter. Better vaporization, lower fuel consumption and absence of carbon deposits are claimed to result from the use of the device. The Weco Mfg. Co., Boston, Mass., was formerly the New England distributor for this device, which is manufactured and sold by the H$_2$O Mfg. Co., Cambridge, Mass.

Graham Exhaust Ventilator

Small ventilating hoods, installed at the top of the motor hood, have air passages so arranged that the air currents produce a strong vacuum which exhausts the hot air from the engine space. The makers state that the device is capable of exhausting 25,000 cu. ft. of air per hour when the car is moving at an ordinary speed, but that it also operates when the car is standing. The raising of the hood is not interfered with, there are no parts which can get out of order and rain cannot get through. A special type is made for trucks with motors under floors.—Ross-Wortham Co., Chicago, Ill.



Warner Prairie Schooner, with tent opened and as a trailer

Cutting the Pace

ALTHOUGH visitors to Indianapolis last Tuesday saw a fine race, as was assured beforehand by the many fast cars entered, it will have been something of a disappointment to some that the speed fell short of what was done last year. Reflection, however, shows that it is really a cause for congratulation that so manifestly excellent a race can be run without breaking any speed records. Racing is interesting because it is a contest; it is also exciting largely for the same reason; the excitement natural to the occasion of a contest is merely enhanced by very high speed and not dependent upon it.

The automobile racing of the old type was to open out everything fully and hope that the car would hold together. To-day we are getting such immense power that this practice cannot be followed, the car must be held in check to some extent lest it pound itself to pieces, so the best speed at which to win a race is that speed which will just, and only just, suffice to win.

Another strong impression gained by seeing the 1916 Indianapolis speedway race, after having witnessed several events on the board tracks, is that the old course is of a far more sporting character. There the skill of the driver in taking the turns is ever being called upon to manifest itself in some new way, for with a big bunch running it is often impossible to take a turn in just the same way on each circuit. That the board speedways are faster is not likely to upset the popularity of Indianapolis as long as we have the drivers to put up such a splendid spectacle as that provided on Decoration Day, 1916.

Industrial Warriors

NOT a man who heard Howard E. Coffin's speech on Monday night could have failed to be convinced of the absolute common sense of the program which the industrial preparedness committee has before it. All in the automobile industry should respond to the appeal as one man, for they all know and appreciate the ability and the creative power of the man at the head of affairs. As long as Howard Coffin holds the wheel and has his foot on the accelerator, the work will go ahead quickly and certainly.

Truck Transmission

IN the evolution of all kinds of machinery the time always arrives when compromise has to be struck, and the automobile is by far the greatest example of compromise which it would be possible to find.

For example, we all know that it is a vicious thing, mechanically speaking, to take power around a corner. We all know that it is possible to build a chassis so that the crankshaft is parallel with the axles, and we also know that such cars are not built because the drawbacks of the construction more than outweigh the theoretical advantages.

For this reason it is never either safe or right to base an argument about any detail of automobile construction solely upon theoretical grounds. Theory must take its place, should be the basis of nearly all good mechanical controversy, but it must be backed up or compared with a proper balancing of the *practical.*

A machine is made for the purpose of performing certain work. A motor truck is made to carry goods. If all motor trucks had to carry the same goods in the same loads over the same roads, it might be easy to find a single ideal design, but so long as everything from the selling price to the nationality of the driver affects the conditions of service, so must the design be a matter of compromise.

Now, when a dozen different men start work independently upon the same problem and that problem is hedged with practical difficulties, they are certain to work out a dozen different solutions. They may all be correct solutions, but more likely they will all be incorrect, some approaching nearer to the right answer than others.

There are scores of different ways of getting power from the engine to the road wheels of a truck, and we are using about six of them to-day. In 3 years we may be using six more as electric and hydraulic schemes are brought to perfection. Thus it is much more probable that more study will produce more types of drive than that it will reduce them, and it is beyond belief that there will be one final system within the present century at any rate.

Macauley to Succeed H. B. Joy

To Be Packard President—Joy Remains Chairman of Directors' Board

DETROIT, MICH., May 31—Alvan Macauley, vice-president and general manager of the Packard Motor Car Co., is soon to be given the title of president in recognition of his service in the affairs of the company. H. B. Joy, now president, will remain actively connected with the organization as chairman of the board of directors.

Mr. Macauley has virtually been president of the Packard company for the past 2 years and the upbuilding of that organization is in his hands and the responsibility also is his. Mr. Joy has been working toward the end of broadening and strengthening the organization to meet the conditions of its very much enlarged business conditions, thus requiring more help at the top. As a result the title of president of the company will be conferred on Mr. Macauley in the near future at the request of Mr. Joy and with the approval of the directors as a well merited recognition of Mr. Macauley's ability.

The change in titles of the officials of the company will not change the conditions which have been in effect for much more than a year.

Hayes to Make Wire Wheels

JACKSON, MICH., May 29—To meet the demand for wire wheels as well as the wood type, the Hayes Wheel Co. has decided to manufacture the wire type along with its wood wheel production. General selling agent for the Hayes wire wheel will be the Castle & Kyte Co., 872 Woodward Avenue, Detroit. The latter is a new organization, composed of F. E. Castle, well known in the trade as the head of the F. E. Castle Co., and H. W. Kyte, former assistant general manager of the Houk Mfg. Co., Buffalo.

Packard Plans Stock Increase

DETROIT, MICH., May 29—P. H. McMillan, secretary and treasurer of the Packard Motor Car Co., has called a special meeting of the stockholders for June 3, at which time action will be taken on a proposal to increase the capital stock of the company from $8,000,000 common stock to $13,000,000 authorized. At the present time there is outstanding $7,065,300 in common stock, $934,700 of that at present authorized being unissued. The $8,000,000 authorized preferred stock will be changed. There is outstanding $5,000,000 of this, the remaining $3,000,000 being retained in the treasury.

It is not stated at this time just what disposition will be made of the new funds resulting from this stock issue, if approved, but with the earnings running very high, it is probable that it will be devoted to plant extensions and a still further strengthening of the Packard's financial position. At the present time Packard is earning approximately 60 per cent on the present common stock for the current fiscal year, after charging off $1,700,000 for depreciation.

1917 Moon Little Changed

ST. LOUIS, MO., May 27—For the first time in the history of the Moon Motor Car Co., this city, there will be no radical changes in Moon cars for the 1917 season.

Because of the congested condition of the material market, the rush to keep ahead of the demand, it is necessary to place orders for parts 6 to 8 months in advance.

This condition prompts the company to hold to the lines of its 1916 models to a large extent for 1917. In order to be ready to put out radically different models in July, it would be necessary this year for the manufacturer to place his orders for parts in December or January, too early to determine definitely what changes were desirable.

It means, too, that the Moon factory will run 100 per cent capacity during June and July. In other words, there will be no lapse in the manufacturing end at all between the end of the 1916 season and the opening of the 1917 season.

Mid-West S. A. E. Meets June 2

CHICAGO, ILL., May 31—"Art and the Motor Car," by W. B. Stout of the Scripps-Booth Co., is one of the papers to be read at the June 2 meeting of the Mid-West Section of the Society of Automobile Engineers. Another paper will be "Problems Involved in the Choice of Motor Truck," by Henry Farrington of the Thomas B. Jeffery Co.

Carter Heads Philadelphia Engineers

PHILADELPHIA, PA., May 27—At the annual meeting of the Engineers' Club of Philadelphia, with which is affiliated the Pennsylvania section of the S. A. E., the following officers were elected: President, E. B. Carter; vice-president, J. H. M. Andrews; secretary, Robert H. Fernald; treasurer, William M. Irish.

Argo Receives French Order

JACKSON, MICH., May 29—The Argo Motor Co., this city, has received an order of 250 cars from the Exporters of Manufacturers' Products of France.

Aluminum Motor for Premier

New Model to Have Electric Gearshift — Thermostatic Water Cooling Control

INDIANAPOLIS, IND., May 25.—Details on the new Premier, which will be put on the market within the next few months by the Premier Motor Corp., are just beginning to be known to the industry. The present organization which has taken over the huge plant of the T. B. Laycock Co., manufacturer of bed springs, is ready to begin operations as soon as the machinery which has been ordered is installed and started on production.

Modern ideas are incorporated throughout the chassis which has an aluminum motor with cast iron cylinder sleeves. The entire cylinder and crankcase is a unit casting of Lynite and the motor dimensions are 3⅜ by 5½. According to present plans the motor will have overhead valves carried in a separate valve head casting. Aluminum pistons, counterbalanced crankshaft and helical camshaft drive are other features.

Among the other important specifications of the car are thermostatic water cooling control, unit power plant, single plate clutch, Cutler-Hammer electric gearshift, Timken spiral bevel axle, sheet steel body and a deep frame, scientific chassis design. Collins curtains that open with the door will be used. The price will be, according to present plans, $1,685 for a seven-passenger touring model.

This concern is now occupying an ideal plant covering a tract of 40 acres and having a floorspace of about 327,000 sq. ft. It is capitalized at $2,500,000.

Denby Truck Prices and Load Capacities Revised

DETROIT, MICH., May 29—The Denby Motor Truck Co. has revised the prices of its several models as follows: Type R, 1-ton capacity, $1,020; type G, 1½-ton capacity, $1,575; type H, 2-ton capacity, $1,790, and type K, 2½-ton capacity, $2,090. It is explained that while these new prices seem higher, they are in reality little changed over the old figures, inasmuch as the Denby trucks have been underrated heretofore and, while they were amply able to carry larger loads, it is only now that they have been given a revised and greater load rating. The new prices, therefore, are simply commensurate with the added capacity. Of course, in making these changes in load ratings, certain alterations have been made in the chassis to take care of all contingencies with the heavier loads, making the vehicles in every sense capable of the work they do.

Ward Leonard Co. in New Plant

Occupies Factory with 50% Larger Manufacturing Facilities in Mt. Vernon

MOUNT VERNON, N. Y., May 26.—The Ward Leonard Electric Co. has moved into its new building in this city. The need of more space and labor operators was the reason for the company moving from Bronxville. The floor space has been increased approximately 50 per cent.

The Ward Leonard Electric Co. started manufacturing electric controlling devices in Bridgeport, Conn., in 1892. After 2 years in Bridgeport, and 3 years in Hoboken, N. J., it moved to Bronxville, N. Y., and has been manufacturing in Bronxville since 1897, or for the past 19 years. The new location is nearer New York.

A 6-Weeks Engineering Course

DENVER, COL., May 26—A short course in automobile and tractor engineering will be given this summer by the Colorado Agricultural College, at Fort Collins. The special course will start June 19 and continue 6 weeks. It will be a practical course for garagemen, car owners, farmers, chauffeurs, threshermen, farming contractors and car and tractor salesmen.

S. C. Johnson & Son Raise Wages 10 Per Cent., Due to Prosperity

RACINE, WIS., May 27.—S. C. Johnson & Son, manufacturing Johnson's prepared wax and cleanser, gave their entire force of employees an agreeable surprise on the last pay-day by adding 10 per cent to their checks and announcing that all wages will be 10 per cent higher in the future. The company employs about 200 men and the wage increase means an additional outlay of $15,000 annually. The action was taken to carry out the wishes of S. C. Johnson and Herbert F. Johnson, owners of the concern that the employees share in the prosperous condition of the business.

Martin V. Kelley Co. Opens Branch in New York

NEW YORK CITY, May 31.—The local branch of the Martin V. Kelley Co., Toledo, Ohio, will be opened to-morrow. The New York City office of this advertising concern will be at 171 Madison Avenue. The company's invasion of this city is due to the purchase by Mr. Kelley of the entire business of Bromfield & Field, Inc., New York.

The new accounts taken over by the Kelley company include the Fisk Rubber Co., Chicopee Falls, Mass.; Ajax Rubber Co., Trenton, N. J.; Mercer Automobile Co., Trenton; F. I. A. T., Poughkeepsie, and the Boston Woven Hose & Rubber Co. The Toledo office includes among its accounts fourteen companies in the automobile field. In taking over the local concern R. A. Field, treasurer of the firm, has been retained and also becomes a vice-president.

Goodman Sets Up For Himself

NEW YORK CITY, May 29—Henry Goodman, who has managed the New York office of the Springfield Metal Body Co. for 2 years, has incorporated the Goodman Auto Body Co. and will handle the Springfield business in eastern territory, the change taking effect June 1. He will continue the office at 1737 Broadway.

Mr. Goodman, who is president of the new company, was connected with the Pope Mfg. Co. for 18 years.

Allen's 300 per Cent Dealer Gain

FOSTORIA, OHIO, May 27.—The Allen Motor Co., this city, reports an increase of 300 per cent in the number of its dealers during the past year. The company's production of cars has tripled in the past 11 months and the dealers' orders exceed the factory's capacity by 50 per cent.

Premier Appoints District Managers

INDIANAPOLIS, IND., May 24.—The Premier Motor Corp., this city, has appointed the following district managers: In the East, H. C. Arnold, formerly with the Hudson Company in Chicago; West, H. L. Pelton, formerly with the Chalmers company; Southwest, A. G. Dale, formerly selling Chandler cars; Northwest, R. S. Ellis, formerly with the Winton company in Detroit; Pacific Coast, P. A. Berry, formerly distributor of the Packard and Hudson in Tacoma, Wash.

Duluth Jitney Ordinance Upheld

DULUTH, MINN., May 27.—The Supreme Court of the state has upheld the jitney ordinance of this city. Police are notifying jitney operators to take out licenses at once. They must pay a wheelage tax also. The law provides strict regulations and the filing of accident bonds. The ordinance was passed in May, 1915. Before effective a referendum petition was filed against it. It was agreed with jitney operators certain provisions would be withdrawn. The ordinance was repealed. Some jitney men refused to abide by the agreement as to the second ordinance. One driver offered himself as test. The court held that the second ordinance differed in important particulars from the first and that the evidence did not show the council acted in bad faith.

DeLaski Loses Tire Core Suit

Decision in Favor of U. S. Tire Co. Upheld by Circuit Court of Appeals

NEW YORK CITY, May 27.—The decision by Judge Hand in the United States District Court in favor of the United States Tire Co., last December, in a suit brought against it by the De Laski & Thropp Circular Woven Tire Co., has been upheld by the United States Circuit Court of Appeals in New York. The case was an effort on the part of the De Laski & Thropp company to secure the upholding of its tire core patent by means of new testimony, following a decision of the Circuit Court of Appeals, holding the patent invalid because anticipated.

The patent in question covered molds used in the manufacture of tires by practically the entire industry, and if upheld would have given a practical monopoly to the owner.

The lower court held the patent invalid through having been anticipated by the B. F. Goodrich Co.

Maryland Jitneys Under P. S. C.

BALTIMORE, MD., May 29.—Beginning July 1 all jitney buses operated in Maryland must have permission from the Public Service Commission. Under the provisions of a law enacted by the General Assembly the Commission must approve the lines before the proprietors will be able to secure licenses from the Automobile Commissioner.

To Test Duluth Wheel Tax

DULUTH, MINN., May 27.—Under the auspices of the Automobile club a move has begun to test the city wheelage tax in the courts. At a meeting of 500 car owners President J. D. Park of the club was authorized to appoint a committee of seven to take the steps. Seventy-five new members were added to take part in the campaign. The tax is held unjust in addition to the personal property tax on automobiles. The law went into effect in July, 1910. The tax is 50 cents per horsepower for cars and $10 per ton for trucks.

Open Motor Demonstration Field

SAN DIEGO, CAL., May 22.—The motor demonstration field at the Panama-California Exposition was opened last Saturday, May 20. The opening celebration was in charge of the San Diego Automobile Dealers' Assn. On Saturday the dealers engaged in a gymkana on the field and the following day a provisional company of the California Section, Automobile Reserve Corps maneuvered on the field with the Twenty-eighth Company, Coast Artillery Corps, United States Army. The cars were driven from Los Angeles by members of the Automobile Reserve Corps and the command returned to Los Angeles as soon as the maneuvers at the exposition were over and the U. S. regulars had been transported back to Fort Rosecrans, where they are stationed. The run was the longest of any yet attempted by a large fleet of cars under the colors of the A. R. C. Of the twenty or more cars in the line, not one suffered from mechanical or tire trouble on the entire trip and the entire command rolled into San Diego just as it left Los Angeles and returned the same way.

Buick Ambulance Sent to France by Wilmington

WILMINGTON, DEL., May 29—As the result of a campaign which has been carried on in this city for the collection of funds to aid in French army relief, a model field ambulance has just been completed in this city and will be shipped in a few days. The car was built by the Wilmington Automobile Co. It is mounted on a Buick chassis, has heavy-duty tires and all parts of the sub-construction are suitable for the strenuous service it undoubtedly will undergo.

Canadian Market for English Cars

MONTREAL, QUE., May 29—The English automobile manufacturer is going to invade the Dominion as soon as the war is over, and will establish agencies in all the provincial cities and towns throughout Canada. The English manufacturer will especially feature light cars, and there is a large field in this country for the cars the English manufacturers are turning out. There are a few light cars of English make in this city at present, and several of a French make. The cars are complete in every detail, are moderate in price and the cost of upkeep is very small.

American Brass Co. To Expand

Plans Expenditure of $1,600,000 to $2,000,000 in Enlarging Its Plant

KENOSHA, WIS., May 27.—The American Brass Co., Waterbury, Conn., operating a large rolling mill and brass foundry at Kenosha, Wis., has made public plans for improvements at Kenosha to cost between $1,600,000 and $2,000,000, which will make the local works the largest of the kind in the country. At the same time about $400,000 will be expended in enlarging the Waterbury works. At Kenosha the brass mill will be enlarged by an addition, 320 by 225 feet, and the foundry by an addition of 320 by 200 feet. A new administration building is included in the plans, which will require about 2 years to carry out.

Emerson Plans $10,000,000 Plant

PHILADELPHIA, PA., May 30—The Emerson Motor Car Mfg. Co., recently formed to build the S. S. E. car, will build a $10,000,000 plant in this city. The buildings and equipment will cost between $2,000,000 and 3,000,000.

The concern is composed of New York City and Chicago capitalists and has a capital of $10,000,000, which is stated to be all paid in.

Gasoline Lower in Oklahoma — Unchanged in Eastern States

NEW YORK CITY, May 29.—Gasoline prices in this city continue unchanged. So far, dealers say, none of the large refineries have indicated their intention of advancing the wholesale charge, which continues at 24 cents a gal., in this city and 23 cents in New Jersey.

Retailers in this city are asking from 27 cents to 31 cents a gal. In New Jersey, some of the dealers are selling at 24 cents a gal.

Oklahoma gasoline prices were reduced last week 2 cents a gal. to 23 cents tank wagon basis.

The active season for gasoline is near at hand, and it is predicted that the chances for a downward revision in prices are not promising. In fact, higher prices are looked for when the consumption of gasoline is at its maximum.

Now Durston Gear Co.

SYRACUSE, N. Y., May 29.—The Durston Gear Co., this city, has been incorporated to carry on the business of the Lefever Arms Co., whose corporate existence has ceased. During the past few years the business of the gear department of the Lefever company has taxed the entire space of its factory, requiring the entire attention of the company. As a result the assets, other than the factory and machinery of the gun department were sold. The proceeds of this sale were transferred to the gear department. The management, ownership and the financial responsibility of the new company remains the same as the old company.

Electric Taxicabs for Chicago

CHICAGO, ILL., May 29.—Guy Woods, the owner of the American Motor Livery Co. of Chicago, has recently placed an order with the Milburn Wagon Co. for twelve specially built electric town cars to be especially equipped. The new electric cab will be of the limousine type and will accommodate five passengers.

Electric taxicabs have for some time past successfully operated in Detroit. The Detroit Taxicab & Transfer Co. now operates a fleet of fifteen electric cabs.

Chevrolet Exports to Australia

NEW YORK CITY, May 29—The Chevrolet Motor Co., this city, is exporting 384 cars to-day for ports of Australia and New Zealand, and has a rush order for 900 more. The steamship *Florence Luckenbach*, which will carry the cars, is taking the largest single export shipment of passenger cars ever leaving an American port.

Olds Doubles Production

LANSING, MICH., May 29—The production of Oldsmobiles, already well beyond the 10,000 mark per annum, is to be raised to 20,000 cars next season.

Materials Market Steady

NEW YORK CITY, May 29—With the exception of a further drop in copper prices, the materials markets on the whole were steady. Both electrolytic and lake coppers dropped 1¼ cents a lb. to 28 cents. The copper market was dull due to sharp breaks at London, indirectly affecting the market. There is little forward buying now in evidence.

Para rubber has dropped to 67 cents a lb. with an easy market in both that grade and Ceylon. The last name has been shown very little interest lately and quotations have been maintained steadily at 70. Mail advices from London state in their explanation of the present low rubber prices that considerable quantities in the warehouses there have been sold, the shipment of which to America has been rather seriously delayed through the difficulty in getting permits.

Goodyear Capital Increased $18,000,000

AKRON, OHIO, May 29.—The Goodyear Tire & Rubber Co., Akron, has filed papers with the Secretary of State increasing its preferred stock from $7,000,000 to $25,000,000. The common stock of the company already amounts to $25,000,000, making a total capital of $50,000,000.

Dividends Declared

Yale & Towne Mfg. Co., quarterly of 1¾ per cent, payable July 1 to stock of record June 23 and an extra dividend of 10 per cent, payable June 7 to stock of record May 31.

Chandler Motor Car Co.; quarterly of 2 per cent and extra dividend of ½ per cent, payable July 1, 1916, to stock of record.

Packard Motor Car Co.; quarterly of 1¾ per cent on preferred, payable June 15 to stock of record May 31. Books do not close.

Record Prices for Securities

General Motors Rises 84 Points —Chevrolet Up 11—Activity and Strength

NEW YORK CITY, May 29.—Another period of activity and strength among the automobile and accessory shares has set in. The motor market was featured by United Motors Corp., selling on a when issued basis. Sales in this security alone totalled 150,500 shares. From an opening of 64½ points, the stock advanced to 78 on Saturday. The movement in United Motors was responded to by a 20-point rise in Perlman Rim Corp. stock, which is to be a part of the United Motors Corp.

On Thursday Chevrolet opened at 249, a new high level. General Motors has advanced to 515 or 115 points higher than its low cost this year. Rumors had it that a special cash disbursement of $100 might be made at the end of the current fiscal year. Earnings for the year, it was said, would probably approximate $25,000,000, which after payment of the preferred dividend would leave around 150 per cent on the common. Chandler Motors was another strong feature of the motor group, with a rise of 5½ points. This company is reported to be earning at the rate of 20 per cent a year. It is expected that the present 6 per cent dividend rate will be placed higher at the coming directors' meeting.

Peerless Truck went up 5½ points to 102. Net earnings of this corporation in April were approximately $200,000, or at the rate of $2,400,000 annually. This has been the monthly average since the first of the year.

Saxon stock went up to 83, a gain of 9½ points. This company inaugurated dividends recently by paying $1.50 a share, thus placing the stock on a $6 a year basis. The stock is soon to be placed on the New York Stock Exchange.

Splitdorf magneto fractional stock is being bought and sold by Kidder, Peabody & Co., in order to make full shares, on the basis of $95 a share for the preferred and $75 a share for the common. As the dividend to Torrington common shares amounts to 7-100 of a share of Splitdorf preferred and 1-10 share of common, the total value of the dividend is about $14.15.

80% Paige-Detroit Stock Dividend Approved by Stockholders

DETROIT, MICH., May 26—Stockholders of the Paige-Detroit Motor Car Co. at a special meeting Wednesday in the company's general offices gave their approval to the recommendation by the company's directors that a stock dividend of 80 per cent of the par value of $400,000 be distributed pro rata to the stockholders of record May 13.

Approval was given also to the directors' recommendations that the authorized capital stock of the company be increased from $1,000,000 to $2,000,000 and that the par value of the stock be cut down from $100 to $10 a share.

Cars Are Faster Than Their Drivers

Indianapolis Produces Opposite Effect to That on Board Speedways Where Drivers Are Speedier Than Cars—Cooling Engines and Tires—Carburetion and Lubrication

(Continued from page 966)

INDIANAPOLIS, IND., May 30—The Indianapolis contest is more of a race of drivers than is Sheepshead Bay or Chicago; the whole situation is summed up in the statement that on the board speedway the drivers are faster than their cars, while at Indianapolis the cars are faster than the drivers. The turns must be coasted and hence speed is lost twice in every lap.

Owing to the necessity for reducing the speed the cars that have the greater acceleration possess a great advantage. This quality of acceleration means that reserve power must be on tap. The engine must be ready to carry the speed back to the highest safe maximum and must be able to hold it there. This condition makes for circumstances that are much more difficult for the engine to meet.

It is this shutting down that causes so many oiling troubles on the Indianapolis track. The closing of the throttle allows the oil to accumulate and it is forced up into the combustion chamber, with the result that the plugs are fouled and have to be frequently renewed. Indianapolis is the hardest speedway on spark plugs in the country, for this reason.

Carburetion Important

Carburetion on the Indianapolis speedway is one of the points which must be watched carefully as the tendency for the driver to step down hard upon the accelerator pedal in coming out of the turns, puts the hardest kind of service up to the carbureter. The tendency is toward a failure to supply sufficient gasoline quickly in order to meet the demands of the wide open throttle. The multi-jet carbureter has been found to work out very well in this respect, because the gasoline has the tendency to collect in the jet wells when the throttle is closed and then to be available immediately upon opening the throttle.

A study of the pit stops does not reveal any definite weakness, unless it be in the tendency to short-circuit the plugs, due to accumulation of oil. It naturally gives rise to the thought that the clearances with the aluminum pistons may be too high. This seemed to be shown particularly in the Frontenac cars, which were in and out of the pits many times, for the purpose of changing plugs. The space before the Frontenac pit was covered with oil and it seemed to show that a great excess was reaching the combustion chamber because the number of plugs that were cleaned and renewed

*Six cylinders, all others are fours.
**Two carbureters.
***Two duplex carbureters giving four mixing chambers.

All cars in the race used Bosch Magnetos, Dixon's Graphite, Motometers and Hartford Shock Absorbers.

was excessive. An examination of the plugs that were used showed that they were not burnt out or destroyed but simply fouled by excessive lubricant.

Motometer readings do not indicate any overheating. It seems that racing cars are now more effectively cooled than ever before. The waterjacketing spaces on all the cars that are now racing are generous, and the seizing of pistons was very conspicuous by its absence. Of course, with the shutting off on the turns, seized pistons are not to be expected as often as at New York where there is no shutting down and the speeds range almost 20 m.p.h. faster.

Difficulty in starting means the loss of many seconds and may sometimes cause the loss of a position. The two Maxwells required vigorous efforts to crank them and the Crawford driven by Johnson lost half a lap at the very start of the race because it could not be started until five or six men pushed it. This may seem a trifling matter, but in a race where 15 sec. counted for perhaps $5,000, it may become a very important detail.

A leaky gasket on the Crawford driven by Chandler caused a considerable amount of trouble. This was replaced twice, but the tank could not be kept sealed due to some defect in the filler cap attachment. This was one of the exceptional cases where details bothered the drivers. The race was particularly free from the small troubles which generally cause a great many delays. There was more tire trouble than would have been expected in the light of the good performances in recent races, but the sun was warm and the vitrified brick of the track was hot to the touch.

A Tire-Cooler

Eddie Rickenbacher had an attachment on his car that he seemed to be a little sensitive about. At any rate, he kept it covered with a pair of overalls before starting. This was eventually discovered to be a tire-cooling attachment. In the tail a quantity of water was contained and leads were taken to each wheel ending in spray nozzles by which the water can be thrown on the tires. It is said to operate under about 4 lb. air pressure, the controlling valve being handled by the mechanic.

England Buys Plant Site

DETROIT, MICH., May 29—The England Mfg. Co., making a specialty of pressed steel door panels for automobiles, and at present located in a factory at Jefferson and Campbell Streets, this city, has acquired a 3-acre factory site adjoining the plants of the Federal Motor Truck Co., and contemplates building a plant comprising 54,000 sq. ft. of floorspace to enlarge its business in its specialty. The plant is to be ready for occupancy in 60 days.

The Record of Pit Stops

Duesenberg—D'Alene—One stop.
Lap 52; 1 min. 35 sec.
Changed right rear tire; took on gas and oil.

Maxwell—Henderson—Four stops.
Lap 53; 1 min. 18 sec.
Rickenbacher relieved Henderson; changed right rear tire; took on gas and oil.
Lap 72; 1 min. 10 sec.
Changed right front.
Lap 82; 40 sec.
Changed right rear and took on oil.
Lap 90; 5 min. 20 sec.
Oil lead broken from oil tank.

Frontenac—A. Chevrolet—Seven stops.
Lap 7; 8 sec.
Took on water.
Lap 19; 20 min. 30 sec.
Changed plugs; took on water and oil; leaking oil.
Lap 23; 19 min. 26 sec.
Changed eight plugs; took on water and oil; tightened crankcase, poured water on the brakes; leaking oil.
Lap 29; 2 min. 20 sec.
Took on water; tightened crankcase.
Lap 33; 4 min. 13 sec.
Took on gasoline; changed plugs.
Lap 40; 20 min.
Changed plugs; took on oil; magneto trouble.
Lap 41; 48 min.
Fouled plugs; magneto trouble; took on water and oil; changed magneto.

Frontenac—G. Chevrolet—Seven stops.
Lap 41; 2 min.
Consultation; oil trouble.
Lap 42; 7 min. 20 sec.
Changed plugs.
Lap 45; 35 min.
Valve bent; changed plugs; Joe Boyers took over wheel.
Lap 53; 5 min.
Fastened under pan; instructions; water leak.
Lap 73; 1 min. 18 sec.
Arranged right front and right rear tire; took on water.
Lap 78; 12 min. 10 sec.
Oil line broken; loose steering post.
Lap 83; out.
Burned out rod.

Osteweg—Halbe—Four stops.
Lap 57; 3 min. 30 sec.
Changed both rear tires; gas and oil.
Lap 91; 2 min.
Changed right rear tire; took on gas.
Lap 98;
Broken oxhaust pipe.
Lap 103; 1 min.
Changed mechanic and driver.

Peugeot—Mulford—One stop.
Lap 72; 33 sec.
Changed right rear tire; took on gas.

Ogren—Alley—Three stops.
Lap 37; 40 sec.
Exhaust pipe broken off.
Lap 55; 7 min.
Bolt in radiator stay rod; changed right front tire; water.
Lap 100; 1 min. 20 sec.
Right rear and water.

Sunbeam—Christiaens—One stop.
Lap 16; 30 sec.
Changed left rear tire.

Peugeot—Resta—One stop.
Lap 70; 1 min. 4 sec.
Changed right rear tire; took on gas.

Delage—Oldfield—Four stops.
Lap 9; 40 sec.
Changed right front tire.
Lap 40; 1 min. 19 sec.
Changed right rear tire; gas and oil.
Lap 72; 1 min.
Changed left rear tire; took on gas.
Lap 103; 23 sec.
Changed right front tire.

Peugeot—Aitken—Six stops.
Lap 18; 1 min.
Changed right rear tire.
Lap 25; 12 min.
Changed left rear tire.
Lap 50; 30 sec.
Changed right rear tire; took on gas.
Lnp 66; 51 sec.
Changed right rear tire.
Lap 68; 4 min.
Oil on plugs.
Lap 69; out.
Broken valve.

Peusun—Franchi—One stop.
Lap 9; 8 min. 37 sec.
Changed plugs.

Crawford—Lewis—Five stops.
Lap 6; 2 min.
Fixed gasoline tank gasket.
Lap 24; 2 min.
Changed hoth rear tires; examined plugs.
Lap 58; 2 min.
Changed both rear tires.
Lap 67; 3 min.
Gas tank loose.
Lap 70; out.
Loose gas tank.

Crawford—Johnson—Six stops.
Lap 15;
Information.
Lap 16; 22 sec.
Changed left rear tire.
Lap 26; 22 sec.
Changed right rear tire.
Lap 54;
Information.
Lap 55; 2 min. 20 sec.
Changed both rear tires; adjusted brake.
Lap 90; 2 min. 20 sec.
Took on gas; adjusted carbureter.

Premier—Rooney—Two stops.
Lap 23; 5 min.
Changed plugs.
Lap 38; 12 sec.
Le Cain relieved Devigne.

Premier—Anderson—Two stops.
Lap 15; 26 min.
Changed plugs.
Lap 25; out.
Broken connecting-rod.

Premier—Wilcox—Five stops.
Lap 4; 6 min.
Changed spark plugs.
Lap 14; 4 min. 6 sec.
Changed spark plugs.
Lap 41;
Gas and water.
Lap 45; 37 sec.
Changed right rear tire.
Lap 72; 3 min. 45 sec.
Took on water, gas and oil; engine boiling.

Crawford—Chandler—Six stops.
Lap 7;
New gas tank cover.
Lap 11;
Information.
Lap 12;
Gasket on tank.
Lap 40;
Changed drivers.
Lap 71;
Changed left rear tire; took on gas.
Lap 74;
Changed plugs.

1917 Model Six-Cylinder Grant Is $30 Higher in Price

CLEVELAND, OHIO, May 30—The Grant Motor Corp., this city, has announced its 1917 six-cylinder model which sells at $825 or $30 more than the 1916 model. The three- and five-passenger models will sell at $825, while the three-passenger cabriolet will cost $1,050.

Though the size of the motor remains the same, 3 by 4¼, several other changes have been made. The 1917 model has a Wagner two-unit starting and lighting system and Remy ignition. The valve rocker cover on the motor has been removed and the gasoline tank has been removed from the cowl to the back of the car. The Stewart vacuum feed system has been installed. The Stromberg carbureter has also been introduced.

Best Mfg. Co. Formed

LOUISVILLE, KY., May 26—The Best Mfg. Co., this city, has been formed with a capital of $100,000 to make electrical devices for automobiles. The incorporators are G. H. Turner, A. T. Burgevin and S. S. Fitzpatrick.

A temporary plant will be rented, which will be equipped and ready for operation by June 1. Later a plant will be erected and the business conducted on a large scale.

15,000 See Races at Twin Cities

Fords, Duesenberg, Buick and Velie Share Honors in Several Events

MINNEAPOLIS, MINN., May 30—Special *Telegram*—Fifteen thousand people witnessed the Twin City speedway races to-day at Fort Snelling, the entries being amateur drivers with the exception of Lee Oldfield in an Oldfield car. The 2-mile concrete track was in fair condition. Twenty-one entries participated in the four automobile events. Time was ordinary, and the only exciting moment was when C. W. Jewett in a Jewett car, an overhauled Ford, crossed the wire 1/5 sec. ahead of C. J. Gilbert's Mercer after a neck-and-neck race for the five laps in the 10-mile handicap, which was won by M. Sorenson in a Duesenberg in 8:35 2/5. Choates in a Carnation was fourth in 10:21. The purse was $300.

Fifteen entries were made in the 50-mile race, which was run in two sections, the total purse being $2,000. A Duesenberg won in 40:56, a Mercer was second in 40:32 3/5, H. C. Feichtinger's Marquette Buick third in 41:40 2/5 and Jewett fourth in 49:41 3/5.

Jewett won the first 10-mile event in 9:33, with Clyde Mohrs, in a Buick, second. There were five entries in this event in class C, division V, non-stock up to 230 cu. in., the prizes amounting to $300.

An interesting event was a non-stock race in the same division and class, 231 to 300 cu. in., 20 miles, for $300, with four entries. This race was won by a Mercer in 17:56. J. B. Defea's Velie was second in 18:50 2/5 and R. Douglas' Corbin was third in 23:32 1/5.

The Twin City trophy race for owners and drivers of the Twin Cities was eliminated by sundown. Two motorcycle events were run, and Ruth Law in an aeroplane beat an automobile for two laps of the track.

Engine troubles were the main causes of frequent failures to finish. The cars were prepared and entered by amateur drivers and, with the exception of the Jewett, were mainly local. Mr. Jewett is State president of the retail automobile dealers, and drove himself.

Although the race lacked the glamor of world-famous drivers who took part in the initial 500-mile event last September, the attendance was as large.

J. J. R. Features Newark Races

NEWARK, N. J., May 30—Bert Watson in a J. J. R. Special featured in to-day's automobile races at the Olympic Park ½-mile dirt track. J. W. Dickinson in a Stutz Special won the 5-mile Australian pursuit race and a 3-mile handicap event.

The J. J. R. made the best time for ½ mile, negotiating the distance in 38 2/5 sec. Its time in a 3-mile event was 4:29 1/5. In another 3-miler, there was a pretty race between the J. J. R. and Dickinson's Stutz Special. The J. J. R.'s time was 3:54 2/5 and the Stutz, 3:56.

A 5-mile free-for-all was also won by the J. J. R. with Dickinson's Stutz a close second. The latter car won the Australian pursuit race in 6:37 after the J. J. R. dropped out in the fourth lap. G. T. Theobald in a Mercedes was the last to drop out of the race.

Dickinson's Stutz also won the 3-mile handicap from scratch after a close race with Theobald's Mercedes, which was in the lead until the last lap, when it was overtaken by the winner.

Road Race for Imperial Valley

BRAWLEY, CAL., May 23—The Imperial Valley is to have a road race. A purse of approximately $5,000 has been subscribed for a race over a course which takes in the three Imperial Valley cities, Brawley, Imperial and Calexico. The length of the course is approximately 25 miles. The event is to be run under A. A. A. sanction and a representative has been sent to Los Angeles to confer with Al. G. Waddell, representative of the A. A. A. contest board in regard to the sanction and the appointment of officials as well as securing entries from Los Angeles.

Five-Car Race for San Diego

SAN DIEGO, CAL., May 24.—Plans are under way for another race at the Exposition. The event is to be staged over the same course that Burman, Oldfield, Durant and Tetzlaff raced over in April. The A. A. A. representative has refused to allow more than five cars to start on the course and the field will be cut to the five fastest cars by elimination trials. It is planned to have the race at night, under the glare of the electric lights.

San Fernando Plans Race

SAN FERNANDO, CAL., May 24.—The Commercial Club of this city has started on the preliminary work for an automobile race to be run over the four-mile course around the city. The event is to be a sanctioned A. A. A. contest and it is quite probable that entries will be limited to cars of 231 cu. in. and under.

Sutterley Gets Pierce Contract

PHILADELPHIA, PA., May 29—G. T. Sutterley & Co., maker of a patented form of non-glaring headlight reflector, has closed a contract with the Pierce-Arrow Motor Car Co., Buffalo, for its device, which is now being used as standard equipment on cars of this make.

Multibestos Buys New Plant

Walpole Tire Building Taken Over—To Double Brake Lining Business

WALPOLE, MASS., May 30—The Standard Woven Fabric Co., maker of Multibestos brake lining, in order to provide additional factory facilities, has purchased the entire plant formerly operated by the Walpole Tire & Rubber Co., this city.

New equipment is being installed which will provide for at least double the present brake lining business and also allow for an expansion in the company's business in friction tape, tire tape and similar mechanical rubber goods.

For the present the plant at Framingham will be continued along with the work at Walpole, although in time it is planned to have all the manufacturing done at the local plant.

The offices and general headquarters have been removed and business from now on will be transacted at Walpole.

New McFarlan Six at $3,200

CONNERSVILLE, IND., May 29—The McFarlan Motor Co., this city, has brought out another new "90" for the coming year. Efforts have been confined to one chassis, equipped with a six-cylinder motor, 4½ by 6. The new model is a refinement of the Series X, which has been built for several years.

New features include a longer wheelbase of 136 in., McFarlan cradle spring suspension, improved body designs, new valve setting and combustion chamber. The motor will be of the T-head type, but the spark plugs will be placed directly over the firing chamber. The tests on this motor show a high efficiency.

Artillery wood wheels, fitted with Firestone demountable rims and cord tires, are standard equipment. A sub-frame mounted on two pressed steel cross members carries the motor and gearbox.

The front axle is an L-beam with Timken bearings in the steering knuckles. The front wheels are also mounted on Timken bearings. The Timken rear axle is of the floating type. The transmission gears are mounted on Timken bearings. Worm bevel type ring and pinion are used in the differential. The steering wheel is of the tilting type, being electrically heated.

Door locks are designed for the individual bodies. The touring car lock is especially heavy, avoiding rattles and being of the convenient type. The lever handle is concealed from the outside, but carries parallel with the top door line and is in a natural position for entrance.

Factory Miscellany

Ford Buys K. C. Land—The Ford Motor Co., Kansas City, Mo., has bought a 50-ft. lot on McGee Street south of Nineteenth Street, and a 75-ft. lot on Oak Street, across the alley from the former purchase, and may improve the property at once. On the McGee Street lot—this street being one of the chief thoroughfares and a car dealers' street—a three-story building probably will be erected, with handsome display rooms on the first floor, to be used for a retail sales department. This department is now at 1710 Grand Avenue. On the Oak Street property there probably will be erected a service station, three stories, to care for the city business. The service station and plant for assembling, at Eleventh and Winchester, would then care for the business from outside the city.

The second and third floors of the two buildings will be connected by runways.

The company opened May 15 a downtown service station at 1905 McGee Street, to serve till the new building is completed.

The total expenditures, if the present plans are perfected, will probably exceed $200,000.

Jones to Move—The Jones Motor Car Co., Wichita, Kan., is moving this month into its new home in North Wichita. The present factory on West Douglas Avenue will be retained for a salesroom. The new factory covers more ground than any other manufacturing plant in the State.

The plant has a floor space of more than 100,000 sq. ft., with six spacious buildings in addition to the office buildings. The American Warehouse Co., a broom corn establishment, is vacating the buildings now and the company is moving in as quickly as possible.

New Era to Double Capacity—The New Era Engineering Co., Joliet, Ill., engaged in the manufacture of automobiles, coming here ten months ago from Detroit, has outgrown the present quarters and will shortly double the floor space. At present the company is turning out sixty-seven cars each week, but with orders on hand for 2500 it was decided to enlarge in order to double the output. Capitalization has been increased to $200,000. The new location will be on the line of the Elgin, Joliet & Eastern Railway, a half-mile east of Joliet. The officers of the New Era company are: F. J. Alvin, president and general manager; James P. Buckley, vice-president and factory manager; Winthrop Burdick, treasurer and sales manager, and W. J. Burdick, secretary and purchasing agent. The company now has a payroll of $1,000 weekly, employing sixty mechanics.

New Haynes Paint Shop—A new three-story paint shop has recently been completed at the plant of the Haynes Automobile Co., Kokomo, Ind.

New Goodyear Plant in Canada—The Goodyear Tire & Rubber Co. New Toronto, Ont., will erect one of the largest and most up-to-date plants for the manufacture of tires in Canada at the corner of Ninth Street and Lake Shore Road. The factory will be a fireproof structure and will be constructed of brick and steel. The total cost is estimated at $200,000. When the plant is in full operation it is estimated that over 300 men will be employed. The Goodyear Tire & Rubber Co. has at present one of the largest rubber plants in Canada, at Bowmanville, Ont. It was stated, however, that it is the intention of the company to use this factory solely for the manufacture of rubber heels and soles and that the proposed plant at New Toronto will be engaged in the making of automobile tires. The reason for the securing of the new site was owing to the difficulty of securing men to live and work in a town.

Ford Assembling Plant Addition for Frisco—The Ford Motor Co. will build a five-story addition to its assembling plant at Treat Avenue and Twenty-first Street, San Francisco.

To Make Automobile Locks—Steps have been taken by Marietta (Ohio) capitalists to organize a $100,000 corporation for the purpose of manufacturing automobile locks, switches and other accessories. The plan is to occupy the plant of the Galvin Manufacturing Co., located at East Norwood, near Marietta. It is proposed to call the concern the C-D Manufacturing Co. F. A. Caskey will be president and secretary; G. F. Dupree, Jr., vice-president and sales manager, and O. D. McPherson, treasurer and auditor. F. D. Kunkle will be chief engineer.

The Automobile Calendar

ASSOCIATIONS

June 12-16—S. A. E. Summer Trip on Great Lakes.
July 2-6—Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
Dec. 2-9—Electricians' Country-wide Celebration.

CONTESTS

June 4—Sheepshead Bay Speedway, 30-mile Race, American Liberty Day Committee.
June 10 — Chicago Speedway Race. International 300-Mile Race, Speedway Park, Speedway Park Association.
June 20—Galesburg, Ill., Track Race, 100 miles.
June 28 — Des Moines, Iowa, Speedway Free-for-All, 300-Mile Race.
July—LaGrande, Ore., Track Race, LaGrande Motor Club.
July 4—Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4—Tacoma, Wash., Speedway Race, Tacoma Speedway Assn.
July 4—Minneapolis 300-Mile Speedway Race.
July 4—Sioux City Speedway Race.
July 4—Newark, N. J., Track Race, Olympic Park, Auto Racing Assn.
July 15—Omaha, Neb., Speedway Race.
July 15—North Yakima, Wash., Track Race, Hiller-Riegel Co.
Aug. 5—Tacoma Speedway Race, Tacoma Speedway Association.
Aug. 11-12—Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.
Aug. 12—Portinnd, Ore., Track Race, Hiller-Riegel Co.
Aug. 18-19—Elgin Road Race, Chicago Auto Club.
Sept. 4—Newark, N. J., Track Race, Olympic Park, Racing Assn.
Sept. 4—Indianapolis Speedway Race.
Sept. 4—Des Moines Speedway Invitation Race. Limited to six entries.
Sept. 4-5 — Spokane, Wash., Track Race, Inland Auto Assn.
Sept. 16—Providence Speedway Race.
Sept. 29—Trenton, N. J., Inter-State Fair, H. P. Murphy, Racing Sec.
Sept. 30 — New York City, Sheepshead Bay Speedway Race.
Oct. 7—Philadelphia Speedway Race.
Oct. 7—Omaha Speedway Race.
Oct. 14 — Chicago Speedway Race.
Oct. 19—Indianapolis Ind., Race, Indianapolis Motor Speedway.
Nov. 16 and 18—Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

GOOD ROADS

Sept. 6-7—St. Paul, Minn., Good Roads Congress, Auditorium.

MISCELLANEOUS

June 8—New York City, Orphans' Day Outing at Donnelly's Grove, College Point, L. I. Orphans' Automobile Day Outing Assn.

SHOWS

Sept. 2-9—Columbus, Ohio, Fall Show, Ohio State Fair, Columbus Automobile Show Co.

TRACTOR

July 17-21—Dallas, Tex., Tractor Demonstration.
July 24-28—Hutchinson, Kan., Tractor Demonstration.
July 31-Aug. 4—St. Louis, Mo., Tractor Demonstration.
Aug. 7-11—Fremont, Neb., Tractor Demonstration.
Aug. 14-18—Cedar Rapids, Iowa, Tractor Demonstration.
Aug. 21-25—Bloomington, Ill., Tractor Demonstration.
Aug. 28-Sept. 1—Indiana Tractor Demonstration.
Sept. 4-8—Madison, Wis., Tractor Demonstration.
Sept. 11-16 — Milwaukee, Wis., Fall Show, Wisconsin State Fair Milwaukee Automobile Dealers.

The Week in the Industry

Trade Happenings

Northwest News—The Smith Form-a-Truck Co. has opened offices in Seattle at 316 East Pike Street. The newly-organized branch is headed by J. H. Ironsides as president, G. F. Haag, secretary and treasurer, and F. P. Kendall, sales manager.

Automobile regulations governing the admission of automobiles into the Mount Tacoma National Park state that the regulations have been revised under date of March 1, 1916, and the fees fixed at $4 for a single round trip and $6 for the season. The permissible speed has been raised from 6 m.p.h. to 8 m.p.h. Otherwise the regulations are the same as those of 1915.

The Utah-Idaho Motor Co. will hereafter handle the Maxwell output in the States of Idaho, Utah and portions of Montana and Nevada during the 1917 selling season, with headquarters in Salt Lake City. Governor William Spry of Utah, ex-Governor Gooding of Idaho and N. T. Porter of Salt Lake City are the guiding figures of the company.

The Chevrolet Motor Car Co., Seattle, Wash., has opened a new home at Tenth and Pike Streets, containing all modern garage conveniences, and will be the Chevrolet distributing center for western Washington.

The Gunn Motor Co., Tacoma, Wash., has opened at 2330 South E Street and will handle Kelly-Springfield trucks in Tacoma and southwestern Washington.

Ill. News Items—Business men of Rockford are negotiating with a Wisconsin automobile firm for the location of a $3,000,000 plant. All of the proceedings so far are under cover and no definite announcement will be made until the deal is completed. Rockford has offered the old glucose property, which has 35,000 sq. ft. of floor space and which will be added to from time to time. The president of the company which is looking for a new site has perfected an automobile engine which has some new and ingenious features which promise extensive usage. The company has two other cities in view and the one offering the strongest inducements will be selected. The representatives of the company have made two visits to Rockford and the business men here are hopeful that this city will be chosen.

H. H. Collier, Rockford, Ill., has leased the Cook Building, corner of Church and Chestnut Streets, and will shortly open a garage and sales agency. Mr. Collier will be distributor for the Studebaker line and will also operate a service station.

The Hepburn & Pope Motor Sales Co., Moline, has leased the building fronting on Fourth Avenue, near Twelfth Street, formerly operated as a garage by Hager & Rank, and will conduct a garage and sales agency. The firm is composed of George Hepburn, for 13 years with the Moline and Deere plow companies, and Henry Pope. The latter was superintendent of the Midland automobile factory in East Moline; foreman of the machine department of the Packard plant in Detroit, and later with the Hudson company. The company will be distributors for the Maxwell and Detroiter cars for Rock Island and adjacent counties.

Kansas City News—The Acton-Parke Auto Co., Kansas City, Mo., has moved its service station for Maxwells to the Velie Building, 3344 Main Street, where three floors are available. The basement will be used for machine shops, the ground floor for offices and workshop, the second floor for storage, accommodating 100 cars. Ray Worthington, formerly of the Maxwell plant, is in charge. There are facilities for handling more than 1000 cars. The Maxwell sales in April, 1916, in Kansas City, were ninety-six, and May is producing business at a rate to make about 125.

The E. S. Cowie Electric Co., Kansas City, has opened at 1238 East Douglas Avenue, Wichita, a branch house for battery and other electrical equipment service. The branch is equipped similarly to the Kansas City house. C. M. Hilt, who has been purchasing agent for the firm, is in charge. The recent rapid increase in the use of farm tractors has been an especially impelling motive for the establishment of the branch, and tractor ignition will probably be the important feature of the service. The company in Kansas City serves many automobile branch houses and dealers. It has recently installed a delivery service, to call for and return batteries and equipment.

Minneapolis Trade News—J. S. Johnson, former manager of the Winton branch, and Eddie Randall, have bought Motor Inn, a garage at 1023 Marquette Avenue, and will sell Standard cars.

The B. F. Goodrich Co. branch, and H. E. Mack & Co., representing Dodge Bros., have moved to a new building at 1221-1223 Harmon Place.

George A. Clark & Son, 227 Fifth Street N., dealers in farm implements, have added an automobile supplies department with service station for repairs and suggestions for dealers.

The Times Square Auto Co. has opened a supplies store at 1229 Hennepin Avenue.

The R. C. Smith Auto Co., 1400 Hennepin Avenue, will move to a new building at 1601 Hennepin Avenue. It handles Velie and Regal cars.

Philadelphia News Items—The Thornton-Fuller Auto Co., 2041-2043 Market Street, Philadelphia, has acquired ground between Twenty-fourth and Twenty-fifth and South and Bainbridge Streets, on which will be erected a large service building for the Dodge and Simplex automobiles.

The Gomery-Schwartz Motor Car Co., Philadelphia Hudson distributors, is accepting bids on the erection of a ten-story service building on the site of the old quarters at Broad and Cherry Streets.

Marathon Tire Changes—H. H. Replogle, formerly manager for the Marathon Tire & Rubber Co. of New York at Omaha, Neb., has been made manager of sales of the Marathon company, with headquarters at the home office at Cuyahoga Falls, Ohio.

G. R. Howell, who has been representing the Marathon Tire & Rubber Co. of New York in Iowa, has been promoted to division manager at Omaha.

C. M. Folger, Southern representative for Marathon tires, has been appointed division manager at San Francisco.

Opper Succeeds Morehead—P. T. Opper, who has been connected with the Detroit branch of the B. F. Goodrich Rubber Co. for a number of years as assistant manager, has been promoted to the position of branch manager to succeed H. J. Morehead, resigned.

Large A C Spark Plug Order—The Motor Car Equipment Co. of Boston and New York City just placed an order for 357,000 A C plugs. This is said to be the largest single order ever given for spark plugs. It tops the Beckley-Ralston order of a few weeks ago for 300,000 spark plugs.

Lyman Joins Cassidy.—H. S. Lyman has resigned as Indiana factory and jobbers' representative of the H. W. Johns-Manville Co. to represent Edward A. Cassidy, New York City.

American Body to Build—The American Body Co., Buffalo, N. Y., will build a $10,000 addition to its plant at Niagara Street.

Rutenber Adds—Work has been commenced on a new service machine shop that will employ 100 more men at the Rutenber Motor Co. factory in Marion, Ind. It will be completed in 2 or 3 weeks. The new building will be 90 by 40 ft. and will be of brick and glass. The company already employs about 700 men.

Sommers Motor to Add—The Sommers Motor Co. will build a 100 by 200-ft. machine and erecting shop addition to its lant at Bucyrus, Ohio.

Parts Co. to Build—A contract has been awarded for the construction of a one-story factory at Lakeside and Fifty-first Street, Cleveland, Ohio, for the Forest City Electric Co., Windsor Avenue, maker of electric equipment and automobile parts. The estimated cost of the plant is $25,000.

Gorton Co. to Build—The L. O. Gorton Mfg. Co., Muskegon, Mich., will erect immediately at a cost of $10,000 a plant for the manufacture of automobile parts.

New Plant for Perfex Radiator—The Perfex Radiator Co., Racine, Wis., maker of radiators for automobiles, truck and tractor engines, will erect a new plant. The main building will be 65 by 250 ft. and there will also be a warehouse and a power house.

Another Pierce-Arrow Addition—The Pierce-Arrow Motor Car Co., Buffalo, N. Y., has completed plans for another four-story addition to its plant at Elmwood and Great Arrow Avenues and the New York Central Railroad, to cost $100,000, besides the four-story addition now under construction, which will also cost $100,000.

Christopher Motor Adds—The Christopher Motor Co., Chicago, Ill., is building an addition to its plant, 50 by 100 ft., to cost $20,000.

Trippensee Body to Enlarge—The Trippensee Mfg. Co., Detroit, Mich., maker of automobile bodies, has increased its capital stock from $100,000 to $125,000, for the enlargement of its plant.

Hercules to Start Production—The Hercules Motor Mfg. Co., Canton, Ohio, will start producing around the early part of June. A new plant has been finished, costing $100,000, and the company will employ over 150 men throughout the year. The new building is two stories and 300 by 70 ft. On each floor at either side there is a continuous glass-wire window. The plant will be operated entirely by electricity.

Rives Pedal's New Distributors—The George H. Rives Mfg. Co., New York City, manufacturer of the Rives adjustable automobile pedals, has established distributors throughout the country and also in Beunos Aires, Argentina, and Montevideo and Rio Janeiro, Brazil, South America. The company's offices are in the Woolworth Building, New York City, and its factory is 171 Fulton Street, Brooklyn, N. Y.

Erickson Joins Packard Electric—J. E. Erickson has joined the sales organization of the Packard Electric Co., Warren, Ohio, and will cover the territory formerly in charge of Benjamin Smith.

Chamberlin Joins Gramm-Bernstein—C. B. Chamberlin has been appointed supervisor of purchasing by the Gramm-Bernstein Co., Lima, Ohio.

Canadian Plant News—The Canadian Regal Motor Co., Ltd., is preparing plans for a factory at Berlin, Ont., to cost $18,000.

The Acme Rubber Co., Brampton, Ont., recently incorporated, will build a factory to manufacture rubber tires, rubber goods, etc., to cost $30,000. F. D. Law, 471 Yonge Street, Toronto, is a stockholder. A by-law giving the company concessions has been passed.

The Willys-Overland, Ltd., 112 Richmond Street, West, Toronto, Ont., has been incorporated in Saskatchewan with a capital stock of $6,000,000 to manufacture automobiles, motors, etc., with headquarters at Regina.

The Begg Motor Co., 1062 Georgia Street, West, Vancouver, B. C., will build an addition to its plant to cost $15,000.

The Seymour Motor Car Co., Vancouver, B. C., has been incorporated and will take over the plant of the Begg Motor Co., at 632 Seymour Street, Vancouver. W. E. Richardson is manager.

The Perfection Tire & Motor Co., Niagara Falls, Ont., with plants at Fort Madison, Iowa, and Wabash, Ind., is carrying on negotiations with the city council. The company is contemplating the erection of a plant to manufacture automobiles, tires, etc., to cost upward of $300,000.

The Russell Motor Co., Toronto, Ont., purposes to build a new factory on 28 acres recently purchased there to house the cycle and skate business. In the past these branches of the company's activities have been handled in connection with the automobile plant at West Toronto. This has been turned over to the new Willys-Overland Co. of Canada.

Ellwood Ivins' Tube Reduces Working Hours—The Ellwood Ivins' Tube Works of Oak Lane, Philadelphia, have reduced the working hours of all employees 1 hr. each day. This applies to both day and night shifts. Its plant is running full 24 hr. This, in addition to a voluntary increase in wages of all employees a few months ago.

Ind. Plant News—The Crow Motor Car Co., Elkhart, has shipped a touring car model 30 to the French Government. If it proves satisfactory the Crow company is promised an order for 100 chassis. Recently the Crow company shipped a car to Singapore and another to Shanghai, China.

The Advance-Rumely Co., Laporte, will enter its small tractor this summer in eight tractor demonstrations in different parts of the country. One noteworthy feature of the machine is that it is reversible and can be run backward or forward with equal facility by simply turning the seat around.

The Lawndale Mfg. Co., Elkhart, has just been incorporated, with a capital stock of $75,000. Among other things the company will manufacture automobile specialties. The incorporators are A. H. Beardsley, James A. Bell and W. H. Foster. Frank R. Flynn is to be office manager.

Ind. Changes—Barney Baker, formerly general sales manager for the M. Rumely Co., has again accepted employment with the Advance-Rumely Co. and will become branch manager at Fargo, N. D.

G. H. Greiger, manager of the South Bend Cadillac agency, has been appointed general manager of the Cadillac Automobile Co. for the State of Indiana, with headquarters at Indianapolis. A building is being completed for the Cadillac company.

S. K. F. Plant Ready for Work—The new factory of the S. K. F. Ball Bearing Co. in Hartford, Conn., is practically completed and machinery set up. A large clerical force from the New York offices has come to this city. Eight Mack trucks arrived Friday evening with furniture for the offices, having been run up from New York.

Hartford Trade Items—The new sales headquarters of the United States Tire Co. in the Britton Co. Building, 121 Allyn Street, Hartford, Conn., is now ready for occupancy. Complete new office equipment has been installed.

J. H. Macdonald of the R. D. Britton Co., Velie and Allen representative, has severed his connection with that concern and joined the sales force of the A. C. Hine Co., 314 Pearl Street. For several years past he has been associated with R. D. Britton, who continues the business of the R. D. Britton Co.

Automobile row in Hartford is undergoing some material changes. Ground has just been broken by the Hartford branch of the Packard Motor Car Co. of New York for a new salesroom and service building at the corner of Park and Washington Streets. The foundation of the new three-story service building of the Fuller Storage Battery Co. on lower Church Street is completed and work will begin this week on the upper structure. The excavating for the new combined service and sales building of Russell P. Taber, Reo distributor, on lower Allyn Street, which is to have an entrance from Church Street adjacent to the Fuller property, is completed and work on the foundations will begin this week. The new three-story brick, steel and concrete service building of the

Britton company, Stearns-Knight and Federal truck representative, is almost finished. Work on the new service building for S. A. Miner, Pierce-Arrow distributor for northern Connecticut, has been resumed and possession will be taken shortly. The Pennsylvania filling station at the corner of Asylum and Hurlburt Streets has been moved a half block west, the Overland company having acquired the original site.

The business and good-will of the Hartford branch of the E. J. Todd Rubber Co. has been purchased by A. P. Gunn, formerly an officer of the company and manager of the store mentioned at 274 Trumbull Street. Business will be conducted at the same address. The firm name remains the same. A. P. Gunn has taken on the exclusive representation of Kelly-Springfield tires and is planning to install a solid tire department, together with the necessary equipment for applying these tires. Andrew P. Gunn is also conducting a store on Hartford Avenue in New Britain under the name of the Gunn Rubber Co. This establishment is being managed by his brother.

A. Kaeser has been appointed service manager of the new service station of the White Motors Co. at 22 Chapel Street.

The Palace Auto Service Co., in order to devote all time to the exploitation of Mitchell cars at 348 Trumbull Street, is disposing of a large stock of accessories. This concern was one of the first in Hartford to feature accessories.

Alterations just completed by the Ashwell Service Station, 341 Trumbull Street, provide for a larger office and a rearrangement of the oil and fuel departments. This concern has been appointed service representative of the A-K ignition devices.

Wis. Plant News—The Four Wheel Drive Automobile Co., Clintonville, Wis., manufacturing the F. W. D. truck, is preparing to build another large addition, 100 by 175 ft. Early this year ground was broken for a structure of similar size, but the capacity is still inadequate, making a second building necessary. It is reported on good authority that the company has taken over the Four Wheel Drive Tractor Co., organized at Antigo, Wis., several months ago to build quadruple drive general utility tractors, and that part of the new building is to accommodate that interest.

The Aluminum Goods Mfg. Co., Manitowac, which is building a five-story manufacturing building, 50 by 300 ft., will erect a 50 by 150-ft. shop addition as soon as possible. The demand for its goods is all out of proportion to its capacity.

A plant for the manufacture of a renewable or everlasting fuse for electric current distribution circuits will be established in Milwaukee at once by the Arrow Fuse & Mfg. Co., incorporated with $35,000 capital stock by capital identified with the Schlitz Brewing interests. The inventor is O. H. Jung, chief electrician of the Schlitz company. Heretofore fuses, when burned out, were thrown away, but Mr. Jung has found a method of easily renewing the fused wire, saving the expense of a new fuse cap and socket. The fuse will be made in all sizes and for all purposes, including motor car circuits. Production starts July 15.

The John Obenberger Forge Co., Milwaukee, organized with $100,000 capital, as noted, will specialize in motor car and engine work. A plant is being equipped at West Allis, Milwaukee County, for the production of drop forgings and forgings hammered from billets, which will be supplied to the motor car, engine and machinery trade unfinished from the dies, with the exception of crankshafts, which will be finished. John Obenberger, head of the new company, is one of the best known men in the drop forge industry of the Middle West and until recently was head of a large drop forge works in Cudahy, Milwaukee County.

Wis. Trade Happenings—The affairs of the bankrupt Milwaukee Motor Co., Milwaukee, are expected to be wound up and closed at the meeting of creditors to be held May 19. At this time the proposition of Ernst G. Miller and Elise K. John to settle claims made against them by creditors for $60,000 in cash will be discussed. The claim of the Imperial Automobile Co., Jackson, Mich., has already been settled, and it is expected that the offer to other creditors, being about 75 per cent of the claims, will be accepted.

Harry Ewing, Hartford, has leased the John Landt machine shop and is opening a public garage and repair shop, to be styled the "Square Deal Garage." Mr. Ewing was for three years a traveling service man for the Kissel Motor Car Co., Hartford, Wis.

The Grover Auto & Implement Co., Junction City, Chevrolet agent, is enlarging its repair shop and installing an oxy-acetylene welding and cutting unit.

The White Automobile Co., Milwaukee, has moved into its new salesrooms and service station at 456-458 Milwaukee Street. The representatives are Matthew C. Moore and J. W. Garbutt.

The Jonas Automobile Co., Eighth and Wells Streets, Milwaukee, representing the Cadillac, is building an addition to its big building, 40 by 70 ft., one story, to be used for extra service work.

A new garage and repair shop has been established at Monticello by Wilbert Hoesley, agent for the Maxwell, Studebaker and King. Mr. Hoesley has leased the Marty Building and is completing remodeling work.

The Milwaukee shaper, a popular machine tool in motor car and parts factories of this country, will henceforth be manufactured by the Milwaukee Shaper & Transmission Appliance Co., Milwaukee, organized with a capital stock of $75,000 by A. J. Schmitz, Robert Wild and E. J. Gross, First National Bank Building. The new company takes over the entire shaper business of the Lutter & Gies Co., 258 Lake Street, which has manufactured the tool for many years. The shaper business has grown so extensive that it was deemed advisable to organize a separate concern to handle it. The new company has leased the former plant of the Stegeman Motor Car Co. at 1148-1152 Holton Street, and is already operating. The tool will not be changed in design or name.

Arthur and Anton Zeman, Milwaukee, Wis., have established an exclusive tire repair shop at Main Street and Western Avenue, Fond du Lac. The firm will also deal in Racine tires and carry a full line of accessories.

Glen Keebler and Charles Bohls have purchased the interest of W. H. Townsend in the Townsend-Metcalf Garage Co., Reedsburg. Both have been associated with the concern for several years. A three-story addition to the garage is now under way.

The Badger Garage Co., owned by Holte & Currier, Stevens Point, has disposed of its machine shop and service station to Joseph and William Koehn, Sheboygan, who have already taken charge. Holte & Currier will retain their livery and sales agency business.

Dallas News Items—G. Newby, representing the Maxwell Automobile Co., Detroit, Mich., was in Dallas recently, negotiating for the purchase of property on which to locate a plant costing $200,000.

It is known, also, that Hart Bros., representing the Maxwell company in this section of the State, have been made the offer of a site with all the necessary advantages. The proposed site will cost $20,000, the limit specified by the Maxwell company.

Two other cities in Texas, it is said, have made overtures for this assembling plant. A definite answer is expected within a short time. The Dallas Chamber of Commerce and Manufacturers Assn. is doing all in its power to have the plant located at Dallas.

After June 15, Dallas will be made the distributing point of the Southwest for the Wilson Tire & Rubber Co., through the Dallas Chamber of Commerce and Manufacturers Assn. The Dallas branch will be the biggest the Wilson company has besides its main distributing plant at Springfield, Ill.

Robinson Joins Jones Six Co.—C. F. Robinson has connected himself with the Jones Motor Car Co., Wichita, Kan. Mr. Robinson will act in the capacity of assistant general manager.

Spiral Bevel Calculations

Helical Bevel Gear Bearing Loads and Tooth Pressures Obtained by Formulæ—A Study of the Radical and Thrust Loads Produced by Helical Bevel Sets, Including Those of the Spiral Type, and the Development of Charts Facilitating Solution of Problems

By A. L. Nelson

THE object of this article is to study the radial and thrust loads produced by helical bevel gear sets including those of the spiral type, and to develop charts for the easy solution of such problems.

Bevel gears are widely used in many classes of work. Perhaps the most exacting and severest service demanded of bevel gears is that of the automobile rear axle drive gears. These gears are made of alloy steels which, for the sake of lightness, are designed to work under very high stresses. This in turn means relatively small pitch diameters and correspondingly heavy bearing loads. The bearing loads are still further increased and high thrust loads added by cutting the gear teeth at an angle of from 15° to 35° with the pitch cone element. This type of gear is now used almost universally to obtain the degree of quietness imperative in acceptable automobile design.

Equations Based on Helical Bevel Type

The equations to be derived in this discussion, for the sake of simplicity, will be based primarily on the type of helical bevel gears cut on generating gear planers. However, gears of the Gleason spiral type, which have teeth that are curved lengthwise on the arc of a circle, may be treated as though the teeth were straight and the angle of the tooth with the pitch cone element taken as the tangent of the tooth at the center of the resultant tooth pressure.

This type of gear is of greatest importance, for the method of manufacture is such as to permit quantity production at a cost so low that they are now used extensively even for machine-tool machinery. For the latter class of work the gears are often run with shaft angles other than 90°; hence the formulæ will be derived for the general case of shafts at any angle.

Condition of the Problem

Fig. 1 shows the resultant tooth load diagram for a forward drive right hand (R.H.) helical gear, and Fig. 2 the mating left hand (L.H) pinion. The dimensions of the gears as required are shown in the figures.

Let $T =$ the pinion torque in pound-inches.

$P = \frac{T}{r_1} =$ the vertical component of the resultant tooth pressure in pounds.

$\phi =$ the tooth angle with the pitch cone element.

$\theta =$ the tooth pressure angle.

$A = \frac{\tan \theta}{\cos \phi}$, and

$S = \tan \phi$ which are constants for given values of θ and ϕ.

$D_1 = \frac{1}{2}$ pitch diameter of the pinion in inches.

$D_2 = \frac{1}{2}$ pitch diameter of the gear in inches.

$R_2 =$ the pitch cone radius.

$f =$ the tooth length.

$R_1 = R_2 - f$

$Kf =$ the distance from the large end of the tooth to the center of the resultant normal tooth pressure.

$\beta =$ the center angle of the gear.

$\alpha = 90^\circ - \beta$

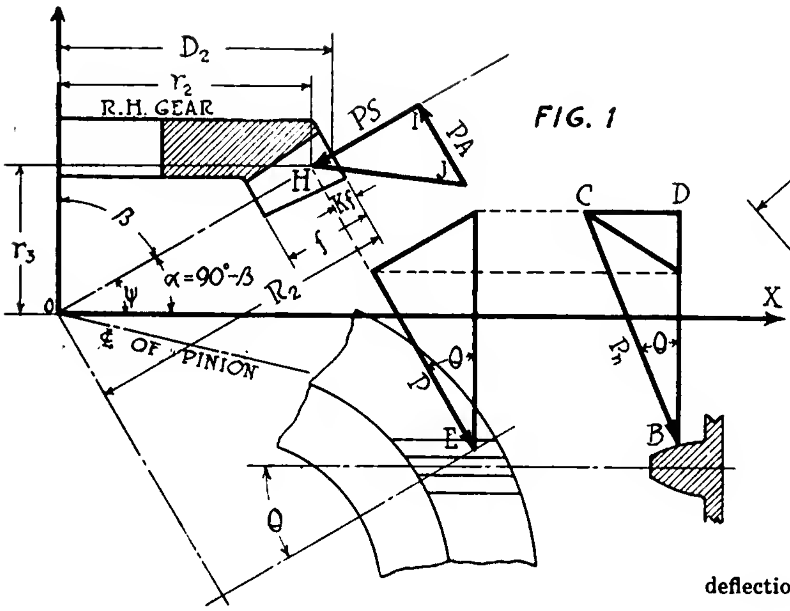

FIG. 1

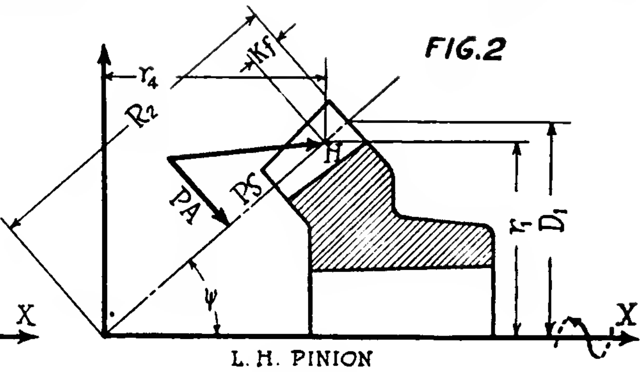

FIG. 2

Fig. 1 and Fig. 2—Diagrams explaining symbols used in calculating bevel reactions

ψ = the center angle of the pinion
(= α with shafts at 90°).

r_4 and r_1 of the pinion are x and y co-ordinates of the point of application of P, having the apex of the pitch cone as the origin, while r_2 and r_3 are the co-ordinates of P for the gear.

Application of Resultant Tooth Pressure (Kf)

For the purpose of determining Kf, Fig. 3 shows a bevel gear tooth whose apex is at O. Fig. 4 shows an end view of the tooth with the normal tooth load at the outer edge of the tooth intersecting the tooth center line at B at a distance h_2 (at large end of the tooth) above the weakest section, whose thickness is t_2 (as determined by Lewis' parabola method).

In Fig. 3 is shown an elementary slice of the tooth of dx thickness and at a distance x from O, loaded with an elementary force dp. It follows from the figure that its height $h = \frac{h_2}{R_2} x$ and its width $t = \frac{t_2}{R_2} x$. since the elementary section is a very short cantilever beam, it is necessary to take into account the deflection due to shear as well as that due to ordinary flexure in what is to follow. Each case will be treated separately, taking up the case of flexure alone first.

Let S be the flexure unit stress at the weakest section (width t and thickness dx) and Δ the deflection at the point where the line of action of dp intersects the center line of the tooth. Since all the elements of the tooth form intersect at the pitch cone apex it is assumed that this is also the case when the tooth is loaded. This assumption will obtain very closely if the gear and pinion shafts are designed properly, that is, so that the deflection of the shafts will have a tendency to keep the gear and pinion in their theoretical alignment. The latter is a point in design well worth striving for in order to obtain quiet and uniformly wearing gear pairs. From the above assumption it follows Δ is proportional to x, or

$$\Delta = C_1 x \tag{1}$$

(The letter C will be used with subscripts to indicate various constants required.)

For a cantilever beam of uniform section and of constant width t the deflection becomes—

$$\Delta^1 = \frac{\left(\frac{h_2}{R_2} x\right)^3 dp}{3EI} = \frac{\left(\frac{h_2}{R_2}\right)^3 x^3\, dp}{3E\frac{1}{12}\left(\frac{t_2}{R_2}\right)^3 x^3 dx} = C_3 \frac{dp}{dx}$$

where E = the modulus of elasticity of the material and I = the moment of inertia of the elementary section.

From the fact that all of the elementary sections of the tooth are similar, it follows that the actual tooth deflection is proportional to Δ^1, therefore

$$\Delta = C_2\Delta^1 = C_2C_3 \frac{dp}{dx} \tag{2}$$

From (1) and (2)

$$\frac{dp}{dx} = \frac{C_1}{C_2C_3} x = C_4 x \tag{3}$$

Equating the bending moment to the moment of resistance

$$\frac{h_2}{R_2} x\, dp = S \frac{1}{6}\left(\frac{t_2}{R_2}\right)^2 x^2\, dx \text{ whence}$$

$$\frac{dp}{dx} = \frac{St^2_2 x}{6R_2h_2} = C_5 S x \tag{4}$$

From (3) and (4)

$$S = \frac{C_4}{C_5} = \text{constant.}$$

Now let P be the resultant of the Σdp at a distance x_0 from O. Taking moments about O by the aid of (4) and from the

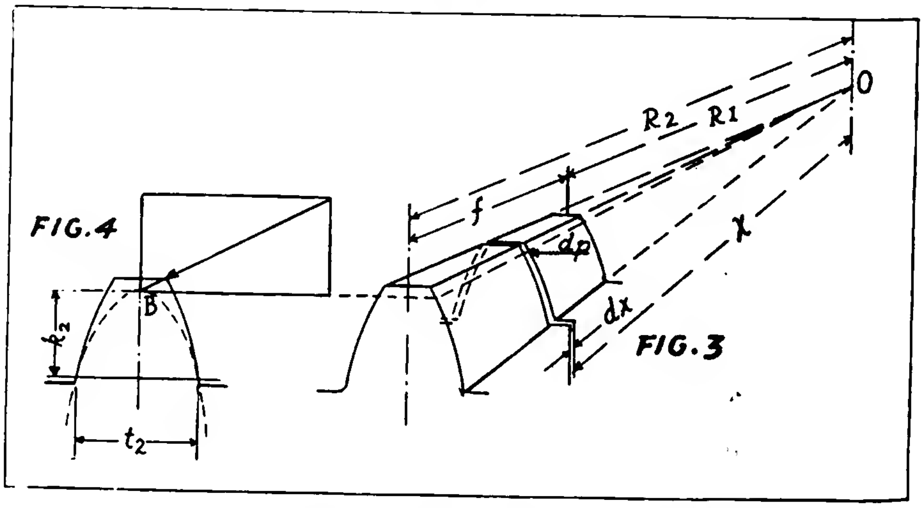

FIG.4

FIG.3

Fig. 3 and Fig. 4—Symbols representing proportions of bevel teeth

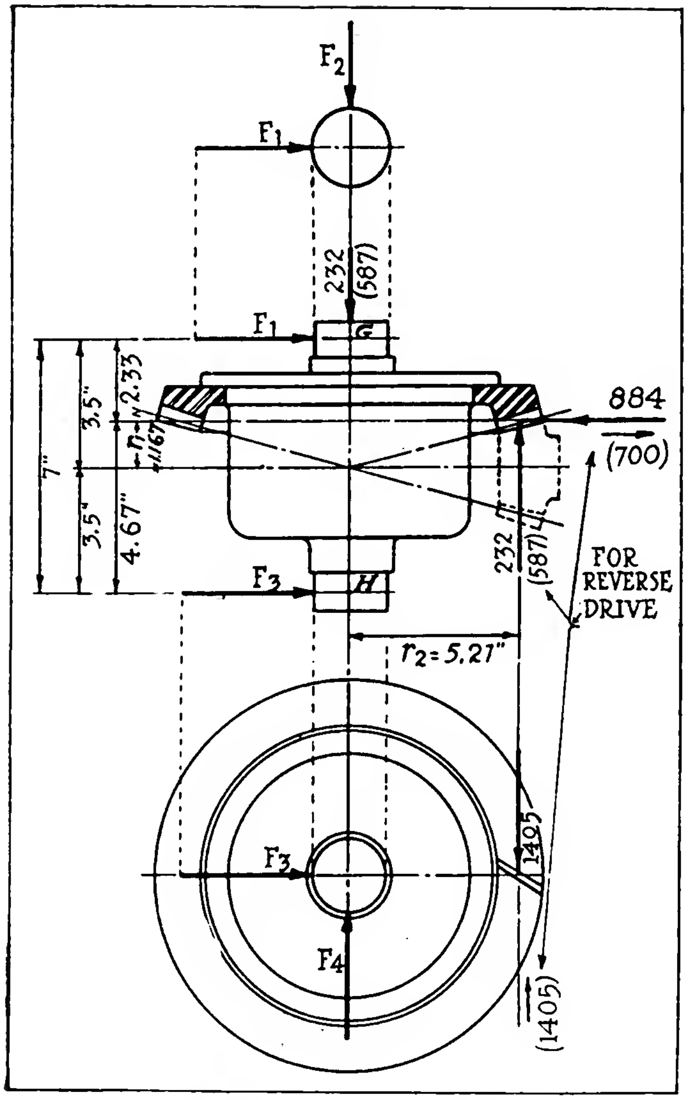

Fig. 8—Actual loads in assumed case

fact that S = constant, it may be taken outside of the integral sign, then it follows that

$$P x_0 = \int_{R_1}^{R_2} x dp = C_s S \int_{R_1}^{R_2} x^2 dx = C_s S . \frac{1}{3} \cdot (R^3_2 - R^3_1) \qquad (5)$$

Also from (4)

$$P = C_s S \int_{R_1}^{R_2} x dx = C_s S . \frac{1}{2} \cdot (R^2_2 - R^2_1) \qquad (6)$$

Substituting P of (6) in (5)

$$x_o = \frac{2}{3}\left(\frac{R^3_2 - R^3_1}{R^2_2 - R^2_1}\right) \qquad (7)$$

The next step is to determine the location of P, considering the shear deflection alone. Let G be the shearing modulus of elasticity. Then for a cantilever beam of length l, unit shearing stress S_s, and unit detrusion e

$$G = \frac{S_s}{e} = \frac{S_s dl}{d\Delta'}$$

$$\therefore \Delta' = \int_o^l \frac{S_s dl}{G} = \frac{S_s l}{G}$$

As before for an elementary tooth section

$$\Delta = C_s \Delta' = \frac{C_s S_s}{G} \frac{h_2}{R_2} x \qquad (8)$$

where S_s is the unit shearing stress at the root of the tooth.

It follows from (1) and (8)

$$S_s = \frac{C_1 G R_2}{C_s h_2} = \text{constant}$$

Equating the shear to the shearing resistance

$$dp = \frac{t_2}{R_2} x S_s dx$$

$$\therefore \frac{dp}{dx} = C_1 x \qquad (9)$$

Now since equation (9) is of the same form as (4) and since S_s = a constant it follows that x_o for shear is the same as x_o for flexure. From Fig. 1

$$x_o = R_2 - Kf$$

$$\therefore K = \frac{R_2 - x_o}{f} = \frac{R_2 - \frac{2}{3}\left(\frac{R^3_2 - R^3_1}{R^2_2 - R^2_1}\right)}{R_2 - R_1} \qquad (10)$$

To simplify the work of finding the value of K for any given case, Fig. 5 is drawn with K as ordinates and $\frac{R_2}{f}$ as abscissa. The values of K were calculated corresponding to the ratio $\frac{R_2}{f}$ by taking $f = 1$, then $R_2 - R_1 = 1$ and

$$K = R_2 - \frac{2}{3} \frac{R^3_2 - (R_2 - 1)^3}{(2R_2 - 1)} \text{ (for } f = 1\text{)} \qquad (11)$$

Now that the location of P is determined the force analysis will be considered.

Force Analysis of Resultant Tooth Pressure

For the force analysis of the resultant tooth pressure friction will be neglected, since it is small, due to the rolling nature of the tooth contact. In Fig. 1 is shown the force diagram for forward drive R.H. helical type bevel gear with the pinion driving. BC is the normal resultant tooth pressure. This pressure is resolved into three components, EG is the vertical component, HI the component acting along the element of the pitch cone, and JI the component acting perpendicular to the pitch cone element. From the figure it follows that the normal resultant tooth pressure

$$P_n = \frac{P}{\cos\theta \cos\phi} \qquad (12)$$

Also from the figure $HI = P \tan\phi = PS$, where $S = \tan\phi$ and $JI = CD = P_n \sin\theta = \frac{P\sin\theta}{\cos\theta \cos\phi} = P\frac{\tan\theta}{\cos\phi} = PA$,

where $A = \frac{\tan\theta}{\cos\phi}$

There are four cases of conditions to be considered. In each case the pinion will be considered as the driver. Clockwise rotation viewing the pinion from the positive end of the X axis will be called the forward drive. The two components of forces in the plane of the gear axes will be broken up into F_x and F_y, that is, the summation of the forces along the X and Y axes respectively.

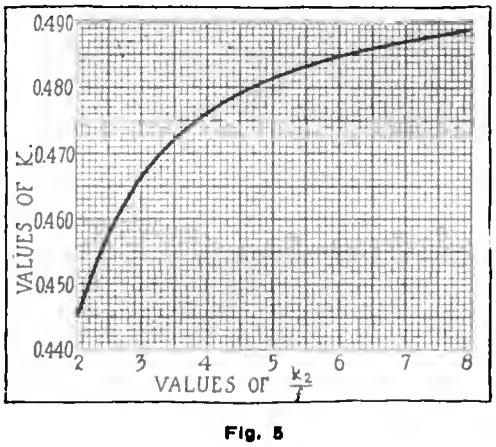

Fig. 5

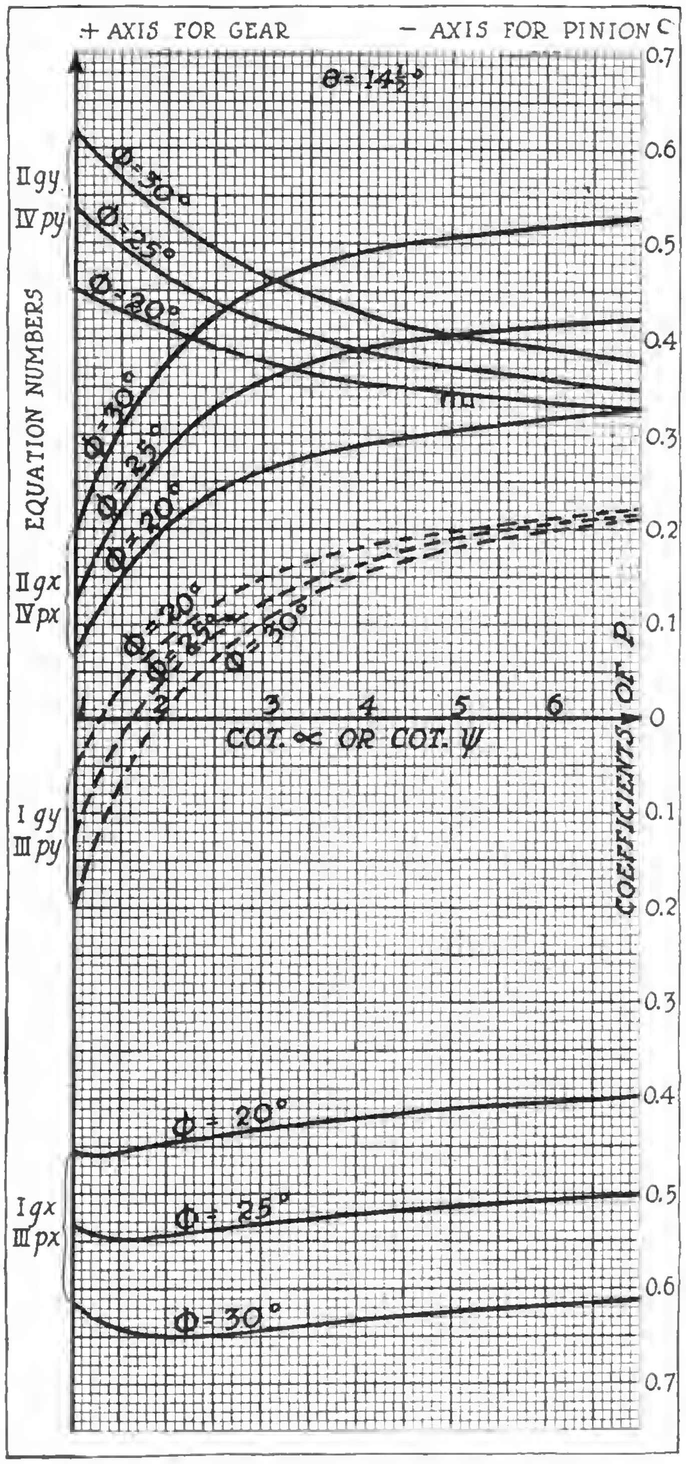

Fig. 6—Coefficients of P for gear and pinion having pressure angle of 14½

Case I. Forward drive R.H. helical gear or reverse drive L.H.

$$F_x = -P\ (A\sin\alpha + S\cos\alpha) \qquad (I_{gx})$$
$$F_y = P\ (A\cos\alpha - S\sin\alpha) \qquad (I_{gy})$$

(The subscripts of the equation numbers may be interpreted as follows: g refers to the gear and x to the X axis, while y refers to the Y axis. Later p will be used to denote the equations for the pinion.)

Reversing the helix to L.H. and also reversing the drive does not change the equations. However, if only the drive is reversed, the component along the element of the cone reverses, while that perpendicular to the element does not reverse. Hence the equations for this case are as follows:

Case II. For forward drive L.H. helical gear or reverse drive R.H.

$$F_x = P\ (-A\sin\alpha + S\cos\alpha) \qquad (II_{gx})$$
$$F_y = P\ (A\cos\alpha + S\sin\alpha) \qquad (II_{gy})$$

In like manner the equations for the pinion become as follows:

Case III. For forward drive L.H. hellical pinion or reverse drive R.H. (See Fig. 2.)

$$F_x = P\ (A\sin\psi + S\cos\psi) \qquad (III_{px})$$
$$F_y = -P\ (A\cos\psi - S\sin\psi) \qquad (III_{py})$$

Case IV. For forward drive R.H. helical pinion or reverse drive L.H.

$$F_x = -P\ (-A\sin\psi + S\cos\psi) \qquad (IV_{px})$$
$$F_y = -P\ (A\cos\psi + S\sin\psi) \qquad (IV_{py})$$

When the axes of the gear and pinion make an angle of 90°, $\psi = \alpha$ and the equations of cases III and IV become the same as for cases I and II except opposite in sign.

Graphical Solution for F_x and F_y

It will be observed from the above equations that they are all written so that the second factor is a coefficient of P. Furthermore, A and S depend only on the angles θ and ϕ, while α and ψ depend on the ratios $\frac{r_2}{r_3}$ and $\frac{r_1}{r_4}$ respectively. General graphical solutions for the equations may then be obtained by plotting two sets of curves as given in Figs. 6 and 7 with the coefficients of P as ordinates and the cot α of the gear or cot ψ of the pinion, as abscissa. Fig. 6 gives the coefficients of P for the gear and pinion having a tooth pressure angle (θ) of 14½°, while Fig. 7 gives those for 20°. Since the tooth angle with the pitch cone element (ϕ) generally varies from 15° to 35°, three sets of curves in each figure are given with the values of (ϕ) taken 20°, 25° and 30°. For intermediate values of ϕ interpolate between the curves. For gears with values of θ between 14½° and 20° interpolate between the values given by Figs. 6 and 7.

Since the equations for the pinion are opposite in sign to those of the gear, the positive ordinate is taken as negative for the pinion as indicated in Figs. 6 and 7 in the upper left-hand corner.

Verification of Calculated Results.

The following table is given as a comparison of average test and calculated coefficients of P. These pinion thrust tests were made by Gleason Works and published by *Machinery*, April, 1914.

Test Number	Gear Type	Number of Teeth in Gear and Pinion	Tooth Angle with Pitch Cone Element ϕ	Tooth Pressure Angle θ	% of Tooth Load $(P = \frac{T}{n})$			
					Thrust on Pinion Forward Drive		Thrust on Pinion Reverse Drive	
					Observed	Calculated	Observed	Calculated
1	Plain Bevel	53–15	0°	14½°	7.34	7.06	7.62	7.06
2	"Spiral Bevel"	53–15	31°21′	14½°	−49.5	−50.3	73.8	66.9
3	"Spiral Bevel"	53–14	19°45′	14½°	−28.7	−28.7	45.0	45.6
4	"Shew Bevel"	57–18	23°46′	14½°	−30.5	−33.5	50.8	50.5

The above pinions are all R.H. In each case the observed average thrust in per cent of the tooth load was taken from a large number of trials. The calculated values agree quite closely with the test values. This fact gives an added assurance to the dependability of the formulas as derived in this paper.

Determining the Magnitude of P

Having determined the coefficients of *P*, the next step is to determine the magnitude of *P*. First find r_1 and dividing the torque of the pinion by r_1 gives *P*. From Figs. 2 and 3 it follows that

$$R_2 = \frac{D_1}{\sin\psi} = \frac{D_2}{\cos\alpha} \qquad (13)$$

$$r_1 = (R_2 - Kf) \sin\psi \qquad (14)$$

$$r_4 = (R_2 - Kf) \cos\psi \qquad (15)$$

In like manner from Fig. 1

$$r_3 = (R_2 - Kf) \cos\alpha \qquad (16)$$

$$r_2 = (R_2 - Kf) \sin\alpha \qquad (17)$$

In case of shafts making 90° with each other $\alpha = \psi$ and then $r_1 = r_2$ and $r_4 = r_3$.

Shaft Bearing Loads

The bearing reactions may be found after having determined the resultant tooth pressure P, F_x and F_y. The bearing reactions will depend on how the bearings are located in reference to the gears. The method of finding the bearing reactions will be illustrated by a numerical problem for forward and reverse drive. The following data are taken from a set of Gleason spiral type automobile differential drive gears:

Pitch of teeth = 5

Number of teeth in gear = 58, in pinion = 13

$\beta = 77° 22'$

$\alpha = \psi = 12° 38'$

$\theta = 14\frac{1}{2}°$

$\phi = 30°$ Gear R.H.

$f = 1.25$ in.

$$D_1 = \frac{13}{2 \times 5} = 1.30 \text{ in.}$$

$$D_2 = \frac{58}{2 \times 5} = 5.80 \text{ in.}$$

$\cot\alpha = 4.461 =$ (speed ratio since $\alpha = \psi$)

$$R_2 = \frac{D_2}{\cos\alpha} = \frac{5.80}{0.9758} = 5.94 \text{ in.}$$

$\frac{R_2}{f} = \frac{5.94}{1.26} = 4.76$, referring this ratio to Fig. 5 it follows that $K = 0.48$ and $Kf = 0.48 \times 1.25 = 0.60$ in.

$r_1 = (R_2 - Kf) \sin\alpha = (5.94 - 0.60)\ 0.2187 = 1.167$ in.

$T = 1640$ lb.-in. max. motor torque (from test).

$$P = \frac{T}{r_1} = \frac{1640}{1.167} = 1405 \text{ lb. on direct drive.}$$

$r_3 = (R_2 - Kf) \cos\alpha = (5.94 - 0.60)\ 0.9758 = 5.21$ in.

Since the gear is R.H the forward drive comes under case I and the reverse drive under case II. Referring $\cot\alpha = 4.46$ to Fig. 6, it follows for:—

Case I,

$F_x = 1405\ (-0.629) = -884$ lb.

$F_y = 1405\ (+0.165) = +232$ lb.

Case II,

$F_x = 1405\ (+0.498) = +700$ lb.

$F_y = 1405\ (+0.418) = +587$ lb.

The gear is mounted on two Timkin roller bearings 3½ in. each side of the pitch cone apex, as shown in Fig. 8. Fig. 8 also shows the free body diagram for forward drive. P, F_x and F_y are shown acting on the gear tooth engaging the pinion. The forces for reverse drive are placed in parentheses to avoid redrawing the figure. Each normal bearing reaction is resolved into two components F_1 and F_2 for the left bearing reaction and F_3 and F_4 for the right. The next step is to find the value of these components.

Taking moments about H

$$7F_1 - 884 \times 4.67 - 232 \times 5.21 = O$$

$$\therefore F_1 = 763 \text{ lb.}$$

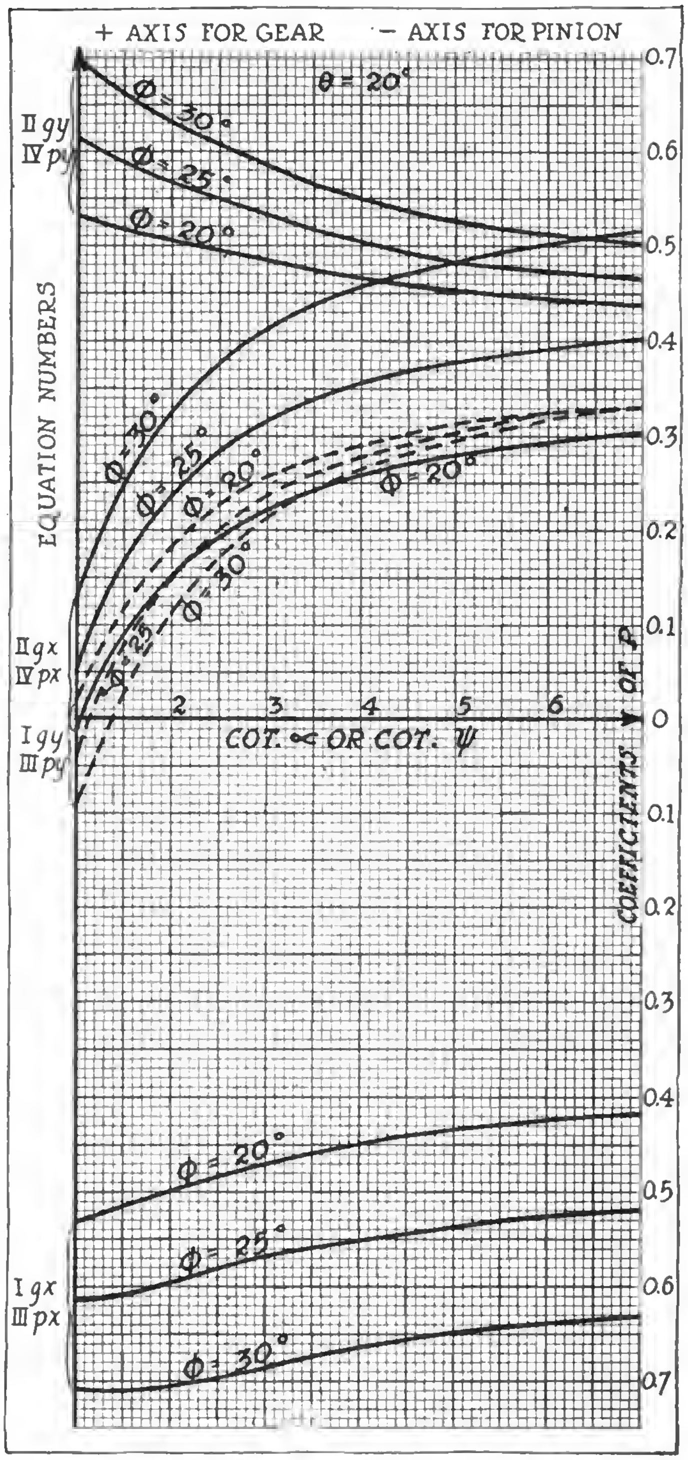

Fig. 7—Coefficients of P for gear and pinion having pressure angle of 20

$$7F_2 - 1405 \times 4.67 = O$$

$$\therefore F_2 = 937 \text{ lb.}$$

Then the total left bearing reaction is

$$R_l = \sqrt{763^2 + 937^2} = 1208 \text{ lb.}$$

The left bearing also takes the thrust of 232 lb.

In like manner taking moments about G, it follows $F_3 =$ 121.4 lb., $F_4 =$ 467.7 lb., and the total right bearing reaction $R_r =$ 483 lb.

The first speed transmission gear ratio is 2.56:1, hence the above reactions become 2.56 times as great for first speed, 3092 and 1236 lb., respectively; while the thrust becomes 594 lb.

For reverse drive, taking moments as before:

$$7F_1 - 587 \times 5.21 + 700 \times 4.67 = O$$

$\therefore F_1 = -30.3$ lb. The negative sign indicates that F_1 acts opposite to the direction shown in Fig. 8.

$$7F_2 + 4.67 \times 1405 = O$$

$$\therefore F_2 = -937 \text{ lb.}$$

In the same manner $F_3 = -670$ lb., and $F_4 = -468$ lb. Then $R_l = 938$ lb. and $R_r = 817$ lb. It should be observed that the magnitude and direction of these reactions are entirely different from those of the direct drive. In case of the pinion bearing reactions it is generally necessary to determine their direction and magnitude for both forward and reverse drive in order properly to design rigid bearing supports.

The reverse transmission gear reduction is generally so low that the rear wheels will slip before the full torque of the motor is applied. In this case the weight on the rear wheels is 2200 lb. The radius of the wheels is 17 in. Assuming the coefficient of friction is 0.6 then

$$P = \frac{17 \times 2200 \times .6}{5.21} = 4308 \text{ lb.}$$

This force corresponds to a gear reduction of $\frac{4308}{1405} = 3.066$. (The actual reduction is 3.42.) For slipping the wheels

$$R_l = 938 \times 3.066 = 2876 \text{ lb.}$$

$$R_r = 817 \times 3.066 = 2505 \text{ lb.}$$

$$\text{The thrust} = 587 \times 3.066 = 1800 \text{ lb.}$$

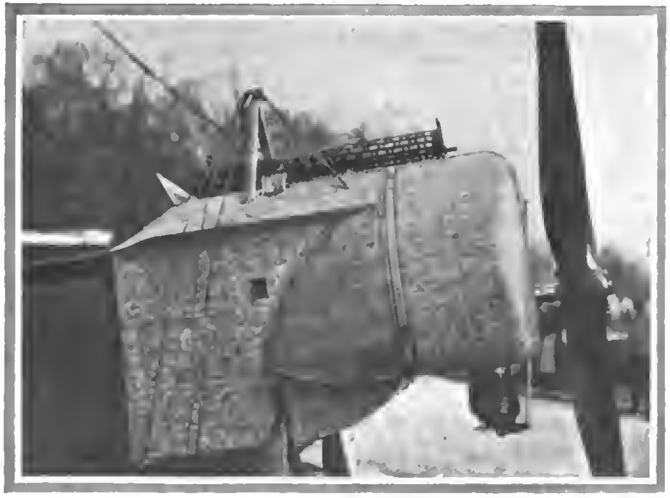
It is interesting to note that, although the torque is not great enough to slip the wheels for forward drive under the conditions as assumed for the reverse, nevertheless the maximum radial bearing pressure obtains on forward drive, namely 3092 lb. Incidentally this pressure is slightly greater than the weight of the entire car precluding the passengers. However, on reverse drive the thrust on the gear is three times as great as for forward drive.

Germans Copy Gnome Aeroplane Motor

CONTRARY to the general impression, the use of rotary air-cooled motors is by no means confined to French aviation. The German army employs the Oberursel nine-cylinder air-cooled rotary motor on practically all Fokker scout monoplanes. The Oberursel is a direct copy of the French Gnome aeroplane engine, while the Fokker aeroplane is a repetition of the Morane machine. With the exception of her Fokkers, Germany fits all her aeroplanes with vertical water-cooled motors. A few of these are six-cylinder overhead valve Benz, with vertical pushrods and rocker arms; the great majority are Mercedes engines with inclined overhead valves operated by a single overhead camshaft. Mercedes began to develop this type of engine in 1912, and in order to make more rapid progress employed the same general design for both aviation and automobile racing. These motors are produced under the direction of Heinrich Haeder, head of the aeroplane and racing departments of the Mercedes company, who has as his assistant the race driver and Engineer Seiler, who ran in the last French Grand Prix at Lyons. The latest Mercedes production is a six-cylinder motor of 5.5 by 6.29 in. bore and stroke developing 178 hp. at 1450 r.p.m. All these motors have separate steel cylinders with sheet steel jackets common to a pair of cylinders and a pair of valves inclined in the head; it is only in the racing type that four valves are employed.

Steel Cylinders Common

Steel cylinders have become very common not only in German aviation but among the Allies since the success obtained with them by Mercedes, and indications are that this type of cylinder will be largely adopted for racing and high efficiency car motors after the war. The construction is not costly, there are very few manufacturing difficulties, the combustion chamber is machined all over, water circulating space can be carefully verified, and the design is lighter than block cast cylinders. In most cases cast-iron pistons are used; but several manufacturers are designing these motors to run at 2400 r.p.m. instead of 1200, with the propeller geared down at a 2 to 1 ratio. This has necessitated lighter reciprocating parts and a considerable amount of successful experimental work has been done with aluminum pistons.



Engine housing and machine gun on captured Fokker monoplane. Engine is a rotary Oberursel like the French Gnome

In the German army much importance is attached to uniformity of design and construction. Thus, motors are invariably mounted in the front of the fusilage, with the tractive screw on the propeller shaft and, of course, running at engine speed, which never exceeds 1400 r.p.m. During the early months of the war the radiator was mounted on each side of the fusilage; this, however, was an exposed position, any stray bullet being liable to break a tube and cause the total loss of cooling water. More recently the radiators are of the honeycomb type, very similar to those used on cars, mounted in the center of the upper plane, with the head inclined considerably toward the rear. The entire cooling surface, which measures 6 meters 80, is above the top of the engine, instead of being below it as on the old type, and the maximum protection is obtained against stray bullets. All German motors, whether Mercedes or other make, are partially silenced, the exhaust gases being drawn into a collector, and the exhaust pipe carried upward and inclined to the rear to a point slightly above the top of the upper plane. With the exception of the Fokker all machines are biplanes.

No German V Engines

Germany appears to have paid no attention to V motors. This can be understood in view of her passion for uniformity. Before the war a very satisfactory type of vertical six-cylinder water-cooled motor was evolved, and the German authorities have remained faithful to this type during the war. The French, on the other hand, have refused to be bound by a mediocre uniformity, and in the midst of the war have not hesitated to give engineers a free hand and adopt the best that they could produce. Thus, the 20 months of war have seen the decline of the rotary and the rise of the six-cylinder vertical and various eight- and twelve-cylinder V motors. The rotary has not been abandoned, for recently there has been a rise in favor of the Rhone engine. This motor, originally a rival of the Gnome, was bought up by the Gnome company 2 or 3 years ago and produced by them. It has been found more satisfactory than the original Gnome and is being built in bigger quantities than the Gnome.

High Spots in S. A. E. History

Tracing the Growth of the Society

By Coker F. Clarkson
General Manager

WE can doubt philosophy and at times ignore friendly advice, but we must listen to wisdom and experience, particularly when the fruits of these are presented in a non-partisan manner for the common good by way of rational co-ordination of governing factors in the adequate development and orderly conduct of an industry. In any industry based upon engineering, the originating department of design, and the consequent department of production are, it is obvious, primarily determining of business success in general, although this fact is not usually given due force by controlling executives in industrial inauguration, and receives belated recognition in some degree, after an industry is well started.

In the case of the automobile industry, which in addition to being very complex and involving endless data a large part of the mass which is undergoing constant development is essentially one of quick decisions and speedy operations; the amount of broadly co-operative engineering work which has been under way for a decade is remarkable from any standpoint. The results of the work are monumental in diverse ways, fundamental among these being prompt presentation and discussion in assembly by qualified experts of design innovations appearing on the horizon, as well as consideration of comprehensive collated data of engineering elements already developed to a material degree (representing the more or less classic idea of professional societies and associations), and the majority, followed by the general, adoption of thoroughly considered formulations of recommended practices and standards of those features of specification, design (in part) and production which represent epochal development and which it is irrational to have differing in an immaterial way.

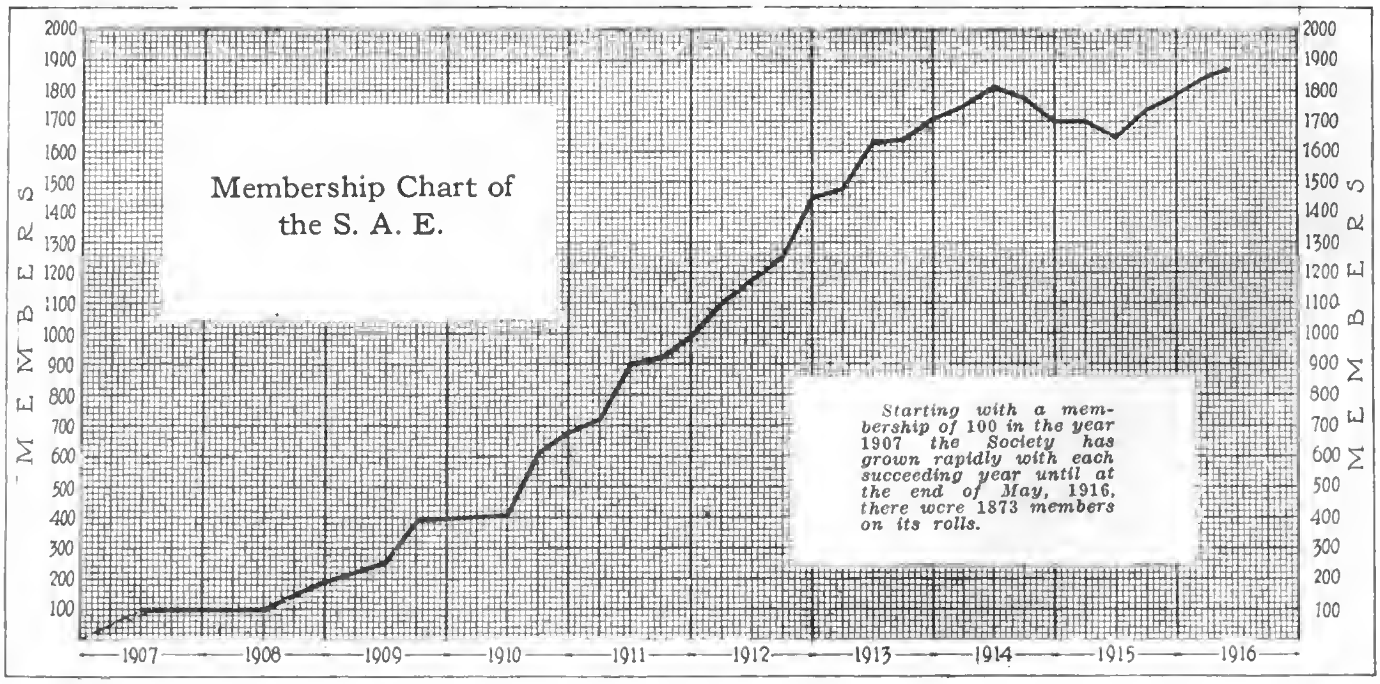
The dominant agency in the planning and conduct of the accomplishment of the progress which has been outlined briefly is, and has been for many years, the Society of Automobile Engineers.

It is the expression of mechanical genius of the American automobile industry. Its work relates to to-morrow and the day after to-morrow, not the past. Constant investigation and research are necessary to even keep pace with the advance in the automobile building art.

Coker F. Clarkson, General Manager, S. A. E.

Founded over 10 years ago, this band of congenial spirits has expanded constantly from a few to upward of 2000 men, associated with nearly 1000 different companies engaged prominently in the automobile and allied lines of production. The early records of the Society are more or less indefinite, but it is clear that the same feeling of fellowship and eagerness for progress, which are so familiar to-day, prevailed during the days when the problems of the members were not so great in degree although not really different in kind.

The impetus of the later and present advance of the Society had its inception shortly subsequent to the discon-



Membership Chart of the S. A. E.

Starting with a membership of 100 in the year 1907 the Society has grown rapidly with each succeeding year until at the end of May, 1916, there were 1873 members on its rolls.

1915

W. H. VanDervoort

1914

H. W. Leland

1913

Howard Marmon

tinuance of the Mechanical Branch of the Association of Licensed Automobile Manufacturers, in which many of the pioneer and leading American automobile designers and superintendents had taken an active part for several years. In 1910 a staff was put to work in the office of the Society, and at that time the aggregate membership was about 400.

An Enthusiastic Session

A large, enthusiastic meeting was held during the summer, a relatively large number of papers being presented on such subjects as pyrometry, testing of metals, engineering basis of vehicle taxation, variation in practice of anti-friction metals, patents, gear grinding, test data on frame sections, smoky engine exhaust, non-poppet valve engines, motor trucks and automobile nomenclature.

The Standards Committee

The paper on non-poppet valve engines represents a type which has been very well received, and valuable in the proceedings. A report on specifications for materials, steels, iron, bearing metals and aluminum alloys was submitted, this being a revision of the specifications which had been issued annually theretofore by the Association of Licensed Automobile Manufacturers. From these, the standards of the Society for the metals in question have been evolved, through several years of work of the Iron and Steel Division of the Standards Committee.

The most significant feature of the first summer meeting, so far as the recent work of the Society is concerned, was the vote of the Society that a Standards Committee should be appointed to take up in a thorough way this most important feature of the Society's work.

A Rapid Growth

In 1911 the publications of the Society became about twice as extensive as they had been before. The 1911 annual meeting of the Society, held at the Automobile Club of America, was attended by about 250 members and 150 guests. The election of over 300 additional members during the latter-part of the previous year was reported. Discussion was held as to the advisability of the Society meeting during the time of the annual automobile show, a dilemma that is always present. The attendance of the professional sessions is undoubtedly affected adversely by the alluring show attractions, so far as members in town at the time is concerned, but on the other hand, the best opinion probably is that the show is the time for the annual gathering as the members cannot get time to make two trips from home within a short period and want to attend the automobile show. The present theory of the Meetings Committee in this matter is to shorten the length of the annual meeting, making it so attractive as to counteract the show "competition."

In 1911 The Iron and Steel Division made its first report on specifications, these being accompanied by notes and instructions on the use of steels and their heat treatment, descriptions of forms of testing and metallurgical definitions. The work of standardizing a stock list of ball bearing sizes was inaugurated at this time, many years of struggle having followed before it was possible to get foreign and domestic bearing manufacturers to agree upon a satisfactory basis, relating particularly to permissible variation from nominal dimensions.

The Sheet Metals Division and the Broaches Division, which have since submitted valuable data for general reference and which before long resulted in accepted practice, began activities at this period. The table of sizes of seamless steel tubing, which had been established by the Mechanical Branch, was reduced about two-thirds in size and a thorough investigation was made on the question of whether the tolerance practice which had been established could be changed to give a condition of greater accuracy; with a negative result. A test was made at the A. C. A. for the benefit of the members on the effect of multipoint ignition on the performance of automobile engines.

Many Papers on Springs

At most of the meetings held in recent years, papers on spring suspension have been presented, as they doubtless will be at meetings for some time to come, this field of engineering being apparently one of the most complicated with which the members have to deal.

The very promising session on automobile fuels, to be held next week on board the Noronic, is, in a way, a culmination of discussion which has been conducted by the members for years. "What is commercial gasoline?" was the question asked at a meeting of the Society 5 years ago, it being pointed out that there was no standard to refer to. We are now at the stage of actually determining what can be done in the way of utilizing kerosene as fuel in engines modified to the extent that shall be necessary. The possibility of benzol as a fuel was brought up for discussion in a meeting several years ago.

One of the most informing phases of the proceedings of the Society is the number of papers which have been submitted on the commercial testing of engines, full pertinent details being given. The matter of putting into effect forms to be used in the testing of engines for the purpose of secur-

ing practical results of performance of different products is still under advisement of a committee of the Society, and will develop into even greater benefit to the members than has already been received by them as to the making and checking of tests.

The Handbook of Data Sheets

The S. A. E., so far as I know, is the only organization of the kind which has undertaken and carried into effect a loose leaf form of engineer's pocketbook known as the "Handbook" of data sheets of the Society. The sheets, the preparation of which involved a great deal of detail, are furnished to the members without cost in addition to the conventional dues, supplemental and revised sheets being distributed twice a year, together with up-to-date indices when required. The last list of sheets giving the substance of matters referring essentially to the Society work shows that there are 110 items to be credited to standardization achievement, many of these items consisting of groups of various subitems. The policy of the Society with regard to the dissemination of its standards publications has been very liberal from the first. Reprints of data sheets are furnished free of cost to any legitimate inquirer, and additional sheets at a nominal sum. These sheets are used widely in different fields of engineering besides that of the automobile industry.

It can be said that the growth and value of the Sections of the Society, the first of which was established in 1911, have exceeded the fondest hopes of the members. The local organizations with headquarters at Detroit, Cleveland, Indianapolis, Chicago, New York and Philadelphia, have a high average of enthusiasm, friendly intercourse and performance in furnishing helpful engineering knowledge to the membership of the Society as a whole, and to the public. About one-half of the annual volume of Transactions of the Society is constituted of papers and discussion presented at meetings of its Sections.

The S. A. E. *Bulletin*, which was started in a desultory way in 1911, became a regular monthly publication with second-class mail permit 3 years ago. The current issue of the *Bulletin* contains 256 pages.

There is a form of membership of the Society called the Affiliate grade to which firms and corporations engaged in the manufacture of automobiles or trucks or the manufacture of parts and accessories used in connection therewith, are eligible. Affiliate members have the right, subject to the approval of the Council of the Society, to designate personal representatives up to a total of six. The interest of many firms is served by the Society, who have the opportunity, through their representatives, to bring to the attention of the latter many things that can be discussed with mutual advantage. Affiliate membership was established in answer to a distinct demand. Frequently firms want their employees to have the benefit of the publications of the Society. Many of these employees are more or less fleeting, they are at one time with one firm, then with another. Through the Affiliate membership firms can secure the advantages of knowledge their employees get through contact with S. A. E. members, attendance at meetings, reading of papers and reports and participating in discussion. It is felt that the Society owes a duty to many firms and companies who should have a channel through which they can present much valuable material in the way of experience, all of which redounds to great progress in automobile engineering, and many allied lines of the automobile industry.

A Visit to Europe

In 1911 the Society made its first official visit to Europe, going to England and France. The reception accorded was most cordial and elaborate. The members were admitted to renowned factories that had never before been opened to outsiders. Among the tangible results of the trip were the acquisition of a great fund of technical information by members of the party at first hand; the making of valuable acquaintances, both as between members of the Society and between them and foreign members of the industry, important commercial and technical relations resulting in many cases; the opening of avenues of information and interchange of ideas between American and European engineers; and the accruing of benefits to the industry at home and abroad.

The I. A. E. as Guests

Returning this visit, a party of British engineers came to America in 1913 to attend the semi-annual meeting of the Society and to go on an inspection tour of automobile manufacturing establishments throughout the country, under the auspices of the S. A. E.

It can be said unqualifiedly that as a result of the Society's careful and thorough work, the barriers which existed between American automobile engineering and that of our English cousins have been broken down.

As showing the breadth and nature of the Society's activities the following paragraph of its Constitution is interesting:

"The Society shall claim no exclusive copyright to any papers read at its meetings, or any reports or discus-

Aviation Engines

What Has Been Learned by Automobile Engineers Through Study of Aircraft Abroad—Development Points to Many Cylinders

By J. G. Vincent
Vice-President of Engineering, Packard Motor Car Co.

AT the beginning of the war there was no settled opinion in Europe with respect to the proper number of cylinders and the best cylinder arrangement, or indeed many other details in aircraft engine design. The only concerted plan possessed by any foreign government was that of Germany, who was contented to leave the task entirely in the hands of the automobile engineers. The latter naturally made use of their automobile knowledge, making the aircraft motors just as they would have built engines for a racing car. This produced a high speed motor with a high volumetric efficiency but not astonishingly light to the proportion of the power developed.

The Mercedes is the best known German aviation engine, and readers of THE AUTOMOBILE are all familiar with its construction and its reliability. It is nothing more than a good vertical six-cylinder in which lightness is obtained by making every possible use of very strong materials. In France development was around an entirely different line and before the aeroplane had demonstrated its military value there were many French aircraft engineers who, being rather ignorant of automobile engineering, developed peculiar engines aiming principally for intrinsic lightness.

Owing no doubt to the great success of the Gnome rotating cylinder engine there was a strong tendency in this direction and rotary engines were developed to a point where their volumetric efficiency was high and they produced a remarkable power per pound of weight. Repeated trials, however, showed that the typical French engines seemed unable to make very long flights while it was common knowledge that the need for frequent tearing down, cleaning, etc., was a distinct trouble. Long before the war it was pointed out that in figuring the weight of an aircraft engine its consumption of fuel and oil should be taken into consideration, because if this were not done the true weight efficiency of the engine would not appear.

Long Flights the Problem

Under war conditions scouts are required to make long flights and the enormous bulk of fuel and oil needed by most of the French motors made them undesirable for anything except very short trips. For long flights the water-cooled engine of much higher fuel efficiency was actually lighter as well as being more reliable. Realizing that something had to be done, and done quickly, the French automobile industry was appealed to, thus receiving official backing which had produced the Mercedes motor in Germany.

Some of the French engineers followed the Mercedes lead, building water-cooled six-cylinder engines. Others already had air-cooled eight-cylinder or twelve-cylinder V-type engines and these, together with newcomers, commenced to make water-cooled six- eight- and twelve-cylinder engines in addition. In England development had been somewhere between the German and the French system so that the British machines were usually better fitted than French.

Despite the apparent strong tendency toward the elimination of the old idea of an aeroplane engine and the substitution of something much more like an automobile motor, it is to be doubted whether there will ever be one ultimate type. Some of the rotary cylinder air-cooled motors have done excellent work in very light scout machines possessed of extreme speed and with ability to rise very rapidly, and it may be this type of engine will continue to find its scope in this field. As soon as it is necessary to carry much weight, such as passengers and ammunition, etc., so far as can be ascertained it is the fixed cylinder type of engine which is used almost invariably.

Leaving the rotary motors on one side and confining consideration solely to the fixed cylinder pattern, there are a number of varieties from which to choose. The four-cylinder is not admissible, partly owing to its inherent vibration and partly because its dimensions would need to be very large if adequate power were to be obtained. The typical German pattern of six-cylinder can be made to give excellent service, but even with six-cylinders we soon come to the practical limit of power.

Width Is a Limit

Using gasoline, we obtain a certain temperature of explosion and this intensity of heat limits the piston size quite definitely. It is noticeable that everyone who has studied the fighting aircraft in use to-day comes back impressed with the immense speed capability of the machines and their enormous power. At first the six-cylinder was able to take care of conditions, then, as more power was asked for, the eight V-motor came into favor, but this was only able to carry the power range a little farther than the six so it was followed rapidly by the twelve-cylinder and it is doubtful if even the latter can be made to give sufficient power for the planes about to be built. One suggestion which is perfectly practical is that of an eighteen-cylinder engine with three sets of six-cylinders arranged fanwise on a single crankcase with a single crankshaft. It is believed that some of these motors are being constructed in England and, theoretically, the only disadvantage appears to be the fact that such a construction will be rather wide. The desire to keep down the width has been largely experimental in developing the twelve-cylinder aviation engine as opposed to the eight. It is stated as a rule that the fusilage of a high speed plane should not be over 26 in. in width and it is none too easy to get even a 60-degree twelve-cylinder engine within that dimension.

Packard Co. Plans

It was with this information before us, and with a feeling that someone in this country should put in some real time developing aircraft motors (partly because we believe there may be some commercial future in it, but largely because we think this country may need some type of that motor) that the Packard Co. set out to develop a twelve-cylinder or rather, a couple of twelve-cylinder aviation motors. Of course, having settled the type of motor, it became important to consider the thousand and one details.

The first important detail that came up for discussion was the matter of propeller ratio. That is, whether the propeller should be mounted direct on the crankshaft, or geared down. Of course, if it is mounted direct on the crankshaft, the motor speed is limited to not over 1200 to 1400 r.p.m. In other words a load-carrying machine will run approximately 1200 r.p.m. at the propeller and, in the very heavy load-carrying machines, it is sometimes desirable to run the propeller as low as 900 r.p.m. So it seemed very desirable to gear down the propeller, but we knew that there were a lot of problems to be met in the geared down construction. While it has been experimented with to a considerable extent, there has been much trouble experienced. So far as that is concerned, the direct driven machine, with the propeller mounted on the crankshaft, is not free from trouble, by any means. Out of balance of the propeller is bound to exist, in spite of fine workmanship. This, coupled with the inequalities of the air through which the machine may be flying, puts some very heavy stresses on the propeller and its mounting. A test that one of the foreign governments is putting on propellers now amounts to something like mounting a seven-pound weight 30 in. from the center of the propeller, and running the engine at its rated speed for some considerable length of time. That may not sound like much, but it will come pretty near walking off with the dynamometer base at 1400 r.p.m.

Propellers Break Crankshafts

The out of balance that exists in propellers is, I believe, responsible for crankshaft breakage on the direct-driven outfits. Many engineers have been working on aeroplane motors who know much more about that subject than I do, but they all agree that the crankshaft is one of the very weak links in aeroplane motor construction. I do not know whether they would agree with me that crankshaft breakage is very largely due to inequalities of balance of the propeller, or not, but nevertheless, I believe that has a very important bearing on it, judging by the way the crankshafts break.

It would seem, in going to the geared type, that we get away from some of the strains on the crankshaft due to the propeller, but of course we must put them somewhere else. A short lay shaft, which must be very rigidly mounted, on very heavy bearings (and those bearings must, of course, provide for radial load, and also for end thrust), seems the best practice using very large self-aligning ball bearings at both ends of the short shaft, and mounting a very heavy double thrust bearing in between. This, of course, causes the use of very substantial gears, to gear down with, and provides ample means for cooling them with oil. I believe that with a properly designed outfit, an efficiency between 98 and 99 per cent can be obtained. This mounting must be very rigid, and I believe it is desirable to cast the crankcase and the case to carry the propeller mounting out of an alloy a little stronger than the ordinary aluminum.

Valve Location a Study

One of the next things that might be considered is the location of the valve. We, of course, know that we want the most power we can get, coupled with the best possible economy and reliability. Noise is not so much a factor, so that we naturally come to the valve-in-the-head. Of course, it is not absolutely necessary to use two overhead camshafts, but it seems desirable, as it does not necessarily add greatly to the weight of the motor, and it very greatly lightens the reciprocating valve parts. This is particularly desirable with the geared down type of motor, because it will probably be desirable to run the motor in the neighborhood of 1800 to 2200 r.p.m., and it must be remembered that, in an aeroplane, the motor is always running, when it is running, at its rated load. It is not like an automobile motor, that is working about one-tenth of its speed the greater part of the time; and some surprising things happen when you put a motor in an aeroplane.

The overhead camshaft is, of course, of very clean-cut construction, and allows a good clearance for the mounting of the carbureter and exhaust pipes. There are, of course, two general schemes in use for mounting carbureter and exhaust pipes. One is to put the two carbureters, one each on the outside, and mount the exhaust pipes in the center. The other is, of course, to mount the carbureters in the center, and the exhaust pipes on the outside. I think that individual mounting in the plane will determine the location of these accessories. It is a little cleaner-cut proposition to mount the carbureter in the center, as low as possible, with the manifold, and put the exhaust pipes on the outside. I believe this is particularly desirable, as the spark plugs should, in my estimation, be on the inside, where the oil will drip off from them, and it would be undesirable to have the exhaust on the inside and the spark plugs also, as more pre-ignition might result.

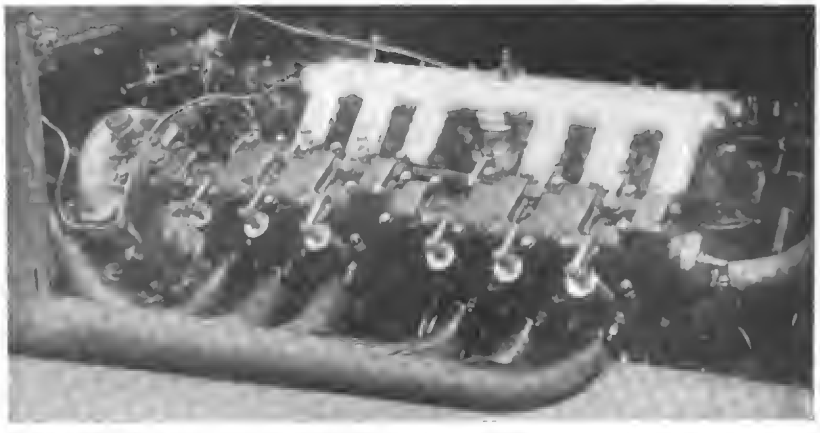
Points in Cylinder Construction

The next point that might come up would be the cylinder design. There are a number of constructions that are fairly satisfactory. The straight cast iron cylinder can be made rather light, especially when you take into consideration that you can nowadays weld jackets onto the cast iron and make quite a light construction. We know that it is good and reliable, and it is probably as cheap as any construction which has been developed up to this time.

Of course, another construction is to use aluminum with steel liners, either casting the cylinder separately, and leaving the head integral with the cylinders, so that you have to take the cylinder off to take a valve out, or casting the main barrels of the cylinder integral with the crankcase, and pressing the liner in, and bolting the head on.

Then there is still the Mercedes construction, of steel cylinders made out of forgings, all properly machined up and welded together. In my opinion, the steel cylinder is the best possible answer, although it is the most expensive, and the hardest to make, and may require considerable experimental work before we find out how to do the job in this country as well as they do it in Germany.

Of the other two constructions, I believe that the aluminum



Small size Packard aviation engine with overhead camshafts and two valves to each of the twelve cylinders

cylinder is more apt to survive than the cast iron, on account of the weight.

Location of Accessories

One of the problems that comes up next is the location of the accessories, and what accessories we want to carry. We of course got in touch with many foreign engineers, as well as our American engineers, and consider carefully the various problems regarding equipment. Practically without exception, they all said that they wanted electric lighting and starting, if it could be put on so that it would operate successfully. They had had experience, however, with badly designed electric lighting and starting, and were more or less skeptical about the design, of course. However, the need for electric lighting and starting seems to be just as great as it was in the automobile, and even more so; because, if your motor stops up in the air, and if you are in a dangerous place, it would be very desirable to start it if you could. So that we are planning to try to get the best possible work out of the electric generator lighting and starting motors for turning the big motor over. You will understand, in coming to these big units, it is pretty hard to turn the motor over anyway, considering that there are twelve cylinders, 4 by 6.

Overcoming with Difficulty

It has already been announced in THE AUTOMOBILE that the Packard company is building a 900 cu. in. twelve-cylinder aviation engine and it may be interesting to show how the width of this large motor has been kept down. As stated earlier in this article, it is far from easy to get a large motor with the cylinders set at 60 deg. sufficiently narrow to be installed in a fusilage 26 in. wide. In order to overcome this trouble the big Packard engine will have the cylinders at 40 deg. The object of putting them at 60 deg. is, of course, to divide the impulses evenly. Both sides of the twelve-cylinder motor are in perfect natural balance, so a change in the angularity of the cylinder blocks will not affect the balance, although it will affect the impulse frequency.

Careful experimental work, however, reveals the fact that the very slight variation in impulse frequency due to setting the cylinders at 40 deg. cannot be detected above speeds of 400 to 500 r. p. m. Seeing that the aeroplane engine runs at a practically constant and much higher speed, this low speed variation is not important.

It has been found that building the large twelve-cylinder Packard engine with a 40-deg. angle saves approximately 7 in. on the width. It also saves a little weight and adds a little to the strength.

Expects Battery Ignition

As to ignition, the foreigners nearly all wanted magnetos, because they are not familiar with the present state of the generator ignition art in this country. I believe it is desirable to design an aeroplane motor so that either magnetos or the generator type of ignition can be used. It is my belief that as electric lighting and starting becomes popular, as I am sure it will, the generator type of ignition will go with it.

It is, of course, necessary to provide an accurate tachometer, which is driven off the camshaft, and also an air pump for providing either pressure or vacuum. There seems to be a growing tendency to use vacuum for the gasoline feed, on account of holes being shot in the tanks, and releasing the pressure.

I will just very briefly run through two other points here: Lubrication is course pressure feed, and there are two general systems in use. One is to carry the oil in the sump, and the other is to pump it all out of the sump, and pump it through a radiator. I have not had enough experience to be able to make any prediction as to which is the better. A great many foreigners want two spark plugs in each cylinder, more for reliability than because it is necessary for power. The radiator location is a very important question. It makes the nicest looking job to locate it in front, but it does add somewhat to the head resistance, although if properly designed, and not over 26 in. wide, it makes a very good work out in a large motor. Of course, the other arrangement is to locate the radiators one on each side of the fusilage.

Weight Second to Reliability

My investigation showed that weight is secondary to reliability and economy. Just one word as to workmanship on aircraft motors. This sort of motor will, of course, have to carry with it workmanship that we could not possibly afford to put in an automobile, and it would not do any particular good if it were put in an automobile. In other words, it is absolutely impossible to put a gasket in an aeroplane motor in any place. You might possibly use it between the intake and the carbureter, but no place else. The constant weaving of the motor in the air seems to just naturally work the gaskets loose, and they blow out. In other words, every joint must be a lapped joint, so that they can be taken down any number of times without leaking, under any conditions.

Seats Staggered in New Three-Passenger Mitchell

The Mitchell-Lewis Motor Co., Racine, Wis., has brought out a three - passenger roadster as an addition to its line for 1917. Some features of the new car are the staggered seating arrangement, slanting windshield and the close-up position of the driver without any segregation of passengers. The Mitchell six chassis with its long wheelbase, cantilever springs and the two-unit, three-point suspension, which, like the other features of construction, are the ideas of the company's designer, J. W. Bate, is particularly adaptable to the roadster type of body. The illustration brings out its smart appearance.

Industry's Debt to the S. A. E.

Part of Engineers in Development of Automobile Business Should Be Appreciated—Great Results from Small Beginnings

By Russell Huff
President S. A. E.

THE rapid development of the automobile industry has aroused the curiosity and admiration of the world. Never in the history of mankind has an industry grown like the automobile business in the United States. It is now classed among the half-dozen largest enterprises in the country.

A New Dynamic Force

When one reflects that this wonderful evolution has been brought about in practically fifteen years' time, one naturally inquires the reasons for such an unusual growth. Of course, capital has played its part in the development of this business, but without a new dynamic force, frank co-operation and able standardization, the industry must have gone forward at a much slower pace.

Spirit of Co-operation

What once looked like a plaything in the business field has now become a real octopus in size and economic importance. Much has been said about the captains of industry who have risked their money and labored day and night for the success of the business, but little is said about the part the silent engineer has played in laying the foundation for the present state of this vast industry. Ten years ago the chief engineers of the leading companies were meeting regularly every month, exchanging ideas and devising standards for the general good of all. These early engineering conferences established a spirit of co-operation between the representatives from the various companies then engaged in the automobile business, which has been maintained through a period of ten years.

Value to Industry

These engineers early recognized the value to the industry, which was even at that time growing by leaps and bounds, of perfecting and adopting many standards for use in automobile construction. The wisdom of undertaking this work in the early history of the business cannot be overestimated, as no one can now figure in dollars and cents the value of the existing S. A. E. standards to the motor car industry. A recent investigation among manufacturers has shown that a large majority are making extensive use of the standards established by the Society.

The S. A. E. screw and bolt standards, which have been specially developed to meet the needs of the industry, are used by 94 per cent of the manufacturers. S. A. E. lockwasher standards now include thirty-five sizes instead of three or four hundred sizes formerly used and are standard practice with 90 per cent of the makers. The S. A. E. spark plug thread size is used by 93 per cent of the producers. These figures merely show a few of the S. A. E. standards which have practically become universal in their use by the industry and are cited to show the far-reaching effect of the early work done by the pioneer engineers in their original monthly conventions.

Energy in Standardization

Dozens of equally valuable standards have been adopted and recommended by the Society and are rapidly being taken up by the different manufacturers. This standardization work has been a great benefit to the manufacturers by permitting a steady reduction in the cost of cars and actual improvement in quality. Finally, the purchaser benefits through the steady reduction in the original price of cars and cost of maintenance. The work of standardization is never finished. The automobile industry is developing so rapidly that constant investigation and research are required. This work is being carried on with greater energy at the present time than ever before. The brightest minds among the automobile engineers of today are at work on numerous problems.

Results of Foresight

It is doubtful if the present methods of rapid manufacture, the low cost of production and the high quality of automobiles could all have been realized in such a short space of time without the untiring work of the engineers, whose foresight and interest in the future of the business spurred them on to sacrifice their valuable time to meet and work out the solutions to the many different problems always encountered in any standardization efforts.

The industry surely owes a debt to the S. A. E., the value of which can never be estimated, and that debt will grow larger as the industry expands, for the S. A. E. will grow in unison. There is no branch of engineering that does not lean upon the work of its societies.

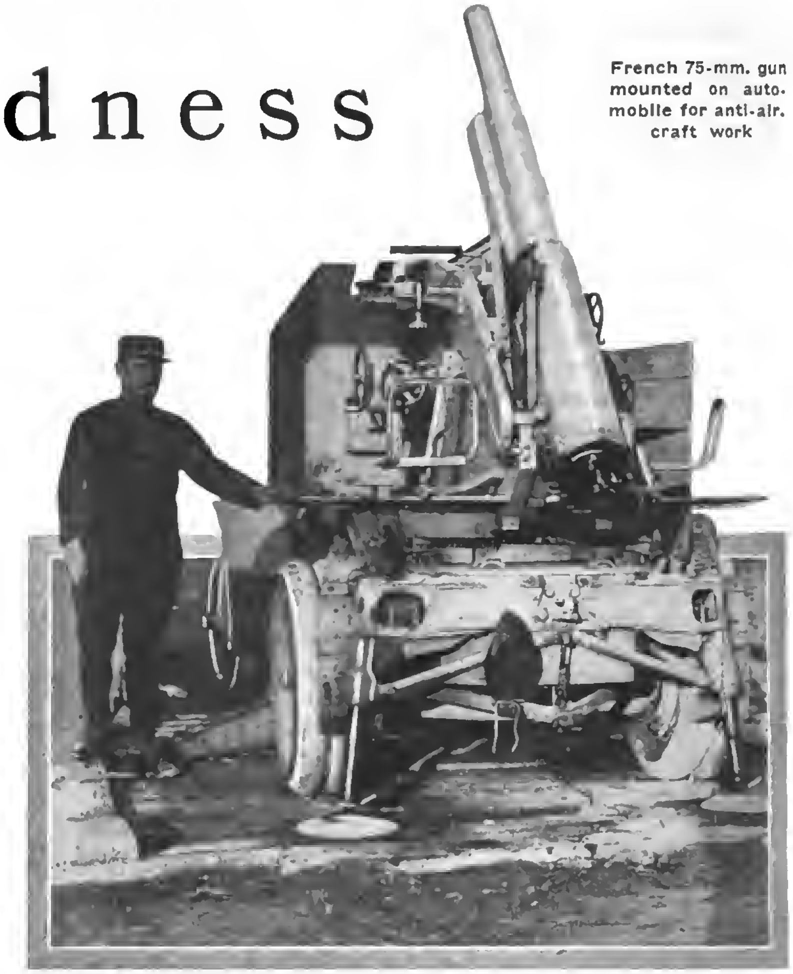
Preparedness

and Motor Trucks

A Review of the Lessons Learned at Heavy Cost in Men and Money by the European Belligerents

Part I

By Donald McLeod Lay



French 75-mm. gun mounted on automobile for anti-aircraft work

WITHIN the past few months the necessity for utilizing motor trucks and automobiles in the expedition into Mexico after Villa has brought home very strongly to the car and truck engineers and manufacturers as well as to the United States army officials the fact that ordinary commercial vehicles are not best suited to military requirements. All these men have been interested in the work of motor vehicles in the European struggle and have watched closely for any salient features in design and manufacture resulting from the experiences brought by war conditions. Still there are numerous points that have not been brought out very strongly but which a review of the development of the motor arm of the service in the European armies throws into relief.

At the outbreak of hostilities it was estimated that there were 100,000 motor vehicles in use with the French army, 18,000 of these being trucks, including 1100 buses, 200 four-wheel-drive tractors, fifty motor searchlights and 100 special vehicles. When the British expeditionary force first established itself in France it was estimated that its motor vehicle equipment comprised 2500 to 3000 machines, the great bulk of which were requisitioned among motor truck users and manufacturers' stocks, the British army's subsidy system at that time having progressed very little beyond the paper stage.

No Uniformity in Vehicles

In comparing the equipment of these two armies the French vehicles were then far superior to the English for military purposes, the latter being of such diversified types that they were not suitable for working together in convoy formation, some of them in operation in convoys having speed abilities varying from 7 to 17 m.p.h. Not only were they of different makes but the bodies were of all kinds for the trucks had been taken direct from private service without even removing the advertising matter with which they were usually almost covered. These convoys worked fairly well on level ground but as soon as hills had to be negotiated the slower vehicles and the defective ones dropped back, thus delaying the entire convoy. Hilly country also necessitated passing and repassing, which of course was dangerous, many radiators being smashed owing to cars running backward down the hills due to the lack of provision of sprags. With a closely spaced procession a rear movement of a few feet would be sufficient to cause an accident. These defects were known to the officers in charge of the motor vehicle service but of course there was no time to remedy them when war had been declared. The French authorities, however, had been working on this problem long enough—8 years—to have created what may be termed a model type of truck in all the factories. These vehicles, although differing considerably in design, were uniform in power, size, speed, load capacity, body, clearance, tire sizes and in such details as sprags, towing hooks, radiator guard, magneto and carbureter.

The English subsidy specification was based on the Leyland chassis and practically ordered manufacturers to abandon their own designs, no matter how good these might be, and accept that provided by the war office. As a proof of the indifference which this scheme met from the manufacturers, the last British army trials before the war comprised only three vehicles as compared with 110 trucks participating in the last French trials at that time.

Under the French scheme, as originally adopted, practically every manufacturer was able to enter with his standard types, there being no preference for bevel-drive over worm or chain, for a particular type or position of motor or for a certain class of gearbox. The field was even left open to steam, gasoline and gasoline-electric machines, the only requirement being that the trucks should be capable of doing good work on the road individually and collectively. Year by year, the regulations and tests became more stringent without, however, interfering with the general design. Thus a type of vehicle of uniform size, power, weight, speed, body, clearance, etc., was developed throughout the country so that when the war broke out practically all the best trucks in France were subsidized types. When called into actual service some of the features on which the army insisted, although of little importance to the private user, were justified. They are the use of sprags, sufficient clearance, radiator guard, uniform bodies, towing hooks front and rear, three-fuel carbureters and tanks allowing a big range of action.

An Early Peace Expected in 1914

It is interesting that in October, 1914, the end of the war was confidently expected in France to be very near, 1915 being looked upon as a dead year or go-between year in the automobile business. At this time it was estimated that the French Government owned 70 per cent of all motor vehicles both cars and trucks, of 12 hp. and over in that country.

The Germans had large numbers of armored cars in readiness at the outbreak of the war and used them with great effect, being able to keep up a steady fire until the enemy was almost upon them and then to get away in safety with cars and guns.

The ability of the German army to shift masses of men from one front to another in extremely quick time has been one of the features of the war and is credited to the systematic use of automobiles and motor trucks in transporting men, supplies and ammunition. Many of the German armored cars in use early in the war were nothing more than commandeered touring cars fitted with plates of steel to protect the vital parts and sometimes the occupants.

Automobile artillery batteries were found of inestimable value almost from the beginning of the struggle. In many cases ordinary 2½-ton chassis were used, the guns being fitted by the arsenal. Better results were obtained however with specially designed chassis having provision against the recoil of the gun and a certain amount of armor plating.

In December, 1914, it was stated that every type of motor vehicle seemed to have been thought suitable for receiving a gun and some armor plating, on the one hand being the traveling German fortresses standing 9 or 10 ft. high and probably weighing 8 or 9 tons and on the other hand ordinary touring cars with a quick-firing gun back of the rear seat and entirely devoid of plating. Two types of armored cars seemed really desirable at this time, the first was a powerful touring car or 2-ton truck chassis well armored without being too heavy, somewhat like the Belgian cars already described. The total height of such a car should not exceed 60 in., the driver being close to the center of the single compartment and the steering wheel raked to make his seat low. Motor and radiator should be completely protected, but wheels need not be inclosed, detachable types being an absolute necessity. Differential locks should be fitted, the second type of serviceable armored car was held to be a very light car of the Ford class with a minimum amount of plating, the object of these cars being to extend the scope of machine guns attached to cavalry and infantry regiments.

Most high grade automobiles with four-cylinder motors of 4 by 6-in. bore and stroke have proved satisfactory for armored car work. With an adequate front radiator and good capacity trunk, overheating troubles are not experienced despite the plating. On many cars a reduction of the gear ratio has been the only mechanical change, double steering is a refinement though not always adopted. A machine gun and sometimes a 1-in. gun in addition comprise the armament of these cars, usually mounted in a turret which protects the gunners. Best results have been obtained when these cars worked together in squadrons.

Some Practical Armored Cars

The Belgian armored cars which won great renown in the campaign of Northern France were built up from powerful touring car chassis fitted with machine guns and armor plating consisting of steel not less than 5 mm. thick, the gun being pivoted in the center of the single compartment. In some places a revolving turret was fitted while others merely had a shield in front of the gun and revolving with it. The driver occupied the most central position in the machine and was practically immune from attack. He had a view straight ahead through a hinged shutter and in addition had a small port on the right, level with his head.

The Renault company built a number of armored cars for the French Government at the end of 1914. The chassis was the Renault 18-hp. model having a four-cylinder motor, 3.7 by 6.3-in. bore and stroke and detachable wood wheels with pneumatic tires, twin wheels being used at the rear. Armor plating protected the entire car with the exception of the tires and wheels. The method of construction was to place steel ribs at wide intervals from frame member to frame member above the motor and as far back as the steering wheel. Steel plates were attached to this framework by means of bolts and wing nuts, so that any plate could be quickly dismounted to get at the mechanism, both motor and radiator being completely covered. A steel plate was carried at the extreme front between the

Right—Rolls-Royce armored car which hauls a naval gun on a special twin-tired chassis

One of the automobile repair shops which help to keep the cars and trucks with the French and British armies in condition

frame members to protect the underpan which with this system of cooling must be completely air-tight to prevent the draft passing otherwise than through the radiator tubes. At the rear there was a similar plate protecting the axle and differential housing. The body was a box-like structure with a quick-firing gun pivoted in the center and having a rectangular shield. The steering column was raked to give the driver a low position.

Overloading a Frequent Fault

A common fault in the construction of armored cars was the loading down of a touring car or light truck chassis with armor and guns too heavy for its capacity. This was especially the case where naval engineers were responsible for the construction, an example of this being a Pierce-Arrow 5-ton chassis on which was placed a big bed plate mounted on heavy I-beams, 1 ft. apart and carrying a 6-lb. gun which brought the weight of the gun and mounting assembly up to 5 tons, the armor plating weighing between 3½ and 4 tons. In addition, ammunitions, stores, supplies, and accessories had to be carried. This truck without full equipment weighed 4 tons. There were a fleet of trucks built in this way and each one developed trouble of some kind. All the springs flattened; one car had a 1¼-in. twist in every universal back of the gearbox and the main shaft was sprung ⅛ in. so that it was impossible to move first or reverse gears without a heavy hammer. Before the car could go into service it was necessary to cut away sufficient unnecessary metal to reduce the weight to a reasonable quantity.

Four-wheel-drive early in the war proved its value for armored car purposes, since such a machine driven and steered at both ends would be capable of traveling over any country and of high speed on good roads. It would also be able to get out of difficulties at a rapid pace from which it would otherwise be inextricable. Four speeds forward and two reverse were mentioned at this time as being desirable for these vehicles.

Four-wheel-drive tractors also found favor with the artillery service early in the war, these vehicles being found much more efficient and serviceable than horses for hauling guns and for bringing up ammunition.

The French artillery was greatly strengthened by heavy guns mounted on special chassis fitted with four solid struts capable of lifting the wheels from the ground and thus providing a solid platform. Many of the 155 mm. guns were drawn by four-wheel-drive tractors instead of horses. After the guns were in position the tractors were run into shelter the same as horses, being more easily concealed, however, and also having the advantage of being able to haul the guns out of a difficult position without actually exposing themselves. The French made a light four-wheel-drive tractor in large numbers which was designed to pull a useful load of 6 tons. These vehicles were found very useful.

Mounting the 75 Mm. Gun

The lighter Peugeot high speed chassis fitted with double steering gears, so that the driver could face either front or rear, a couple of reverse gears and two quick firing guns and adequate armor protection was later adapted by the French army to its artillery work.

Later, the 75 mm. gun was extensively mounted on 30 hp. chassis, a pivot carried on the steel platform and bolted to the frame members carrying the gun, at the left side of which the gunner's seat was attached. When brought into action the chassis was raised from the ground sufficiently to remove all weight from the springs but not to lift the road wheels, this raising being done by four hydraulic jacks, one at each corner of the chassis and simultaneously operated.

There appear to be no four-wheel-drive tractors in Italy, but heavy gasoline tractors for hauling heavy artillery are produced in considerable numbers, these vehicles being designed primarily to operate away from made roads. The Fiat chain-driven 70-hp. tractor is an excellent example and is fitted with a caterpillar band attached to the driving wheels which can be used for traveling across rough country.

A number of special army trucks such as searchlight and wireless telegraphy cars are now being produced while armored cars with 5 mm. plating and generally fitted with two machine guns are manufactured in moderately large quantities.

Standards for Aircraft

Work Done by S. A. E. and Success Thereof Brings Existing Standards Into Aviation Field—Need for Special Air Standards

By Henry Souther

Past President of the Society; First Chairman S. A. E. Standards Committee

AFTER getting away from active participation in the work and looking at it from the standpoint of an observer on the side lines, and as an executive in a manufacturing firm using S. A. E. standards, I am glad that some work of the kind was done by our S. A. E. standards committee. Much use is being made of the standards and much confusion and waste of money have been avoided; of this I am certain from personal observation. The gap existing between these two limits is very wide, when measured in dollars and cents.

Eliminating Waste

As an executive it was a great comfort to feel that a lot of time and money was not being wasted in the drafting room by some ambitious young draftsman in the design of a new screw thread, a new spark plug thread, or a new lock washer. A general order to the engineering department to adhere closely to S. A. E. standards was easily obeyed by the engineering force. Departure from S. A. E. standards was very rarely necessary.

I am sure S. A. E. data books are a success in this matter. The information is quickly available, thanks to the untiring efforts of the manager and his force at S. A. E. headquarters. It is a great pleasure to hear in many quarters the commonplace nomenclature adopted by the S. A. E. standards committee in the naming of the many qualities of special steels used. Producer and consumer now talk the same language when steels are mentioned. The consumer knows how to ask for them and the producer knows how to furnish the desired quality without argument or unnecessary correspondence.

Saves Drafting Time

It is much easier for the designer to lay down a tube section, an angle or channel section, or other standard shape, with an exact detail drawing to follow, than to work up something original. It is vastly easier for the producer to furnish a standard stock size than to make something special.

This all seems platitudinous; but there are a few who have not learned it yet. Such consumers must be lacking in common sense.

The old bugaboo of throttling originality has evaporated. Progress in the art has been rapid, in spite of the money saved by the use of S. A. E. standards. It is fair to assume that some of the money saved has been spent to advance the art even more rapidly.

Just now my attention is focussed on the development of the aeroplane. The observations of a few days show that S. A. E. standards are playing an important part. They creep naturally into the detail of design. They are natural standards. The engineering detail has stood the criticism of many minds. The producer has approved, and so has the consumer. Nearly every objection was eliminated at the outset. The result is as good as may be, and the airship designer is quick to see this. It is plain that similar work in making standards is to be done in airships. A preliminary glance shows that certain parts of all air machines should be the same. Propeller hubs, spark plugs, screw threads for turnbuckles and end connections for wire cables are a few examples.

It is plain, also, that this new industry is to be a real one in this country. The progress made is far beyond that realized by the public; even the engineering public, who should be best informed.

Schools Give Fundamentals

Our technical schools have courses of instruction that are teaching the fundamentals in a very practical manner. The students are not all youngsters, but are the business men, engineers and flyers who are pioneering the industry. The result is many good air-planes and many good engines. The term good is used in reference to the age of the art. The art is young and the product no more 100 per cent good than was the product in the automobile art 10 years ago.

It is fair to assume the same rapid progress in the new art. Airships are practically new; they will come into use more and more rapidly, just as the motor car did.

Will Help New Work

I hope to play some part in developing the new standards. It is natural to assume that, inasmuch as the United States will be a large consumer of airships, army and navy engineers will be active in establishing standards for the new fighting arm. Such co-operation with all concerned will make progress very rapid.

Consumer and producer have learned to get together in one art; surely it will not be hard for them to do so again.

Library Extension by Volunteer Service for Aid in Research

A Proposition Dedicated to the S. A. E. and Addressed to the Library Authorities Throughout the United States

By **Marius C. Krarup**

SOME librarians have a surprising amount of information in different branches of knowledge, as well as a "nose" for quality in books, enabling them to make excellent selections from the book market and from collections which come under the hammer. Requests for certain books from patrons of the library probably help or hinder in each case, according to the liberality of the budget for purchases and the average information of the patrons. But, on the whole, librarians cannot be specialists in any branch, and the public value of the library must depend mostly upon its *completeness* in the branches it aims to cover. On this basis there are few, if any, libraries in the United States which are well enough stocked for the research work of specialists. The information wanted is too often in books which are not on hand. Only the modern resumption of the good old habit of citing all sources of information in scientific books helps out somewhat. But it does not produce the cited book, which may be wanted.

In addition to the scarcity of good libraries, their local character curtails their usefulness. To get the full benefit of them, one must be on the spot. Chicago's libraries are mainly for Chicagoans, Boston's for Bostonians, that of the Case School for Clevelanders, and the New York Public Library as well the library of the United Engineering Societies mainly for New Yorkers and visitors to New York.

The idea that such a policy may be deliberately maintained for the purpose of drawing visitors to the city where the library is located, can probably be dismissed without comment. The spirit of library boards is broader.

Now, apart from the bulk of work done by visitors, quite a bit of research work is done in these libraries, or in some of them, through the employees, but the requests come principally from persons living in the same city, who shrink from doing the work themselves, because they are unfamiliar with it or cannot spare the time. This is excellent, so far as it goes, but the library can usually not hire more assistants than needed for routine work, and these cannot as a rule be competent beyond a mere word knowledge in any specialty. Knowledge of foreign languages is merely literary, and seldom that. Both quantity and quality of the requested work must suffer. The greatest curtailment of library utility comes, however, in the work which is neither done nor requested, because the facilities for having it done well or at all are not on hand, and because the public within as well as outside of the library city are not aware that anything of the kind might be arranged. Occasionally a physician or engineer living in a provincial town commissions a friend living in a library city to look up a subject for him, but, on the whole, *no conception of the large libraries as national stores of information which may be drawn upon from any part of the United States, under a regular routine system involving moderate fees for competent work, has been cultivated or exists.* This although the general system of library arrangement and extension work within the home community is more advanced in other respects in the United States than in most other countries.

The writer remembers from the period 1873 to 1882, during which he occasionally frequented the Royal and the University libraries in Copenhagen, Denmark, that the chief librarian at one or the other of these large institutions sometimes received requests for research work to be done for pay and that he commissioned competent outsiders who were willing to do this class of work to come and do it at the library; in most cases on a time basis for the compensation, I believe. Whether he had a list of such men or merely picked them from his circle of personal acquaintances in each instance, I do not know. This vague recollection prompts the suggestion that the same thing may be done here on a much larger scale, as a perfectly regular feature in library activities and one entitled to frequent and free mention in the newspapers.

Though not highly competent in this matter, I must for the sake of completeness outline the kind of service contemplated.

A good-sized room in the library set aside for the Volunteer Extension Service, in the charge of the second or third assistant librarian.

A corps of workers, graduates from universities or equivalent institutions, each worker having some broad specialty and being indorsed with regard to character as well as competence; those from foreign countries and institutions being provided especially with consular attestations; all of unobjectionable personal habits. The list secured by advertising; its members to qualify to the library board.

The services of these volunteers or examiners for research work to be obtainable on call by mail or telephone, with preference for those, among equally qualified, who can respond most promptly. Evening work permitted, even at late hours, in order to have a good selection of men. Women only on perfectly equal terms of qualification. Compensation on a time schedule, with registry of time for coming and going at library upon the service card for each job. In cities with more than one library, co-operation in service cards and registry.

A number of typewriter machines at disposal in the room set aside for this work. A list of operators obtainable on call. One or two of them constantly on hand, the list taking turns at full day and full evening service. Their compensation on a time schedule, for each job, even on days when whole time is required, the assumption being that the time on these days will be fully engaged, while the necessity is the avoidance of any incalculable special expense for the libraries.

The uniform charge may be composed of $1.00 per hour to the examiner, 40 cents per hour to the typist who transcribes his dictation, notes or selected passages from books and 10 cents to the library for each hour of examiner's time. For rush work or when translations render such disposal expedient, more than one examiner and more than one typist may be employed for a job. Each request for research must be accompanied by cheque or postal order for $25, the unused balance of which is returned to the sender by library cheque. If work cannot be completed within this sum, sender is notified, and he must send another cheque for $25.

When request is received, blank is mailed the sender, specifying the rate of charges and the methods used, and this must be mailed back to library with the subject for the desired research clearly stated and limited. The need for translation must be stated in order to have it done. In default thereof, foreign language is merely transcribed.

When the research work is finished and transcribed, it is mailed to the client with filled-in blank stating number of examiner, his qualifications, number of hours used by each worker, attestation that examiner has verified the work of the typist, and giving a complete list of the works (with edition and year of publication) which have been examined, including not only those mentioned in the research record but also those from which no results have been obtained.

For photographs (by photostatic or similar process) done from books or plates upon request of examiner, a special charge of 25 cents for each is made, including the white-on-black negative. An apparatus for this work shall be at disposal, but may be shared with library at large.

—

Such or similar might be the plan by which thousands of professional men, newspaper men and business firms could become affiliated with the libraries of the large cities in the matter of acquiring knowledge which they may need and which they now usually acquire less promptly, in less reliable form, more expensively or not at all.

So far as members of the S. A. E. are concerned, it is by no means the idea to suggest that any considerable amount of research among books and periodicals usually comes within their province or would be profitable. On the contrary, their interest can be enlisted for the plan mostly because, in their case, it could occasionally save their own individual time, while giving them nearly the same security to the effect that nothing has been overlooked—in patent records or earlier developments akin to the subject in which they are interested—as they could obtain by laborious personal research.

Paragraphs on Current Topics

By **Marius C. Krarup**

Motto: Radical Thought, Conservative Action

Weather and time-tables, swashing waves and shady stoops begin to assert their silly rights of temporary precedence over gears and uncomfortable calculus. Cooling by splash and lubrication by syphon begin to look rational. Single-cylinder headgears are in dead storage. The season of frivoling is on. It is to be formally opened next week, when fortunate members of the S. A. E. are to try once more to reach the shores of Georgian Bay by skilful navigation and such jettison of accumulated loads of learning as may be found necessary and practicable.

□□□□□

This joyous event throws its shadow beforehand over these topics. War echoes, gasoline prices, the dust of the road, the overhauling of the old motor boat, Preparedness in all its five senses (each more important than the other), the results of the races, our new hopes in aeronautics—all these subjects receive a new coloring through the stupendous amount of pessimistic philosophy which the S. A. E. excursion stirs up in the breasts of members who can't go. What would become of the automobile industry, for example, if Lake Huron were infested with the tin sharks of the North Sea; nay, if a single U-boat had been dropped into the lake (through diplomatic channels of course) and were to direct its devilish aim at the precious ship carrying most of our hopes of progress? This dread thought alone may account for many cautious absentees.

□□□□□

This raises the question: Why do automobile engineers go junketing by sea or lake, instead of sticking to their own professional element, which we believe is an equable mechanical mixture of gasoline vapor, road dust, curves and equations? An authoritative answer is fortunately at hand. It comes in several sections. They could not get to Georgian Bay by car in a straight line, and any other is abhorrent to engineers. They could not get back in time. They might be commandeered in Canada. They would have to go one engineer in each car, as nobody would want to advertise or indorse the more or less erratic product of his less clear-sighted colleague. Furthermore, they are, each and all, 90 per cent human and only 5 per cent engineer, the remaining 5 per cent being made up of variable impurities which defy chemical analysis, but in which all sorts of special abilities are said to reside.

□□□□□

Additional reasons can be mentioned: With regard to gasoline, Standard Oil continues to offer substantial prizes for operative economy with this commodity, and the engineers are not out for economy on this trip. They are out to forget gasoline and dust, to give the 90 per cent human a needed airing and to work all the rest into a stable emulsion of fraternal sentiment in which no conflicting interests can be distinguished; for they have discovered that Fraternity is now the only one of the revolutionary trio whose gilt remains untarnished, while Liberty and Equality look much the worse for wear and tear.

□□□□□

No doubt, from the clear atmosphere on board the ship a few thoughts will revert to the dust which has been left behind. Unlike Dr. Guglielmini and Pierre Giffard we always carefully dodge this subject. It is unflattering to our resourcefulness. Dust—to be cussed! That is about all you can do with it at less than five to sixteen dollars per square yard of road surface. But, of course this is only because the S. A. E. has nothing to do with road engineering. May the thought come to them to take it up; to form an S. A. E. division of civil engineers or a road division within the S. A. E. Since the road is recognized as the other half of the automobile, the subject should lie at least as close to interest and duty as Industrial Preparedness. And Pp is getting as common as π with automobile engineers. No, it does not stand for preposterous propensities, but for prosperity and preparedness.

□□□□□

In another direction the influence of the automobile engineer seems to have been too strong. Because racing motors were taken out of the automobile and put in the motor boat, the four-cycle type of motor has predominated in boats ever since. Is this again because there is no influence among motor boat constructors comparable to the discriminating and yet unifying effect of S. A. E. work? The opportunity for developing the two-cycle motor to equal perfection with the four-cycle motor under the most favorable conditions is identified with boats, and if this natural bent had been followed, we might now have had twin-cycle twin-twelves, which in turn might have become useful for automobiles and aeroplanes. How about a motor boat division of the S. A. E.?

□□□□□

If cars were faster than their drivers at Indianapolis, as on ordinary roads, while the drivers were faster than the cars on the smooth Sheepshead speedway, a superlative spring suspension seems to be the next logical demand for racing cars.

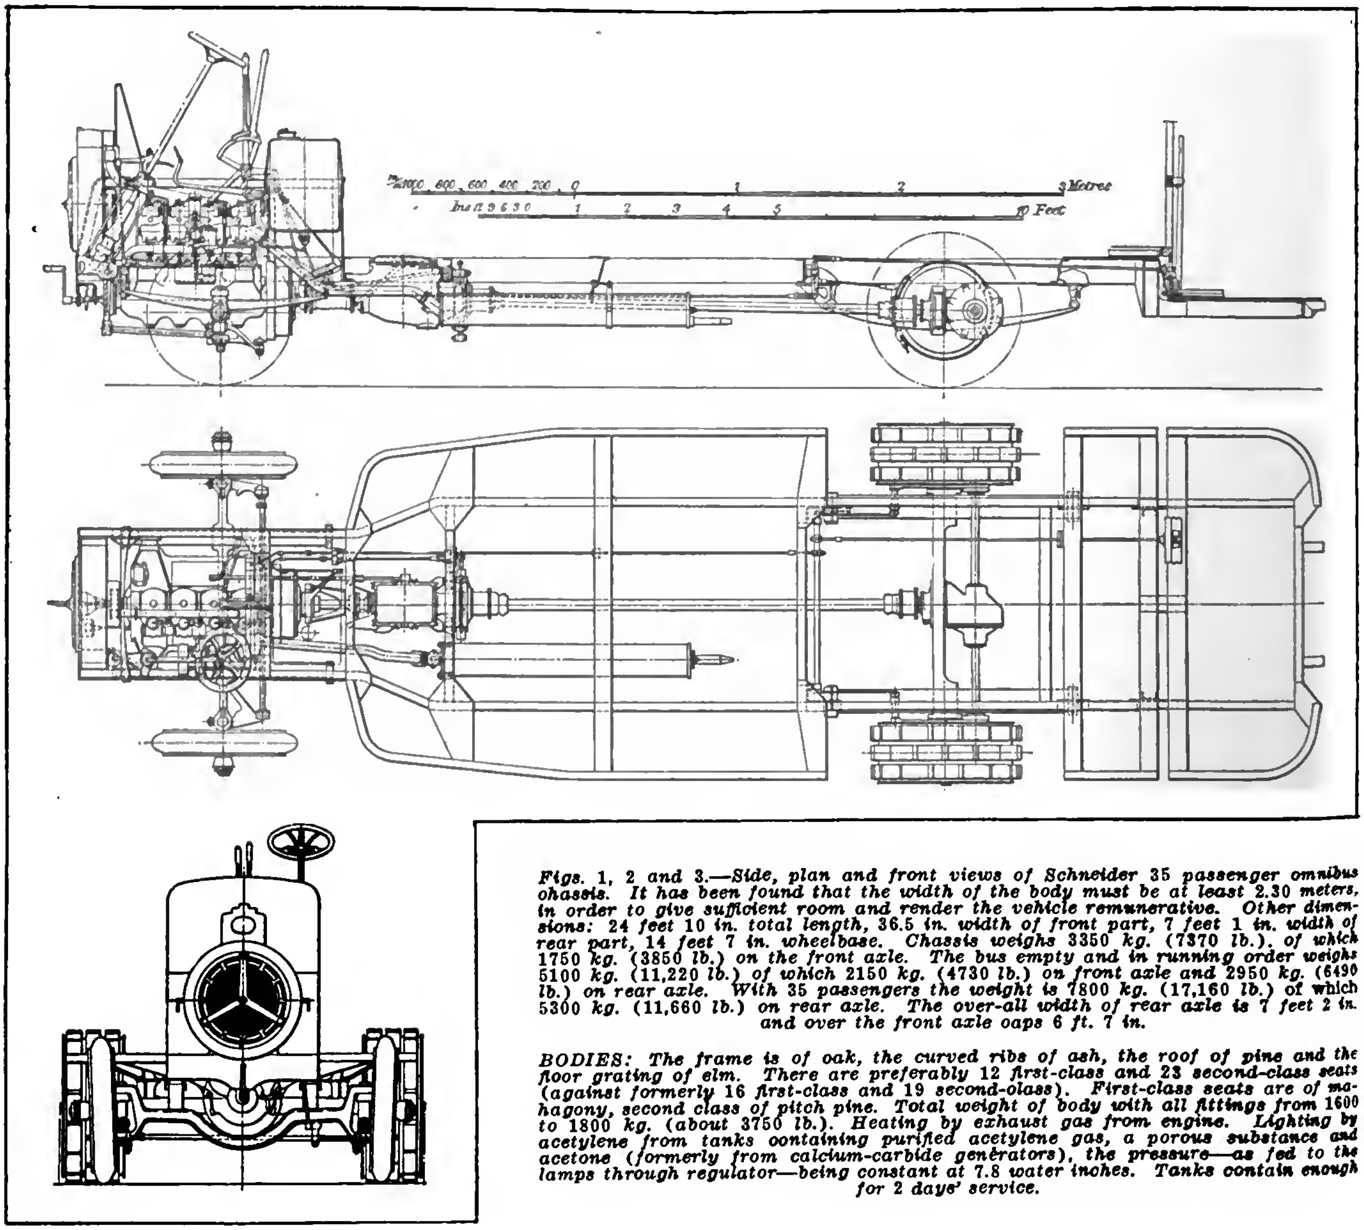
□□□□□

That aeroplanes are mostly shot down these bellicose days, makes us forget perhaps—the president of the Aero Club says they are now safe—that they can still come down for less complimentary reasons, and do. Scarcely too safe for sport, as yet, they should be meat for S. A. E.

Omnibus Construction Graduated from Both Peace and War Service

WHEN a few months ago the Paris General Omnibus Company decided to resume on a small scale the service which had been interrupted at the outbreak of the European war, it was held that the best thing to do in the matter of design and construction was to duplicate the type of vehicle which had been finally adopted in the middle of 1914, just before the company's entire equipment was commandeered for use in the military operations. Many new vehicles were built on this plan, but they did not go into commission in the streets, as the army continues to take them as fast as they are turned out. The indorsement which this type has received through its success as a money-maker in the public transportation system of Paris and subsequently through the satisfaction derived from the use of the chassis for very rough war service, lends special interest to a study of their construction and, actuated from this point of view, *Engineering* (of London) presents a number of scale drawings representing the main features in the Schneider chassis and body and also the principal varying features in the De Dion chassis, which is used to a more limited extent. These drawings are reproduced in the following, with brief explanatory captions, but the reader is likely to find, according to his own needs and experience, special points of interest in each drawing which are left unmentioned.

These omnibuses are the result of a practical evolution which had reached the stage at the beginning of hostilities that breakdowns had ceased to occur, expenditure was on the decrease and receipts were rising. The population favored the buses more and more in competition with the underground service, and neither the comparatively heavy gradients of Paris streets, nor the short routes rarely exceedingly 4.3 miles in length and necessitating considerable waste of time at the termini, prevented satisfactory financial returns to the operating company.



Figs. 1, 2 and 3.—Side, plan and front views of Schneider 35 passenger omnibus chassis. It has been found that the width of the body must be at least 2.30 meters, in order to give sufficient room and render the vehicle remunerative. Other dimensions: 24 feet 10 in. total length, 36.5 in. width of front part, 7 feet 1 in. width of rear part, 14 feet 7 in. wheelbase. Chassis weighs 3350 kg. (7370 lb.), of which 1750 kg. (3850 lb.) on the front axle. The bus empty and in running order weighs 5100 kg. (11,220 lb.) of which 2150 kg. (4730 lb.) on front axle and 2950 kg. (6490 lb.) on rear axle. With 35 passengers the weight is 7800 kg. (17,160 lb.) of which 5300 kg. (11,660 lb.) on rear axle. The over-all width of rear axle is 7 feet 2 in. and over the front axle caps 6 ft. 7 in.

BODIES: The frame is of oak, the curved ribs of ash, the roof of pine and the floor grating of elm. There are preferably 12 first-class and 23 second-class seats (against formerly 16 first-class and 19 second-class). First-class seats are of mahogany, second class of pitch pine. Total weight of body with all fittings from 1600 to 1800 kg. (about 3750 lb.). Heating by exhaust gas from engine. Lighting by acetylene from tanks containing purified acetylene gas, a porous substance and acetone (formerly from calcium-carbide generators), the pressure—as fed to the lamps through regulator—being constant at 7.8 water inches. Tanks contain enough for 2 days' service.

Many of the buses taken over by the war department were, after the first rush, returned to Paris from the war zone, and their bodies were converted with the object of further facilitating the transport of men and foodstuffs. For the commissary service, the whole of the seating accommodation was removed, the glass panes were replaced by wire netting and strong hooks were secured in the roofs. Some of the new-built vehicles were equipped in the same manner.

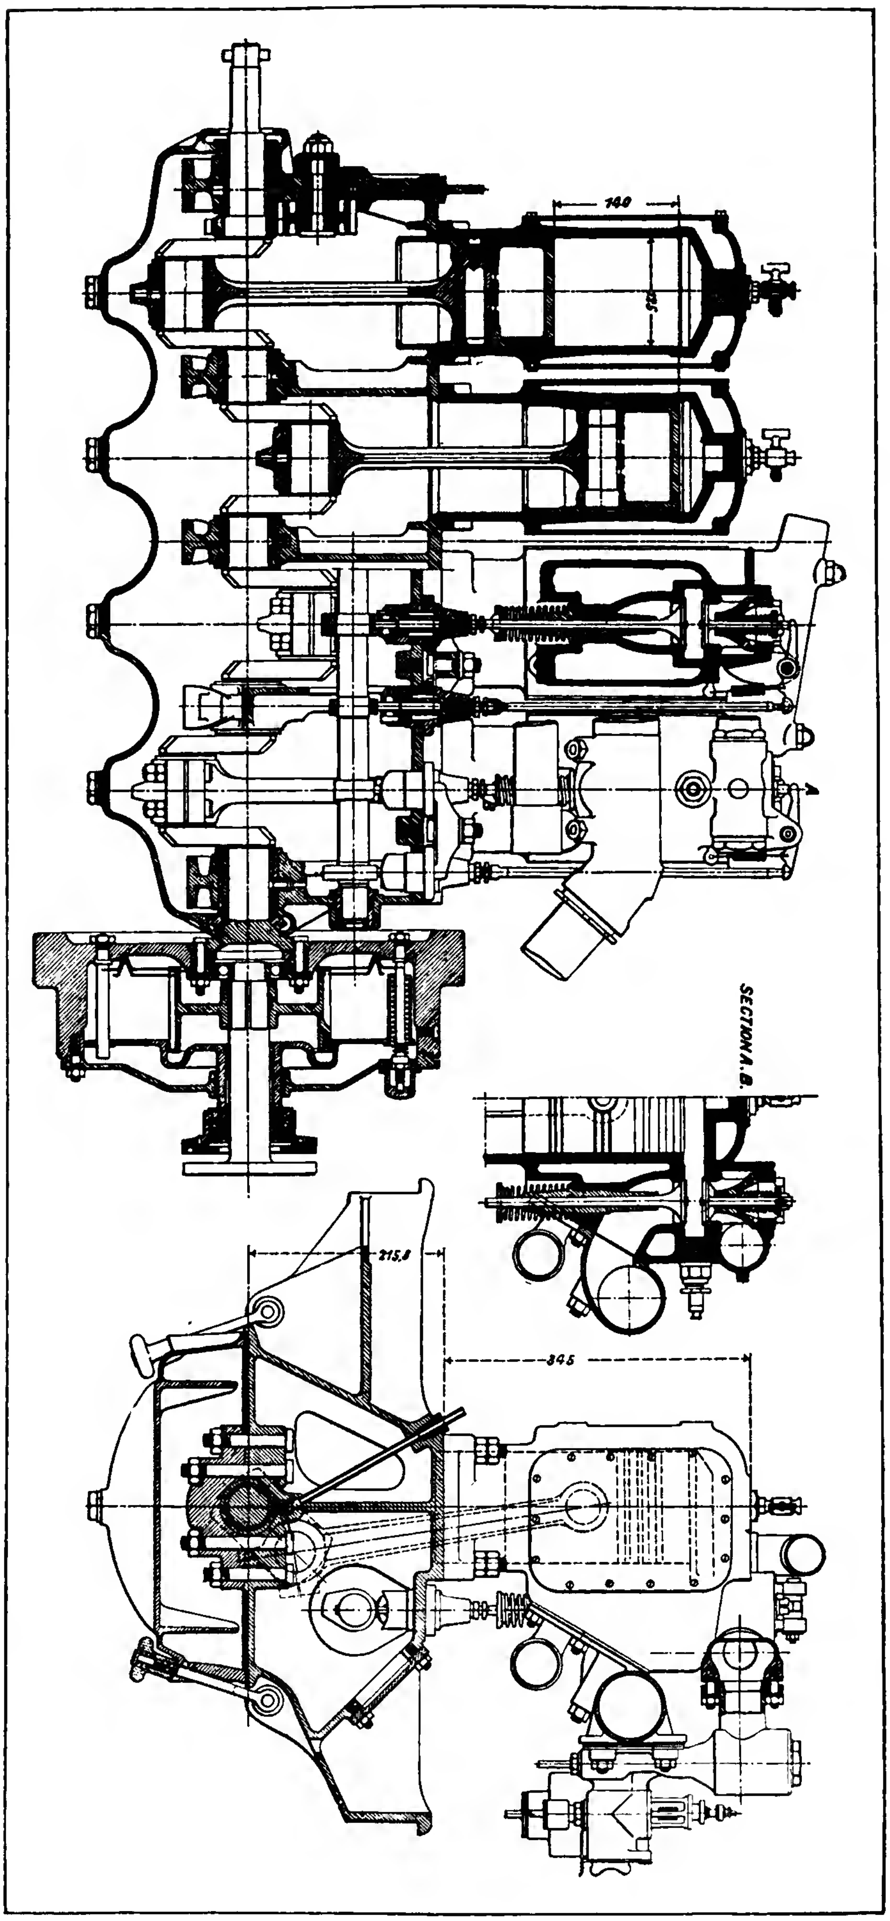
Earlier Developments

Prior to 1906 a number of double-decked buses were in use, but they have been gradually discarded, mostly owing to the delays caused by passengers taking their time when entering or leaving. An otherwise satisfactory bus of this class carried thirty-two passengers and was mounted on a Schneider chassis. The four-cylinder Schneider motor, with bores of 4.9 and stroke 5.5 in., developed 30 hp. at 900 r.p.m. The chassis weighed 3190 kg. (7018 lb.), of which 1690 kg. (3718 lb.) was on the front axle. The empty omnibus weighed 5060 kg. (11,132 lb.) with 2030 kg. (4576 lb.) on the front axle. With all seats occupied the weight came to 7270 kg. (15,994 lb.) and the maximum speed on the level was 13.7 m.p.h. Second speed was 8.1, and low was 4.05 m.p.h. The same type was built to thirty-four passengers, while engine and vehicle speeds were slightly increased, becoming the same that are now used; namely, 1000 r.p.m. and 14, 7.9 and 4.05 m.p.h. On the whole this became the prototype for the present model, by removal of roof seats and lengthening of the chassis, a platform built of angle bars being added. Many of these remodeled vehicles are among those still in service.

Other types which were tried and discarded were: One seating twenty-three passengers longitudinally; one with twenty-one seats and wheels shod with pneumatic tires those on the rear wheels being treble; one seating twenty-eight with side entrance close to rear end; one seating thirty with rear platform on a lower level and reached by a step on center line of vehicle.

Heating

The buses are heated with the exhaust from the engine, for which purpose these gases are piped



Figs. 4, 5 and 6—Sectional views of engine for 35-passenger Schneider omnibuses. The four-cylinder engine is carried by two cross-members. The cylinders are of the L-type and lubricated by splash. Bore 4.9 in., stroke 5.5 in., as in earlier type before referred to. Camshaft has keyed-on cams and is gear-driven. Inlet valves operated by long tappets and exhaust valves by overhead rockers. Ignition by high-tension magneto. Cooling by thermo-syphon, with radiator and fan on front of chassis. Aluminum three-armed spider protects copper tubes of radiator. Power transmitted by Hele-Shaw clutch in flywheel.

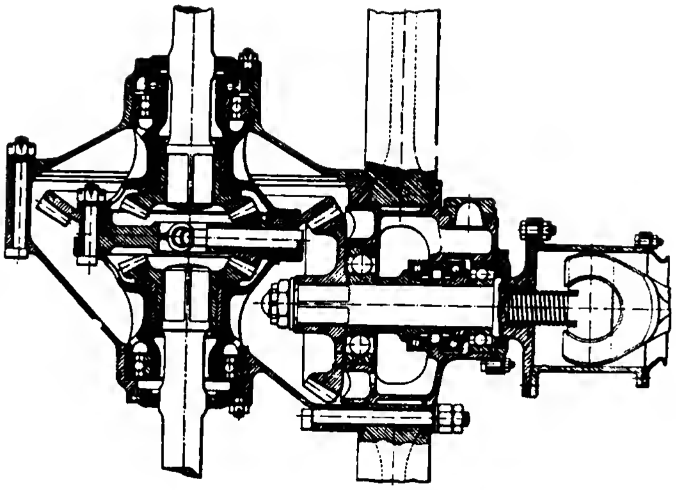


Fig. 7—Shaft drive with universal, bevel gear and differential gear in Schneider omnibuses, showing also relations to the load-carrying axle and wheel shafts to final gear reduction by annular spur gear drive in the rear wheels, the latter parts being shown in Fig. 13. The vehicle has two brakes; a transmission brake actuated by a pedal which also disengages the clutch, and a rear wheel lever brake.

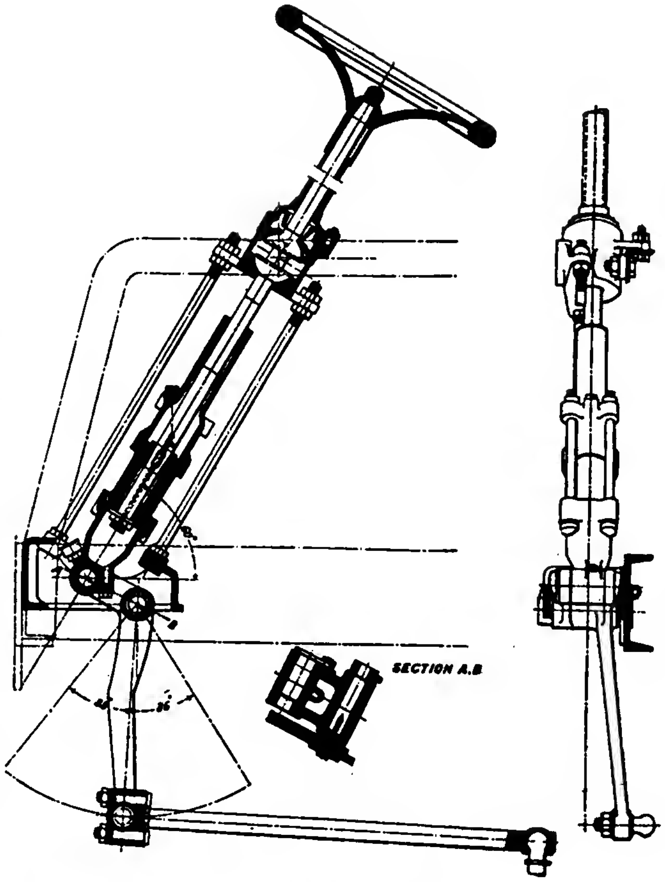


Figs. 8, 9 and 10—The Schneider steering-gear. It is of the screw and nut type and on the left side of the vehicle on the outer side of the frame members. (Figs. 1, 2 and 3 show it on the inside of the frame and also in other respects seem to represent the chassis of a remodeled double-decked omnibus rather than the final type, showing, for example, treble-tired rear wheels though final type has only twin tires.) The front wheels, which have single rubber tires, are 35.4 in. in diameter.

through aluminum foot-warmers, and baffle plates in the pipes in conjunction with a butterfly valve in the muffler serve to regulate the temperature in each heating unit. But these foot-warmers have not always been found perfectly gas-tight.

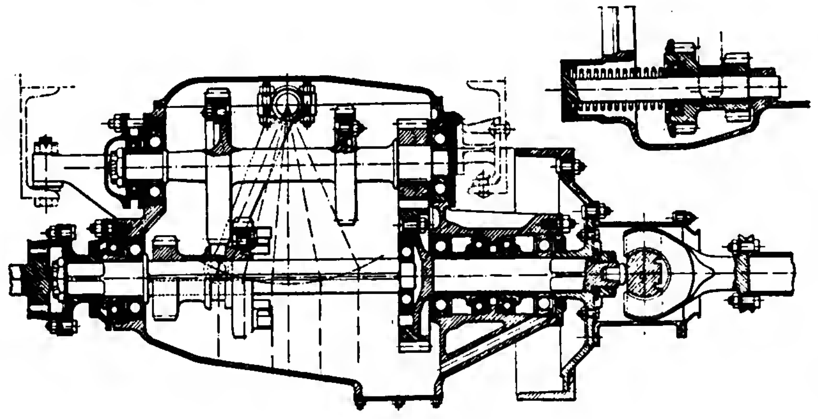
The 31-Passenger De Dion-Bouton Omnibus

In the development referred to above it was found most profitable to use vehicles of slightly smaller size for the shortest routes; and these were built on De Dion-Bouton chassis at Puteaux, near Paris. The frame is 22 ft. 8 in. long, 37.2 in. wide in front and 7 ft. 1 in. at the rear, while the total width over front axle caps is 7 ft. and over rear axle caps 7 ft. 4½ in. The body width in front is 6 ft. 3 in. and at the rear 7 ft. 4 in. The wheelbase is 11 ft. 8 in. The wheels have the same diameter as those of the Schneider chassis. The weight is 3470 kg. (7634 lb.) of which 1770 kg. (3894 lb.) is carried on the front axle. The whole vehicle empty and ready for service weighs 5070 kg. (11,154 lb.) with 3100 kg. on the rear axle. With thirty-one passengers the weight comes to 7160 kg. (15,752 lb.) and the front axle load to 2085 kg. (4587 lb.). The speeds on the level, with the motor at 1000 r.p.m., are 12.4, 6.85 and 3.75 m.p.h.

The accompanying illustrations, Figs. 14, 15, 16 and 17, show the most important details in which these omnibuses differ from the 35-passenger Schneider omnibuses.

Maintenance of Paris Omnibuses

When the omnibuses were in city service, they were inspected by a mechanic at each terminus of routes and every



Figs. 11 and 12—The speed gear box of Schneider chassis, mounted between two transverse frame members and connected by universals at front and rear ends of lower shaft. Three forward speeds and reverse (Fig. 12). Transmission brake of large diameter, internal expansion type. All universal housings metallic; leather discarded.

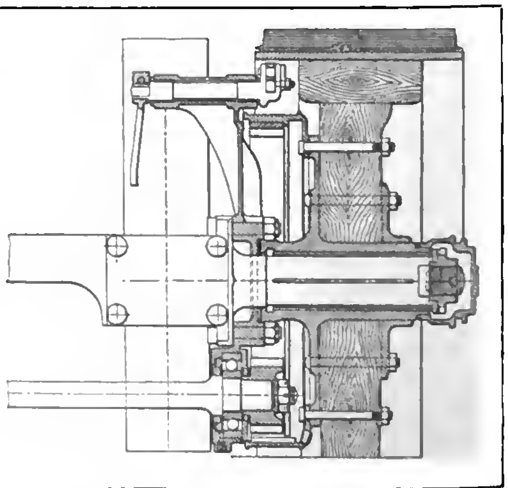


Fig. 13—Rear wheel of Schneider chassis, with spur-gear drive, brake drum and one-piece twin tire. Diameter 37.4 in. The shoes of the brake are wood-lined. The wheels are of wood and manufactured at the omnibus company's works; the spokes of acacia; the rim of elm; the naves of steel with phosphor-bronze bushes.

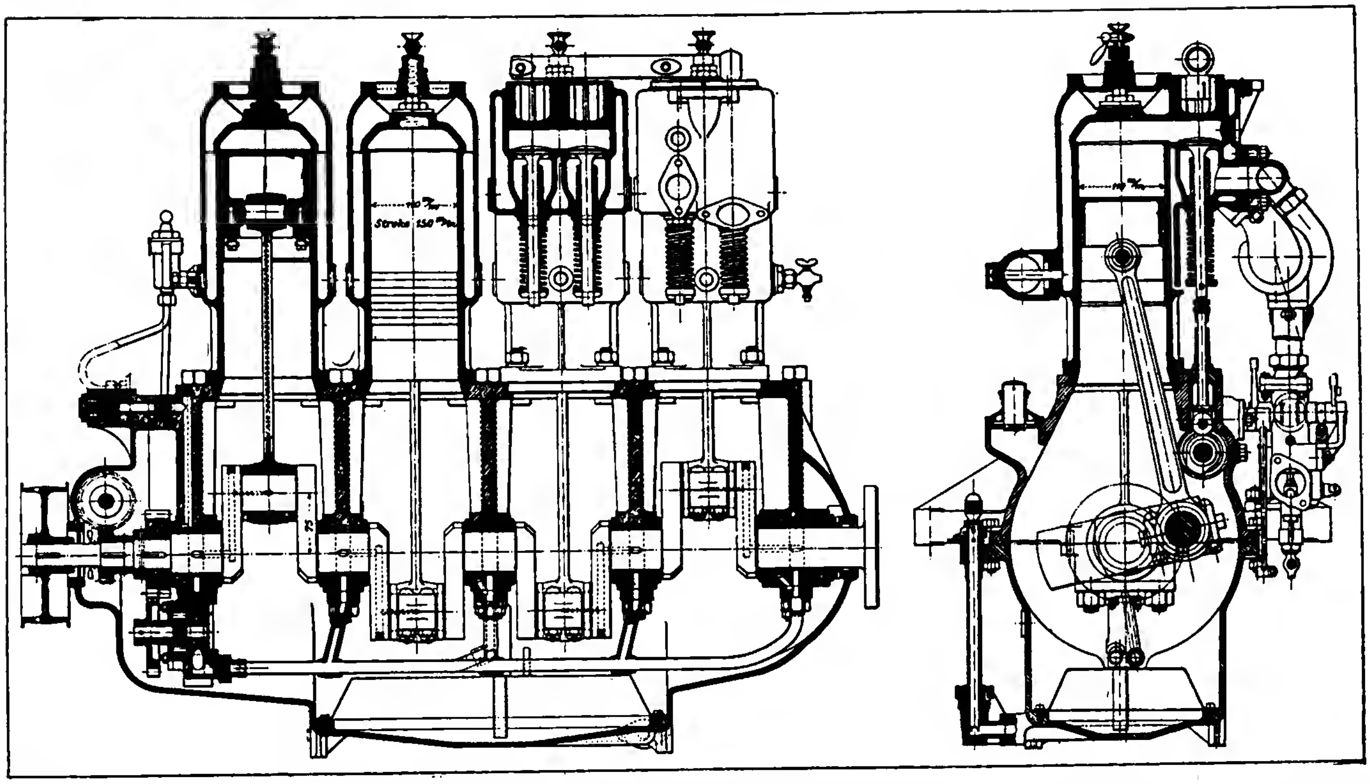

Figs. 14 and 15—Four-cylinder, 30-hp. engine in De Dion-Bouton 31-seat omnibuses. It is placed beneath the driver's seat. Bore and stroke are 4.3 and 5.9 in., respectively. Normal speed 1000 r.p.m. Ignition by high-tension magneto, without adjustment for timing the spark. Carbureter is of double-jet type. Control by accelerator pedal. Engine speed limited by governor. Cylinders are fired 1, 3, 4, 2. Cooling by thermo-syphon. Lubrication forced. Radiator similar to that in 35-seat vehicle. The plate clutch is of the De Dion type. The engine is mounted in a cradle resting at 3 points in cross members of the frame. Three forward speeds, direct on third, and reverse. Steering by worm and segment, irreversible. Transmission brake and rear wheel brakes similar to those on Schneider chassis. The front axle is a one-piece drop forging.

night at the garage. After working 25,000 miles each vehicle was taken to the shops and overhauled, the body being first removed; all loose rivets were replaced. The whole working mechanism was taken apart, re-adjusted and tested.

Cost items under this plan were found distributed as follows: .13 franc per kilometer for chassis and motor; .03 franc for the body; .12 franc for tires; .0265 franc for washing, lighting and heating; .2125 franc for fuel.

The fuel was at first an equal mixture of benzol and alcohol; later; benzol alone. The consumption was, average, .176 gal. per mile of 90 per cent benzol, density .880; .180 gal. per mile of gasoline, density about .745; .2 gal. per mile for the alcohol-benzol mixture. Lubricant, grease and cotton waste totaled .02 franc per kilometer; driver's wages .10 franc; depot charges .06 franc.

These figures are here given for mutual comparison only, as the radically different cost of labor and materials in France renders all other comparison illusory. The same applies to administration expense. The Paris company collected 426 million fares and 58 million francs in 1913.

Fig. 16—Bevel gear drive and differential on De Dion-Bouton omnibus. The wheel shafts by flexible joints operate spur pinions which engage the internal gear teeth of two rings which are bolted to the wheels, as shown in Fig. 17.

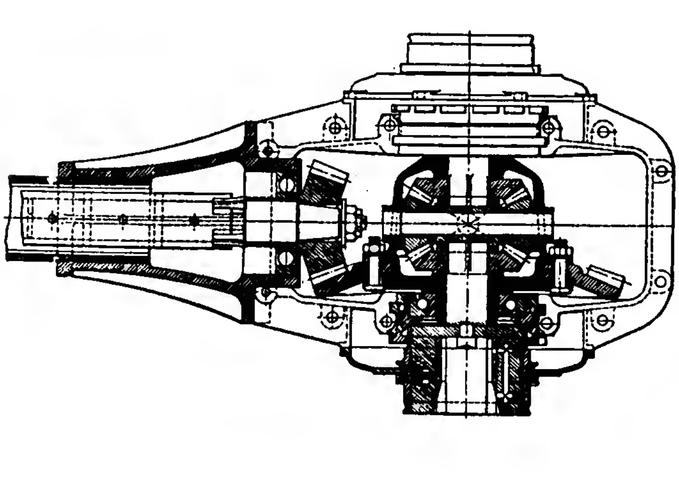

Fig. 17—Rear wheel and axle head of De Dion-Bouton omnibus. The rear axle consists of a tube fitted in two cast-steel axle heads, and the latter are connected to the rear springs.

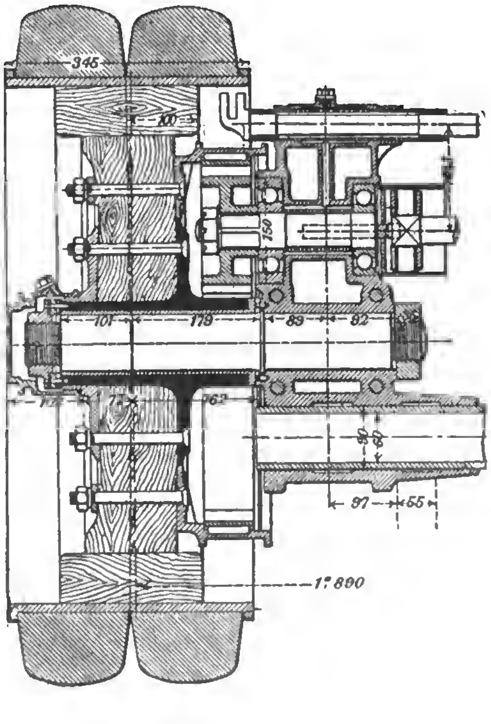


What Can We Learn from Racing?

Engineering Lessons Derived from Speed Contests Too Valuable To Be Neglected—Manufacturers Must Not Overlook Value of These Tremendous Tests

By J. Edward Schipper

RACING means no more to the automobile industry than baseball, golf or any other form of sport and entertainment if the valuable lessons to be derived from it are not taken to heart. There are just two ways of looking at automobile racing from the standpoint of the industry. First, is racing merely a means of attracting attention to the automobile, a sort of advertisement for its possibilities, as it were, or is it a means of imposing the greatest possible test of strength, endurance and speed in order that from the lessons we learn we can make stock cars that better endure the stresses of every-day usage?

Not a Sales Proposition

The automobile industry is not in a stage where it needs racing or any other form of hippodroming to act as an incentive for car sales. Perhaps this is the underlying reason why factories are not engaged upon the manufacture of speed creations which will be able to win contests on the country's speedways. Rather than build high-priced racing cars, the costs of which must be added to the costs of regular production, they are bending every effort toward the more productive business of reducing output costs.

As a Teacher

With this phase of the situation out of consideration, the other standpoint comes to the fore. The automobile race as an object lesson for the designer, the metal worker and the machinist, is a different proposition. Valuable lessons can be learned on the track which would never be brought to light by the testing dynamometer or by the road test. The stock car will never be a speed creation, but if the parts which fail in speed creations are strengthened in the stock jobs, it is quite certain that the factor of safety and of life of the touring car will be increased.

Watching for Weak Points

The average cost of building a racing car will range between $5,000 and $20,000. This is actual cost of building and there is no profit or overhead figured in with it. It is not uncommon for a car that is racing all around the circuit to carry with it in spare parts alone a supply that is valued at $10,000. Almost enough parts to build an entire new engine and practically a new chassis are necessary in order to make the replacements that become necessary. This great burning up of metal should be watched very carefully by the engineer of the factory, for by watching the parts that fail through weakness and through faulty design he can guard against the same failures in his own standardized product and also may incorporate little features of design which cost no more but which make his car better.

Multi-Valves an Example

Perhaps the most striking lesson from racing is coming in the way of multi-valves. There are at least five manufacturers in this country who have been playing around with four-cylinder motors of four valves to a cylinder. More than one announcement of models of this type can be expected within a few months. Where did the idea develop? In racing. High speeds are necessary on the racing car. It is also extremely necessary to have the power high at these faster rates of travel in order to overcome the enormous wind resistance and also to carry and maintain the speed itself and still have a little in reserve for a spurt. This condition of high speed and high power means that the gas has got to be brought into the cylinder and burned. It must not remain in the intake pipe or allowed to wire draw. Big valves and plenty of them is the answer.

The same condition is beginning to hold true in the passenger car. Speed capabilities are demanded more than ever. The engines are running at higher rotative speeds. At these fast rates of travel, the engine must be efficient and it must be developing high power. The same conditions as in racing obtain all the way through. Hence, wide-awake designers are going very deeply into the merits of the sixteen-valve four for stock work.

Importance of Details

It is not all in basic design that the lessons of the racing car are to be learned. Pick up the little details that are being tried from time to time on the speed creations. The lesson of the pistons is still being watched. Many are on the fence regarding aluminum. In racing the slap at low speeds is not to be contended with, and that renders the situation different. On the other hand the hour-glass shaped design used in some of the racing cars with the piston supports at top and bottom are worthy of consideration. May it not be that the system of piston rings all near the top as used with the iron piston is wrong with aluminum? Rings near the top and bottom are being tried out in many cars and may result in securing the advantages of aluminum without its one disadvantage.

Placing the Plugs

There is much food for thought in the placing of spark plugs. Even in some of the racing cars this has not been given the care that it should have been given. This was shown on one or two cars at Indianapolis this year. It was not the fault of the plugs that they sooted or failed. Placing spark plugs in close proximity to the exhaust where they are away from the cooling influence of the intake and also placing them where they are subjected to the spray of oil that is apt under conditions of high vacuum to shoot past the pistons is a mistake that brings its own penalty. The same conditions may hold true with a touring car, only not anywhere near to such a degree. In a word, a 300-mile race will show plug troubles that are covered in the space of a year on the touring car.

Larger Waterjackets

In no one thing have racing cars improved so much in the last few years as they have in waterjacket spacing. This same lesson can be taken to heart in the stock motor. It is true that an engine which is too cool is inefficient. Every heat unit thrown away through the radiator is lost as far as power is concerned. On the other hand, every part of the motor should be as near the same temperature as possible.

When waterjacket spaces are cut down and skimped, especially around the valves and plugs, the engine is sure to be troublesome. Larger waterjacket spaces gain more for the engine as far as life and all-around satisfaction are concerned than they lose in the way of heat. This trend toward larger jackets is very noticeable in racing cars, where particular care is being used to keep the water around the head of the cylinder, especially where the overhead actions are employed.

Lubrication Problems

Oiling problems are so pronounced in racing cars that it is very doubtful whether the questions of oiling the ordinary passenger car and the racing car are at all parallel. On the other hand, where the touring motor is operated at high speeds the question of proper oil feed is quite important. Of late there has been quite a reverse in racing motors as well as in some of the touring cars as regards cylinder lubrication. The question up to a short time ago was how to get enough oil to the cylinder. It has now become how not to get too much.

With Aluminum Cylinders

With aluminum pistons the problem of how to keep the oil supply to the cylinder walls properly regulated is even more complex. The difficulty lies in the number of conditions under which the car is handled, and the problem of securing proper oil at all speeds and under different load conditions becomes very much like that of carburetion. A variation in feed is really required to handle the work properly even on a touring car. On a racing car the difficulty is so pronounced that a car oiled correctly at Sheepshead Bay will suffer from too much oil at Indianapolis.

A Question of Speed Variation

The reason for this is that on the Sheepshead Bay track the speed is nearly uniform. Here the pressure feed system works beautifully and where splash is used also the amount fed is very close to constant. At Indianapolis when the car reaches the turns the engine is shut down, with the result that the oil has an opportunity to build up, and when the throttle is opened again the combustion chamber is filled with lubricant and consequent carbon. As the car is accelerated, the smoke shoots from the exhaust.

The Touring Car's Problem

The same problem holds true in the touring car, but not nearly to the same extent. If the oil feed could be regulated to each driver, the proposition would be different. As it is, it must be so arranged that under conditions of city driving at low speeds the proper amount of oil must feed as well as at speeds of 50 or more miles an hour. On the track, the low-speed condition does not have to be met to any extent; on the touring car it is becoming very common to drill the pistons with oil holes to relieve the excess of low speeds, and at high speeds the oil is fed freely without having an opportunity to escape to any great degree by the way of the drilled ports.

Closing the Valves

One of the difficulties of high speeds is to obtain positive closing of the valves. In the racing cars the springs have to be so stiff that the power consumed in operating the valves amounts to a considerable factor. With the higher speed motors in the touring car, it is quite certain that this point of valve closure will have to be watched. In one racing car which has had considerable success on the track this year, it takes a pressure of 150 lb. to operate the valve the distance of its lift, which is ⅜ in. In other words, it takes about 56 inch-pounds, or practically 5 foot-pounds, to open one valve.

Preventing Valves from Riding

It is becoming necessary to give a similar amount of thought to the valves in the ordinary stock motor. These are being run at speeds which make it quite possible that the valve will have a tendency to ride. This can only be cured in one of two ways. The springs have got to be made so heavy that they are quick-acting enough to positively close the valve, or the same principle as Delage uses on the new racing cars will have to be employed and the cam so shaped that it not only opens the valves but closes them.

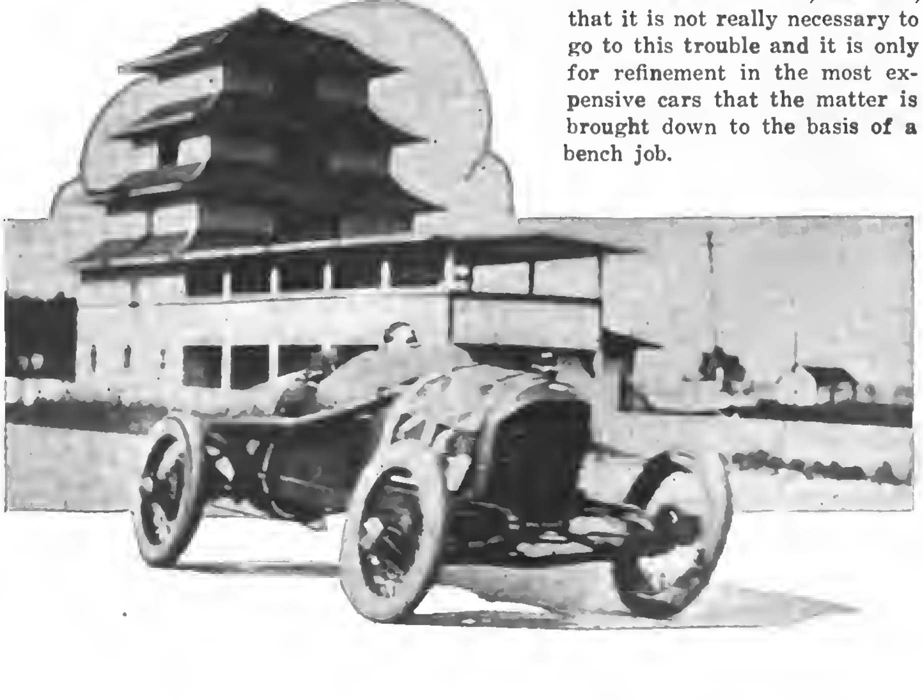
The constant engagement cam is a difficult thing to handle on account of the expansion factor. It has been handled nicely on this Delage type, however, and may act as a hint to some high speed motor manufacturer in this country.

Connecting-Rods Are Important

Connecting-rods are a detail that form an interesting study. At first sight the stresses on a connecting-rod seem to be very simple. When the speed of the motor increases, however, to such a degree that the inertia forces begin to become very high, the stresses on the rod are more complex. It would seem, however, that after all the rod experience the industry has had an almost ideal rod would be worked out by now. Still rod troubles have haunted the Peugeot racing cars and others. Even now one of the engine manufacturers in this country is turning away from the I-beam and adopting the rod of elliptical section. It is difficult to see the reason for this, as the disposition of the metal on the I-beams seems to give the proper section modulus.

Light Parts Are Factors

Rods must be watched on racing cars and touring car manufacturers have to follow their example closer now than ever before, in view of the light reciprocating parts tendency. It is difficult to machine around the bosses at the upper and lower ends of the rods. It means hand work on the racing car, and on at least one expensive stock car hand filing is resorted to on every rod. This is impossible in quantity production and the handling of a good rod when turned out by production methods is a difficult problem. Rod failures in stock cars are so few, however, that it is not really necessary to go to this trouble and it is only for refinement in the most expensive cars that the matter is brought down to the basis of a bench job.



Finding a Figure of Merit

Search for an Ability Formula Is Worldwide—Comparison of Different Efforts Shows Close Correspondence in Results

By John Younger
Chief Engineer Truck Division Pierce-Arrow Motor Car Co.

THERE are many ability formulæ expressing the fundamental functions of a car. They may, however, be divided roughly into two groups, the one showing the physical conditions the car is able to overcome, the other showing its economy in so doing.

The first group contain such formulæ as

Thomas' $$\frac{63000\ Pre}{p \times \frac{D}{2} \times W \left[\frac{20g+R}{2000}\right]} = 1. \qquad (1)$$

Roebuck's $$K = 14{,}550 \frac{d^2\,s\,n\,r}{D\,W} \left[\begin{array}{l}\text{Converted from cm. to}\\ \text{in. and long tons to lb.}\end{array}\right] \qquad (2)$$

Roebuck (*The Autocar*, England, June 22, 1912) states:
K should range from
120 to 130 for "de luxe" cars,
100 to 110 for ordinary touring cars,
80 to 90 for trucks.

Thomas' $$Q = 3000 \frac{d^2\,s\,n\,r}{D\,W} \qquad (3)$$

Myer's $$T.\,F. = \frac{7.055\ d^2\,s\,n\,r}{D.\ W.} \qquad (4)$$

(S. A. E., June, 1913)

The fifth formula, which is the only one that takes into account values obtained in practical road work, is Thomas' Sigma. (*Automobile Engineer*, England, April 2, 1913.)

$$\Sigma = \frac{.0047\ d^2\,s\,n\,r\,M}{D} \qquad (5)$$

In these formulæ

d is diam. of cylinders in inches
s is stroke of cylinders in inches
n is number of cylinders (4-cycle principle)
r is total gear reduction
D is diameter of wheel in inches
W is gross weight of vehicle in pounds
e is mechanical efficiency of transmission
P is Brake Horse Power of engine at p revs. per min.
p is revs. per min. at which P, hp., is developed
g is percentage gradient
R is Road Resistance in pounds per 2000 lb.
M is average gasoline consumption in miles per gallon.

Let us first consider formulæ 2, 3 and 4. Obviously, they are exactly the same in composition, except that the arbitrary constant K, Q or TF has been chosen differently. K was formulated on a basis of metric measurements, Q on a basis of inches, whilst TF was formulated for use with trucks. These three formulæ represent actual piston displacement per pound moved 1 ft., and on the reasonable assumption that every cubic inch of piston displacement represents so many foot pounds of energy, these formulæ give a measure of a car's ability. The greater the displacement per pound moved 1 ft., the greater should be the car's ability to speed, to climb and to accelerate on the particular gear reduction considered. Incidentally, the greater should be its gasoline consumption, but this we will come to later.

Inasmuch as K, Q and TF are arbitrary constants, there would seem to be no reason why the straightforward $\frac{d^2\,s\,n\,r}{D\,W}$ should not, itself, be used, or perhaps better still the Q value, $\frac{3000\ d^2\,s\,n\,r,}{D\,W}$ which represents the actual number of cubic inches piston displacement per pound moved through one foot.

Take now formula (1). This represents what might be called the static condition—the condition of balance, in which the inherent power of the vehicle exactly balances the combined resistances of incline and road surface. This falls into the "ability class," because it represents the practical physical conditions the car will overcome. Suppose we write $\frac{P}{p}$ as "$k\,d^2\,s\,n$" in this formula, we arrive at

$$\frac{63000\ e\ \text{“}k\text{”}\ d^2\,s\,n\,r}{\frac{1}{2}\left[\frac{20\,g+R}{2000}\right] D\,W} = 1.$$

This shows exactly the similarity of (1), (2), (3) and (4), inasmuch as for given conditions of "g" and "R" there is no difference between any of them.

Take now the Σ value (5), which is $.0047\ \frac{d^2\,s\,n\,r\,M}{D}$. It is obvious that if we take the displacement per pound per foot moved and multiply it by the weight of the car, we get the gross displacement per foot traveled. Multiply this by the theoretically perfect quantity of gasoline that is required to explode in this displacement and you have the perfect value of gasoline used per this displacement.

If, however, you multiply it instead by the average observed, gasoline consumption in miles per gallon, you at once obtain a figure of the car's economy. This is *Sigma*.

We have seen that a car is able to perform better the greater its K, Q or F values, but at the expense of greater gasoline consumed. If, however, we multiply the K, Q or F values by the miles obtained per gallon of gasoline, either in average practice or as obtained by the proposed S. A. E. method, we at once obtain a formula which imposes a penalty at once on either the big Q value, or the small Q value, and tends to strike an amount which will represent standard good practice.

I would, therefore, strongly recommend that the *Sigma* formula be considered fully, as a necessary rating formula in all cases where gasoline consumptions are measured.

Mr. Thomas, in his original article on *Sigma*, states that probably the best recorded gasoline consumption for straightway road work was that obtained on the R. A. C. officially observed Rolls-Royce car in 1911. The *Sigma* value works out at 4.70, giving a suggestion that an ideal *Sigma* would be about 5. Values are given here for other cars, based on long road work. None of them is for freakish gasoline tests. They are all values such as would be obtained by the ordinary driver over give and take roads.

Rolls-Royce, 50 hp., 1911, R. A. C. trial	4.70
Napier, 60 hp., 1912, R. A. C. trial	4.27
Rolls-Royce, 50 hp., on average roads round Buffalo, 1912	2.60
Mandslay 3-ton truck, 1907, R. A. C. trials	2.70
Pierce-Arrow 5-ton truck in Buffalo service	2.60
Pierce-Arrow 38 in 1912	2.25
Pierce-Arrow 48 in 1912	2.24
Pierce-Arrow 66 in 1912	2.16
Pierce-Arrow 38 on several hundred miles, hilly country, 1912	2.00
Sunbeam 30 on same route at same time	1.69
Pierce-Arrow 66, average of a long tour in California	2.62
Sunbeam, 30 hp., 200-mile run, Buffalo-Toronto and back, 1913	2.20
Pierce-Arrow 2-ton truck in two weeks' N. Y. service	2.57
Pierce-Arrow 5-ton truck on 100-mile good road run	2.91
Ford, 1913 model	3.84
Thomas-Leyland-Delahaye electric transmission truck, R. A. C., observed in 1911	3.56

Digests of S.A.E. Papers To Be Read on S.S. Noronic

Official Abstracts Show the Wide Range of Subjects Covered by the 1916 Program—Many of These Papers Will Be Read Simultaneously—See Program on Page 1048

THE following abstracts of the papers to be given at the S. A. E. summer meeting include all but H. E. Coffin's address, which was not available at the time of going to press. It is understood that this will follow in a general way the talk which he gave recently before the Indiana gathering, which was reported in the last issue of THE AUTOMOBILE.

Possibilities of the Constant Pressure Cycle

By Arthur B. Browne and Herbert Chase

THE authors, having shown that Otto cycle engines possess certain limitations, notably low thermal efficiency and characteristics which render the use of any but highly volatile fuel exceedingly difficult, state their belief that engines of this type must sooner or later give place to others operating on a different cycle.

The advantages and disadvantages of various other cycles are then discussed and it is shown that only constant pressure cycle engines seem to be well suited to the requirements of motor vehicles. The many advantages of constant pressure engines are then set forth as follows:

(1) High M.E.P. with low maximum pressure.
(2) Variable cut-off with constant compression pressure.
(3) Adapability to use of low grade fuels.
(4) Superior scavenging qualities.
(5) Absence of volumetric losses from which Otto cycle engines suffer.
(6) Adaptability to two-stroke cycle.
(7) Lower maximum temperatures.
(8) Absence of complication because no fuel or starting pumps are necessary.

The reason for slow development of constant pressure engines are then given and a new form of constant pressure cycle engine is proposed and its operation fully described as is also a special burner giving "flameless combustion," the latter being an essential feature of the engine. This engine compresses into a receiver, heats it with exhaust gas and expands it *at constant pressure* by adding heat (due to combustion of fuel in the burner) as the air enters the working cylinder. Both compression and work take place in the same cylinder. The operation (and resultant card) is practically the same as that of a steam engine, but is accomplished without a boiler, condenser or other accessories used with a steam engine. The proposed engine is said to possess all the advantages of the steam engine without any of the latter's complications or disadvantages.

As applied to motor cars the proposed engine is said to possess the following among other advantages:

(1) It renders readily available for use cheap fuel such as kerosene and fuel oil.
(2) It is thermally efficient at all loads because of constant compression pressure, utilization of exhaust heat, etc.
(3) It has lower maximum pressures, higher M.E.P. and more constant torque than Otto cycle engines. It will therefore be freer from vibration and will be lighter itself than Otto cycle engines. For this and other reasons cited its use will result in lower car weight.
(4) It has a large overload capacity and therefore requires no changed speedgear.
(5) It may operate on a two-stroke cycle with all the advantages and none of the disadvantages of two-stroke Otto cycle engines.
(6) It requires no starter and is expected to be free from carburetion and carbonization difficulties.
(7) Its use will result in simpler car control since no change speed gear on spark advance mechanism will be required.
(8) It will be readily reversible.

Car Performance

By D. L. Gallup

THE author points out the diversity of opinion on what constitutes desirable car performance in the minds of engineers and of the public generally. He believes this is largely due to the great diversity of claims which have been made in advertising literature and decries the sort of tests which have been made the basis of this publicity, pointing out that a majority of them are conducted under such conditions as make it practically impossible for the car owner ever to duplicate or confirm them.

The kind of an expression or test which will inform the buying public most is one which will tell what the car will do in the hands of the average owner, and define the conditions under which a demonstration of this ability can be made, such conditions to be relatively simple and easy of fulfillment.

Only very broad tentative suggestions are made but it is hoped that concrete suggestions will be formulated as a result of the discussion.

High-Speed Engines

By A. P. Brush

THE author outlines in a general way the relation of car performance to modern engine development. He considers particularly weight reduction and torque performance of high-speed engines, giving the undesirable characteristics attending the increased torque range gained by higher speed.

He next discusses the relation of torque to total car weight, to acceleration and to hill-climbing ability and suggests a method of determining the value of a car in terms of its performance ability.

The author holds incorrect those systems in which the amount of lubrication is in proportion to speed only; and in which oil for crankshaft and crankpin bearings must cool as well as lubricate them. He shows a system designed to solve these oiling problems.

Static, running and distortion balance of a rotating mass are defined by the author, who shows how they apply to a large number of types of crankshafts. The paper not only deals with the counterbalancing problem as regards the crankshaft itself, but also with the centrifugal effects of the connecting rod and piston parts. In conclusion a discussion is given of what are correct counterbalancing masses for service conditions.

Some Factors of Safety in Automobile Design

By President Russell Huff

THE author has selected fourteen automobiles on which to make a study of the factors of safety used in their design. He considers specifically the front axles, front-wheel spindles, propeller shafts, clutch shafts, transmission drive shafts and rear-axle drive shafts. The method of calculating the stresses is outlined; compositions of the steels used are given; and complete data are presented showing the factors of safety of the various parts, together with the intermediate figures used in obtaining the factors.

Mechanical Transport Mobilization

By Arthur J. Slade

The paper opens with a number of quotations from publications issued by the Army War College and showing the bearing of motor transport on a proper military policy for the United States. The author then describes two experimental trips recently made by motor-truck owners near New York in an effort to determine proper motor-transport operating conditions. A statistical summary is given for these two experimental trips.

Differential Substitutes

By D. D. Ormsby

MR. ORMSBY considers the conventional type of differential in a somewhat different light than it is usually regarded. According to his view, the conventional differential, rather than being inefficient is, on the other hand, too efficient in that it differentiates for all differences, whereas the automobile engineer only wants it to take care of the unequal velocity of the rear wheels.

Substitutes for the conventional type of differential are considered under four classifications; namely, the free-wheel type, the crank and eccentric types, the spiral gear type, and the solid axle. Examples of each of these classifications are described and the advantages and disadvantages of some of the more practical ones discussed.

In connection with the free-wheel types, the author explains that while these eliminate the inherent defect of the standard differential by differentiating when the wheels have unequal traction, yet with unequal size of tires the free-wheel type will drive more on a large tire because the wheel with smaller tire will have to rotate faster to make up for the distance traveled by the wheel having the larger tire. It is explained further that in making a turn all the power is applied to the inner wheel.

Mr. Ormsby believes that the spiral gear type will be the ultimate solution of the present differential problem.

Considerable space is devoted to a discussion of the elimination of any form of differential whatever. Although such construction has advantages of eliminating the spinning of the wheels and assuring positive travel under all conditions, Mr. Ormsby believes the disadvantages too great to be overcome. There must always occur, when the car is making a turn, a slippage of either the inner or outer wheel, or both, and from experiments conducted with a standard type of touring car and a well-known runabout, the author of the paper has come to the conclusion that the difference in travel of inner and outer wheels in making a turn at a given angle depends on the gage and not upon the radius of the turn. Therefore, no matter how great the radius, the amount of slippage through a given angle is always the same; consequently, no matter how slight the diversion from a straight line, an extra load is always thrown upon the rear wheels, tires and axles where the solid axle construction is used. Another objectionable feature of the solid construction is the extra amount of power consumed in making short turns, on account of the necessity of slipping one or both wheels. Another condition which the solid axle does not take care of is unequal size of tires. In a motor truck one tire is usually worn more than the other. To make up for the greater distance traveled by the larger wheel, the smaller wheel must slide the difference, or the larger must slip part of the time to compensate for the less distance traveled by the smaller one. This would occasion excessive wear on the new tire until both were brought to a uniform size.

Mr. Ormsby mentions some interesting experiments conducted by street railway engineers in connection with using differentials for street cars, to eliminate the corrugation of rails and wheels, as well as to economize in power consumption. It was indicated that with a street car equipped with a differentiating mechanism about one-half the power consumed by a car equipped with solid axles would be saved.

The author believes that the ultimate differential will be one which compensates freely for the difference in speeds of the rear wheels when the car diverges from a straight course, and is so constructed that it will be impossible for either wheel to spin when the other has lost traction.

"The year 1915 stands out more than any other as the one in which considerable effort was made to correct the inherent faults of the conventional type of differential. These efforts have extended into the present year and have been attended with much interest on the part of automobile engineers as well as gear accessory manufacturers. The outcome of present experiments will be of interest to all.

"Before discussing the substitutes that have been designed to rectify the faults of the spur and bevel type differential, let us consider whether the standard types fail through inefficiency or because of too great efficiency. I believe the latter to be the fact. With these conventional gears we find that in making a turn the outer wheel, which travels the greater distance, accelerates and the inner wheel retards, this being the desired action. There is another difference which the standard differential takes care of; that is, a difference in load which is caused by unequal traction of the wheels, by allowing the wheel having the lesser load to revolve faster than the one having the greater load.

"From the above, one can see that the conventional differential rather than being inefficient is on the other hand too efficient in that it differentiates for all differences, whereas the automobile engineer wants it to take care only of the unequal velocities of the rear wheels. It becomes inefficient as a means of transmitting the power to the rear wheels if the wheels have unequal traction. It is to correct this defect of differentiating for unequal traction of the wheels that a great many intended substitutes for the present types of differential have been invented. I will describe a few of them briefly."

The Farm Tractor

By C. M. Eason

THE author shows the need this country has for farm tractors, due to the fact that, so far, less than one-half of the possible farm resources have been developed.

Reviewing the necessity for developing our tillable lands to take care of ourselves in time of war, it is pointed out that farm production is largely a matter of power. Aside from windmills used for pumping water, the available farm power equipment of the United States consists of about 25,000,000 horses and mules, 60,000 gas tractors, 100,000 steam tractors and 1,000,000 stationary gasoline engines. Large as this total is, however, it only allows 1 hp. for each thirty acres of farm land, which is not enough by perhaps one-half or one-third. Inasmuch as horses cannot meet the demand for increased farm power, the tractor must come right away. So far the supply of tractors has been entirely inadequate to meet the demand.

The writer specifies some of the problems which confront designers of farm tractors. To make the tractor immediately available for farm work, it must be adaptable to practically all of the existing types of horse-drawn implements, besides furnishing belt power for a wide variety of present power-driven farm machinery. In designing tractors it must be remembered that the horse is a very flexible unit, capable of a wide variation in power output. The tractor must compete with this. Designing a tractor to furnish power for the majority of farm conditions requires an intimate knowledge of crops, soils and farm management. These must be analyzed carefully so as to make the machine have as wide a range of usefulness as possible. Mr. Eason dwells on the power required for operations in connection with various crops, including what conditions must be met in the plowing and cultivation. There is a wide variation in this respect as between corn, wheat, oats and other crops. The power required for pulling plows varies from 250 to 1500 lb. per bottom, depending upon the condition and kind of soil, depth and type of plow. One objection to the tractor is that it must be made to follow the furrows by careful attention from the driver, whereas a horse follows the furrow instinctively.

The author reviews what the tractor must show in the way of economical operation, pointing out that for permanent success it must show higher returns on the investment than horses.

Valuable information is given in regard to the mechanical efficiency, engine efficiency, friction losses, rolling resistance and general design requirements. Other factors peculiar to farm tractor work, which must be taken into account, are treated. The tendency in tractor design is toward better material, greater refinement and higher efficiency.

Bronze Alloys for Automobile Construction

By W. M. Corse and G. F. Comstock

THE authors point out the need for more concrete data concerning the physical properties of bronze alloys and present an extensive chart covering the results of actual tests on a large range of cast bronze alloys. The influence of the method of making a test-specimen is discussed and it is hinted that new evidence concerning the proper interpreting of the true proportional limit is available.

A very extensive set of photo-micrographs illustrates the variety of structures existing in the ordinary and in some unusual bronze alloys.

Large Single Versus Dual Solid Tires for Rear Truck Wheels

By W. H. Allen

THIS paper is mainly an argument in favor of the use of large, single rear wheel truck tires instead of smaller dual tires. Although the practice of using large singles is comparatively new, the author gives the results of experience and research to show the advantages of the newer method of rear tire equipment.

In developing his arguments in favor of single tires, the author goes into the history of dual tire application to show why it was necessary to use two tires in the earlier days of truck operation. As the necessity for increased carrying-capacity grew, tire manufacturers found the then existing single tire equipment inadequate, and they set about to develop suitable equipment to meet the new condition, the result being dual practice. According to Mr. Allen, dual tires were supposed to have a carrying-capacity two and a half to three times that of a single tire of the size of which the combination was composed. The method of attaching the earlier dual tires is shown to have been poor, inasmuch as the cross bars tended to draw the rubber together in such a way that it was impossible to secure the same degree of friction over the entire base, owing to the outward spring which took place in the center of the cross bar, thus relieving compression under these bars. This reduced the stability of attachment, which resulted in circumferential creeping of the whole tire to a much greater extent as the width of the dual equipment increased. Inability to correct this weakness resulted in conclusion to the effect that tires of such method of attachment were not suitable when widths in excess of 4 or 5 in. were employed. The metal base type of tire was developed to overcome the difficulty.

Mr. Allen holds that dual tires are overrated, and believes that the practice of saying that dual equipment is capable of carrying loads double that of the single of which it is composed, is open for discussion.

Some reasons for advocating large singles in place of small dual equipment are:

1. The contact area of single tires exceeds that of the duals which they are proposed to replace. 2. The load per square inch distributed over the contact area is in every case reduced correspondingly with the increase in contact area. 3. Small dual equipment does not give satisfactory performance for the reason that neither single tire is sturdy enough to resist momentary imposition of the total wheel load, such as occurs, for example, when traveling over rough road surfaces, excessively crowned or furrowed roads. It is pointed out that in such cases one of the small tires carries during a large part of the time the entire wheel load, which is shifted back and forth from one small tire to the other; with large, single units the load is concentrated on a tire sufficiently sturdy to absorb reasonable load inequalities. 4. Saving in tire cost, ranging from 8 to 15 per cent. 5. Saving in wheel cost, because of narrower felloe and wheel rim. 6. Saving in cost of handling and applying one tire in place of two. 7. Saving in wheel, tire and rim weight. 8. Fitting of non-skid chains easier. 9. Better trackage with front wheels. 10. Greater height of rubber tread, providing better cushioning properties and increasing tire lift. 11. Less strain on axle and wheel bearings.

The large single tire has, however, its limitations and, pending the results of further investigation, it seems advisable to consider 7-in. tires as the limit of practical single equipment.

The Pneumatic Tire and Rim Situation

By J. E. Hale

MR. HALE follows up the development of the pneumatic tire since its invention by Dunlop in 1888, and shows why there are now several different types of tire construction in use. The main thought expressed is that the straight-side tire is the logical solution of the variety of requirements, in this country, South America and Europe.

Why should the car manufacturers continue to complicate their production processes by making some of their cars with millimeter clincher equipment and others with straight-side, when by proper co-operation between the tire and car makers, the straight-side tire can be introduced quietly into the foreign market, fully standardized? Mr. Hale discusses in detail the merits of the three types of tires; namely, the clincher, straight-side and quick detachable, confining his discussion to energy consumption, traction, total mileage, cost-per-tire-mile, cushioning effect, reliability, ease of applying and service. The results brought out show principally the advantages of the straight-side tire.

Statistics are offered to show the trend of the rim situation, and it is pointed out that it is just a question of time until the quick detachable clincher will cease to survive. It had a legitimate place during the development stage, but with the developed straight-side tires giving entire satisfaction, Mr. Hale holds that there is no excuse for continuing the quick detachable clincher type.

The American standard inch clincher rim contours, the British standard millimeter clincher rim contours, and the American wide standard inch straight-side rim contours will undoubtedly survive all others. However, outside of the rim contours, the rim situation is still in the process of evolution. In the struggle to minimize weight, expense, and tire troubles, the existing demountables may lose ground, particularly as the light-weight one-piece clincher and the two-piece straight-side rims, on either permanent or detachable wheels, apparently offer the next step in progress of this department of the automobile industry.

On the Dynamics of Vehicle Suspensions

By Dr. Benjamin Liebowitz

THE author believes the riding qualities of present motor vehicles are unsatisfactory and that this is due largely to a lack of appreciation on the part of automobile engineers of the fundamental dynamics of the problem. He undertakes to strip the problem down to the consideration of a simple system consisting of a wheel with its sprung weight carried on a simple type of spring and then to analyze the action which takes place when simple irregularities are encountered by the wheel.

Analysis of this problem results in several expressions, the interpreting of which reveals the influence which the varying of specific factors has upon the action of the spring and its suspended load. These expressions take into account the effect of the ratio between sprung and unsprung weight, of speed, of size and kind of irregularity encountered by the wheel, tire inflation, flexibility of the spring, and wheel diameter. Other factors which are considered as a result of interpreting the very interesting curves are the effect of friction in the suspension, and of synchronism. Statements of the betterment which can be looked for in riding and steering qualities as a result of varying different factors are made. The effect of shock absorbers is discussed.

Kerosene Versus Gasoline in Standard Automobile Engines

By Charles E. Lucke

THE author outlines the factors leading up to the present high cost of automobile fuel, states that the introduction of new distillation processes will not solve the problem, but that the development of kerosene-utilizing appliances will produce results satisfactory to everybody.

The paper proceeds to show why kerosene cannot be used on the present gasoline cars. The adaptation of the gasoline automobile engine to the use of heavier fuels than will vaporize without the use of heat is entirely a problem of heating and heaters.

The author reviews at length the principles embodied and the construction of the heated vaporizers or vaporizing heaters now used in stationary and traction kerosene engines and in alcohol engines, giving illustrations of a number of such devices.

After thus developing what in his opinion are desirable and good principles, the author describes a form of vaporizer embodying such principles, which he states has had successful trials (both block and road) in automobile service. A semi-automatic starting burner to accompany the vaporizer is also described, both as regards its construction and operation. In conclusion the hope is expressed that the principles outlined will result in the production and use of kerosene automobiles on a scale sufficiently large to affect the price of fuel within the next year.

Coarse Crystallization in Cold-Pressed and Cold-Drawn Steel Parts

By Ralph H. Sherry

FOR reasons of economy in production and in construction cold-worked low-carbon steel in such forms as cold-rolled or cold-drawn bar stock and cold pressings has assumed an important position in motor car construction. Expensive and heavy castings have been replaced by cheaper and lighter pressings and the use of cold-drawn or cold-rolled bar stock has permitted the use of greater speed in machining with a resulting increase in production. There has been, however, one factor which has made the use of such material seem of doubtful value from the standpoint of reliability. From time to time certain parts made from cold-worked low-carbon steel have been found to be exceedingly brittle, a condition usually accompanied by a coarsely crystalline fracture which in some cases resembled fractures found in steel known to be "burnt." Mysterious epidemics of brittleness appeared intermittently in material supposed to be in the best possible condition. The annealing usual in such cases not only did not cure the trouble but often seemed to aggravate it. Parts were often placed in service with a feeling of doubt as to their reliability. The cause of the trouble being unknown, breakage of such parts was ascribed to "crystallization in service."

The causes of this condition have gradually become known and methods of control have been clearly defined. In this article the author gives the results of an investigation of this phenomenon which was carried out with commercial materials such as cold-drawn wire, hot and cold-rolled sheet, strip steel, cold-drawn tube, and cold-pressings. The results of other investigations are briefly outlined.

Coarse crystallization, or grain growth, it is stated, is due to the action of a limited amount of strain, exceeding the elastic limit, followed by annealing within certain temperature ranges. The experimental work which led to this conclusion is stated in detail in the article. The effect of forging, cold-drawing, cold-rolling and cold-pressing was determined with commercial materials. Some study was made of the effect of carbon on grain growth and of the effect of coarse crystallization on the physical properties. No grain growth was noted in steels that were uniformly above 0.15 per cent in carbon content. The effect of coarse crystallization on the physical properties was marked. Not only was the resistance to shock seriously lowered, but there was also a marked drop in the elastic limit, maximum strength and elongation.

In the discussion of commercial materials special reference is made to those used in motor car construction. Methods are given by which coarsely crystalline material may be detected. Methods of control which are necessary for the elimination of coarse crystallization are given in detail for each commercial material investigated, together with a general summary of the essential factors. When it is considered that the ranges of temperature within which coarse crystallization is produced are those within which annealing usually takes place, the necessity for exact knowledge of the details becomes apparent. The materials which receive individual consideration here are sheet, strip steel, cold-drawn tube, cold-pressings and cold-drawn rivet stock. The occurrence of coarse crystallization in cold pressings, of particular interest to the automobile engineer, has received special attention.

The author's conclusions outline briefly the general conditions under which grain growth occurs as determined in his investigation. Accompanying the article are tables giving in detail the results of cold-rolling and cold-drawing, together with other experimental data. A considerable number of photo-micrographs are given which illustrate a number of the factors determined in the investigation.

Automobile Experiences in the Great War

By W. F. Bradley

THE author outlines the constructions that have shown up well under war conditions of operation, mentioning especially that four-cylinder engines carried under a hood were the most satisfactory. The internal combustion engine had found favor as compared with the gasoline-electric and steam-driven vehicles. The defects revealed by war service are given in considerable detail, the author finding that all of the trucks used had developed some weak point. Radiators and springs were given as a general source of trouble. The author believes more attention should be paid to the draining off of water from radiator, pump and jackets. The lubricating system for the engines should be of the pressure or circulating type so designed that the dirt will deposit away from the pumps. He outlines a number of operating troubles developed under the existing conditions of operation and gives examples of the way these have been remedied.

Considerable attention is paid to the methods of operating trucks away from made roads. The methods of fitting chains to the wheels and the use of carterpillar attachments are described. All-metal wheels are being used in place of the wood wheels. Considerable tire trouble has developed; one reason being the tendency for the cambered roads to force one of the dual tires to carry the greater portion of the load. Dimensions are given for bodies and a number of suggestions made as to their proper construction.

Although practically all the general transportation is done by rear-driven trucks the four-wheel-driven vehicle is used to a limited extent mainly for operation off the main roads or on no roads at all. A description is given of tractors developed for this service. These are used mainly to draw batteries and heavy artillery. The importance of the armored car has been exaggerated mainly because of the adoption of underground warfare. The author describes briefly the most suitable type of such a machine. One effect of the war has been to bring about the extensive use of trailers, the author stating that they are now being used behind all kinds of automobiles, both for the transportation of men working in the rear of the lines and for general haulage work around the depots.

In conclusion the paper considers the arguments found in the war zone in favor of standardization. The author holds that such a tendency should be opposed as regards the general features of automobile design. Certain features that can be adopted without handicapping the design should, however, he insisted upon. He gives specifically the size and style of bodies, sizes of wheels and tires, magneto bases and couplings, carbureter flanges, towing hooks, turning radius, clearances, driving chains, and threads for all bolts and nuts as subjects for standardization. He also mentions the necessity for uniform nomenclature inasmuch as a great deal of confusion has been created by the difference in the names of American trucks, not to mention the trouble caused by the variation in English and French terms.

Recent Aeroplane Engine Developments

By Neil MacCoull

THE author gives a brief review of developments during the past year in the construction of aeroplanes, particularly as affected by the European war. He takes as an example the Renault twelve-cylinder engine, citing the respects in which the present differs from previous models. Such factors as the changes in cooling systems, method of drive, valve construction and starting devices are considered.

The requirements of aeroplane engines, such as constant service, high speeds (of aeroplanes) and stream-line form of engines and radiators, are outlined. Propellor requirements are dealt with at length, curves being given by which the efficiency and diameter of the propeller can be obtained. In conclusion a number of different engine installations are illustrated and compared.

Refinement and Generalities in Truck Design

By H. D. Church

THE author describes a number of detailed developments that took place during the working out of a line of worm-driven trucks.

The details of front axle and steering parts are dealt with at length, the reasons for the final constructions being clearly explained and the constructions themselves well illustrated.

Details concerning difficulty with the Hotchkiss type of drive on heavy trucks, troubles with drive shafts and lubrication of the worm wheel are all covered thoroughly; spring shackle construction and lubrication, radiator and hood mounting come in for detailed attention, and the question of governors is interestingly covered.

Brief reference is made to the influence of unsprung weight, the differences between truck and pleasure car practice in this respect being pointed out.

Moreland Sprinklers Show Economy Over Horses

OVER a year ago the officials of Los Angeles, Cal., began investigations to determine the cheapest and most effective method of cleaning the streets. A motorized equipment was finally decided upon, and the city engineering department prepared plans for modern sprinklers and flushers, embodying numerous improvements over other systems and in keeping with the other motor equipment already installed in other departments. Later the contract for the sprinklers and flushers was let to the Moreland Motor Truck Co., Los Angeles.

The official tests show a large saving in the cost of operation over the cost of operating horse-drawn vehicles. One outfit of horse-drawn apparatus will sprinkle 5 miles of street in an 8-hr. day at a cost of $4.50; while one truck will sprinkle 38 miles in 8 hr. at a total cost of $14.71. These figures show that each truck will save the city approximately $20 every 8 hr. Furthermore, the trucks are so constructed as to eliminate all overlapping of the streams, with a consequent saving of 25 per cent of the water used in the old sprinklers.

In the night hours the trucks are used for flushing and here they show to even greater advantage when compared with horse-drawn equipment. One driver, team and harness cost the city $5 a night. The flushers are owned by the city, and the interest on the investment, depreciation and upkeep is figured at $1 a night. Taking into consideration the greater amount of territory covered by the motor flushers and the lower cost of operation, each truck will save the city $21 a night. When to this amount is added the $20 saved by each truck during the sprinkling hours, it appears that each truck so used will save the city $40 every day in the year.

British Standardize Automobile Steels

Following Example of American Industry—Ten Steels Agreed Upon by Automobile Engineers, Steel Makers and National Engineering Standards Committee

As was mentioned last week in THE AUTOMOBILE, the American lead in matters of standardization is being followed by Great Britain. In *The Automotor Journal* (British) for May 12, there is a good review of these standard steels from the engineer's viewpoint. The author is A. E. Berriman, chief engineer of the Daimler Motor Co., a man holding a high position in the British industry. His report follows:

The publication of the British Engineering Standards Committee's specifications for automobile steels inaugurates a new phase in the progress of this industry, and renders important assistance to its allied branch of aircraft manufacture.

Ten classes of steel have been labeled by these official specifications, and they cover the whole range of the more important kinds in common use.

There are four case-hardening steels and six steels that may be called, for distinction, stamping steels.

The E. S. C. specifications are wide, that is to say, they define classes rather than "brands."

This is as it should be. There is nothing to prevent users with particularly definite requirements from obtaining special casts of steel to guaranteed fine limits of chemical composition.

Steels of Average Requirements

The specifications themselves were drawn up by a committee of the Institution of Automobile Engineers, comprising steel makers, stampers and automobile manufacturers. The steels specified, therefore, may be taken as representative of average requirements.

The formation of the committee in question was the direct outcome of a paper read by L. H. Pomeroy, technical director of Vauxhall Motors, Ltd., before the I. A. E. during the early part of the war.

It must be remembered that all the steel used in motor cars is "special" from the standpoint of ordinary engineering construction. These specifications are, therefore, a first attempt to define the more commonplace materials of a particular group.

So far from handicapping development, this standardization of what is merely ordinary should promote intelligent interest in what is really new. Undoubtedly, much confusion of mind hitherto has prevailed among steel users about matters well known by steel makers to be insignificant.

To Test Physical Properties

The standardization of these steels has prepared the way for an important line of research that has been undertaken by the joint research committee of the Society of Motor Manufacturers and the Institution of Automobile Engineers. The funds for this research have been contributed partly by the Government, partly by the S. M. M. T., and partly by individual firms in the automobile industry. The object of the research is to test the physical properties of the standard steels over the range of chemical composition tolerated by the specifications and over the range of heat treatments appropriate to the class of material.

When this information is published, the full value of the specifications themselves will be realized, and the automobile industry will have acquired a collection of data that has long been wanting as the basis of scientific design.

Under the ordinary conditions of commercial production, it is essential that the engineering department's specification should give sufficient latitude for the proper exercise of the functions of the purchasing department. This co-ordination is much facilitated by the E. S. C. standards, for it is now possible for the engineering department to place a thoroughly definite specification on the drawing without limiting the source of supply.

E.S.C. STANDARD STEELS (*Tons are long tons = 2240 lb.*)

	Case Hardening Steels

Reduction	•50%	•50%	•55%	•55%	•50%	•45%	•50%	•50%	•50%	•13%
Brinell (approx.)	92/112	103/143	103/153	103/179	105/149	121/179	140/202	179	179	418

• = Not less than. † = Not more than.

Colors in Which Steels Should be Painted Before Delivery

Case Hardening Steels									
"10" Carbon	"15" Carbon	2% Nickel	5% Nickel	"20" Carbon	"35" Carbon	3% Nickel	1½% Nickel Chrome	3% Nickel Chrome	NC Air Hard
Yellow	Yellow and Dark Brown	Yellow and Red	Yellow and Violet	Light Brown	Dark Brown	Red	Light Blue	Violet	Green

Such a specification might read, for example, 3 per cent nickel chrome steel to fulfill R. A. F. test No. 32a. This insures the supply of an appropriate class of material for the work, and its use in a suitable heat-treated condition; at the same time, it enables the entire steel industry to compete for the business on even terms.

Building Up Reputations

It is, however, necessary to remember that much of what constitutes "quality" in steel appertains to detail of manufacture that cannot be recorded in the chemical composition, and is not necessarily apparent in the physical tests. Reputation, both for good material and for good service, is, therefore, likely to be much more securely founded in the full light of the standard specifications than ever it was before under the vague glamour of a "brand."

In the long run, it will be worth more to the steel maker to supply the best steel of a universally used class, than a very good steel of an isolated kind.

The specification of high quality was not really faced by the committee responsible for drawing up the E. S. C. standard steels, and there is no doubt that useful work remains to be done in this direction by any representative group of steel makers willing to concentrate upon the subject. The absence of a quality clause in the E. S. C. specifications is no detriment to their fundamental purpose, for it must be remembered that quality is a question of degree and therefore of price. It is undesirable in engineering to employ steel that is unnecessarily costly for its purpose, and it would be a mistake for the standard steels arbitrarily to define only the highest quality, and, therefore, the most expensive class of material. It is, however, important that engineers should be able effectively to specify the highest quality when they require it. On this aspect of the subject authoritative information is at present lacking. To say, for example, that a steel must be crucible cast, is perhaps to take a very arbitrary action in respect to the capabilities of the electric furnace, which may be able to produce the highest quality steel more economically. Similarly, there are points in connection with the casting of the ingot and its subsequent preparation into the billets and bars of commerce on which the steel making industry might well prepare some authoritative information that would serve as a most useful supplement to the existing E. S. C. standard specifications.

The accompanying table summarizes the E. S. C. standard steels, and gives additional information relating to the testing of steel.

Check Tests for Stock

Check tests for steel that is bought for stock purposes are included in the E. S. C. specifications. Most of them are specified for annealed test bars in order to facilitate uniformity of the conditions under which the steel is checked.

Steel that is bought for a particular purpose as defined by a special test must necessarily be the subject of special arrangements as between the purchaser and the supplier.

In principle, the responsibility for producing the results should coincide with the source of the specification; and the appropriate source for the specification is the firm undertaking the heat treatment.

Maker Is Responsible

In short, if the steel maker supplies heat-treated steel, he should be wholly responsible. If the stamper heat treats the steel, he should be responsible for the specification and for the results, the steel maker being merely responsible for the standard check test. If the engineer manufacturer heat treats his own steel, he should specify it and be responsible for getting the results, and also for getting good stampings that do not spoil the steel.

In any event, if the purchaser discloses the results he requires, a responsibility naturally rests with the steel maker to demur if he considers the steel specified to be unsuitable for the purpose.

When the research on the physical properties of these steels is published, the appropriateness of any particular physical test will rest on a firmer foundation than it does at present.

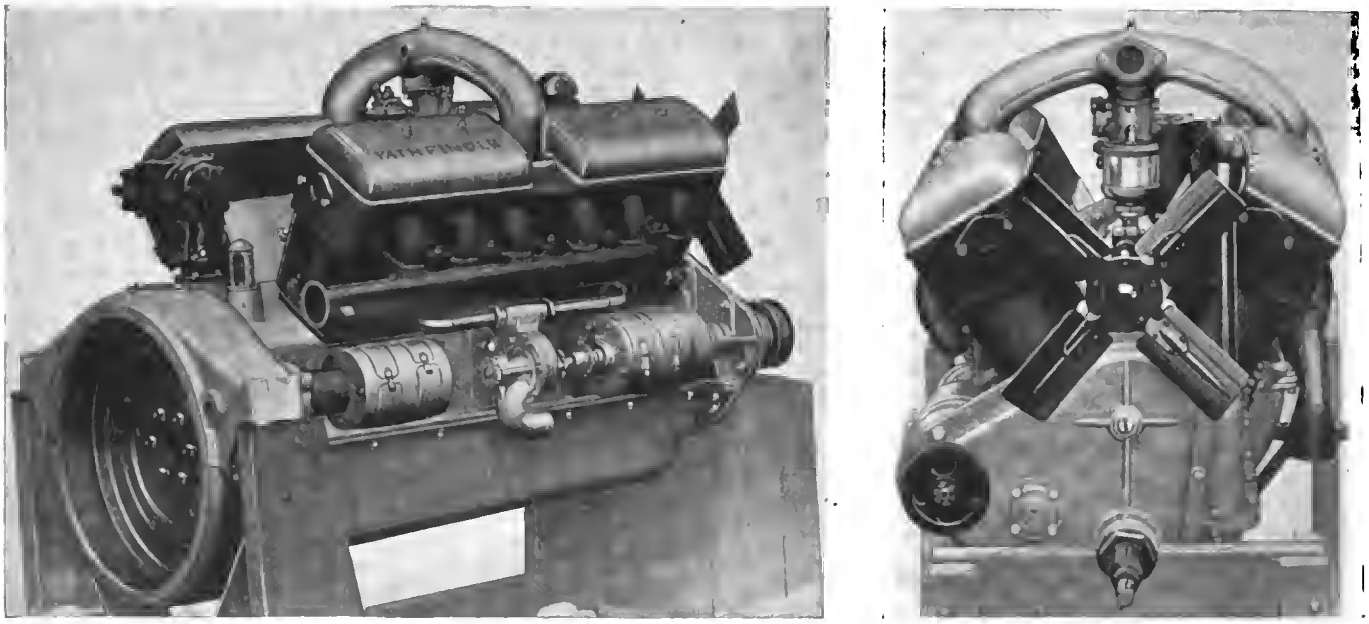
In the meantime, it is only possible in a general way to use a hypothetical series of tests based on the characteristic variations of the physical qualities of steels.

A Scheme of Coloring

The E. S. C. standards specify a scheme of coloring to facilitate the visual identity of steel. It is to be hoped that uniformity in this direction will come into vogue. Most firms have some system of coloring, and as none can be perfect, all might as well conform to the E. S. C. standards, so that the steel could be painted at the source.

Trucks Expedite Delivery of S. K. F. Bearings

THE accompanying illustration shows how the S.K.F. Ball Bearing Co. rushed a shipment of 40 tons of bearings from the parent factory in Sweden to the new plant at Hartford, Conn., before which the train of Mack trucks and their trailers are lined up. The bearings were needed to fill rush orders from manufacturers of automobiles, machine tools, textile machinery, etc., and, due to war conditions, hold-ups in the customs and other delays, the company chartered the trucks and trailers, thus saving many precious hours in the delivery of the three hundred cases of bearings at the Hartford factory, whence they were shipped to customers. The new plant will commence making S.K.F. bearings next month, the machinery being practically all installed.



Twelve-cylinder Weidely engine used in the 1917 Pathfinder chassis. Side-by-side connecting-rod bearings are used

1917 Pathfinders All Twelves

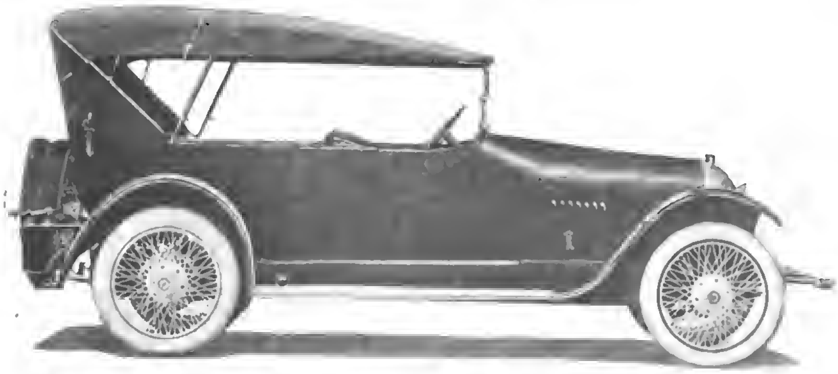
Six-Cylinder Model Discontinued—Weidely 2⅞ by 5 In. Motor with Overhead Valves Employed

PATHFINDER cars for the 1917 season will have twelve-cylinder engines exclusively. The entire chassis has been redesigned to take the new power plant and this model, which is put out in two body forms, touring and cloverleaf, now makes up the entire line of the company.

Probably the most distinctive feature of the car is the power plant which is the Weidely 2⅞ by 5 in. twelve-cylinder unit. This is also manufactured in Indianapolis, not a very great distance from the Pathfinder factory.

The cylinders are cast in blocks of three with the head castings, containing the intake manifolds, water outlets and valve seats, in blocks of six. With this arrangement the stiffness of the block casting is secured and at the same time the cylinder castings themselves are simpler. The right set of cylinders is pushed 1¼ in. forward of the left to provide for side-by-side connecting-rod bearings on the crankshaft.

Cast-iron pistons are used, and they are fitted with patent high-compression rings. There is an oil ring at the bottom and a V-groove cut all around the piston, which is drilled for oil passage. The connecting-rods are elliptical in section. They are drop forged and have the weight reduced to the lowest practical minimum consistent with ample strength.



Pathfinder seven-passenger La Salle touring car which sells for $2,750. Like the Cloverleaf, it is mounted on a 130-in. chassis

A 2⅛-in. crankshaft is used, carried on three main bearings and provided with the curved-cheek counterbalancing system, the oil leads for the pressure system being carried in tubes across the curved cheeks.

A feature of the valve action is in the exceptionally wide faced helical gears. These are so arranged that there is a constant drag on the gears, even at idling speeds, thus preventing them from rattling when not under load. The entire valve drive is taken off a single camshaft which is provided with twenty-four cams. These are integral with the shaft, which is a hardened and ground drop forging. The camshaft is placed directly above the crankshaft. The cams act directly upon mushroom followers, the tappets passing through long guides, the pushrods extending upward behind the cover plates to the rocker arms.

The valve diameter is 1½ in. in the clear. The springs are large in diameter and the rocker arms bear directly on caps on the end of the valve stems. The entire valve mechanism is inclosed by aluminum cover plates which extend over the tops of the cylinders, covering the rocker arm mechanism and also inclosing the push rods at the sides. In working out the oiling system the lower half of the crankcase forms the oil pan in the usual way. This pan is covered with a strainer so that all droppings from the motor are screened before they enter the space below which contains, at its lowest point, the oil pump.

There are four leads from the oil pump. Three of these go to the main bearings, whence the oil enters the drilled crankshaft and is led to the connecting-rod bearings by means of the tubes across the curved cheeks of the crankshaft, as described. The fourth lead carries the oil to the camshaft, and takes care of the bearings for this shaft as well as the tappets. The overflow from the fourth lead also supplies the timing gears with a copious supply of lubricant. Special provision is made for maintaining a supply of oil at the rocker arms so that only infrequent oiling is necessary.

A neat arrangement of the water circulation has been provided, in spite of the natural difficulties presented by the separate castings for valve head and cylinders, and also by the overhead valve action. The water pump is mounted on the generator shaft which is driven off the fourth gear of the timing set. The pump is about the center of the motor on the right side. The water intake is at the lower end of the pump and it is led out through a divided manifold at the top. The water enters the lower part of the cylinder blocks on the right side and is fed directly to the waterjacket of right block.

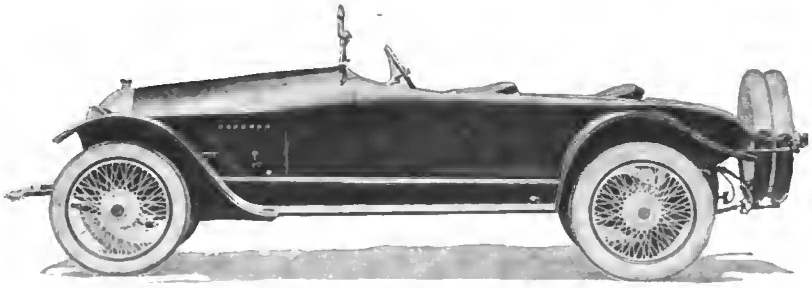
The water for the left block passes through a lead tunnelled through the crankcase and formed by a core in this casting. The aluminum integral tube is lined by a steel tube which is driven through, forming a passage for the water. A Fedders radiator is used, cased with German silver. It is supported on an individual cross member which is detachable and so arranged that the supporting members do not put any strain on the radiator itself. It is maintained in an upright position by stay rods. The edges of the radiator are rounded off in a distinctive style and conform to the shape of the Pathfinder hood. The water capacity is close to 12 gal., the big capacity being obtained by the V-shape and the 4-in. cores.

Manifolds Are Combined

In arranging the manifold work on the car the water outlet from the cylinders and the intake pipe have been merged together. This produces the two-fold effect of the water-jacketed intake and a unit casting which carries both the water and the intake gases. The intake is semi-elliptic in shape, with the carbureter beneath and the flange for the radiator connection in front. This is a ground surface to allow for a tight gasket.

Balanced Gas Flow

Carburetion is provided by a specially arranged Stromberg instrument of the H-type, slung in the center between the two cylinder blocks. The effect is perfectly symmetrical and should give exact balance of the gas flow. The exhaust is led to the outside of the head casting and the manifold is swept low to keep the heat away from the occupants of the car. Separate exhaust headers are provided for each cylinder block, leading to separate mufflers so that the back pressure due to exhaust in one cylinder cannot affect the exhaust of another.



Pathfinder Cloverleaf roadster for 1917 which lists at $2,900. Wire wheels and 35 by 5 tires are standard equipment

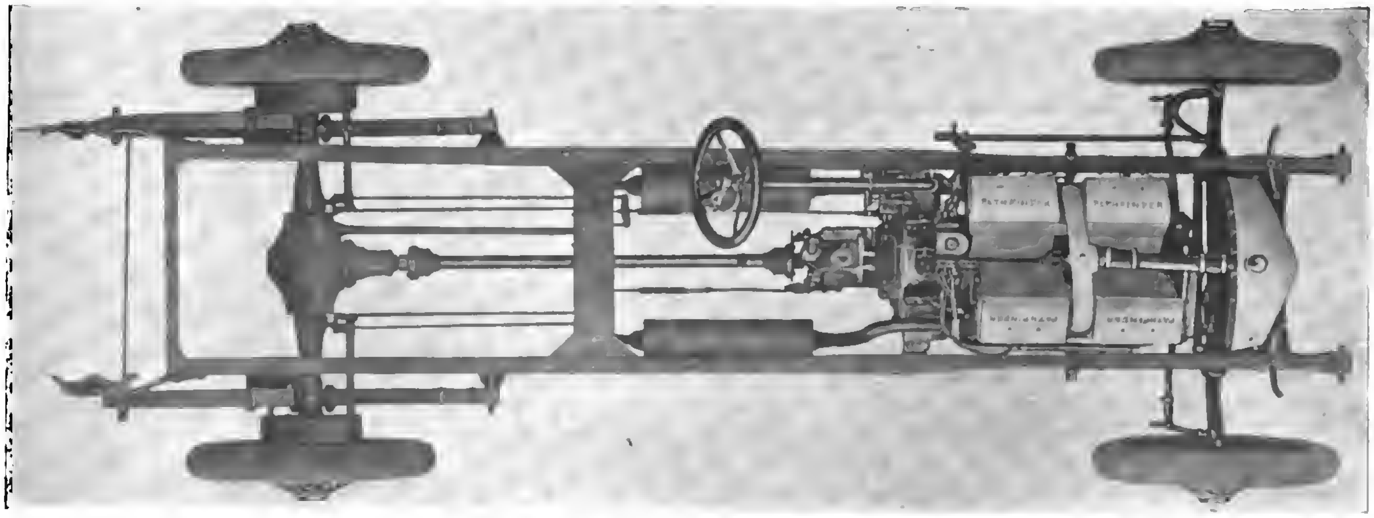
Gasoline feed is provided by the Stewart vacuum system. The tank is suspended on the rear of the car and has a capacity of 21 gal. The manufacturers claim that mileages with this car 14 to the gallon are not exceptional. A detail of interest is that in case of flooding of the carbureter the space between the cylinder blocks is arranged as a drain and carries away the gasoline instead of allowing it to accumulate there as a possible cause of fire.

Electrically the car is entirely Delco, the three-unit system for starting, lighting and ignition being used. Initial current is supplied by a 160-amp.-hr. storage battery floating on the line. This is supported on the right frame side member. The timer-distributer is mounted on the top of the rear end of the crankcase and is driven by a vertical shaft which carries at its lower extremity the oil pump. The drive is taken from the camshaft. There is a centrifugal governor in the base of the timer housing which regulates the spark under normal running conditions. In addition there is a hand advance for setting the spark manually if so desired.

Delco Starting System

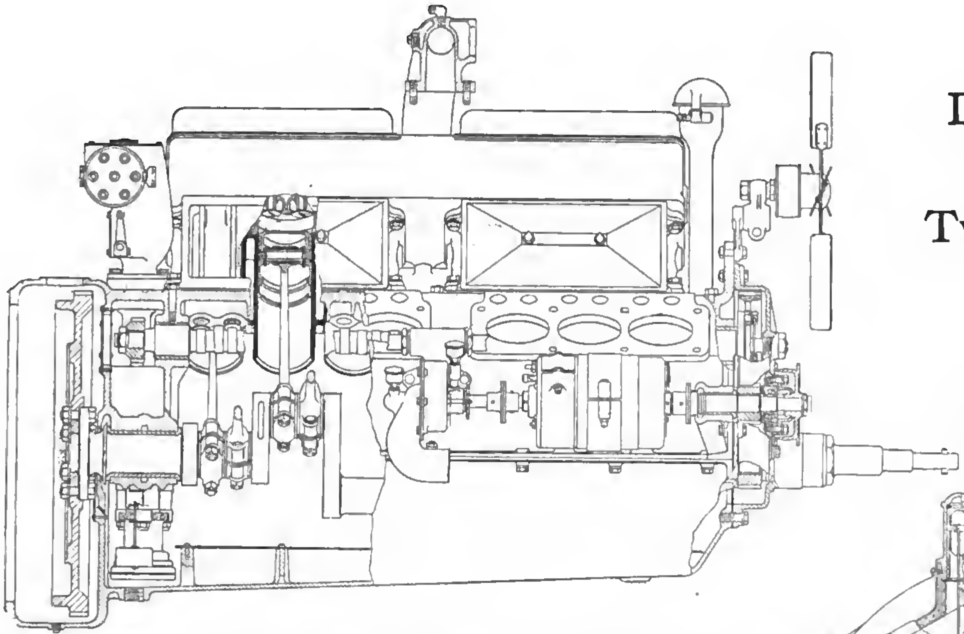
Starting is by the independent series-wound Delco unit so wired that the motor is cranked by pressing a button. A feature of the starting motor is the detachable commutator housing. The capacity of the battery on this car is said by the manufacturers to be such that it is capable under normal conditions of furnishing sufficient current to crank the engine steadily for 25 min. There are only two wires from the starting motor to the battery, the switch being in the line.

Like the remainder of the electrical equipment, the lighting system operates at 6 volts. A feature of this unit, which is also of Delco manufacture, is the ease of reaching the brush assembly by removing the detachable cover plates. This permits of ready inspection of the brushes and also allows the ordinary owner to keep this part of the generator clean with-

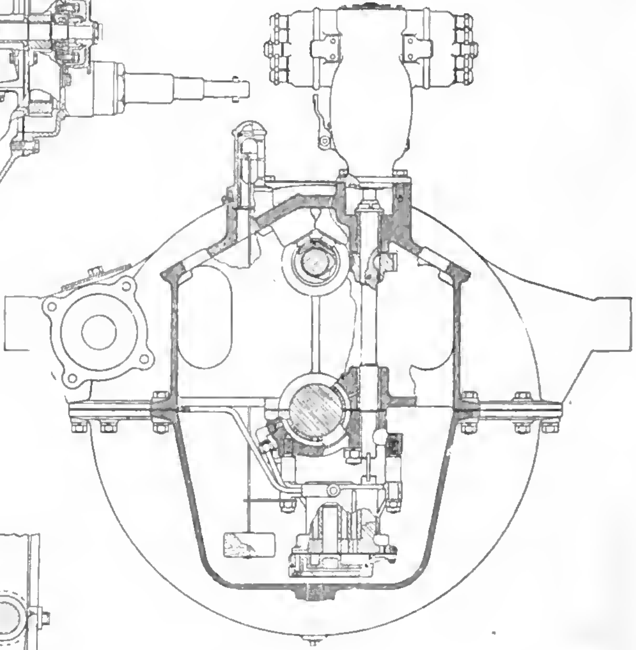


Pathfinder 1917 chassis showing mounting of the twelve-cylinder Weidely unit power plant. This chassis has 130-in. wheelbase and either touring car or roadster body is fitted

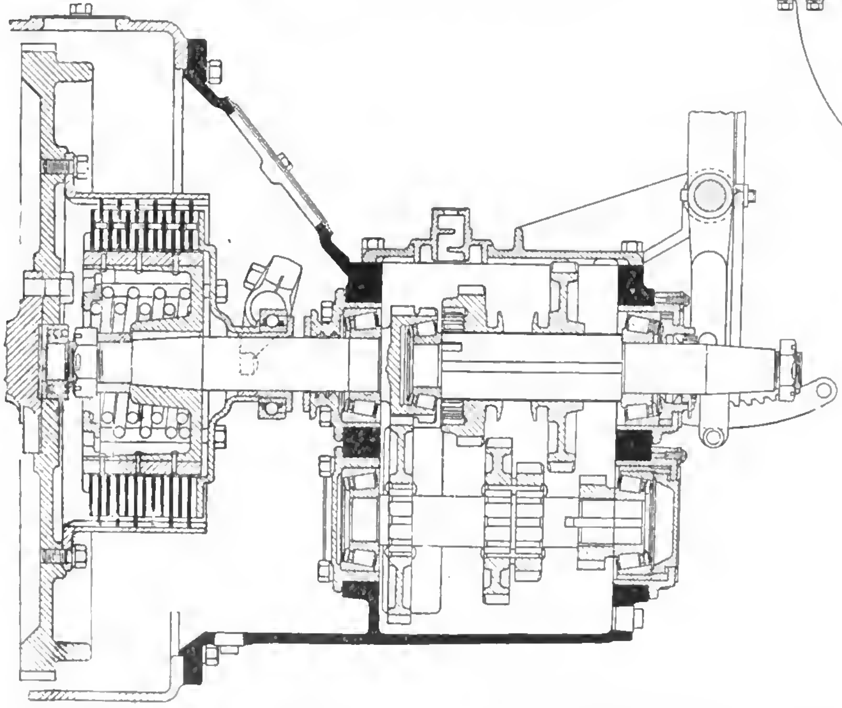
Details of the Pathfinder Twelve Chassis



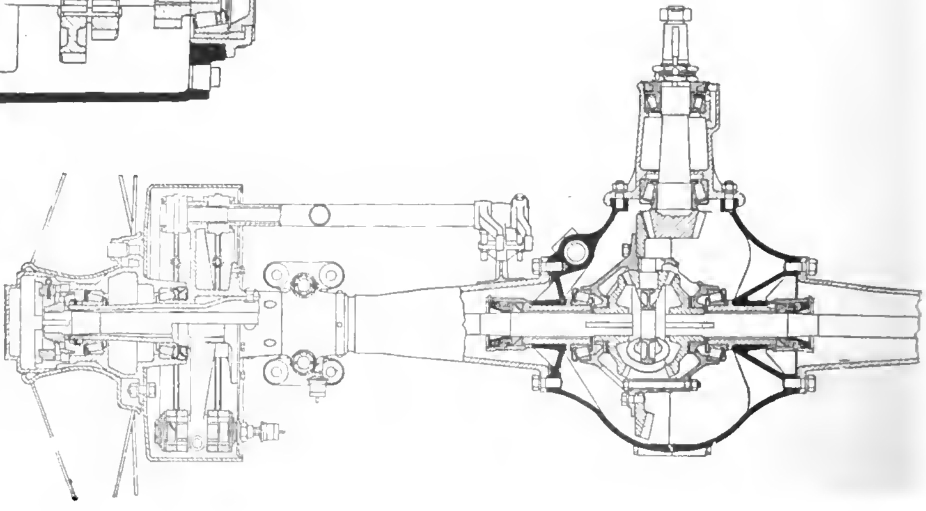
This drawing of the Weidely-Pathfinder twelve-cylinder engine gives a good idea of the internal simplicity and the accessible layout of the engine accessories. There is a cored hole passing right across the crankcase, behind the pump which takes water to the further cylinder block; it is lined with a steel tube to prevent leakage



End section of Weidely engine showing the oil pump and the float for indicating oil level. The distributer and the tappet gear are also shown above. Notice the way in which the oil pump driving shaft is connected to the distributer shaft



Above—Multiple-disk clutch and three-speed transmission used on Pathfinder chassis. Notice the breather on the gearbox cover to allow escape of air and so prevent the expulsion of lubricant through the bearings



Right—The American Ball Bearing Co. axle used by Pathfinder. This is a rugged type with double expanding brakes and uses Bock taper **roller bearings** out having to wait until serious trouble makes a trip to the service station necessary.

Complete Lighting Equipment

The headlights have two sets of bulbs, for country and city driving. There is a rear tonneau light controlled by a convenient switch and also a cigar lighter which is countersunk in the back of the front seats and which is accessible to those in both the front and rear. The headlights are mounted on extra rigid brackets and all the wiring is inclosed in flexible conduits.

Asbestos and steel are used in the dry plate clutch. There are six asbestos faced disks which form the driving member. These act against hardened and ground steel plates which form the driven member. There is one stiff coil spring holding the clutch in engagement. No lubrication is used on the clutch.

Unit Power Plant

A unit power plant is formed by the gearbox, clutch and motor. The bell housing is an S. A. E. type and the plant is supported at three points with a trunnion carrier in front. Timken bearings are used throughout the entire transmission. The gears are held in mesh at any speed by a gear interlock which locks the sector not in use.

The drive is taken to the rear axle through a universal joint and propeller shaft. The rear axle is a floating American type, with 1¼-in. axle shafts of chrome-nickel steel. The central housing is a malleable casting and the external ends of the housing are made up of 3½ per cent nickel steel tubing. The driving gears are spiral bevel and made from nickel steel carried on Bock taper roller bearings.

Rear Springs Underslung

Vanadium steel springs are employed with three-quarter elliptics in the rear. The front springs are 39 in. long and 2¼ in. wide. The rear are the same width and 54 in. long. Bronze bushings are used. The drive is taken through the front ends of the springs, which are shackled only at the rear. The springs are swung under the rear axle, giving the car a low appearance.

Convenient Seating Arrangements

Both body models, the La Salle seven-passenger and the cloverleaf roadster, are mounted on the same 130-in. wheelbase chassis. The front seats on the touring car are divided and the auxiliary seats fold into the backs of the front seats. Touring cars are furnished as standard in blue black, wine and dark green, with white wire wheels. Cloverleaf roadsters are furnished in red, yellow, battleship gray and blue black with red wheels. The wheels are Houk wire and the prices are $2,750 for the touring car and $2,900 for the cloverleaf. The tire size is 35 by 5 and equipment is complete in every particular.

High Spots in S. A. E. History

(*Continued from page* 1011)

sions thereon, except in the matter of their official publication under the Society's imprint as its Transactions. The policy of the Society shall be to give the professional and scientific papers read before it the widest circulation possible, with a view of making the work of the Society known, encouraging engineering progress and extending the professional reputation of its members."

Wide Scope of the Work

It is clear that the Society has performed and is performing an important public duty. It is deserving of very widespread support. Its work is of interest not merely to the technician but to the layman who demands efficiency, safety and comfort, but who has little idea how largely these desired qualities are the fruit of vast research and labor.

Theoretical Side Not Neglected

It is entirely logical that the S. A. E. should have become a real power to which can be referred numberless engineering questions which can be settled definitely only by the official action of some organized non-partisan body. Meanwhile the theoretical work has gone on, and more and better papers have been presented and discussed at its successive semi-annual national meetings.

Its Distinguished Membership

In the words of a veteran critic, "A glance over its membership list confirms the belief that the best inventive and mechanical brains in the country, both in and outside of the automobile industry, are associated in the Society of Automobile Engineers. These men have given their time and service unsparingly and it would be difficult to gage the value of the work they have done. Many of them are at the head of vast industries. It would be almost impossible to put a monetary value on their time which has been given so freely to committee work of the Society."

What the development of the next decade or of the next generation will be, none probably can conceive, but it is clear that the essential necessity of co-operative work will be more and more appreciated. No one can reach his attainable development intellectually or professionally without sharpening his wits through much contact with men in and out of his own station of life. The wise men say that those who give shall receive, and it is indicated strongly that those who do not give to others in some material degree the benefit of their practical and scientific experience, never receive as much as they could and should otherwise; and they can never be assured of being right in deductions as to data which they endeavor tenaciously to hold exclusive to themselves.

Building for the Future

The members of the S. A. E. and the automobile industry and the public in general may well be grateful to the founders of the Society from small beginnings, and to the splendid men who from time to time in recent years have served most effectively and gratuitously in devotion to an idea—the conception of what a properly organized association of talented engineers can and should do toward facilitating the evolution of mechanical transportation in the most efficient manner, toward assisting the younger men in the profession (with whom the future of the industry rests) in a spirit of true altruism, and toward the establishment of the best principles of ethics throughout the fabric of automobile design, production and maintenance.

Society's Services Summarized

The Society of Automobile Engineers has been aggressive, and produced indisputable evidence in many concrete instances, of valuable service rendered which no other body has rendered or perhaps could render. It has brought order out of chaos in the marshalling of group after group of innumerable details of motor car fabrication. Through logical forcefulness of facts, the merit of its standardizing and scientific work is clear to the man who runs.

The FORVM

A SYMPOSIUM ON THE POSSIBILITIES, ADVANTAGES AND DISADVANTAGES OF TWO-STROKE TYPE OF MOTOR—THE IDEAL OBJECTS OF A DIFFERENTIAL—OTHER VIEWS ON SUBJECT

Thinks Time Element Prohibits Two-Stroke

By Finley Robertson Porter
President, Finley Robertson Porter Co., Inc.

IN reference to the return of the two-stroke engine, I can hardly believe that this will ever amount to anything. My impression is that the future motor will be rated by a cubic inch displacement per minute, or firing strokes per minute. In view of the high piston speeds now possible with apparent safety, the greatest factor to be dealt with seems to be the time sufficient to get the gases in and out without a corresponding lowering of the brake mean effective as the result of back pressure. If one would be satisfied with a comparatively low brake M.E.P., piston speeds could be increased without any detrimental results.

In view of this situation I cannot understand a two-stroke engine as being at all possible, because of the fact that the one controlling factor as mentioned above is divided by two, as compared to motor revolutions, and the intake and exhaust periods in relation to one cycle are likewise divided. The answer seems to be a very low power ability and likewise a high heat flow to both the cooling medium and exhaust.

Personally I have never heard of the two-stroke engine even approaching efficiency, so that, unless some decided improvement is brought about, I do not anticipate any great increase in the use of the two-stroke engine.

Two-Stroke Problem Grows Harder

By A. F. Milbrath
Secretary and Engineer, Wisconsin Motor Mfg. Co.

CONCERNING two-stroke engines, the writer does not believe these will come in to any extent in the near future, as it is difficult to get the certain operation out of the two-cycle which the four-cycle will give. One of the main causes of this is the fact that it is impossible to hold the crankcase compression in these engines for any length of time. As soon as the bearings wear slightly, the gases will leak through the bearings and will thus cause weak explosions in the cylinders affected. In order to get good economy, compressions have been going up the last year, and with the higher compressions, it would be more difficult to prevent leakage than with the lower pressure.

Good Two-Stroke Probably Complicated

By F. E. Watts
Chief Engineer, Hupp Motor Car Corp.

I HAVE been rather out of touch with the developments of the two-stroke engine for several years past. I believe, however, that the common form of two-stroke engine using crankcase compression has only the very apparent advantage of simplicity to recommend it for pleasure car work. Its more prominent faults are that it is not possible to fill the cylinders as completely with a fresh charge as in the standard type of four-stroke engine; and, as it is practically a constant compression engine, the charge drawn in is mixed with a large amount of burned gas left from the preceding explosion. This, together with a considerable portion of the fresh charge which passes into exhaust, in most designs, results in very poor fuel economy, and in comparatively slow working speed as compared with recent four-cycle practice.

These same faults are found to a greater or less extent in ordinary modifications of the crankcase compression type, such as the two-diameter piston engines. These modifications, moreover, are even more difficult to get into good running balance than are the ordinary crankcase compression types, which are noticeably more difficult to balance than the standard four-cycle type.

Apparently, the only way to get efficiency in the two-stroke engine is to forget the maximum cheapness. Successful engines can be built by using separate pumps and pre-compressing the charge. Fuel injection with high compression is probably a possibility for commercial cars and for gas-electric cars.

It is, however, very likely that none of these engines may prove attractive enough to be manufactured in quantity, for it is by no means certain that when a two-stroke engine is produced having the flexibility and fuel efficiency of a modern four-stroke engine, that it will be simpler, lighter or cheaper to build than the latter.

The recent book of D. A. M. Low, published by the Temple Press Limited, London, England, covers the development and the possibilities of the small two-stroke engine in a very enlightening and interesting manner.

Thinks Subject Worth More Study

By C. W. McKinley
Engineer, Willys-Overland Co.

THE ordinary type of three-port, two-stroke motor has several points to recommend it on first glance. These are simplicity, due to lack of moving parts, and power due to the two impulses to the four-stroke motor one.

These apparent advantages, however, are more than balanced by operating conditions. For instance, up to the present time no two-stroke motor has been produced successfully that will equal the performance of the four-stroke motor as regards flexibility. While I believe it possible to accomplish this result, it would be by the action of valves and ports in addition to the simple three-port type. These additions, however, would offset the original advantage of the three-port, two-stroke motor.

Secondly, as regards power. The apparent gain is in the best instances about 40 per cent. The consumption of fuel rises to a great degree and the amount of fuel required to produce the same power with the two-stroke as with a four-stroke, would be 30 to 60 per cent greater than with a four-stroke. I believe, however, that if a thorough attempt was made to improve the two-stroke motor it would be well worth while.

Perfecting Two-Stroke Spoils Simplicity

By E. G. Gunn

Chief Engineer, Premier Motor Corp.

I HAVE followed the recent development in two-stroke engines, and while although the underlying principle is simpler in the case of the two-stroke engine, it does not appear to me that the game is worth the candle; in other words, by the time the various devices are put on to make the two-stroke motor operate in a satisfactory manner, a great deal of the attractiveness is lost.

Efficiency Demands Air Pump

By E. Gruenwald

Chief Engineer, Moline Automobile Co.

THE efforts which are being made to bring the two-stroke engine for motor vehicles back to life again, is a task which in my opinion, does not promise ultimate success.

I personally feel that efficient engines of the two-stroke type are only possible if the gases are controlled in the same manner as in the large stationary two-stroke engines, necessitating considerable complication and weight for the automobile engine, while the two-stroke engine without the auxiliary air pump is not efficient enough to compete with the high-grade four-cycle engine of to-day.

I am very much interested to learn of the views of other engineers on the same subject.

Limit of Engine Power Is Heat Developed

By W. R. Strickland

Chief Engineer, Peerless Motor Car Co.

IN regard to agitation in favor of two-stroke engines, I am of the opinion that two-strokes and two-cycles are in somewhat similar relative position, that is, they both tend to over-heated conditions for the development of the extra power which can be more simply and easily obtained by an enlargement of bore or stroke of the present simple design.

The piston design, especially, necessary for two-stroke motors would seem to be impossible from the present standpoint, as you are familiar with the space utilized on the top of our present pistons where increased clearances are necessary to prevent seizing before we reach the point sufficiently cool for natural clearances to be used.

The skirtings even now, where the natural clearances are used, are none too long to carry away the heat from the combustion end and, where two stroke pistons are designed, they have generally resorted to water circulation in order to reduce the size of the piston. I should say that the complications are more than four-fold without attendant compensation.

Two-Stroke Needs Good Gasoline

By F. N. Nutt

Chief Engineer, Haynes Automobile Co.

PERSONALLY, I never did have any love for, or patience with, the two-stroke motor and my experience with it was at a time when gasoline analysis was much different and better than at the present time. I am afraid that the present low-test gasoline will cause considerable trouble with the two-stroke motor.

The Ideal Objects of a Differential

By Lewis H. Scurlock

President M. & S. Gear Co.

BEFORE commencing a discussion of this subject, let it be said that the application of the power to the motor through the wheels to the ground, up to the present time has been largely a matter of theory and guesswork as no one has as yet been reported who could show the actual measurements of the horsepower delivered to the individual driving wheels of a motor under actual road traveling conditions.

The only real facts which we may feel safe in believing are those which stand out most plainly and apparent as obviously true, such, for instance, as where one wheel is permitted to spin in a mud hole or on a slippery pavement.

Until such time as actual measured tests are made to determine the amount of power delivered to each of the rear wheels of an automobile on the road the question of power distribution to the rear wheels will remain somewhat in doubt as to the actual figures.

Let us see what we would require of an ideal differential.

First, a positive pull on both driving wheels when car is traveling in a direct line ahead.

Second, the power equalized on both driving wheels when the car is turning, proportionately to the resistance offered to each of the wheels.

This would give us the following results:

First, a positive drive on both rear wheels.

Second, power equalized on both rear wheels when car is turning, according to the resistance offered to the driving wheels.

Third, increased efficiency of the motor of the car by virtue of the application of all its power which is capable of being absorbed by the resistance of the traction.

Fourth, less wear on the rear set of tires, it being impossible for one wheel to skid or spin in mud holes or sand.

Fifth, the elimination of much of the skidding on wet streets and doing away with the side sway of the car.

It would seem that other minor advantages would come from an ideal differential which would accomplish all of the above results.

Bevel Gear Differential Inefficient

Let us refer to the defects of the bevel and spur type of differential, both of which have been in common use, and we find from a mechanical standpoint that these differentials are both as good as could be desired, but find them weak from a functional use.

First, the bevel gear differential will permit the spinning of one wheel if it encounters less resistance than the other wheel and will lose the power of the motor through the spinning wheel.

Second, it permits unequal differential action when the resistance to either of the driving wheels is materially different.

From these defects it may be observed that the ordinary type of differential can cause a lot of trouble such as getting stuck in mud holes, wearing out of your tires, skidding of wheels which causes car skidding and dangerous accidents, unnecessary use of gasoline, and all of the evil effects which go with the spinning of one wheel and the standing still of the other when unequal traction is encountered. Thus it would seem that had the present type of differential been deliberately designed to accomplish these defects it would have been very successful.

Defects of the Solid Axle

The defects as well as the advantages of the solid axle have been heretofore set forth too elaborately to need further discussion except to add some of the defects which have not as yet been mentioned.

The differential lock which has been used extensively by some of the largest manufacturing concerns and discarded as impractical seem to offer all the advantages of an ideal differential for the solid axle, and at the same time provide for differential action when necessary. The differential lock used to lock together the driving bevel gears of a differential gave the desired effect of a solid axle when pulling out of a mud hole or getting a load out of some place where going is hard, but it happened so frequently that the driver failed to release the lock. Then, when turning a corner or taking up the uneven road play something always broke, which demonstrates the fact beyond question that the strain from a solid driving shock such as was the result when the differential was locked, brought extraordinary strains on different parts of the truck principally, however, in the rear axle, to such an extent that this idea of using a differential lock has been abandoned by most of our manufacturers, although we believe that some few are still holding on to them waiting for the ideal differential.

The experiments made on the solid axle in New York would be valuable were it not for the fact that they were made on good macadam streets and in the season of the year when there was snow or rain on the macadam, which made the retard slipping action on the rear wheels very easy and not condusive to tire wear. Undoubtedly were this experiment conducted under road and travel conditions as exist in hundreds of our inland cities, where good pavements are scarce, it would not have proved quite so satisfactory. The experiments with racing drivers have led most of them to prefer using even the ordinary differential in preference to the solid axle as it makes the car too hard to control on the track.

Turning Corners Unimportant

The statement that a differential is required only 1 per cent of the time while a straightaway pull is required 99 per cent of the time is largely theory and is not based on actual conclusion. Differential action is required many times in road travel when you are not turning corners. The turning of corners is one of the smallest requirements of a differential. It is the constant change of direction and the uneven road play under practical road conditions that requires differential action.

We believe that our spiral gear differential, known as the M. & S. comes as near meeting the *ideal* requirements of the differential as it is possible to conceive at this time. This differential applies the power to both wheels under all conditions and at the same time gives the necessary differential action when turning a corner for the following reasons:

First, the internal gears of the M. & S. differential are irreversible from the power applied by the motor to the driving gear.

Second, the internal gears of the M. & S. differential are reversible from the roll of the wheels in coming in contact with the ground giving the necessary differential action.

These two salient features cover the action of this differential and give the advantages of the solid axle as well as all the advantages of a differential. Unlike the bevel gear differential the M. & S. gives equalized differential action in turning a corner or taking up uneven road play. Many thousands of the M. & S. differentials on the Jeffery quad and light cars are now in use, and it has not been found necessary to increase the size of the axle drive shafts in any instance. Theoretically, it is not possible to apply more than 70 per cent of the entire power of the motor to one wheel even though the other wheel be on soft or slippery ground, and by the steady application of this power to the M. & S. it would not seem possible to deliver as great a shock load to the differential as it would be to a bevel gear differential where one wheel could be spinning rapidly and suddenly checked.

In Detroit there is now being completed a set of instruments for testing the actual power delivered to road wheels under actual road conditions which will undoubtedly determine plainly many of the questions with reference to the application of power to the rear wheels and give some actual facts and data on which to base a conclusion.

That there is a lack of authentic data with reference to power distribution is evident, and it is hoped these experiments will help to clear up the situation and give us facts as a basis on which to prepare future data as to power distribution under actual road traveling conditions.

Built Friction Drive Without Differential

By Charles Guernsey

Engineer, Service Motor Truck Co.

WE have read, with considerable interest, the discussion in THE AUTOMOBILE dealing with the possibilities of eliminating the differential. There are a number of things which have made good in practice which do not look good on paper, and this may be such a proposition.

However, the writer doubts its advisability. He was, at one time, connected with a company making a friction driven truck, in which a separate friction wheel delivered power to each rear wheel. There was no provision made in the job for differential action. In the hands of a capable driver this transmission gave very satisfactory service, but if someone got hold of it who would not release the power in going around a corner a great deal of trouble was experienced on account of breakage of various parts, which trouble we attributed entirely to the lack of a differential.

It is the writer's belief that it would be a constant experience of the same kind of trouble with axle shafts, etc., if the differential be eliminated.

Thinks Differential Doomed

By H. L. Palmer

Director of Sales, Standard Motor Truck Co.

WE believe there is much to be gained by the elimination of the differential although we are not having any trouble along this line, but always have been great believers in simplicity and our experimental department has been trying to eliminate the differential and think that they will do so by construction which is not at present open to public discussion. We believe that the day is not very far distant when this construction will be eliminated from the automobile.

Making History

EACH successive annual summer meeting of the S. A. E. is a milestone in the progress of automobile science. To every such meeting a number of members go with unsettled minds. Conversation, discussion and the chance remarks of others help to determine a course of action, so that the previous hesitancy is replaced by a complete confidence.

To a greater or lesser extent this happens to every individual engineer who attends these great gatherings. We all depend to an immense extent upon others, for modern man is a helpless creature by himself. Our civilization has become so complex that the accumulated experience of thousands is necessary for us previous to making any forward step whatever in science or in engineering.

From the beginning of time till a century ago, mechanical knowledge progressed with extreme slowness, because of the difficulty of transportation; men could not get together, and individuals of engineering bent were forced to work out things alone and unaided. The automobile industry has had a century of growth in 10 years owing to the ever-existing readiness of the engineers to get together. It is not too much to say that the summer meetings of the S. A. E. have been responsible for doubling the pace of development, that had it not been for these gatherings, the car of 1917 would have been advanced no further than the car of 1914.

Mammoth Mergers

THE formation of a $300,000,000 corporation to absorb a large proportion of the automobile industry of America is an event of commercial magnitude seldom if ever equalled in the history of business. Furthermore, there seems good reason to believe that the cause is a new one, that the object of the combination differs somewhat from that of previous amalgamations in the automobile and in other fields.

Co-operative buying is one of the main objects, if not the chief object of all. It is the ambition of the leaders in this latest of mergers to have so big and so rich a body that it can control every stage in the production of an automobile, commencing from the digging of the ore from which the steel is made.

In the cocoa business for years past there have been big corporations owning plantations and mills, so making the cocoa trade self-contained from the planting of the ground to the delivery of the finished product to the consumer. Never before has a manufacturing industry of anything like the complexity of the automobile business attempted an A to Z control of this kind.

To the consumer the effect should contain more of good than of evil. Immense economies in production cost enable huge profits to be made without raising the price of the article; they allow the price of the product to be cut without cutting the profits. Absolute monopoly in these days is almost impossible, with any complex thing it is quite impossible, so a big company may have immense power for economy without any power to inflate price. Probably dealers and users will discover nothing different in their circumstances due to the combination, which should tend to stabilize the value for money now obtainable.

Aviation Engineering

THAT the engineering of aircraft is closely allied to that of road transport vehicles has long been realized, and the tendency has lately been for the two branches to come closer together rather than to separate. This is because automobile engineering experience prepares a man better than anything else for a subsequent divergence into the newer field.

Thus we see automobile engineers becoming more and more interested in aviation, and aeroplane builders more and more confident in the ability of automobile firms to build their engines and help them with the mechanical detail of their planes.

There is no doubt but that the aviation industry of America is going to be a large and important one. Just now the only customer is the Government, but governments the world over are going to absorb a very large output for years to come. Meanwhile, there are many thinking men convinced of the future value of aeroplanes for mail-carrying and even for rapid passenger traffic between certain points. So, cutting out the enthusiasts who foresee the privately owned plane as a pleasure machine, there is ample encouragement to enter the field.

S. A. E. Summer Meeting Program

Details of Activities for Each Day on Lake Cruise Session, June 12-16

Monday

Meeting the incoming members and guests.
Registration headquarters—Pontchartrain Hotel.

8:30 a. m.—*First Business Session — Observation Deck.*

9—*Automobiles to be available for factory visiting, sight-seeing and shopping.*

11:30—*Lunch to be served at headquarters, in the ball room of the Pontchartrain Hotel.*

2 p. m.—*Steamship Noronic Sails.*

2:30-5—*Promenade, Observation Deck.*

3-5—*Standards Committee Meeting—Main Deck.*

6-8—*Dinner—Bugle at 6 and 7.*

8:30—*First Business Session.*
President's Address,
Future Scientific Development of the Automobile—C. F. Kettering.

11-12:30—*Dancing.*

Tuesday

7-10 a. m.—*Breakfast—Bugle at 7:30 and 9.*

9:30-12—*Professional Session—Observation Deck.*
Differential Substitutes—D. D. Ormsby.
High-Speed Engines—A. P. Brush.
Car Performance—Prof. D. L. Gallup.
Possibilities of the Constant Pressure Cycle—A. B. Browne and Herbert Chase.
Straight-Side vs. Clincher Type Pneumatic Tires —J. E. Hale.

12-2 p. m.—*Lunch—Bugle at 12 and 1.*

2—*Arrive Mackinac Island.*

5:30—*Noronic Sails.*

6:30-8:30—*Dinner—Bugle at 6:30 and 7:30.*

8:30—*Entertainment—Pennsylvania Section.*

9:15—*Entertainment—Cleveland Section.*

10—*Dancing Contest.*

Wednesday

7-10 a. m.—*Breakfast—Bugle at 7:30 and 9.*

7:30—*Arrive at Killarney.*
Fishing, Sports and Trip on Waubic.

12-2 p. m.—*Lunch—Bugle at 12 and 1.*

6-8—*Dinner—Bugle 6 and 7.*

8:30-10:30—*Entertainment.*
Detroit Section.

10:30-12:30—*Dancing.*

Thursday

5 a. m.—*Sail from Killarney.*

7-10—*Breakfast—Bugle at 7:30 and 9.*

9:30—*Professional Session—Main Deck.*

Bronze Alloys for Automobile Construction—W. M. Corse and G. F. Comstock.

Recent Aeroplane Engine Developments—Neil MacCoull.

Mechanical Transport Mobilization—A. J. Slade.

Automobile Experiences in the Great War.—W. F. Bradley.

Automobile Engineer and Preparedness—H. E. Coffin.

12-2 p. m.—*Lunch—Bugle at 12 and 1.*

2-4:30 p. m.—*Standards Committee Reports and Transaction of Adjourned Business—Observation Deck.*

4:30-6:30—*Owen Sound.*

6-8—*Dinner—Bugle at 6 and 7.*

8:30-10:30—*Entertainment*

Metropolitan Section.

10:30-12:30—*Dancing.*

Friday

7-10 a. m.—*Breakfast—Bugle 7:30 and 9.*

9:30—*Professional Session—Observation Deck.*

Crystallization in Cold-Drawn and Pressed Steel Parts—R. H. Sherry.

Kerosene vs. Gasoline in Standard Automobile Engines—Prof. C. E. Lucke.

Engine Fuels of the Next Decade—Dr. W. F. Rittman.

Open Discussion on Fuel Situation.

12-2 p. m.—*Lunch—Bugle at 12 and 1.*

2—*Professional Session—Observation Deck.*

Large Single vs. Dual Tires for Truck Rear Wheels—W. H. Allen.

Farm Tractors—C. M. Eason.

Refinements and Generalities in Truck Design.—H. D. Church.

Dynamics of Vehicle Suspensions—Dr. Benj. Liebowitz.

6—*Arrive Detroit.*

Overland, Hudson, Chalmers, Auto-Lite and United Motors in Monster Merger

New Corporation Second Only to U. S. Steel in Magnitude Formed with $223,000,000 Capital—Total Capital May Be Increased to $313,000,000

DETROIT, MICH., June 5—Two hundred and twenty-three million dollars is the capitalization of one of the biggest mergers in the history of commerce. It will cause the automobile industry to rank next in order to the steel trade, as only the United States Steel Corp. will have a larger amount of stock.

The new Willys-Durant merger of four automobile companies, with a substantial interest in a fifth, will start off on the basis of $223,000,000 of capitalization, it was announced yesterday.

It is understood that the name of the new combine will be the American Motors Co., with $70,000,000 preferred stock of $100 par value and 2,000,000 shares of common with no par value. The entire preferred stock issue will probably be apportioned among the companies entering into the merger, with none being offered to the public. Only a limited amount of the common stock is to be sold to the public at large, and at the present time it seems likely that this will be largely over-subscribed.

The company, which represents a union of the Willys-Overland, Hudson, Chalmers, Auto-Lite and United Motors Corp., the latter a combination of five accessory companies, which will supply parts for the cars made by companies in the merger, will make its début with $73,000,000 of 7 per cent preferred stock and 2,500,000 shares of common without par value. As it is proposed to sell the common stock to the public at 60, the capitalization represented by this stock is $150,000,000. The parent company will not be cramped by its capital limitations, however, if the management decides to expand, for the charter provides that the number of common shares may be increased to 4,000,000, which at the issue price would make the total capitalization $313,000,000.

Fisk a Possibility

It was said yesterday that no additional companies are being considered at this time as possible members of the new Willys-Durant family, with the exception of the Fisk Rubber Co., which may be taken in if terms can be agreed upon with holders of the large blocks. L. G. Kaufman, who has been handling the financial end of the merger, said that if the Fisk is purchased it will not be necessary to call upon any of the additional authorized stock, as there will be sufficient cash in the treasury to supplement the stock issued in payment.

John N. Willys, who is understood to have received $90,000,000 for his controlling interest in the Willys-Overland Co., will be paid in preferred stock and cash. It is said that he receives $45,000,000 in cash. He and his associates in Toledo have agreed to take a one-fourth interest in the 2,500,000 shares of common stock to be offered for sale. All of the $93,000,000 of 7 per cent preferred stock will go to the venders of the companies entering the combination.

William Salomon & Co. will head the underwriting syndicate to handle the common stock. Associated with them in the management will be Dominick & Dominick, who underwrote the recent Durant flotation of United Motors; J. S. Bache & Co., who underwrote the Durant Perlman Rim Corp., and W. W. Laird of Wilmington. The powder millionaires of Wilmington will take a very large interest in the company.

Other Mergers Rumored

Simultaneously there are rumors of a possible combination including Chevrolet, General Motors, Packard, Edmunds & Jones and a number of accessory manufacturers. It is claimed that the Timken company may line up with either the Willys-Overland or the Chevrolet group and that it is even possible General Motors, the Chevrolet group and the Willys-Overland group may enter into working agreements which will be almost the equivalent of a single combination.

The reason for these suggested mergers is to be found in the abnormal state of the raw material market. Every large manufacturing concern this year has suffered more or less severely owing to the unexpected rise in the price of steel and many other commodiities. It is felt, therefore, that the best insurance against fluctuations in the cost of raw materials is either for the automobile plants to establish steel mills, etc., of their own or to form combinations of such strength that they can take over existing steel mills, thereby absorbing them into the merger virtually if not actually.

Howard E. Coffin, vice-president of the Hudson Motor Car Co., is the authority for the statement that no automobile manufacturer is wealthy enough or consumes sufficient to make it worth his while to establish an individual steel mill, but that if the automobile industry divided into two or three groups it would be entirely self-supporting from the extraction of the ore to the finished article.

The situation at present is the existence of the General Motors Corp., of which W. C. Durant is president, the United Motors Corp., of which W. C. Durant is president, and the new corporation merging the Willys-Overland, etc., of which John N. Willys will be president. It is firmly believed that there will be at least a close working agreement between the new Willys merger and General Motors. If this proves actually to be true it will mean that W. C. Durant and John N. Willys will jointly control the great bulk of the automobile business of America.

THE THREE COMBINATIONS ARE:

1. New combination includes:
   Willys-Overland Co., Toledo, Ohio.
   Chalmers Motor Co., Detroit.
   Hudson Motor Car Co., Detroit.
   Electric Auto-Lite Co., Toledo.
   United Motors Corp. (Group No. 2).
2. United Motors Corp. includes:
   Dayton Eng. Lab. Co., Dayton, Ohio.
   New Departure Mfg. Co., Bristol, Conn.
   Hyatt Roller Bearing Co., Detroit.
   Remy Electric Co., Detroit.
   Perlman Rim Corp., New York.
   (General Motors, United Motors Corp. and Chevrolet Co. linked together through the common presidency of W. C. Durant.)
3. General Motors Co. includes:
   Buick Motor Co., Flint, Mich.
   Cadillac Motor Car Co., Detroit.
   Oakland Motor Car Co., Pontiac, Mich.
   Olds Motor Works, Lansing, Mich.
   Jackson-Church-Wilcox Co., Jackson, Mich.
   Weston-Mott Co., Flint, Mich.

The five companies which are merged into the new corporation have unfilled orders on hand amounting to $8,000,000, are sold out for over a year in advance, and have contracts for supplies to provide this output.

The officers of the Motor Products Corp. are W. C. Rands, president; C. F. Jensen, president of the Vanguard company, vice-president and supervisor of purchasing; H. H. Seeley, head of the Superior company, is vice-president and sales manager; D. B. Lee, vice-president of the Diamond company, is treasurer and general manager; M. L. Brown, treasurer and manager of the Universal Metal Co., is secretary. The board of directors consists of these men and R. R. Seeley, who is to be the Motor Products Corp. production manager.

Company to Branch Out

W. C. Rands states that while it would appear that windshields would be one of the most important products of the new combine, the intentions are to branch out into several other fields of automobile parts manufacturing. It is planned to build a large drop-forge plant and to add a screw machine department, so that in the end windshield making will only be about one-third of the concern's total activities. Later it is intended that the somewhat scattered plants are to be brought together in one very large institution here, building plans looking to this end already being under way. Some of the concerns in the combine have Canadian plants also, and these will be concentrated eventually to adequately care for business across the border.

J. K. Stewart Dead

NEW YORK CITY, June 2—John K. Stewart, president of the Stewart-Warner Speedometer Co., Chicago, Ill., died to-day at his home, 12 East Eighty-seventh Street, this city, in his forty-seventh year.

Mr. Stewart became president of this company in December, 1913, at the time of the Stewart-Warner merger, when that company purchased the plant and patents of the Stewart & Clark Mfg. Co., maker of the Stewart speedometer, and also the plant and patents of the Warner Instrument Co., Beloit, Wis.

Chrysler Resigns from Briscoe

FLINT, MICH., June 3—Walter Chrysler, who has ably supervised the manufacturing and production departments of the Briscoe Motor Co., has tendered his resignation following the resignation of C. W. Nash as president of General Motors. Nothing has yet been given out regarding Mr. Chrysler's future plans, nor as to who his successor will be. Mr. Chrysler is regarded as one of the foremost production men in the industry and has had much to do with the remarkable expansion and growth of the Buick factories.

Big Parts Makers Combine

Five Companies from Detroit Territory Merge as Motor Products Corp.

DETROIT, MICH., June 3—On the eve of the formation of other great mergers in the industry comes the announcement of the completion of plans whereby several large parts makers in other lines located in Detroit and vicinity are to be combined under the name of the Motor Products Corp., with a capitalization of 100,000 shares of no par value and with W. C. Rands, head of the Rands Mfg. Co., this city, as president. Incorporated under the laws of New York and with a main office in New York City and headquarters here, this corporation as at present outlined takes in the Rands Mfg. Co., the Vanguard Mfg. Co., the Diamond Mfg. Co., and the Universal Metal Co., all of Detroit, and the Superior Mfg. Co., Ann Arbor, Mich.

The Rands Mfg. Co. is a very large concern making at the present time windshields, tops and steering wheels, having begun this activity in 1900. Vanguard makes a specialty of windshields, and has been located in Detroit for about 3 years, during which time it has shown a remarkable growth. The Diamond Mfg. Co. makes metal stampings, such as radiator fittings, radiator shells, hubs, hub caps, manifolds and tubing. In a similar line is the Universal Metal Co., this concern having a large tube mill and making a variety of metal parts as well. The Superior Mfg. Co. is also a big windshield maker, besides doing business in other accessories necessary to motor vehicles.

Stock Oversubscribed

It is understood that the stock of the new holding company will be put upon the market very soon. It is said to have been heavily oversubscribed, there being 100,000 shares of no par value. The underwriting has been done in New York.

Seventy thousand shares of its stock are now being issued, 5000 shares of which are to be designated as Class B stock and have full voting power and the remaining 65,000 shares to be designated as Class A stock and will have full voting power, but will be identical with Class B stock in all other respects. The articles of incorporation will provide that the voting power of Class B stock will pass to all stockholders alike in the event of the failure of the company to earn a minimum of $5 per share per annum for any two consecutive years on all the then outstanding capital stock.

The syndicate, which has been formed by J. S. Bache & Co., is to continue in force for a period of 6 months, but may be extended at the option of the managers for a further period of 60 days.

The stock of the corporation was offered for subscription at $74 per share. Of the total 70,000 shares, 20,000 shares were given to holders of the stocks of the five companies that constituted the merger in part payment for their holdings, leaving 50,000 shares that were purchased by the underwriting syndicate.

1917 Pierce Arrows To Be Sixes

BUFFALO, N. Y., June 3—The Pierce-Arrow Motor Car Co., Buffalo, is out with a direct announcement that it will adhere to the six-cylinder type of power plant in its 1917 output.

The six-cylinder type of engine, according to the company's announcement, is being continued solely because the company finds it most efficient. No question of price, no discussion of selling argument, enters into the verdict. The decision of the engineering staff follows a close observation of motor experiments and tendencies in the United States and Europe.

Pullman to Make Truck

YORK, PA., June 2—The manufacture of a 1000-lb. light delivery truck is the latest venture of the Pullman Motor Car Co., this city. Two standard bodies are provided in its manufacture, the express type, selling for $750, and the panel type, at $775.

The truck is brought out on a special chassis which will hold maximum loads. The wheelbase is 114 in. The four-cylinder motor, 3¾ by 4¼ in., develops 32 hp. The valves are inclosed. The cooling system is of the thermo-syphon type and the radiator of the Pullman honeycomb style.

Left hand drive is provided, with center control and emergency brake lever forward of center. A 9¼-gal. gasoline tank is carried on the cowl.

Van Deusen with Detroiter

DETROIT, MICH., May 31—Walter H. Van Deusen, formerly commercial manager of the E. R. Thomas Motor Co., and assistant general sales manager of the Chalmers Motor Co., and more recently district sales manager for the A. Elliott Ranney Co., New York City, has been appointed director of sales for the Detroiter Motor Car Co.

McMullen Joins Chalmers Sales

DETROIT, MICH., June 1—B. J. McMullen, who was district sales manager on the Pacific Coast for the Willys-Overland Co., has been appointed an assistant sales manager for the Chalmers Motor Co.

S. A. E. Adds Tire Division

Military Committee Created—Truck Division Reorganized—Tire and Rim Division

NEW YORK CITY, June 6—At the April meeting of the standards committee of the S. A. E. in Cleveland it was suggested that a new division be added to deal with all matters in connection with tires and rims. This was discussed briefly by the standards committee and heartily approved. The council of the society at their last meeting in Indianapolis consequently decided to establish the new division to be known as the tire and rim standards division. H. L. Barton, production engineer of the General Motors Co., has accepted the position of chairman of the division and the other members represent the bulk of the tire and rim business. They are: W. H. Allen, C. C. Carlton, J. E. Hale, Russell Hoopes, C. B. Whittelsey, C. E. Bonnett, John Kelsey, J. V. Mowe, J. C. Manternach, C. B. Williams, E. K. Baker, J. C. Cole and Christian Girl.

To Handle Tires and Wheels

The division will take over from the truck standards division questions relating to solid tires, rims and wheels and will also assume responsibility for the pneumatic tire and for pleasure car wheels and rims, thus carrying on the work of the old division which was dropped 4 months ago. It is believed that there is a real opportunity for standardizing passenger car felloe bands in the near future.

Aiding the Army

A special committee to be known as the military transport committee, was also appointed by the Council. This committee is not a part of the standards committee, but will co-operate with committees of other societies and with Government officials in the development of a military transport scheme. It will also have a close relationship with the truck standards division of the standards committee. It is composed of men who are not connected with any truck manufacturing companies. Its membership is as follows: C. F. Clarkson, Chairman; Geo. W. Dunham; E. A. Deeds; Henry Souther, and W. P. Kennedy.

The appointment of the military transport committee means the creation of a new body, as this committee will be independent of the standards committee, having the right to call upon the latter in work required. The recent conferences held between army engineers and truck makers under the auspices of the society prove conclusively how greatly the S. A. E. could help the military authorities in the creation of the military transport committee and provide a ready means of communication between the society and the military.

Reorganize Truck Division

Owing to the creation of the tire division and the fact that the truck standards division will probably be mainly occupied with military work the council decided to reorganize the truck standards division so that its membership consists solely of truck engineers connected directly with the manufacture. W. P. Kennedy, formerly chairman of this division, has been appointed a member of the military transport division and his place has been taken by H. D. Church, chief engineer of the truck department of the Packard company, the other members of the division being: B. B. Bachman, L. P. Kalb, W. T. Norton, Jr., A. L. Riker, W. R. Strickland, Geo. W. Smith, A. J. Scaife, F. A. Whitten, John Younger and E. R. Whitney. This increases the number of divisions of the standards committee to fourteen.

24,000 Carloads of Automobiles Shipped in May

NEW YORK CITY, June 7—The National Automobile Chamber of Commerce at its monthly meeting to-day reported a return to normal conditions in shipments. May shipments amounted to more than 24,000 carloads, as compared with 15,392 in May last year. Conditions have so improved that the use of flat cars is no longer necessary.

The truck interests met to-day in convention, the meeting being attended by about forty makers with Windsor T. White, chairman. Policies of service and repair were adopted, so as to better the conditions of the truck users.

There will be no truck show this year.

The truck committee adopted at its meeting the definition of standard type chassis. Just what is included under the definition has not as yet been completed.

108,286 Cars in Minnesota

ST. PAUL, Minn., June 3—Secretary of State J. S. Schmahl turned into the State treasury in May $11,902 covering automobile licenses at $1.50 each. The office issued 6900, at times at the rate of 500 a day. The total for the year is 108,286 cars.

230,000 Registration For Ohio

COLUMBUS, OHIO, June 3—W. H. Walker, Ohio Registrar of Automobiles, in a recent report showed that 165,000 gasoline automobiles have been registered since the first of the year. The number of electrics registered is 4100, and dealers and manufacturers 2650.

Breaks Chicago-to-N. Y. Record

B. F. Durham in Chalmers 6-30 Roadster Covers 1047 Miles in 31 Hr.

NEW YORK CITY, June 7—Chicago to New York City in 31 hr. exactly, is the new record set by a Chalmers 6-30 fully equipped roadster, which negotiated in that time just 1047 miles. This record compares with that established by E. C. Patterson in his Packard 3-38 last July, when he covered 1015 miles in 35 hr. and 43 min. Thus Durham, who drove the record-breaking Chalmers, beat the old record by 4 hr. 43 min. and averaged 33.7 m.p.h. for the entire distance.

Durham and his observer, B. Harris, left Chicago yesterday at 3 a. m. and arrived here to-day at 11 a. m. The car went through the trip without any mishaps or punctures, the only stops being those for replenishment of fuel, oil and water. The car averaged about 14 m.p.g. on gasoline.

The route followed was through South Bend, Goshen, Kendelville, Bryan, Ohio, Fremont, Cleveland, Erie, Buffalo, Elmira, Binghamton, Middletown, Ft. Lee and into New York. The car reached Bryan at 8:30. Cleveland was made in 11.4 hr., a distance of 371 miles. The car up to this time averaged about 33 m.p.h. Last night at 8:47, the car left Buffalo and reached Middletown this morning at 8:30. Durham was relieved as driver by Al Walden from Cleveland to Elmira.

The car was equipped with A C spark plugs, Silvertown cord tires, Stromberg carbureter, Atwater Kent ignition, Westinghouse starter, and a Motometer.

Fiat Factory in Hungary

BUDAPEST, April 18—A branch of the Fiat Automobile Works has been founded in this city by the local branch of the Anglo-Austrian Bank and the Fiat Works, Ltd., Co. of Vienna. The capital stock of the company is 1,000,000 crowns, $203,000. A factory building situated at Kelenfold, in the suburbs of Budapest, has been rented.

Willys a Bank Director

BUFFALO, N. Y., June 6—John N. Willys, president of the Willys-Overland Co., Toledo, Ohio, was elected a director of the Third National Bank of Buffalo to-day.

Jacoby Overland Service Director

TOLEDO, OHIO, June 6—K. R. Jacoby, who has been Toledo zone district manager of the Willys-Overland Co., has been appointed director of service, succeeding Herbert J. Finch.

Mid-West Section S. A. E. Meets

Re-elects Officers and Discusses Body Design, Trucks and Blakeley Motor

CHICAGO, ILL., June 3—The old officers of the Mid-West Section of the Society of Automobile Engineers were re-elected unanimously at the quarterly meeting of the section at the Chicago Automobile Club last night. Inasmuch as the section has been organized for less than a year, the first administrative year was less than 12 mo., and the old officers therefore were eligible. Those re-elected were F. E. Place of the Buda Motor Co., chairman; J. DeCou of the Thos. B. Jeffery Co., vice-chairman; Darwin S. Hatch, *Motor Age*, secretary; C. W. Stiger, Stromberg Motor Devices, treasurer.

Art and Body Design

The relation of Art to Motor Car Body Design formed the subject of a paper presented by W. B. Stout of the Scripps-Booth Co., Detroit, Mich., and in the discussion that followed the paper the point was brought out by Mr. Stone of C. Stone & Sons, Chicago, body builders, that there was room for great improvement by builders of chassis along the lines of making better arrangements for high-class, custom-built bodies. Such things as the angle of the steering wheel, the arrangement of the pedals, etc., often limited very much the scope of the body builder in working individual designs. To refute this a number of representatives of the car makers arose to the occasion with the statement that in most instances the angle of the steering column was changeable and the pedals were adjustable.

Buying a Truck

Henry Farrington, Thomas B. Jeffery Co., Kenosha, Wis., presented a paper entitled Problems Involved in the Choice of a Motor Truck, and discussed the points that the prospective truck buyer should take into consideration in selecting a commercial vehicle for his particular service. Mr. Farrington presented the advantages of the four-wheel drive as against the rear drive truck and in closing made a plea against manufacturers and salesmen rating the carrying capacity of their vehicles at too high a mark for all conditions of service, as it is the tendency of the user to load it to this capacity no matter what the operating conditions might be.

The Blakeley Motor

E. D. Blakeley of Sears, Roebuck & Co., this city, presented a description of a new type of high-compression engine of his own design which at present is applicable only for stationary use and is developed for small isolated plants, but which has possibilities of adaptation to truck service. Although of high compression it varies from the Diesel type, but like the latter is capable of running satisfactorily on very low-grade fuels.

Mr. Blakeley gave a demonstration of his design with a motor temporarily installed in the Automobile Club garage, in which he started it cold on kerosene and later ran it on very low-grade of oil and also on olive oil. The unusual features of the engine are that it has neither carbureter, electric ignition, or any special ignition features. Even with the low-grade fuel there was practically no smoke and very little odor. A description of the engine will be published in a later issue.

Gamble Goes to Duplex Co.

NEW YORK CITY, June 4—D. E. Gamble, for the past 3 years designer and assistant chief engineer of the Herschell-Spillman Co., North Tonawanda, N. Y., has resigned to become chief engineer and superintendent of the Duplex Engine-Governor Co., this city. On May 26, the officers and department heads of the Herschell-Spillman company gave a theatre party and banquet in honor of Mr. Gamble at which Guy White, general manager, acted as toastmaster.

Manson Succeeds Ilse on Jiffy

DETROIT, MICH., June 3—Frank H. Ilse, inventor of the well-known quick-acting curtain for automobiles, and president of the Jiffy Curtain Co., licensor of patent rights under Ilse's patents, has disposed of his interest in the concern to R. C. Manson, also connected with the company, and has retired as president. Mr. Manson becomes president and treasurer.

Clarkson Comes to United States

NEW YORK CITY, June 2—J. B. Clarkson of the firm of Messrs. J. B. Clarkson & Co., Ltd., New Zealand, will arrive in this city June 15. Mr. Clarkson is one of the leading New Zealand importers of automobiles. He will first visit Chicago, which he will reach June 9. From there he will go to Detroit, reaching that city on June 12.

Bindbeutel Leaves Motor Print

NEW YORK CITY, June 3—George T. Bindbeutel has resigned as editor of *Motor Print* to become active in the field of literary endeavor. John Chapman Hilder is his successor. Mr. Bindbeutel had been editor of *Motor Print* since December, 1914.

Norma Co. Plans New Factory

Buys 10-Acre Site at Elmhurst—To Build Four-Story Building

NEW YORK CITY, June 2—The Norma Co. of America, manufacturer of Norma high-precision anti-friction bearings, announces through its president, W. M. Nones, the purchase of a 10-acre factory site at Elmhurst, on the outskirts of Long Island City. The property fronts on Queens Boulevard and has a depth of about 1000 ft., abutting in the rear upon the main line of the Long Island Railroad, from which a siding will be built directly into the plant.

The company has, in 5 years, become prominently identified with the American automobile industry. Beginning as importer of bearings, the merit of its product gained quick recognition among the manufacturers of ball-bearing automobile accessories.

The latest move is made in response to an imperative demand for a still larger immediate output, with facilities for extension with the future growth of the business. The plans now under way provide for a four-story building, 70 by 350 ft., to be erected immediately in reinforced concrete. Every modern improvement will be embodied, looking toward the maximum of production efficiency. The location was determined upon, not alone for the excellent shipping facilities afforded but also for its ready access to the labor markets and home sections grouped around Long Island City—surface and subway lines running close to the property giving quick communication with neighboring Long Island towns as well as with Manhattan Island via the Queensboro Bridge.

Chandler Employees to Share Profits

CLEVELAND, OHIO, June 2—A share in the profits earned by the Chandler Motor Car Co., this city, will be given to the employees of the company. It is indicated that a sum equal to 5 per cent on all wages paid, including overtime, commencing July 1, 1915, and ending June 30, 1916, will be paid with the July 20 payroll.

Splitdorf Employees Get 10% Bonus

NEWARK, N. J., June 1—The Splitdorf Electrical Co., this city, has announced a 10 per cent monthly bonus to all employees to take effect at once. Over 1600 employees will be affected by the increase, which will amount to about $150,000 a year. The increase was given voluntarily on the part of the company.

Both piece-workers and day-workers will receive the bonus.

According to the bonus plan, every man or boy in the production end of the plant will receive the increase. A man employed at an hourly rate with a weekly wage of $20, at the end of the month will receive $8 extra. If he is a piece-worker the bonus will be figured on the total amount of wages he receives for the entire month.

Two Shifts Working

This is the first of a series of improvements in the working conditions of the employees, many of which will not go into effect until the completion of the new building of the company on Aug. 1, when many of the departments will be rearranged. At the present time two shifts are working at the plant, an open shop.

Profit-sharing for Lee Rubber

New York City, June 2—A profit-sharing plan has been adopted by the management of the Lee Rubber & Tire Corp. Under this plan the important employees of the company will receive the benefit of a certain percentage which is to be taken from the net earnings over and above the $300,000 required for the payment of the present dividends of 50 cents regular and 25 cents extra quarterly. The plan provides for the distribution of the bonuses to the employees who are beneficiaries in proportion to the salaries received.

Enlarge White Tractor Plant

Cleveland, Ohio, June 1—Rollin H. White has purchased 18 acres of land fronting on St. Clair Avenue, giving a total of 61 acres for the manufacture of tractors. It has been announced that the farm tractor plant is eventually to be a $1,000,000 plant.

The parcel of land just bought is directly in the rear of 43 acres fronting on Euclid Avenue, just east of the Baltimore & Ohio railroad's Bluestone quarry branch railway, which Mr. White purchased last fall. Mr. White has had plans made for gradual development of the tract and eventually expects to use the whole of it for factory buildings and storage yards.

To Sell Great Western Co. Assets

Detroit, Mich., June 5—Samuel Levy & Co., commercial auctioneers of this city, have purchased the entire assets of the Great Western Automobile Co., Peru, Ind., including all stock, material, real estate, etc. The service department of the concern will be continued for the time being but all material as well as the real estate is to be sold at auction within the next 6 weeks.

Kissel Brings Out New Six

Hundred-Point Model to Sell at $1,095—4-32, 4-36 and 6-42 Discontinued

Hartford, Wis., June 3—The Kissel Motor Car Co., this city, has brought out the Hundred Point Six. It is a light six with a 3¼ by 5-in. motor, developing 52 hp. The price for the three-passenger roadster, four- or five-passenger touring body is $1,095. All-year bodies with detachable tops are made in sedan, coupe and town car styles at additional prices. The new car takes the place of the four-cylinder model which sold at $1,050, the 4-32 and 4-36 and the 6-42 models being discontinued.

The new model resembles in a general way the larger six-cylinder model, which will be continued. The block motor is L-head and its S. A. E. horsepower rating is 25.4. A few of the features are: Remy ignition and lighting; Kissel-Stromberg carbureter; three-speed gearset; Leak-Proof piston rings; Non-Gran bronze bushings; Timken bearings; Willard storage battery; and Stewart vacuum fuel feed system. The wheelbase of the new car is 117 in. and the tires are 32 by 4.

Ten-Story Building for Packard in Long Island City

New York City, June 2—The Packard Motor Car Co., Detroit, has purchased the block fronting in Queens Boulevard, between Hill and Rawson Streets, Long Island City. This block adjoins the site now occupied by the Packard Building and it is to be utilized for the erection of a building for the use of the company. According to present plans the building will be ten stories in height and will be double the capacity of the present building between Hill and Van Dam Streets.

Plans are already prepared for another addition to the building in Van Dam Street and Queens Boulevard. It will be eight stories high and will contain 90,000 sq. ft. and its cost will be about $350,000. This addition will front on Van Dam Street. An addition costing $50,000 is just about completed, fronting in Hill Street.

Sterns Tire & Tube Co. to Manufacture in St. Louis

St. Louis, Mo., June 1—Plans have been completed by Edward Sterns, president of the Efficiency Oil Corp., and the inventor of the Sterns automobile inner tube, to establish in this city a plant for the Sterns Tire & Tube Co.

The Sterns tube in appearance is like other inner tubes, but is constructed of a patented black rubber material which is said to be proof against punctures and blow-outs. It is said to be sold to motorists under a factory guarantee of 20,000 miles, at a price slightly higher than that charged for other tubes.

These tubes require 40 per cent less air in inflation and there is but a slight difference in their weight and the weight of other tubes.

It is the intention of the officials of the company to begin operation as soon as possible. The erection of a plant will be started on a 10-acre tract in the fall. This plant will adjoin the Efficiency Oil Corp. plant near Suburban Garden, in St. Louis County.

Dodge Acquires More Land

Detroit, Mich., June 2—Dodge Bros. continue to expand their plants, as evidenced by the purchase this week of property along Whiting Avenue adjoining present buildings. An effort is being made to close this thoroughfare, but so far this action has not been approved by the Hamtramck council, the Detroit suburb in which the Dodge property is located. Just what the new factory additions that will be erected on this land will be utilized for is not stated, but it is expected that the added floorspace will make possible the augmenting of the Dodge payroll by some 3000 men.

Oakes to Add 50 Per Cent Floorspace

Indianapolis, Ind., June 3—The Oakes Co., this city, maker of automobile horns, accessories and metal stampings, will build a one-story, reinforced concrete building alongside its present plant, giving it 50 per cent more floorspace. This building will also contain the new offices and will be ready for occupancy about Sept. 1.

American Motor Plans Plant

Plainfield, N. J., June 1—Tentative plans have been completed by the American Motor Co., for a factory group in this city. The main building will be 860 ft. long by 60 ft. wide and several smaller buildings are to be built.

Jordan Takes Title to Land

Cleveland, Ohio, June 1—The Jordan Motor Car Co., this city, has taken title to a tract of 5 acres it recently purchased in East 152d Street, south of St. Clair Avenue. The first building, a $50,000 structure, now is being erected on the land.

New Booklet on Willys-Knight

Toledo, Ohio, June 2—The Willys-Overland Co., this city, has issued its new booklet on the Willys-Knight car, in which it gives valuable information on the operation and construction of the Knight engine.

S.S.E.Co. Will Make Complete Car

$5,000,000 Philadelphia Company Formed To Build $5,000 Chassis

PHILADELPHIA, PA., June 3—The S. S. E. Co., a $5,000,000 corporation, composed of New York and Chicago capitalists, has purchased ground in the vicinity of the Hess-Bright plant in Kensington on which it will build a large plant for the manufacture of high grade automobiles.

The Organizers

In back of the new Philadelphia industry are: Victor Lee Emerson, designer of the Emerson engine, formerly president of the Emerson Marine Engine Co., and holder of a number of patents covering gasoline engines; E. E. Smathers, a New York capitalist of prominence, and C. B. Shaeffer, of Chicago and head of the Shaeffer-Smathers Oil Co. Mr. Emerson is general manager, Mr. Smathers president and Mr. Shaeffer vice-president. Temporary offices have been opened at Twenty-third and Chestnut Streets, this city.

Capital All Paid Up

The company was brought here through the efforts of the industrial bureau of the Philadelphia Chamber of Commerce, which is also negotiating for several other automobile plants. It is capitalized at $5,000,000 all paid up.

Buildings and equipment alone will cost close to $1,000,000 in addition to $250,000 already spent in getting the enterprise under way. The company owns and controls its own patents and will make everything going into the finished car except the tire and electrical equipment. This, Mr. Emerson said, is practically the first attempt anywhere to make a complete car. He estimates the value of the first year's output to be $5,000,000.

20-Acre Plant Site

The plant will be located on a piece of ground having a frontage of 2000 ft. on the main line of the Pennsylvania Railroad. It will cover approximately 20 acres. The buildings will be of concrete and steel and one story high.

Everything will be made on the ground floor under a saw-tooth roof. The equipment will be along most modern lines and will be electrically operated throughout.

It is claimed that the car will be the highest-priced of any made either in this country or in Europe. The chassis alone will cost in excess of $5,000. The body will be made in a number of styles and will be both open and closed.

None but the highest grade of workmanship and material will be used and the main idea will be to turn out a highly-scientific and flawless car regardless of price. Two of the principal features will be nimbleness and lightness. So pronounced is the latter feature that it will move while standing with a pressure of hardly more than 3 lb.

New Gasoline-Saving Device Burns Crude Oil

DALLAS, TEX., June 2—T. S. Causey, 3303 Oak Lawn Avenue, Dallas, has invented a gasoline-saving device for an automobile which is claimed to burn crude oil successfully. Patents are pending for the device. It will be called a Thermal generator.

With gasoline selling at 20 cents per gal. and crude oil at 5 cents per gal., Mr. Causey believes he has an invention which will mean more to the automobile world than any other one thing.

"The proposition has been thoroughly tested and if it accomplishes nothing more than to save the fuel expense for gasoline cars it will prove the greatest boon the automobile world has known for some time," Mr. Causey says.

Speaking further of the device Mr. Causey said: "It controls the heat of the exhaust in a manner to get any amount of the heat desired and by it the gasoline is fed into a generator through a very fine needle valve. The oil comes into contact with the heated surface and is generated into gas, while at the same time the air is admitted in an automatic way that thoroughly mixes with the gas which is taken into the cylinders in the highest condition to produce the result needed."

Mr. Causey said that several big firms have offered him a handsome price for the exclusive rights on the device. He expects as soon as his patent is received to interest Dallas capital and establish a factory here. It will be several weeks, he said, before this can be done.

May Issue Gasoline Cards in England

LONDON, ENGLAND, June 1—New regulations limiting the use of gasoline, which is scarce in England on account of the large consumption by the army and navy, will be issued next week. The regulations will take effect as soon as published.

It is said that the amount of gasoline used by the British army in France is equal to the entire consumption of the British Isles in times of peace. The use of automobiles on Sunday, except under special licenses, will be prohibited in the new regulations, which aim at the suppression of pleasure riding in the United Kingdom. It is probable that even the omnibus lines will be included in the new regulations. The use of gasoline cards, similar to the Berlin bread cards, is being considered.

To Open Mexican Oil Fields

Large Scale Development Under Way—Present Political Conditions Only Hindrance

TAMPICO, MEX., June 3—As an evidence that the larger foreign interests which have oil holdings in Mexico are confident that the present depressed condition of the industry will soon be relieved by an improvement in the political and financial situation of this country several large purchases of oil land leases have been made by them during the last few weeks. These transactions were given the official approval of the de facto government, as was recently decreed by Venustiano Carranza. It is stated here that the Texas Co., which now obtains a daily output of about 10,000 barrels of oil from its wells in the Tampico region, plans to enter the Mexico field on a big scale as soon as conditions here become more settled. It has obtained options on large tracts of oil producing land which it will develop. It is said that it also has under consideration the erection of a refinery here.

Big Developments

Development operations upon a scale such as was never before witnessed in any oil region in the world will be inaugurated in this part of Mexico as soon as assurances are felt by the investment interests that political and industrial peace has come to Mexico to stay and that the government will not overburden them with taxes and restrictions. It is authoritatively announced by the Lord Cowdray syndicate of London, Eng., which is operating in Mexico under the names of the Mexican Eagle Oil Co. and S. Pearson & Son, Ltd., that it has appropriated $75,000,000 American gold or £15,000,000 sterling for expanding its oil industry in Mexico. This vast sum will be spent in boring wells, laying pipe lines, enlarging its two refineries and the building of at least one additional, and the construction of oil-tank steamers.

The Mexican Petroleum Co., which is at this time the largest producer of oil in Mexico, has adopted tentative plans for the enlargement of its business that call for the expenditure of more than $50,000,000 gold, it is announced by its representatives here. This company recently closed a contract for supplying the Standard Oil Co. with 6,000,000 barrels of crude oil.

Many millions of dollars are to be spent in development work in the different fields of the Gulf coast region by the Pierce Oil Corp., the Dutch-Shell Trading and Transport Co., the Magnolia Petroleum Co., the Gulf Refining

Co., the Penn-Mex Fuel Oil Co. and other operating concerns. All of the older companies in Mexico are operating under concessions that were granted them by the Diaz administration. There is some uncertainty as to what standing these contracts have with the existing de facto government, but it is the opinion of oil men here that no attempt will be made to forfeit the concessions which have been standing so long.

No New Work

So far as undertaking new work in the different fields at present, nothing is being done. Everything in the way of opening up possibly new producing territory is at a standstill, pending the establishment of a stable government. The Mexican Petroleum Co. and the Mexican Eagle Oil Co. have a few rigs still at work putting down holes, and wells of enormous production have been bought in by both of these companies recently.

German Gasoline Scarcity Stops Use of Private Cars

AMSTERDAM, June 1—Owing to the alarming scarcity of gasoline, the German authorities have practically put a stop to the use of automobiles, not only by private individuals, but also by members of the neutral Diplomatic Corps in Berlin.

Report Reduced Manufacture of Carriages and Wagons

NEW YORK CITY, June 2—The inroads of the automobile into the carriage and wagon industry during the period from 1909 to 1914 were greater in respect to passenger vehicles than those used for business purposes. In 1909, according to statistics gathered by the United States Bureau of Census, carriages represented 53.2 per cent and wagons 39.7 per cent of all vehicles made, but in 1914 the proportion represented by carriages had declined to 47 per cent, while that represented by wagons had increased to 48.2 per cent.

293 Fewer Makers

In the preparation of the 1914 census of manufactures for the manufacture of carriages and wagons and of bodies, tops, cushions, hubs, felloes, spokes, wheels, and other materials used in the production of the complete vehicles, reports were received from 5320 establishments, which manufactured 1,187,002 vehicles of all classes, valued at $72,283,898. At the 1909 census there were reported 5613 establishments, with an output of 1,584,571 vehicles, valued at $94,037,900. The number of establishments thus decreased during the 5-year period by 293, the number of vehicles by 397,569, and the value by $21,754,002.

Gasoline Hearings June 12-13

Federal Trade Commission Meets in Washington to Complete Its Information

WASHINGTON, D. C., June 3—An opportunity to explain the rise in the price of gasoline will be given various oil companies on June 12 and 13, when the Federal Trade Commission will hold a series of meetings in this city. The commission is investigating the price increase in gasoline under a Senate resolution. It is announced by the commission that a report will be submitted within a few days after the hearings.

Data Collected

The commission has sent letters to refiners, jobbers, pipe-line companies and crude oil producing companies throughout the country, asking them for any information they might care to present in addition to that already uncovered by the commission.

The Letter Sent

The letter sets forth that "It is the Federal Trade Commission's desire in every inquiry to secure all the facts and to draw the correct conclusions therefrom. To this end, having completed a preliminary tabulation and analysis of the data concerning the gasoline situation, as furnished by your company and others, the commission will now give to interested parties an opportunity for discussing the facts of the situation before reaching its conclusion."

Information Desired

The commission further sets forth in its letter that at the time of the hearings any company that may care to present, in addition to any information already submitted, any further information, it will be received and "any statement concerning your company's cost of production and the increase therein, as compared with the increase in prices, will be welcomed."

Investigate Competition

The commission also says it will be glad to have the various companies submit at the hearings a concise statement concerning competitive conditions in the petroleum industry, especially in regard to gasoline.

The commission's letter says in conclusion that "at this hearing the commission would desire to ask certain questions concerning these matters of your representatives, and to that end it is suggested that in case your company desires to appear it should be represented by officers thoroughly familiar with the executive, accounting, operating and marketing departments of your business."

It is believed in Washington that the gasoline quiz on June 12-13 will bring out a lot of interesting information about the high cost of gasoline and the real reasons for it.

---

120 Trucks Displace 60,000 Oxen with Bulgarian Army

WITH THE BULGARIAN ARMY, MACEDONIAN FRONT, May 10—The motor truck has revolutionized transportation for the Bulgarian army. Figures have been given proving that each truck used by that army has been doing the work of 500 oxen and 250 wagons each day.

In the past the Bulgarian army has depended entirely upon the ox wagon for the transportation of its food, supplies and ammunition.

The truck carries a crew of two, is able to transport 3000 kg. at an average speed of 15 m.p.h. and runs 16 hr. a day if necessary. This means that each truck replaces, at a 16-hr. run, 180 ox wagons, 360 animals and about 200 men, as the ox wagon is in charge of one driver and carries an average load of 300 kg. and moves at a speed of about 2½ m.p.h. for 8 hr. each day. Considering that the truck, with a capacity of more than 3000 kg., is by no means rare at the Macedonian front, and taking into consideration the length of the various lines of supply, the average for each truck is 250 wagons, 500 animals and about 300 men.

These figures indicate that only about 120 trucks are necessary to permit the Bulgarian general staff to restore to the farms the 30,000 oxen which were furloughed some time ago. The change also liberated from the military service 30,000 men who had been drivers.

Oxidation of Cylinder Oils in United States Bureau Paper

NEW YORK CITY, June 1—The United States Bureau of Standards has issued a pamphlet, Technological Paper No. 73, giving data relative to the oxidation of automobile cylinder oils, which has been made the subject of a recent study of that bureau.

The rate of oxidation of three oils when exposed to sunlight and air was studied, and the increase in weight, acidity, and carbonization value, as well as changes in the Maumene and iodine numbers and in the demulsibility were determined. Changes in the carbonization values of these three oils and of eight others, when heated for different lengths of time at a given temperature, and for the same time at different temperatures, were studied and are discussed very fully in the paper.

Durant Heads Gen. Motors Co.

Succeeds C. W. Nash, Resigned—W. C. Leland Takes Place of Strauss on Board

DETROIT, MICH., June 1—All doubt as to where the control of the General Motors Co. lies was dispelled by the election of W. C. Durant to the presidency at the meeting of the directors in New York City to-day, succeeding C. W. Nash, resigned. Coincident with this action came the election of W. C. Leland, vice-president and general manager of the Cadillac Motor Car Co., to the board of directors of the giant combine to fill a vacancy occasioned by the resignation of Albert Strauss, of the banking firm of J. & W. Seligman & Co., one of the banking interests which financed the General Motors following its difficulties several years ago and which was not favorable to the Durant faction. Another director, J. J. Starrow, of the firm of Lee, Higginson & Co., another of the banking interests opposed to the new control, has also resigned. Mr. Starrow did not attend the meeting.

Mr. Nash a Director

Mr. Nash remains a director of the concern, although his resignation as president comes as no surprise to those in a position to know, since dominance by the new interests is understood to have made his retention of the presidency untenable for certain reasons. Mr. Nash's connection with General Motors dates back to 1910, when, coming from the carriage and implement business, he was made vice-president and general manager of the Buick Motor Co., replacing Mr. Durant in that position. In 1912 Mr. Nash was elected president of the entire combine, and the remarkable growth and prosperity of General Motors is ample proof of his ability as an organizer and manager of so large a combination. He is regarded as one of the foremost figures in the industry today and he is at the present time closely identified with other interests in the field.

It is now believed that merging of General Motors and Chevrolet is forecast by this latest development. Mr. Durant's election to the presidency is his second incumbency in that office, and comes as a result of the regaining of control from the group of banking houses which carried the concern over its period of depression some years ago.

Overland Common Stock Quartered

TOLEDO, OHIO, June 2—Sanction has just been secured from the State of Ohio and the New York Stock Exchange to reduce the par value of each share of common capital stock of the Willys-Overland Co., this city, from $100 to $25 a share. This change has been made in order to create a wider market and more general distribution of the stock.

The Willys-Overland stock, which has been steadily advancing during the past 6 months, reached its highest point during the past week, when it climbed to 276 3-4.

A notice of the reduction in par value will be sent to all holders of common stock, requesting a return of the old certificates in order that a reissue of the new paper can be made—four $25 par value shares being exchanged for each $100 par value share.

Markets Steady

NEW YORK CITY, June 6—Prices of automobile materials last week were steady with few changes. Antimony dropped ½ cent a pound, lead went down 25 cents per 100 lb., and tin was $2.50 per 100 lb. lower.

The rest of the prices were unchanged. Fine up-river Para rubber fluctuated throughout the week, dropping to 65 cents a pound, it lowest quotation, and rising to 68 cents, its highest. Yesterday it closed at 66.

K. C. Conditions Excellent

Crops Increased and Dealers Are Optimistic—Record Sales for 1916 Predicted

KANSAS CITY, MO., June 3—The June report of the Kansas City branch of the Federal Reserve Bank states that conditions have been extremely good in that territory and the outlook is for an unbroken continuance of prosperity. Crop conditions are excellent, there is a large increase in corn acreage, the valuable alfalfa crop is in the finest shape, stock and feeding cattle are money makers, there is a big movement of cattle from Texas and New Mexico to the Kansas and Oklahoma pastures, and altogether the situation and the prospects are highly satisfactory. "Banks have difficulty in keeping surplus funds profitably employed," the report concludes.

Automobile dealers and branch managers apparently can concur in this optimistic report. Their situation this year is far better than last year; for they have more cars to distribute.

"There can be no comparison between May, 1915, and May, 1916," said J. F. Martin, manager of the Buick Motor Co. "Our business was ten times the volume we had last year. But that was because we had the cars to deliver. Conditions are very fine in this territory, there is a good demand for cars, and I understand all the leading companies are looking forward to a record-breaking trade. The people are able to buy and pay for cars, the roads are being improved rapidly to make the use of cars even more desirable, and there seems nothing to prevent the continued expansion of the business in this district."

Electrics Gain

A. T. Clark, manager of the factory branch of the Anderson Electric Car Co., said that his company had an increase of 281 per cent in business in the Kansas City district the first 5 months of this year. There were forty-one cars sold in 1915, this period, and 164 this year. The interesting part of this record is that electric cars are going into the small towns, where previously salesmen had no idea they could sell—or it was considered hardly worth while working.

Portage Rubber to Increase Capital $1,750,000

AKRON, OHIO, June 1—The directors of the Portage Rubber Co., Barberton, at its annual meeting on May 29, declared a quarterly dividend of 2 per cent on the common stock, the first to be paid common stockholders since the organization of the company. The regular quarterly dividend of 1¾ per cent, will be paid on the preferred stock.

The directors adopted a resolution calling for a meeting of stockholders on July 11 to consider a proposed increase from $1,250,000 to $3,000,000 in capital stock. It is proposed that $1,500,000 of the increase be disposed of as common stock. If the increase is approved all stockholders will have the privilege of purchasing the increase in common at 105. It was announced that the company increased its business this year by 100 per cent over that of 1915.

Packard $5,000,000 Capital Increase Authorized

DETROIT, MICH., June 3—To-day the stockholders of the Packard Motor Car Co. authorized an increase of $5,000,000 in the common stock of the concern, bringing the total capitalization to $21,000,000, of which $8,000,000 is in preferred stock.

At this meeting a new office was created, this being chairman of the board of directors, which new position will be filled by Henry B. Joy, who retires from the presidency in favor of Alvin Macauley, formerly vice-president.

Sparton Stock for Cleveland

CLEVELAND, OHIO, June 6—Application has been made to list the stock of the Sparks-Withington Co., Jackson, Mich., on the Cleveland exchange.

Sensational Rise in Stocks

New High Marks with Phenomenal Strength—Millions Made on Advance

NEW YORK CITY, June 7—Automobile and accessory securities on the New York Stock Exchange and the Curb Market closed on Saturday after one of the most sensational rises ever recorded in this city. Yesterday, automobile issues had a day of greatest activity and millions of dollars were passed back and forth as rumors of gigantic mergers were verified. The easily-won fortunes in the munition business have played a prominent part in the spread of automobile speculation.

General Motors Up

The Bethlehem Steel movement which carried that stock to $600 a share is outmatched in the matter of fluctuations by General Motors, which opened last week with a drop of nearly 60 points between sales, and on Saturday rose 87 points to the accompaniment of rumors of the $200,000,000 merger. Willys-Overland, the nucleus of the merger, made a new high record of 314 and closed 6 points up on the day. Other gains in the motor shares were Chandler with 11 points, and Studebaker, 3¾ points. On the curb Chevrolet sold up to the new record price of 272 and closed at 270, a net gain of 9 points.

The advances recorded for the week were as follows: Chalmers common, 30 points; Chevrolet, 20 points; General Motors, 33 points; Goodrich, 121¼ points; Packard, 15 points; Portage, 25 points; Willys-Overland, 45 points; Chandler, 18 points, and United Motor Corp., 10¾ points.

Fully 10 per cent of the whole week's dealings on the New York Stock Exchange were in motor stocks. In the Curb Market the transactions were still larger. The turnover in the brand new United Motors amounted to nearly 190,000 shares. White Motors were dealt in to the extent of nearly 90,000 and Chevrolet had a turn-over of 42,600 shares.

Many of the more conservative brokerage houses are refusing to carry the higher-priced motor stocks on margin except for customers who they know have ample means, and then only on big margins, which must be kept good.

The appreciation which has taken place in the shares of automobile, tire and accessory companies, has added hundreds of millions of dollars to the market value of these properties. Many of these concerns have been stock corporations for only a few months, and the owners who sold a controlling interest in them have in some cases seen the value of their minority holdings surpass the value of the greater interest which they sold, as appraised at the time of incorporation, less than a year ago.

Munitions Profits Factors

Bankers state that the rapid rise in automobile stocks has been due very

largely to the prosperity enjoyed by persons engaged in the manufacture of automobiles or in allied industries and to the immense sums for investment accumulated by the owners of companies engaged in the munitions business.

The following table listing a number of the companies whose stocks have been particularly active during the past week, shows the large appreciation caused by the wild speculation. All of the issues are new, with the exception of Willys-Overland and General Motors and in these issues the price of a year ago is used:

Company	Issued at	Yesterday's High	Appreciation
General Motors.....	150	560	$66,400,000
Willys-Overland ...	130	325	40,950,000
Chandler	85	131	3,220,000
Lee Tire	50	56½	650,000
Chevrolet	85	278	154,400,000
United Motors......	62	94	38,400,000
Perlman Rim.......	120	162½	4,250,000
White	51	60	2,880,000
Total advance			$311,240,000

Dividends Declared

Rubber Goods Mfg. Co.; quarterly of 1¾ per cent on preferred, payable June 15 to stock of record of June 9.

Kelly-Springfield Tire Co., quarterly of 1½ per cent on preferred, payable July 1 to stock of record June 17.

Yale & Towne Mfg. Co., quarterly of 1¾ per cent, payable July 1 to stock of record June 23, and an extra dividend of 10 per cent, payable June 7 to stock of record May 31.

$20,000 Prize Money for Twin City Meet

MINNEAPOLIS, Minn., June 5—With $20,000 in cash prizes, four races are open to professionals on the Twin City Speedway for July 4. The Mid-Continent races are for 150 miles, 50, 20 and 10 miles. For the first race seven prizes are hung up ranging from $6,000 to $400. For the second are five prizes from $1,000 to $200, and for the third five prizes from $600 to $100. The final race is a consolation handicap for non-winners. First prize is $400, second is $200, third is $175 and fourth is $125 and fifth $100.

Correction

In THE AUTOMOBILE for Jan. 27, 1916, an article was published entitled Working Out the Rolls-Royce Brake. We have just been informed by the Rolls-Royce company that the experiments therein described were not conducted by any member of its staff. In justice to the author it should be explained that the mistake was due to no fault of his but a confusion between his name and that of a recent member of the Rolls-Royce engineering force.

Oldfield Sets Record for 2 Miles

Drives Front-Drive Christie Racer at 113 M.P.H. on Chicago Speedway

CHICAGO, ILL., June 5—Barney Oldfield, driving his front-drive Christie car, established a new American speedway record for 2 miles on the Chicago speedway here to-day, averaging 113 m.p.h. in an unsuccessful attempt to break the world's record for the distance. The best previous American speedway record for the distance was that made by Caleb Bragg in a Fiat on the Los Angeles 1-mile speedway April 13, 1910, in 1:15.96, or at 95 m.p.h.

Harkness Delage Team and Peusun Out of Chicago Race

CHICAGO, ILL., June 2—The Harry Harkness racing team, composed of the Delage cars and the Peusun, will not race at Chicago. They are being shipped to New York City instead and will be rebuilt. The cars are top heavy for track work as they have the gasoline too high. The tails will be taken off and the tanks underslung. Another fault in the cars is in the baffling of the gasoline. There is only one baffle plate in the tanks and the gasoline has a tendency to rush to the outside under the influence of centrifugal force, on the curves. The result is that the cars are not suited for track work.

It is expected, according to Gaston Morris, who is traveling with the team in an advisory capacity and who is well known for his track generalship, that the cars will be ready for Minneapolis.

Studebaker Convention Opens

DETROIT, MICH., June 3—More than fifty branch managers and assistant branch managers of the Studebaker Corp. reached Detroit this week for the convention which is scheduled to be in session from June 6 to June 9. They came from all parts of the country, as far East as Boston and as far West as San Francisco.

Daily meetings are on the program to be held at the Studebaker factory, at which L. J. Ollier, vice-president and director of sales, will preside. A. R. Erskine, president of the corporation, came over from South Bend, to be present throughout the week. Talks by heads of the sales, service, engineering and production departments, along with inspections of the factories, will complete the business session.

One of the events of the program will be a view of the factory improvements which were announced at the last convention in December and have since become a reality. These improvements have been made with a view to increasing the production of Studebaker cars, making possible an output of 100,000 cars.

Reports from the branch managers and retail sales managers on conditions in their territories are expected to furnish a good gage on the prospects for the remainder of the year. Among the branch managers who attended are F. R. Bump, New York; Henri Neubauer, Philadelphia; G. N. Jordan, Boston; A. H. Pearsall, Chicago; L. B. Alford, Dallas; W. S. Williams, Kansas City; R. D. Maxwell, Los Angeles; E. R. Carpenter, San Francisco; J. A. Graham, Minneapolis; R. H. Williams, Detroit; L. A. Keller, Omaha; L. S. Weeks, Atlanta; A. H. Brown, Portland, Ore.; C. J. Simons, St. Louis; T. W. Naylor, Salt Lake City; J. B. Renshaw, South Bend. The following district managers are also in attendance: J. O. Hahn, Cleveland; E. W. Gans, Indianapolis; J. A. Haskell, Des Moines.

C. A. C. Calls for Cars

CHICAGO, ILL., June 6—The National Committee of Home Defense motorists have appointed a committee from the members of the Chicago Automobile Club headed by Joseph E. Callender as chairman to organize a motor reserve corps in Chicago. As its initial effort this committee will transport the First Infantry of the Illinois National guards to their annual camp at Fort Sheridan and to do this the services of 200 touring cars and fifteen trucks will be required.

King Establishes New York Branch

NEW YORK CITY, June 2—The King Motor Car Co., Detroit, Mich., has bought out the King holdings of the A. Elliott Ranney Co., this city, and is now managing the sale of the King Eight at Broadway and Fifty-second Street. At the present time the business is being handled by factory representatives under the direction of Joseph Porter. The service department will be located at 250 West Fifty-fourth Street.

Christiaens Used Rajah Plugs

NEW YORK CITY, June 6—Joseph Christiaens, whose Sunbeam car finished fourth in the Indianapolis 300-mile race last week, used standard Rajah spark plugs. Eight out of the ten cars to finish the race were equipped with Rajah plugs.

Lexington Speedway Co. Formed

LEXINGTON, Ky., June 2—The Lexington Speedway Co., this city, has been organized for the purpose of building a $300,000 automobile speedway. The incorporators are J. T. McKee, Rosedale, Ky., and G. M. McCarthy, Louisville.

Question Benefit of Ga. Law

State Finds Owners Are Not Paying Ad Valorem Tax—33,840 Cars Registered

SAVANNAH, GA., June 2—Whether the several counties of the State get any more out of the new automobile law or not, there are more automobiles registered this year in Georgia than last by about 33 1/3 per cent. The manner in which the statistics will be compiled under the new law will, too, show exactly how many automobile owners in just what counties are not returning their cars to the county for ad valorem taxation—and exactly who they are.

A Gain of 11,630 Cars

At the opening of business in the office of the Secretary of State on the first day of May, 1915, the last automobile registered was 22,210. The 1916 record for the same date shows that the last number sold was 33,840, or 11,630 more cars registered up to the close of business on the last day of April this year than last year. After the first of May last year there were approximately 3000 more cars registered, and secretary Cook believes the final registration this year will add 5000 to 6000 more cars to the 1916 list.

States Loses $30,698 on Fords

On Ford cars alone the State has, this year, lost $30,698, as compared to the return on the same number of Ford cars under the fixed fee of the old law. Heretofore a State tag cost as much for a car of that class as for any other, $5, while under the new law that class of automobiles has been graded down, the present fee being $3, and the list shows that there are 15,349 Ford automobiles registered in Georgia this year. There are 237 pleasure electric and 1140 delivery wagons and motor trucks registered. In both the latter class, however, it is evident that added registrations will have to be made, since there are more of both classes in operation in the State than the record shows.

The New Law

The new law provides that, on or before May 1, the board of commissioners in each county of the State shall report to the Secretary of State the official number of miles of public roads in the county, outside the incorporated cities and towns, the correct number of motor vehicles returned for taxation in the county in 1915, as shown by the county tax books, and certify that 90 per cent. of the motor vehicles owned in the county have complied with the State law requiring registration in the office of the Secretary of State, and have 1916 license numbers attached to their cars. On the basis of this report the Secretary of State apportions the fund derived from the sale of 1916 license tags among the several counties, provided they have complied with the 90 per cent. registration and other features of the new law.

New York State to Tax Motor Vehicles on Road Wear

ALBANY, N. Y., June 1—All owners of automobiles and motor trucks will have to pay additional fees to the State within a year because of the wear and tear of the vehicles on the highways. Governor Whitman has signed the Hewitt bill providing for the levy of the fees by Feb. 1, next year.

The Hewitt bill directs the commissioner of highway, superintendent of public works and the State engineer to adopt a schedule of fees for the registration of omnibuses that carry passengers and trucks for the transportation of freight. They are to classify the vehicles upon the basis of time and extent of use upon the highways relative to the wear and tear of the roads. The schedule is to be turned over to the Secretary of State by the first of next year.

Lift Massachusetts Blue-Law Ban

SPRINGFIELD, Mass., June 4—Motorists in this city in particular and throughout Massachusetts in general are breathing easier, and so are the garage men as a result of Chief of Police William J. Quity delving more deeply into the law of Sunday sales. He had notified the garage men that the sale of gasoline was illegal on Sunday. There had been a prosecution, and as the Legislature had refused to make a change in the law there seemed to be a deadlock with the prospect of the trouble spreading throughout the State. Then some of the automobile officials got busy and claimed that as gasoline is derived from gas, and the latter can be sold on Sunday, gasoline could be retailed.

Safety First Society Urges New Rules

NEW YORK CITY, June 2—At a meeting, yesterday, before the General Welfare Committee of the Aldermen, this city, four ordinances in the interests of Safety First, were proposed by the Safety First Society of New York. The meeting was also attended by members of the Automobile Dealers' Assn. and the Police Department. The proposed ordinances introduced were: To guard unprotected side chains on motor vehicles; to prevent trespassing upon or hitching on motor vehicles and wagons; to safeguard properly motor vehicles when left unattended in the streets; and to eliminate the glare of automobile headlights.

Tractor Engineers Convene

Problems of Growing Industry Discussed at Session in Minneapolis, Minn.

MINNEAPOLIS, MINN., June 2—The Society of Tractor Engineers met May 29 at the Andrews in convention.

Two papers were read. C. D. Meyers of the Timken-David Brown Co. discussed "Worm Gearing and Its Application to Tractors." The Ford Tractor Co. has applied the gear and other companies are reported adopting or considering the application of the same gear. Meyers discussed this in a technical way.

Haulage a New Field

A. W. Scarrett of the Minneapolis Steel & Machinery Co. read a paper on "Tractor Haulage." This is a comparatively new field, and the limitations and advantages of the tractor for this work were ventilated. The speaker used charts and statistics to show what disadvantage to the tractor in road work is even a light grade and bad conditions of the track.

Robert Gaylord of the Gray Tractor Mfg. Co., secretary of the society, said that the whole field of tractor discussion is a new one and is capable of indefinite development and discussion. In particular the question of tractor haulage is capable of infinite elaboration and study. He said Minneapolis is now the greatest tractor city in the country and that the society is therefore growing rapidly.

Plan National Extension

Plans for national extension are working out, and any tractor engineer, tractor factory firm or accessory manufacturer in the tractor line is eligible for membership.

Officers of the new organization are: President, G. T. Strite; vice-president, W. J. McVicker; secretary-treasurer, Robert Gaylord; additional directors, H. A. Buffington, C. C. Cavanaugh, G. C. Andrews and O. B. Kinnard.

To become a national organization is the purpose of the society. The local association has fifty members, which is a rapid gain from a modest start last winter.

Patterned After S. A. E.

It was announced at the meeting that the society is for tractor engineers and tractor firms, with an associate membership for manufacturers of tractor accessories. It is patterned after the S. A. E. on a smaller scale.

Outside memberships are coming in rapidly and it is probable societies will be organized in other large tractor centers.

Factory Miscellany

Ideal Wheel Plant in Massillon—The Ideal Wheel Co. has planned to construct a factory in Massillon, Ohio. The company recently increased its capital from $50,000 to $150,000.

Kressler to Add—The Kressler Auto Co. is planning the construction of a two-story, 100 by 200-ft. addition to its plant at Fostoria, Ohio.

Kankakee Welding to Reconstruct Plant—The Kankakee Universal Welding Co., maker of wire wheels for automobiles, will reconstruct its plant at St. Anne, Ill., which was recently destroyed by fire with a loss of $100,000.

J and D Tire to Build—The contract has been awarded for the construction of a factory for the J and D Tire and Rubber Co., Charlotte, N. C., at an estimated cost of $500,000.

To Build Motors—The Davies-Mitchell Engineering Co., 220 Union Bldg., Cleveland, Ohio, has been organized to build six- and twelve-cylinder automobile motors and expects to begin the erection of a plant in about 90 days.

Limousine Top Acquires Bldg.—The Limousine Top Co., Kalamazoo, Mich., maker of automobile tops, has acquired an additional building and will increase its output considerably.

To Make Bodies in Savannah—F. C. Kramer of Savannah, Ga., will shortly begin the erection of a factory, 150 by 200 ft., of steel and reinforced concrete, for the manufacture of bodies for commercial automobiles, automobile wheels, etc. The equipment has been bought and will have a daily capacity of 600 wheels from 24 to 28 in. in diameter. A site has been purchased on Dale Avenue and it is expected that the plant will be ready for operation April 1, 1917.

To Make Parts—The Lawndale Mfg. Co., Elkhart, Ind., has been formed with a capital of $75,000 and has secured factory space in which equipment is being installed for the manufacture of automobile parts. A. H. Beardsley, W. H. Foster and J. A. Bell are the directors.

Newark Stamping Adds—The Newark Stamping & Foundry Co., Newark, Ohio, has let a contract for a second addition to plant No. 2, foundry department. This is the second addition since Feb. 1. The company manufactures gray iron castings, brass or aluminum. The stamping department is working nights making the Thompson hose clamps.

Ogren Adds—The Ogren Motor Car Co., Chicago, Ill., is constructing a three-story mill on Sacramento Boulevard, between Chicago and Grand Avenues, at an estimated cost of $85,000.

Jeffery to Add—The Thomas B. Jeffery Co. has awarded the contract for the construction of a foundry and manufacturing building at Kenosha, Wis.

Akron Tire Co. Acquires Site—The Punctureless Auto Tire Co., Akron, Ohio, has acquired a site in Barberton on which it will erect a plant, 60 by 400 ft., and a powerhouse.

Detroit Heating Co. to Add—The Detroit Heating & Lighting Co., Detroit, Mich., maker of sheet-metal specialties for automobiles, has completed plans for the erection of additional buildings to double its present capacity.

Wadsworth Body to Build—Plans have been prepared for the construction of a two-story, 95 by 350-ft. factory in Detroit, Mich., for the Wadsworth Mfg. Co., maker of automobile bodies. The estimated cost is $60,000.

Double Service Tire for Barberton—The Double Service Tire and Rubber Co., Akron, Ohio, is coming to Barberton. The company has bought 4 acres of land and work has been started on the new buildings.

General Tire Adds—The General Tire & Rubber Co. is building a large addition to its plant in Akron, Ohio. The company was formerly the Western Tire & Rubber Co., Kansas City, Mo.

The Automobile Calendar

ASSOCIATIONS

June 12-16—S. A. E. Summer Trip on Great Lakes.
July 2-6—Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
Dec. 2-9—Electricians' Country-wide Celebration.

CONTESTS

June 10 — Chicago Speedway Race. International 300-Mile Race, Speedway Park, Speedway Park Association.
June 17—Newark, N. J., Track Race, Olympia Park, Auto Racing Assn.
June 20—Galesburg, Ill., Track Race, 100 miles.
June 22-23—Chicago, Interclub Reliability Run, Chicago Automobile Club.
June 26—Des Moines, Iowa. Speedway Race, Price Speedway Co.
June 28 — Des Moines, Iowa, Speedway Free-for-All, 300-Mile Race.
July—LaGrande, Ore., Track Race, LaGrande Motor Club.
July 4—Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4—Tacoma, Wash., Speedway Race, Tacoma Speedway Assn.
July 4—Minneapolis 300-Mile Speedway Race.
July 4—Sioux City Speedway Race.
July 4—Newark, N. J., Track Race, Olympic Park, Auto Racing Assn.
July 4—Visalia, Cal., Road Race, Tulare Co. Auto Club.
July 4—Spokane, Coeur D'Alene, Track Race, Reigel-Hiller Co.*
July 4—Benton Harbor, Mich., Track Race, F. E. Fitzsimmons.
July 4—Elmira, N. Y., Track Race, Elmira Auto and Motorcycle Racing Assn.
July — Burlington, Iowa, 100-Mile Track Race, Tri-State Fair.
July 15—Portland, Ore., Track Race, Northwest Auto Assn.
July 15—Omaha, Neb., Speedway Race.
July 15—North Yakima, Wash., Track Race, Hiller-Riegel Co.
Aug. 5—Tacoma Speedway Race, Tacoma Speedway Association.
Aug. 11-12—Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.
Aug. 12—Portland, Ore., Track Race, Hiller-Riegel Co.
Aug. 18-19—Elgin Road Race, Chicago Auto Club.
Aug. 26—Kalamazoo, Mich., 100-Mile Track Race.
Sept. 1-2—New York, N. Y., Sheepshead Bay Speedway, 24-Hour Race, Trade Racing Assn.
Sept. 4—Elmira, N. Y., Track Race, Elmira Auto and Motorcycle Racing Assn.
Sept. 4—Cincinnati, Ohio, Speedway, Cincinnati Speedway Co.
Sept. 4—Newark, N. J., Track Race, Olympic Park, Racing Assn.
Sept. 4—Indianapolis Speedway Race.
Sept. 4—Des Moines Speedway Invitation Race. Limited to six entries.
Sept. 4-5 — Spokane, Wash., Track Race, Inland Auto Assn.
Sept. 16—Providence Speedway Race.
Sept. 18—North Yakima, Wash., Track Race, Washington State Fair.
Sept. 29—Trenton, N. J., Inter-State Fair. H. P. Murphy, Racing Sec.
Sept. 30 — New York City, Sheepshead Bay Speedway Race.
Oct. 7—Philadelphia Speedway Race.
Oct. 7—Omaha Speedway Race.
Oct. 14 — Chicago Speedway Race.
Oct. 19—Indianapolis Ind., Race, Indianapolis Motor Speedway.
Oct. 21 — Kalamazoo, Mich., Track Races, Kalamazoo, Motor Speedway.
Nov. 16 and 18—Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

GOOD ROADS

Sept. 6-7—St. Paul, Minn., Good Roads Congress, Auditorium.

MISCELLANEOUS

June 8—New York City, Orphans' Day Outing at Donnelly's Grove, College Point, L. I. Orphans' Automobile Day Outing Assn.

SHOWS

Sept. 2-9—Columbus, Ohio, Fall Show, Ohio State Fair, Columbus Automobile Show Co.

TRACTOR

July 17-21—Dallas, Tex., Tractor Demonstration.
July 24-28—Hutchinson, Kan., Tractor Demonstration.
July 31-Aug. 4—St. Louis, Mo. Tractor Demonstration.
Aug. 7-11—Fremont, Neb., Tractor Demonstration.
Aug. 14-18—Cedar Rapids, Iowa Tractor Demonstration.
Aug. 21-25—Bloomington, Ill. Tractor Demonstration.
Aug. 28-Sept. 1—Indiana Tractor Demonstration.
Sept. 4-8—Madison, Wis., Tractor Demonstration.
Sept. 11-16 — Milwaukee, Wis. Fall Show. Wisconsin State Fair. Milwaukee Automobile Dealers.

The Week in the Industry

Trade Happenings

Oregon Items—The Scripps-Booth line will hereafter be distributed in Portland and throughout Oregon by the Braly Auto Co. Coincident with this announcement is the news that H. W. Lyons has returned to the Braly Auto Co. as sales manager.

The Oregon Oakland Motor Car Co. has been named representative for the Vim truck in Portland and vicinity.

Washington Items—Turnley & Rathke, Rosalia, have contracted to handle the Oakland line in that territory.

The Traders Tire & Motor Suppy Co., Spokane, has been appointed distributor for eastern Washington and part of Idaho for Smith Form-a-truck.

The Washington Automobile Chamber of Commerce at a recent meeting in Seattle perfected a plan of organization for automobile dealers in all the cities and counties of the Northwest.

To Make Automobile Sleepers—The Bradley Manufacturing Co. has recently been incorporated in Tacoma, Wash., to produce a folding berth or automobile sleeper that can be quickly adjusted to any model of automobile, and used for sleeping quarters.

The bed can be adjusted in from 3 to 5 min. and weighs only 30 lb. It folds up so it can be conveniently placed on the running board of an automobile.

A three-story building near Tacoma will house the new manufacturing plant, and the automobile beds will be shipped to all parts of the world.

Philadelphia Tire Co. Opens Branch—Carrier & Harlan, Philadelphia, Pa., have opened a branch store in West Philadelphia at 3322 Chestnut Street under the supervision of C. W. Glose. The Philadelphia store is at 263 N. Fifteenth Street. They specialize in repairing and vulcanizing and also carry U. S. tires and other automobile accessories.

Changes in San Diego, Cal.—San Diego's automobile row has shifted to lower Broadway. During the past week automobile houses have sprung up like mushrooms on the busy street.

The first Broadway automobile house was the Pacific Kissel Kar branch which opened up in a location at Broadway and Union Street. Then F. B. Naylor, Buick distributor, moved into the new Naylor building directly across the street.

A few days later, the San Diego Motor Co. opened up on the corner of Broadway and State Street, with the agency for the Chevrolet. This move was followed by the opening of a tire store on one corner by a firm operating under the name of Higgins & Shaw, and the Pacific Auto Sales Co. on another corner. The Pacific Auto Sales Co. has the San Diego agency for the National, Oldsmobile and Oakland, and the new location is one of the finest corners of the many new automobile houses erected in San Diego during the past few months.

Mead Cornell and Ed. Caley then opened a tire store at 311 Broadway, next to the Pacific Kissel Kar branch and the Paige and Peerless agency moved into a location three doors south. There are more to come; and all the places on Broadway are about as attractive as any in California. The Mitchell agent is erecting a new garage, and Green & Fleming, Chandler and Grant dealers, are soon to occupy their new home.

New York City Items—The Hudson Motor Car Co., New York City, has just opened its new six-story service building at 243-249 West Sixty-seventh Street. The building contains more than 60,000 sq. ft., is fireproof, and the exterior is of white glazed brick and terra cotta. At the present time there are about 3500 Hudson cars in this territory. The Hudson Sales Co., in Philadelphia, Pa., will also have a new service station and salesroom. This building will be a two-story brick structure, 22 by 66 ft.

The Ford Motor Co. has purchased a site for a salesroom on the northeast corner of Fifty-fourth Street and Broadway, adjoining the Hotel Woodward. The property, which brought close to $600,000, is 129.6 by 54.7 ft. on Fifty-fourth Street, and has a depth of 86.8 ft. on the northerly line adjoining the Hotel Woodward. The present buildings will be replaced by a sixteen-story structure.

J. C. Nichols, factory distributor for the Compensating Vapor Plug, is placing extra orders for the device. Since the plug was introduced last January more than 600,000 have been sold.

Stevens & Co., 375 Broadway, have introduced an automatic blow cock and cleaner for garages and machine shops. It is used in connection with the air service system, and is convenient for dusting out cars, cleaning engines, etc. The valve is furnished with a ground-in metal-to-metal seat.

Charles E. Reiss & Co., handling the Stearns-Knight and Hupmobile, have opened a service department at 226-234 West Fifty-sixth Street. This will occupy the entire top floor of the building.

Longenecker & Sanders, handling the Abbott-Detroit, have inaugurated a service department at 245-247 West Fifty-fifth Street.

Scharps Promoted—C. E. T. Scharps, who recently joined the C. T. Silver Motor Co., New York City, as advertising manager and assistant to Mr. Silver, has been promoted to the position of manager of the Newark, N. J., branch. Mr. Silver, who handles the Overland, Willys-Knight and Peerless business in this territory, has also made G. Franklin Bailey director of branches. W. E. White has been put in charge of the service department.

New Agencies for Braender Tires—The following new agencies are reported by the Braender Rubber & Tire Co., Rutherford, N. J., manufacturer of Braender tires and tubes: American Motor & Equipment Co., 181 Massachusetts Avenue, Boston, Mass.; The Kassler Motor Co., Fifth and White Streets, Dubuque, Iowa, and H. B. Herr, 30 West King Street, Lancaster, Pa.

Mountain Trade—C. V. Swenson, proprietor of the East End Garage, 2325 Larimer Street, Denver, has secured the Colorado and Wyoming distributing agency for the Republic Truck, and has opened a salesroom in a central location at 1940 Champa Street, opposite the new Federal and Postoffice Building. A service station is maintained at both the garage and the downtown salesroom.

The Wm. Thorney Auto Co., Apperson distributor for Colorado and Wyoming, has moved from 1443 Cleveland Place, Denver, to 1133 Broadway.

Cassell Brothers Music Co., 205 Sixteenth Street, Denver, has secured the Abbott-Detroit distributing agency for Colorado and Wyoming, and has remodeled its piano business quarters by adding an automobile salesroom around the corner to front on 1607 Broadway.

The Plains Automobile Co., 1605-1607 Central Avenue, Cheyenne, Wyo., Buick and Packard agency, has been sold by H. A. Andrews to F. H. Gleason.

The Colorado Motor Car Co., 1520 Broadway, Denver, Saxon, Reo and Cole distributor for Colorado and Wyoming, has taken the Hesse Trailer distributing agency for the same territory.

The Chalmers Exchange is the name of a new concern at 1443 Cleveland Place, Denver, which handles used cars traded in upon Chalmers sales, and also operates a garage and service station.

James A. Nisbet, 1551 Broadway, Denver, Scripps-Booth distributer for Colorado and Wyoming, has secured the Glide distributing agency for the same territory.

Mulnix & Rarie, East Colfax Avenue and Lincoln Street, Denver, Grant and Pathfinder distributors for Colorado and Wyoming, have secured the distributing agency for the Atterbury truck for the same territory.

D. S. Eddins, recently Rocky Mountain district supervisor for the Maxwell, with headquarters in Denver, has been transferred to the Detroit district, where he is special traveling representative.

The Rocky Mountain Motor Co., a new Denver concern, has secured the Case distributing agency for Colorado, Wyoming and New Mexico, and is remodeling its quarters at 1635 Broadway to provide a car salesroom.

De War Brothers, Denver, have bought Earle H. Frazier's garage at 741-747 Broadway, and have taken over the Detroit Electric agency for Denver and vicinity.

The B. F. Goodrich Rubber Co.'s Denver branch, 1422-1424 Court Place, is now in charge of C. A. Cotter, formerly chief adjuster at the St. Louis branch. H. E. White, whom Cotter succeeds as manager, has been transferred to a factory position. J. K. Laird, formerly Kansas City adjuster, is the new assistant manager of the Denver branch, and C. L. Harding is new chief clerk.

The Philadelphia Storage Battery Co. has closed its Denver factory branch at 1435 Cleveland Place, and the business for this territory has been taken over on an agency basis by De War Brothers, 741-747 Broadway.

New England Trade Items—An agency for the Elkar line has been placed in Boston with the Paine-Krogman Company, Commonwealth Avenue.

F. S. Brewer, Springfield, Mass., has taken the agency for Empire cars for central Massachusetts.

An agency for Pullman cars has been placed with Mosher & Fimbell, Springfield, Mass.

The Elite Garage, New Haven, Conn., has taken on the Halliday line.

M. H. Chase, Owen Magnetic dealer at Boston, has leased 20,000 sq. ft. in a new service building in that city.

The Crane & Bratish Motor Co., Providence, R. I., has been dissolved and the garage it conducted sold to A. J. Howard, agent for Scripps-Booth.

A. S. Holley, formerly manager of the New England branch of the R. E. Taylor Corporation, Garford dealer, has accepted a position as retail sales manager for the New England agency for Jackson cars.

Firestone Factory Branch in Springfield—The Firestone Tire & Rubber Co. has established a factory branch at Springfield, Mass., with headquarters at 44-50 Hillman Street. It is in charge of G. I. Engle and he will direct Firestone sales in Vermont, southwestern New Hampshire, northern Connecticut and central and western Massachusetts. The local agency for the tires will still remain with F. N. Sauers.

Columbus Items—A. J. Adams, formerly an engineer with the General Electric Co., has opened a repair shop at Lafayette and Lazell Streets under the name of the Adams Auto-Electric Service Co. He will specialize on the repair of electric systems on automobiles.

The Dixie Flyer Sales Co. has been organized at State and Front Streets to handle the Dixie Flyer in central Ohio territory.

The Ohio Auto Brass Co. has removed from 27 West Russell Street to larger quarters at 36 and 38 West Swan Street.

The Overland Agency in Columbus was taken over June 1 by Willys-Overland, Inc. The agency was held by the O. G. Roberts Co. for about 6 years. The service station of the branch will remain at 933 East Gay Street, while the salesrooms will be moved down town in automobile row, located at Gay and Fourth Streets. C. T. Dunkle is Columbus branch manager.

The Brashner Motor Car Co. has been moved from Fourth and Gay Streets to 167 North Fourth Street. It handles the Studebaker in central territory.

Connecticut News—S. A. Miner, Hartford, distributor of Pierce-Arrow cars in northern Connecticut, has opened a new service station on Spruce Street. The building is of steel and brick one story high and fully equipped. The floor space is nearly 100 ft. square.

E. C. Andrews, Hartford, formerly of the Overland-Hartford Co., in the wholesale department has accepted a position as Connecticut district manager of the Chevrolet Motor Co., Inc.

The Williams sales stables, Hartford, have been torn down to make way for a new building to be erected by W. W. Walker which is to adjoin the service and sales building of R. P. Taber, Reo distributor, now in course of construction.

The R. D. Britton Co., Hartford, Conn., has doubled its salesroom capacity by utilizing the west side of the garage proper. The change gives the concern one of the very largest show rooms in the city.

E. H. Harris, Hartford, treasurer of the Charter Oak Motor Car Co., Chandler and Hupmobile distributor, has acquired the old local factory of the National Biscuit Co., at 99-103 Albany Avenue. Upward of $100,000 will be expended in the improvement of the property. The building will be remodeled and the main floor will be dropped to the street level and will be changed to accommodate two stores. A modern service station will be provided in the course of alterations. This acquisition adjoins property owned by Mr. Harris.

News from the S. W.—The Lexington K. C. Co., Kansas City, Mo., has moved from 1729 McGee Street to 1924 Grand Avenue.

The Ramsey Auto Co., Kansas City, Mo., has taken the agency for Western Missouri and Kansas of the Detroiter Six.

Roy and Elmer Chamberlain, Smith Center, Kan., have bought the garage of Will Bell, and taken his agency for the Maxwell and Overland in that section of the State.

The Shawnee Motor Co., Topeka, Kan., has the North Topeka agency for the Overland.

The H. A. Dougherty Motor Co., Kansas City, Mo., distributor of the Republic truck and the Smith Form-a-Truck truck of Chicago, will soon be established in its new quarters at 1701 to 1707 McGee Street. It has a new brick and concrete building 105 by 122; on the McGee Street frontage is a display room and the offices, 50 by 105 ft. In the rear is the service department and a parts department. The basement is also to be used for shops, with complete equipment for gear cutting, in fact, equipment with which an entire automobile could be built. There are numerous skylights serving the first floor. A private garage is entered from Seventeenth Street, for the automobiles of the heads of departments. Across Seventeenth Street a two-story building 100 by 100 has been leased for storage and paint shop. The company retains its former quarters, 1808-10 Grand Avenue, for a body factory, and machinery for woodworking is being installed there. Mr. Dougherty was for 7 years manager of the Overland company at Kansas City. H. M. Genung, manager of the Dougherty company, was also with the Overland before the branch was established in Kansas City.

Edwards & Standish, Larned, Kan., are opening a new salesroom which will be the headquarters for the Inter-State.

J. T. Tough & Son, Metz, Mo., have bought a garage at Mound City, Mo., and have taken the Ford agency.

Charles Scherrer, Admiral and Independence boulevards, Kansas City, Mo., are now agents for the New Era.

The Buick Garage, Sweet Springs, Mo., will henceforth be operated by John Eckhoff and his son Harry, Mr. Eckhoff having bought the interest of his partner, Des Haggard.

Lester Cadman and Mr. T. Bird, Joplin, Mo., have been transferred to the Kansas City branch of the United States Tire Co., the Joplin branch having been discontinued.

The Verdict on the Hudson Super-Six

THE Super-Six at this writing—May 25—has been on the market five months. Over 7000 of the cars are now running. The resultant demand exceeds anything ever known among high-grade cars.

All our general advertising on the Super-Six has been stopped for months, because of the over-demand. For months the Hudson factory has run in three shifts, 24 hours per day.

We have been steadily building new factory additions. Scores of big machines to equip them have been brought in by express. We are now equipped to turn out 4000 cars per month.

We prepared in advance for a doubled demand, but the demand for the Hudson has quadrupled. And every day increases it as new cars go into service.

Still the demand for the Super-Six is only beginning. It will be a year before men in general realize its supremacy. This has always been true, and will ever be true, of every great advance.

But the man who buys a fine car would do himself a vast injustice if he failed to get the Super-Six. A lesser car will mean years of regret. It will mean a car which is far outclassed in performance and endurance. It will mean less pride of ownership.

We urge you, for your own sake, to consider these things and to prove them.

HUDSON MOTOR CAR COMPANY

Suggestion No. 22

Costly Explanations

Many and many a retail car sale has been lost because the dealer had to "explain" the unknown speedometer on his car.

It can't be done, for car buyers know the Stewart—know that it is their safest guide as to the quality of a car as a whole—know that 95% of all car manufacturers use it as standard equipment—know that a manufacturer who doesn't use the Stewart is not willing to pay the little extra for quality.

Why buck the stone wall of public sentiment?

For every penny saved on a cheap speedometer, dollars are lost in retail sales.

Insist that the car you sell be equipped with Stewart Products.

"No car is better than its accessories"

S. A. E. Off On Lake Cruise

550 Members Leave Detroit on S. S. Noronic for Record-Breaking Summer Session—Complete Nomenclature Report Accepted—Dunham Is Nominated for President

MACKINAC ISLAND, MICH., June 13—*Special Telegram*—Just a little over 24-hr. old is the Society of Automobile Engineers' annual convention and midsummer meeting, but already it has written itself upon the annals of the Society as one of the most successful events it has ever held. To-day, at 3 p. m., the party landed at Mackinac Island and paraded ashore in groups made up by the six sections of which the Society is composed, and the members unattached to any of the geographical sections. Gayly-colored hats, bands and banners arrayed against the verdant background of historic Mackinac made a brilliant picture which will long live in the memories of those fortunate enough to be present. The vessel is running very closely to the schedule which had been announced and the professional sessions have been going on with methodical progress. The waters of Lake Huron have been exceptionally placid, the weather beautiful and the 550 members of the party have been enthusiastic over the success of the trip, which is only passing its first quarter with 3 more days to go.

Many Interesting Points

Mackinac Island offers some interesting points to the sightseer. Its historic forts and old Indian camping and burying grounds are still to be seen and the party of engineers soon covered the entire island, driving to the more removed points and searching out the places of interest. As the group paraded ashore a moving picture man recorded the antics of the party, so that those at home will have an opportunity of seeing what they were unfortunate enough to miss. The first affair was in the way of a get-together event in which the members of the party searched for various unknown Raffles who were disguised as ordinary members of the party. This served to make the party acquainted with each other, and in the evening after the professional session, there was dancing and later a midnight luncheon.

Meetings Well Attended

The engineering meetings are all well attended, the space on the observation deck being crowded at every session. After Russell Huff had made the principal address at the opening of the meeting yesterday, C. F. Kettering, engineer of the Delco company, gave a talk on the accomplishments in pure science within the last few years. His lecture, which served as a curtain-raiser, was far from abstruse and was very spectacular with experiments of a very interesting nature with such materials as radium and liquid air. Even some of the ladies found this talk so interesting that they lingered on the balcony above the speaker to watch and listen. This morning papers were read by D. D. Ormsby on Differential Substitutes, A. P. Brush on High-Speed Engines, Herbert Chase on Possibilities of the Constant Pressure Cycle, and K. W. Zimmerschied read the paper by Professor Gallup on Car Performance. The discussions on these papers appear in the following pages.

Entertainments Planned

The boat is due to leave here at 5.30 p. m., and this evening, after supper, there will be an entertainment by the members of the Pennsylvania section and another by the Cleveland section. Henry Hess, on behalf of the Pennsylvania section, it is understood, will show his examples of color photography, an art which he has been experimenting with for some years. The entertainment of the Cleveland section is being kept a secret. After the entertainments a dancing contest will be held. Everything points at the present time to a highly successful convention from a social as well as from an engineering standpoint. The professional program is well arranged and the papers are of such importance to the industry and indeed, to the entire automobile-buying public that every engineer who could possibly afford to be on board is here or is represented. The eagerness with which the sessions are attended and the spirit of the meetings show that the importance of the program is realized, and in all probability by the time the vessel docks at Detroit next Friday, the entire program will have been gone through with, as arranged. To-morrow is a picnic day for the whole party with nothing scheduled except a day of enjoyment, and in all probability many of the members will take advantage of the opportunity to fish in the far-famed waters of Killarney and Georgian Bay. There will be a side trip on the steamer Waubic through the scattered islands in the bay, and also games and athletic contests, giving the engineers an opportunity to relax.

Important Standards Work

S.S. NORONIC, GREAT LAKES, June 12—*Special Telegram*—Punctuality has been the watchword of the first day's work of the largest meeting the Society of Automobile Engineers has ever held. With 550 members on board, the Noronic pulled out from the dock shortly after 3 p. m. and was well on her way to Lake St. Clair by the time the standards committee meeting was due to begin. The various committees of the Detroit section who undertook to care for the many needs of so large a party have done their work in a way that has earned the unstinted praise of every member of the party. On the lowest deck a theater has been arranged and it was here that the standards committee was called to order by Chairman Clayden this afternoon.

Nomenclature Report Accepted

Owing to the fact that the last meeting was held at the end of May, there have not been many division meetings, and no great quantity of new business was before the house. Reports had been prepared by the chairmen of most of the divisions, however, and one subject of the utmost importance was accepted by the committee. This was the complete report of the nomenclature division containing a name for every principal part of an automobile. The work of compilation has been difficult and has taken over a year of constant hard work on the part of the chairman of the division, K. W. Zimmerschied, of his many helpers and of the recorder, A. C. Woodbury.

Already the names chosen are appearing in the manufacturers' parts lists, and the old-time confusion should be a thing of the past before another year has gone. The ready way in which the industry has accepted the work even before it was complete is the greatest testimony to its value. On behalf of the electrical equipment division the most important parts of the report were a complete list of sizes and dimensions for flexible steel conduit for incasing electric wires. This includes fifteen sizes from 3/16 to 1 in. inside diameter.

Standard Headlamp Bracket

A standard headlamp bracket was accepted in three sizes which cover all requirements, this being first fruit of the subcommittee which has been at work on lamp standardization generally. It was reported that the sub-committee had conducted a number of tests of lamps and bulbs at the National Lamp Works and had discovered certain important facts with respect to the shape of filaments and reflectors. This work is to be continued and it is hoped to complete it by Winter. Other resolutions suggested by the lamp committee and accepted were: Sockets for bulbs should be so set in lamps that the pins on the bulb base are vertical; that lamps should be mounted not less than 3 ft. high, measuring from the ground to the center of the lamp, and *that dimming devices are not to be recommended for the purpose of eliminating glare.* Standards presented by the carbureter fittings division were accepted for throttle lever throw, for throttle lever rod ends and for gasoline pipe sizes, this phase being converted to pipe tap sizes for gasoline tube unions. The throw of the throttle lever end is to be as follows: 1½ for the three smallest standard carbureter sizes, 1¾ for the next five sizes and 2½ for the three largest sizes.

The electric vehicle division reported progress and recommended some specified dimensions for charging plugs which were accepted.

Speedometer Connection Standard Impossible

The miscellaneous division reported that the hoped-for standard speedometer drive connected had proved impossible at the present time. New recommendations accepted included standards for taper sockets for fender irons, the formula and standard dimensions for piston ring grooves previously reported, and an increase of ¼ in. in the length of thread of the standard S. A. E. bolt. Progress was reported in the many other matters before the division.

The iron and steel division added little to the report given at the Cleveland meeting. A new steel was added and it was also recommended that: It is inadvisable to advocate standard colors for designating steel bars in stock because the difficulties seem insurmountable. The number of permanent colors available is limited, and the range of steels large. As each user requires only a limited number of steels it is not so difficult for him to select colors adapted to his own needs.

From the other divisions only progress reports were presented, but these show great activity and many matters rapidly approaching the final report stage. There was little discussion on the reports which is testimony to the thorough work of the division.

Aeronautic Standards

Henry Souther spoke on the new division for aeronautic standardization, outlining the great need for standards in military machines. It is obvious that the other divisions of the standards committee will be kept busy by the consultative demands of the new division. Howard Coffin also spoke on the same subject, saying that there were 30,000 men being trained by the allied armies and that the allowance was four aeroplanes per man at the front. He added that the number destroyed daily was greater than all in America.

The evening session opened by President Russell Huff who made a short address.

Should Have More Members

He said that though the membership of the Society was now nearly 2000, this was far short of what it ought to be. At the council meeting held that morning the matter of affliating some other allied societies with the S. A. E. was discussed. Mr. Huff said that the aeroplane, the passenger car, the truck and the tractor, even the motor boat, all had much in common and that a natural bond bound together engineers in all these professions. There were about 900 different firms represented by the membership of the Society, and lists which had been compiled showed 5000 firms which could fittingly have such representation. At present the number of men per firm shown on the membership list was 2.2, though some firms had as many as ten representatives. Even figuring on only one per firm, the Society's roll ought to contain 5000 names. Continuing, the president thanked the different committees, mentioning that the membership committee had met with wonderful success; that the finance committee had the accounts of the Society in splendid condition, and that the standards committee was showing a still greater activity and doing most satisfactory work. He added that the excellent papers offered had gone far to increase the power and importance of the sections which showed a remarkable growth. Mr. Huff mentioned the fact that the war department had twice called upon the Society for conference work in connection with the army truck specifications, and that much good had resulted. He also drew attention to the fact that there were two past presidents of the S. A. E. on the naval consulting board, A. L. Riker and Howard Coffin, the latter also being chairman of the industrial preparedness committee, while a third past president, Henry Souther, was consulting engineer to the aviation corps by government appointment.

$47,000 in the Treasury

Concluding his address, Mr. Huff called upon Herbert Chase to read the treasurer's report. This showed a balance in hand of $47,000 and contained the information that unexpected demands upon the funds had been more than met by uncalculated increase in the membership. Mr. Chase stated that the finance committee hope soon to be able to place all initiation fees in the reserve fund as is done by some other societies. Meanwhile a considerable sum is being held as a reserve.

1910 Members

Next came the report of the membership committee, read by R. C. Combs. This was a brief statement showing that the present membership was 1910 with ninety-seven applications on file. This is considerably higher than the previous high-water mark of 1852 in 1914.

Nominations of Officers

George W. Dunham, consulting engineer, was nominated for president of the Society for the coming year with J. G. Vincent, Packard Motor Car Co., as vice-president, and B. B. Bachman, Autocar Co., and F. E. Moskovics, Nordyke & Marmon Co., as councilors. Herbert Chase remains treasurer. The nominating committee held at the business meeting consists of K. W. Zimmerschied, Detroit section; F. E. Place, Mid-West section; G. P. Dorris, Indiana section; E. S. Foljambe, Pennsylvania section, and David Fergusson, member at large.

Before closing the business meeting, two presentations were made. K. W. Zimmerschied was made a life member of the Society without the payment of further dues, in recognition of his valuable work as chairman of the standards committee up to last January. Captain Foote of the steamship Noronic was presented with a clock as a token of friendship and admiration for the masterful way in which he has handled his vessel on the S. A. E. cruises and for his seamanship in negotiating the tortuous and rocky passages of Georgian Bay with the large steamship.

A movement being on foot to ally the activities of the Society with the marine, tractor, stationary and aeronautical fields may mean the addition of four vice-presidents to the governing staff of the organization and two additional members of the council. The societies which represent the activities of these four kindred industries have made a move toward consolidation with the S. A. E. and this gives prominence to the thought that in a very short time the membership of the Society will be greatly increased and its power and influence also greatly expanded.

Kettering Opens Professional Session

Never has a more interesting talk been given the Society than that by C. F. Kettering, Delco engineer, in opening the professional session. Mr. Kettering offered the rare and happy combination of a fascinating subject and a clever lecturer, and consequently kept the 300 attending members spellbound as he led them through some of the wonderful developments in materials recently obtained through the medium of pure science. He spoke of how our close attention to the work of production has allowed us to forget to a large extent the work of the experimental scientists who are forever searching through the medium of pure science for new materials and new methods. As a concrete example he mentioned alloy steels and rubber. Our cars would be ponderous affairs if it were not for the alloy steels which compose the principal parts. It would be impossible to make them anywhere near as economically if it were not for the alloy steels that are necessary in the tools that turn out the metal parts. Vulcanization was discovered in the laboratory and from this seemingly unimportant discovery the entire art of rubber working with all its importance to the human race came into being. Another simple discovery, if regarded superficially, was that of mixing tungsten with other metals. This discovery has revolutionized the manufacture of automobiles, as it is the basis of high-speed steel, without which present manufacturing schedules would be impossible. Mr. Kettering related the development of the tungsten filament lamp. He spoke of how it was once a draw between the Welsbach gas mantle and the electric lamp. The question was to secure more light for the same expenditure of energy. The carbon lamp was improved and then the tantalum lamp was introduced. This in turn was succeeded by the tungsten filament. The carbon filaments were first manufactured by squirting cellulose through a die and then carbonizing the cellulose. After this the cellulose was removed, leaving the carbon filament. The reason of this method of manufacture was that the filament was very fragile and of unequal thickness with the reason that its life was short and great care had to be used to protect it against jar and vibration.

When the tungsten arrived it was first manufactured by the same process, being mixed with a binder and then squirted through a minute opening. The binder was then removed, leaving the tungsten filament. This was very delicate and had to be handled with the greatest amount of care, but it did have three times the illuminating power for the same amount of energy consumption.

Drawing Tungsten Wire

How to draw the tungsten into a wire filament was the next subject of study. In order to make the dies it was necessary to pierce the diamond—the only material hard enough—with a hole 2/1000 in. in diameter. This was finally accomplished and the experimenters were at last able to produce 2200 ft. of wire before the die broke. The bulbs at first were made of vacuum type, but it was discovered that if an inert gas were introduced into the bulb the illumination was greater, hence nitrogen was used. But it was discovered that after a while the nitrogen went into combination with the tungsten, forming nitrides of the metal, so that now argon is used. Without tungsten we would not have the wireless telephone receivers which allow us to talk nearly across the Pacific Ocean.

Bakelite was the next example of a new material. Mr. Kettering spoke of how it had been discovered in the laboratory, that two chemicals—carbolic acid and formaldehyde—if heated under pressure, reacted together to form a new

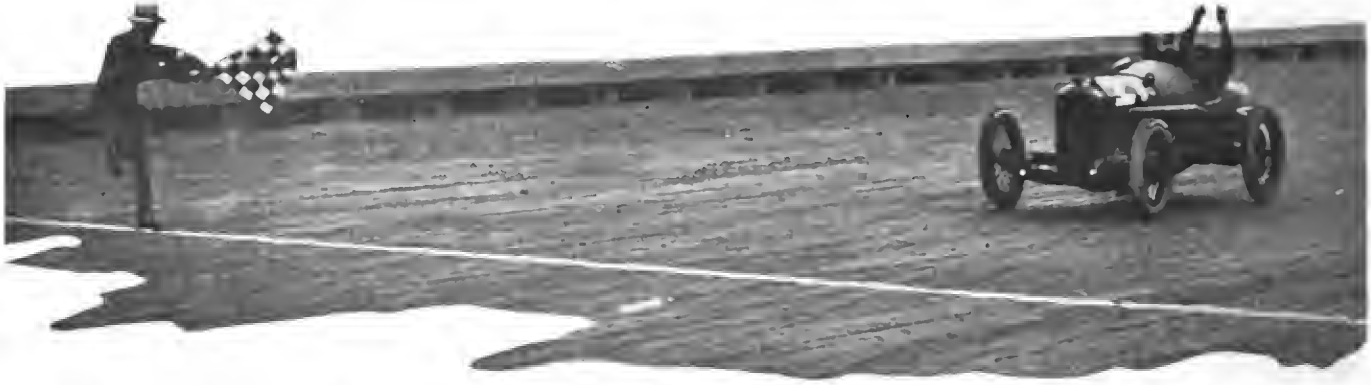
Resta Captures Chicago Derby

Covers 300 Miles in Peugeot at 98.7 M.P.H.—De Palma Second After Terrific Speed Duel with Leader—Christiaens Third in Sunbeam



Resta, in the Peugeot, getting the checkered flag as he roared across the finish line, winner of the Chicago Derby

By L. V. Spencer

CHICAGO MOTOR SPEEDWAY, June 10—Thundering over the finish line in his blue Peugeot, Dario Resta, fresh from winning the Indianapolis classic, to-day repeated his victory of a year ago in capturing the 300-mile International Derby on the Chicago speedway at an average speed of 98.61 m.p.h., his time for the three centuries being 3:02:31.64, or bettering his last year's mark made here, when he covered this distance at an average speed of 98.2 m.p.h. Although no speedway records fell before the onslaught of the French-built racer, Gil. Anderson's mark of 102 m.p.h made last Fall in the Stutz at Sheepshead Bay still standing, the thrilling battle of brain, muscle and machine between Resta's Peugeot and De Palma's Mercedes will long be remembered by every one of the 90,000 spectators who thronged the stands and field.

Although Resta added another to his list of victories, neither he nor the crowd was sure of that victory until there remained but two laps to go. Ralph De Palma, driving his cream-colored Mercedes, seemed to be about as certain to get the checkered flag first as did the eventual winner, until a spark plug interfered in the 296th mile.

Resta and De Palma had been fighting, fighting for over 150 miles, almost hub to hub the entire time, and it looked as if the winner would lead by less than a car length, when on the back stretch the eager crowd saw De Palma slow down and Resta shoot ahead as he had not been able to do since he had left the procession and come into the front rank back in the 120th mile of the race.

Then the crowd knew that De Palma's jinx had come to him again, just as it did in 1912, when, in the Indianapolis 500-mile race of that year, he had been robbed of practically certain victory with about two laps to go because of a broken piston.

De Palma, who finished second, snapped with Resta, the winner, after the race. De Palma, who drove a Mercedes, has his hand on Resta, Peugeot pilot

And to-day, as on that day 4 years ago, De Palma proved himself to be the gamiest of the game. For he smiled philosophically as he rolled by in second place, after having stopped at the pit to change that $6,000 spark plug on his green-flag lap. De Palma has tasted defeat before when victory was almost within his grasp, and he knows a race is not finished until the last lap has been completed.

De Palma covered the 300 miles in 3:04:25.37, or at an average speed of 97.6 m.p.h., and was well ahead of Christiaens, who was third in a Sunbeam, one of the two English sixes which were among the staunchest in the race. Christiaens made the three centuries in 3:07:55.48; and less than a minute behind him was O'Donnell in a Duesenberg, who finished in 3:08:30.46, at an average speed of 95.48 m.p.h. Next came Galvin in the other Sunbeam, whose time was 3:10:23.45. Close on his heels was Vail driving a Hudson, about 7 sec. behind, with a time of 3:10:30.65.

The other four who came within the money were farther apart, although all were running well as they crossed the tape for the last time. D'Alene, driving the Duesenberg that gave him second money at Indianapolis this year, drove it to seventh place to-day, finishing in 3:13:2.85. Two minutes later Gable ended his grind in a Burman Special, with a final time of 3:15:51.31; and ninth place went to McCarthy in another Hudson Special, doing the distance in 3:19:10.73. He had about a 5-min. lead over Lewis in the Crawford Special, the latter getting tenth money with a time of 3:24:58.07.

Oldfield Goes Out Early

Early in the race Barney Oldfield looked to be a serious contender in his shiny blue Delage, but it broke a driveshaft after 18 miles and left the veteran driver a spectator. Eddie Rickenbacher, who was among the first three for over 100 miles, and who was driving Mulford's Peugeot, was forced to drop out with a broken valve after he looked to be a favorite with many for first money. After the withdrawal of all of the Indianapolis cars on Carl Fisher's edict against Sunday driving, Rickenbacher, who was to have driven his formidable Maxwell, received permission to drive Mulford's car, the latter also having scruples against contending in a Sunday race.

Winners of Chicago Derby

Car	Driver	Time	M.P.H.	Prize
Peugeot	Resta	3:02:31.64	98.70	$13,000
Mercedes	De Palma	3:04:25.37	97.60	6,500
Sunbeam	Christiaens	3:07:55.48	95.78	3,000
Duesenberg	O'Donnell	3:08:30.46	95.48	1.500
Sunbeam	Galvin	3:10:23.45	94.54	1,300
Hudson	Vail	3:10:30.65	94.48	1,200
Duesenberg	D'Alene	3:13:02.85	93.24	1,100
Burman	Gable	3:15:51.31	91.90	900
Hudson	McCarthy	3:19:10.73	90.03	800
Crawford	Lewis	3:24:58.07	87.80	700

As is always the case, the winning cars made the fewest pit stops. Resta stopped only once, changing a right rear tire and taking on supplies of gasoline, water and oil. This was in his 121st mile. Likewise De Palma had been forced to make but one stop up to the time his spark plug trouble came. In his 105th mile he stopped for a left rear tire change and for supplies, and it looked as though he was going to equal Resta's one-stop record when his disappointment came. Coming slowly back to his pit after ignition had cost him a possible $6,000, he lost no time in removing the defective plug and getting away again for second place. But it was too late, when he was under way once more, for him to catch the fleeting Resta.

Twenty-one Starters in the Race

Twenty-one cars started. Starter Wagner and his able coadjutor, Chairman Edwards of the technical committee, gave each driver his position, and then final instructions were doled out to each crew. Amid stirring music from the band, drivers, mechanics and officials lined up before the camera men and moving picture operators for the customary photographs. Then, with De Palma as the pacemaker—he had the pole—the cars circled the track once at a mile-a-minute clip, and being fairly well bunched when they again passed the line, the signal was given and they were off for Chicago's second race and perhaps one of the most thrilling speed duels the sport has ever known.

The crowd knew it would be a fierce struggle between Resta, De palma and Rickenbacher, at all times mindfull of the stamina of the English Sunbeams, of the dark-horse possibilities of Oldfield and the fight that was in the Duesenbergs. Never was a gathering of over 90,000 persons treated to greater thrills than in the terrific speed battle that was to follow the thrillingly swift send-off.

Resta Takes the Lead

At 20 miles Resta was in the lead, with De Palma about half a lap behind and O'Donnell in his Duesenberg a close third. Back of him came Rickenbacher, driving in characteristic style, and then the two Sunbeams appeared, Christiaens leading his team-mate by a few yards. The rest of the field was spread out somewhat; but before another ten laps had been covered Rickenbacher was stepping on his accelerator and climbing toward second position, fighting it out strenuously with Resta. O'Donnell was a little ahead of De Palma, now in fourth place, and the Sunbeams hung together fifth and sixth. Several of the drivers were doing their utmost to capture the coveted first position but others hung back for strategic reasons.

Rickenbacher in the Van

Driving at a terrific pace, Rickenbacher forged into the lead and Resta, perhaps a little more conservative, clung to his set pace just behind, leaving the others in about the same relative positions they had held 20 miles before. But O'Donnell had to stop for a tire change and this put him in seventh place at 80 miles, with Resta leading and Ricken-

Sending off the cars in the running start of the 300-mile International Derby on the Chicago Speedway

Times Made by Cars in the Chicago Derby at 20-Mile Intervals

Peugeot	Rickenbacher	12:11	24:06	36:11	47:53	59:35	1:11:14										

bacher at his heels. De Palma then went into third position, and for the next 40 miles the three tore along, alternately striving to get the pole so as to gain the advantage. The illustration at the top of the opposite page gives an idea of this excitingly close struggle.

De Palma Grasps His Opportunity

Trailing the two Peugeots, which were fighting it out for the lead, Resta having it at 80 miles and 100 miles and Rickenbacher getting the upper hand at 120 miles, De Palma soon had his chance to come to the front. Like the super-driver that he is, he soon saw his opportunity. Having stopped at his pit on the 104th mile, where he replaced a tire and took on oil and gas, he was driving like mad to regain lost ground, when suddenly Resta hove in sight and limped to his pit. This was in his 120th mile, and a right rear tire was the cause. But before he could get away Rickenbacher, too, stopped, he being in the lead and on his 122d mile. This was De Palma's chance. With the two Peugeots at a standstill, he put on some more speed and clipped many seconds off the gap between himself and the Peugeots.

Rickenbacher Is Out

But Rickenbacher was not to trouble him further. A broken valve meant that the race would be between the cream-colored Mercedes and the blue Peugeot. Resta was soon on his way again, and then the day's real excitement began. Almost from that minute the immense crowd was treated to real racing. It was the kind they had paid to see, and one minute Resta had the lead, then De Palma, by a master spurt, had overtaken him. The spectotars never knew which car would be ahead until they were directly in front of them.

A Terrific Speed Grind

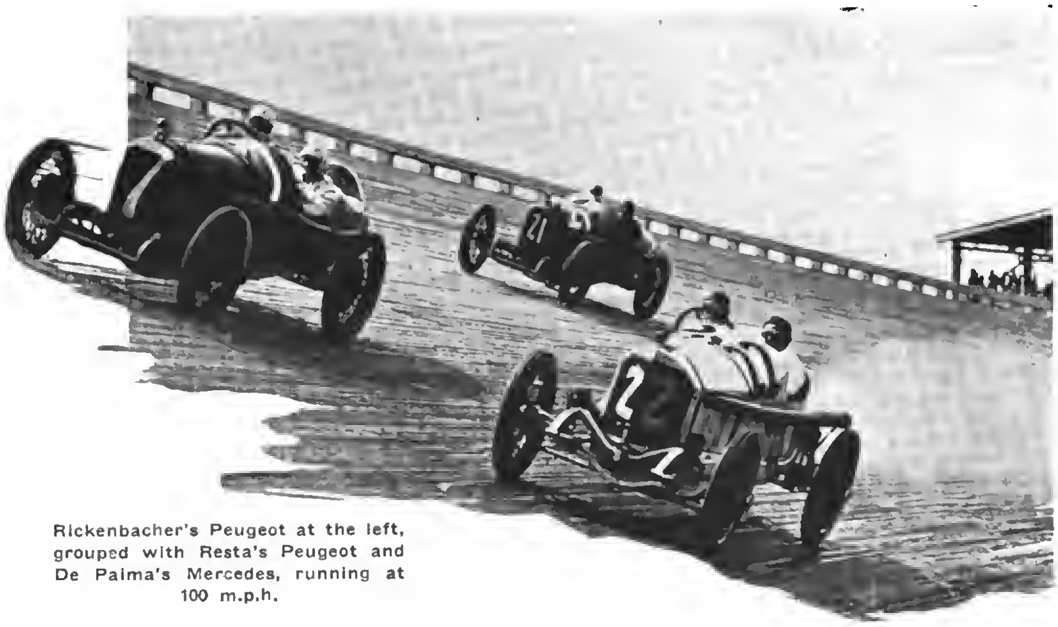
On they sped, lap after lap; now Resta was two car lengths ahead of the Mercedes, now he was trailing it by the same amount or more. It was evident to all that if they kept it up it was simply a matter of which car would withstand the grind the longest. At 280 miles De Palma took the lead again, after Resta, by terrific bursts of speed, had snatched it from him time and again. There never seemed to be much advantage for either car; they passed each other at intervals amid the cheering of the crowd.

Resta Regains First Place

The rest of the field, all running well, was forgotten for the time being in the breathless excitement of that great duel of speed and nerve. Now another car would get in the way of De Palma and he would bow before Resta's better position on the track or the turns; then Resta would have to relinquish his place to De Palma's more advantageous location.

With only 24 miles more to go, and with neither driver able to shake off the other, it promised to be a finish the like of which American speed fans had never before witnessed. But De Palma was allowed to hold the lead for only 6 miles more, when Resta again forged ahead on a terrific sprint on the home stretch. For 10 miles more Resta clung to his place by barely a car length. It seemed as if the Mercedes would run into its rival at each moment, until at the tape on the 292d mile they were almost abreast. De Palma getting the lead at the turn by nosing the Peugeot out of the pole position. Now De Palma had the race, the crowd thought; but, almost as they said it, the Peugeot was seen to

Resta leading De Palma at the 290th mile of their thrilling speed duel for first place in the Chicago Derby shoot ahead on the back stretch. Something had happened to Ralph, for he slowed down in front of the far grandstand and came home to his pit at a moderate pace. All was over, for there was no stopping Resta. Almost before De Palma could change the plug that had done the damage Resta had the green flag, and a few seconds later was cheered as the winner once more.



Rickenbacher's Peugeot at the left, grouped with Resta's Peugeot and De Palma's Mercedes, running at 100 m.p.h.

Sunbeam Third

Christiaens, who had clung to third place ever since his 180th mile, was quick to see his advantage and gave his mount every ounce of speed it had in an effort to take the unfortunate De Palma's lead away from him for second money; but the Mercedes was too far ahead for that. The Sunbeam proved itself a car of stamina, for it covered the distance with much credit and had reserve power for a brilliant finish. O'Donnell's Duesenberg also made a great showing. Taking the fourth position away from Vail's Hudson in the 240th mile, it held to its acquired berth to the end. Galvin's Sunbeam also bested Vail in the last 20 miles for fifth money, but the Hudson was not to be shaken from sixth position.

Two Cars Flagged

Only one other car finished the full 300 miles. This was Buzane's Duesenberg, which came in eleventh and at least had the credit for going the distance. Two cars were flagged —Johnson's Crawford, on its 290th mile, and Henning's Ogren, at the 246th mile. No accidents marred the day, leaving Chicago's track still unblemished by a fatality. There was a chance for trouble, however, when Galvin's Sunbeam skidded just after finshing its last lap and on the southern turn. The car whirled around and crashed into the inner guard rail, but neither driver nor mechanician was injured. Henning threw a tire on a turn also, but he retained control of his machine.

$30.000 in Prizes

The cash purses amounted to $30,000. Resta won $13,000; De Palma, $6,500; Christiaens, $3,000; O'Donnell, $1,500; Galvin, $1,300; Vail, $1,200; D'Alene, $1,100; Gable $900; McCarthy, $800, and Lewis, $700. Of the $500 prizes for leaders at 100, 200 and 250 miles, Resta secured two and De Palma one, for his lead at 250 miles.

Too Many Tire Changes

Studying the tire situation, as developed in this race, one cannot but feel that too many tires are blown in these races. Tire changes before the shoes were actually blown were down around 10 per cent of the total. It not only endangers the drivers, but also the cars when these shoes are blown on the turns at speeds around 100 m.p.h. The tendency for the car to spin about one of the wheels is great, especially on the cars fitted with the heavy and long tails which carry the center of gravity some distance to the rear.

Nineteen Right Rears Changed

A right front shoe, blowing at a critical moment, makes the car very difficult to handle in the counter clockwise direction used in the races. There were five right front tire changes in the race and all of these were blown. Of course the majority of changed tires were right rears. A total of nineteen of these were made, of about two-thirds of all the tire changes. This is lower than the average percentage in these races where generally over 75 per cent are right rears.

Too Much Smoke

Another feature which may be criticised is the over-lubrication which was common, to the detriment of plugs and valves and the enjoyment of the spectators. The smoke was particularly bad when the cars drew up at the pits and, naurally, in getting under way. At times the track was clouded over to such an extent that it was difficult to drive through.

Resta Adds 900 Points to Lead for Championship

22 DRIVERS COMPETE FOR HONOR

New York City, June 12—A total of 1800 points is placed to Dario Resta's credit in the championship table of 1916. By winning the 300-mile race at Chicago yesterday, 900 points more was added to a like number made by winning the 300-mile race at Indianapolis on Memorial Day. So far he has a tight grip on the title of champion driver of the year and for the leader's share of the $10,000 purse hung up by the B. F. Goodrich Co. and the $3,500 donated by the Bosch Magneto Co., including the $1,000 Bosch trophy.

Resta has increased his lead over Rickenbacher by 1185 points, the latter adding only fifteen points in the Chicago race in which he was placed in eleventh position. D'Alene held on to third place and De Palma moved into fourth place. Christiaens passed Vail, Mulford and Devigne by recording 240 points more, thus pulling him from seventh to fifth place in the table.

Twenty-two drivers now figure in the championship table, the standing being as follows:

Resta	1800
Rickenbacher	615
D'Alene	510
De Palma	470
Christiaens	370
Devigne	320
Mulford	240
Vail	220
O'Donnell	130
Devlin	90
Oldfield	80
Galvin	80
Adams	55
Wilcox	40
Watson	35
Gable	30
Johnson	30
Chandler	25
McCarthy	25
Henderson	22
Haibe	20
Lewis	20

Over 70 Stops Made at the Pits

The pits at the Chicago Speedway during the race. Resta is stopping for gasoline and tire

OVER seventy stops at the pits made this one of the liveliest races that has ever been witnessed from a technical standpoint.

Twenty-nine worn and blown shoes were changed, fifteen stops were made for gasoline, eight for plugs, eight for water and eight for oil. The other miscellaneous stops including those which from their nature were permanent totaled fifteen.

Henning was king of the tire changers, as he went the entire circuit on his car, changing both fronts and both rears in rapid succession and then shortly afterward changing the right rear twice again, making a total of six tire changes. There never was any doubt about his having to change any of his shoes either, as they generally resembled a bunch of rags whenever he rolled up to the pits to make a change.

Oil Adjustment Important

Outside of tires, the question of oil adjustment is the one that had the most to do with success or failure. A little too much oil meant sooted plugs which soon brought cars to the pits for time-consuming changes; a little too fine an adjustment meant burned and seized bearings which destroyed the chances of the car permanently. Thus this question of oil adjustment is paramount. It varies even with the track, and it is the one point upon which all the drivers have to work with the keenest appreciation for conditions in the race, in order to keep the car on the track and away from the apron along the pit wall.

The eight stops for plugs represent a very small percentage of the cars, as three of these were made by Johnson in his Crawford and three by Buzane in the Duesenberg. Thompson also stopped once for a plug change and De Palma, with the demon of ill-luck still pursuing him, had to make a plug change when he had an even chance for first money. The delay cost him the opportunity for the final battle across the finishing line and spoiled what should have been the prettiest sprint ever seen on a speedway.

Eight stops were made for oil. Altogether the drivers played on the generous side with the oil supply. The smoke on the track was more than has been seen in some time and very often the officials were almost in doubt whether or not to rule off cars that gave forth too much of the blue-gray vapor. The race was only a few minutes old when Tom Alley was flagged off for excessive smoke.

Few Stops for Water

A sidelight on the plug changes of Buzanne may be noted in his stops for water. These also numbered three, and from the two factors, plugs and water, it can be inferred that overheating was the cause of the stops made by him. This trouble was due to the fact that the packing gland at the water pump connection was leaking.

The greatest number of stops during the day was made by Henning in the Ogren. He drew up at the pits nine times.

Barney Oldfield was out early in the race. For some time he was in doubt as to the exact nature of the trouble, but finally traced it back to the transmission drive members. Broken connecting-rods destroyed the chances of Thompson, Rawlings and Watson. A broken valve put Mulford's Peugeot driven by Rickenbacher out of the running and finally, Frank Galvin broke a steering link on his last circuit and crashed through the retaining wall into the infield. Luckily neither he nor his mechanic were injured.

Haibe in the Osteweg started with a sticking valve and ended prematurely with the same trouble. He rolled into the pits several times to apply oil to the stem of the valve, but the sticking finally became so bad, due to the added expansion when the motor became hot, that he had to withdraw.

4:06 p. m., 5 min. Repacked water pump; took on water.
4:31 p. m., 9 min. Wires broken water pump bracket in place; took water.
4:58 p. m., 4 min. 3 sec. Repacked water pump gland; changed left rear tire.

Sunbeam—Christiaens. One stop.

3:47 p. m., 35 sec. Took on gas.

Delage—Oldfield.

2:25 p. m. Out; broken transmission.

A Study of High-Speed Engines

Reviewing the Reasons for Their Existence and Analyzing Several Important Problems of Their Design Including Lubrication and the Elimination of Balancing

By A. P. Brush
Consulting Engineer

THIS paper is a review of the reasons for the existence of high-speed engines and touches upon several of the problems in connection with their design, notably lubrication and the elimination of balancing. The author's analysis of the reasons which have brought the high speed engine into prominence are very interesting and admit of small debate, and his championing of the interconnected throttle and oil supply is also a matter with which few can disagree. The portion of the paper reprinted herewith deals with the problems of crankshaft balance, and is about as clear an explanation as could be devised. The paper follows:

We now come to a phase of engine design the effect of which increases as the square of the engine speed. In any rotating mass three kinds of balance are involved. For comparison and analysis I shall call them static balance, running clear an explanation as could be devised. The paper follows:

Static balance is secured whenever the axis of a rotatable mass passes through its center of mass, but such a mass need not necessarily be in either running or distortion balance.

Any mass in either running or distortion balance must however be in static balance; that is, running balance and distortion balance are each a special condition or form of static balance.

Running balance can be described as that condition or form of static balance in which any centrifugal couples are equal and opposed, and therefore neutralize each other.

Distortion balance can be described as that condition or form of *static and running balance* in which all centrifugal forces within any plane at right angles to the axis (that is, within any plane of rotation) are balanced.

For purposes of illustration and analysis, let us consider the diagrams of rotatable masses, Figs. 1, 2 and 3, in which A represents the axis, M any specified mass, R any specified distance between M and the axis, and C the center of mass of the system.

In Fig. 1 we have a case of static balance, inasmuch as A passes through C, but we have not running balance, since M and M' upon rotation about A will form an unneutralized centrifugal couple tending to force A out of position.

In Fig. 2 we have a condition of static balance (inasmuch as A passes through C) that is also running balance; that is the centrifugal couple between M and M' is equal and opposed to the centrifugal couple between M'' and M''', and there is no tendency to displace A as a whole. Fig. 2 does not, however, represent a condition of distortion balance, as the opposed centrifugal couples tend to bend the axis A.

If, however, our masses be arranged as in Fig. 3, so that M' and M lie in the same plane of rotation as do also M'' and M''', we have the special form or condition of static balance (inasmuch as A passes through C) that also represents running and distortion balance.

Balance in Four- and Six-Throw Crankshafts

As applied to conventional four- and six-throw crankshafts, static and running balance are, or should be, always achieved within the limits of workmanship.

For reasons I shall point out later, a single-throw crankshaft, for best results in service, should not be in either static or running balance; a two-throw crankshaft with the throws opposed, for best results in service, should be in static, but not in running balance.

It is only within the present period of high-speed engine developments that the importance of distortion balance, so nearly as it can be achieved in a crankshaft, has begun to be understood. Inasmuch as its functions exercise a certain control over the form of a crankshaft, what is commonly known as counterbalancing is required to bring any crankshaft into any condition of static balance.

Running balance in conventional four- and six-throw crankshafts, by means of counterbalancing, can readily be and, as I have said, is almost universally secured. Distortion balance in a crankshaft can never be absolute, because of the effect of its functions upon its form. The closest possible approximation to distortion balance that can be secured in any crankshaft was commonly known and used before the advent of the automobile.

Irreducible Minimum Distortion Couple

Fig. 4 represents a single-throw crankshaft in which M and M' are counterweights, having a common centrifugal effect equal to the centrifugal effect of the crank-cheeks and -pin. There is obviously a slight distortion tendency here, due to the fact that the pin mass lies between the counterweights M and M', with a slight resultant tendency to bend the crankpin. This approximation of distortion balance in a crankshaft can be properly described as the irreducible minimum or single-throw distortion couple, and will be recognized by all of you as ancient mechanical practice.

I shall hereafter refer to a crankshaft which has a single-throw distortion couple, as being in complete distortion balance. Of course no condition of static balance can be achieved in a single-throw crankshaft without resorting to the addition of counterbalancing masses, as represented in Fig. 4. In Fig. 5 however (representing a single-plane two-throw crankshaft) we find a condition of static balance (not of running balance) apparently without the use of counterbalancing. The counterbalancing exists, inasmuch as each throw acts as a counterbalance for the other. This is also true in Fig. 6, which represents the conventional three-bearing four-throw four-cylinder crankshaft. In Fig. 6 however (which like Fig. 5 is automatically counterbalanced without the addition of extra counterbalancing masses) we have a natural condition of running balance, but not complete distortion balance, and the center bearing is required to help resist the bending tendency due to the lack of distortion balance. This load on the center bearing, while negligible in low-speed engines, is by no means negligible in the modern high-speed engines, and it is not unusual to see counterbalancing masses added to shafts of this type as in Fig. 7 to bring them to complete distortion balance.

Two-Bearing Four-Cylinder Crankshafts

In small-bore high-speed engines the lack of distortion balance causes much greater load upon the center bearing than

does the explosion pressure in the cylinders. This fact accounts for some of the troubles encountered in two-bearing four-cylinder crankshafts. Two-bearing four-cylinder crankshafts for small-bore high-speed engines are entirely feasible, provided counterbalancing masses are added to the crankshaft as indicated diagrammatically in Fig. 8. In this figure the value given for the center counterbalancing mass is $2M+$, since the center crankpin carrying two connecting-rods is always longer than the two end pins. This difference in length and weight should be considered in determining the centrifugal value of the center counterbalancing mass.

In both Figs. 7 and 8 the distortion couple is reduced to the minimum of a single throw, although a counterbalancing mass is added only at one side of each throw. A counterbalancing mass might be added at each side of each throw, as shown in Fig. 4, but inasmuch as the crankshafts so far considered are all single-plane crankshafts (that is crankshafts in which the axes of all crankpins and the axis of the crankshaft lie in a single plane) the mathematical merging of two counterbalancing masses, opposed and in the same plane of rotation, results in a cancellation of their centrifugal forces and therefore *permits* the elimination of such masses. So far as the single-plane crankshaft is concerned, the securing of complete triple balance (that is, static and running balance with distortion couples reduced to the irreducible minimum of a single throw) is mathematically identical with the counterbalancing of a single-throw crankshaft.

Six- and Twelve-Cylinder Crankshafts

Let us now consider the three-plane crankshaft as used in modern six- and twelve-cylinder automobile engines. Fig. 9 shows a side and end view of a counterbalanced single-throw crankshaft, in which, as is obviously possible, the applied counterbalancing mass has a contour such that the included angle between its sides when viewed from the end is 120 deg., P representing the center of crankpin, A the axis of the crankshaft, and M the center of mass of the counterweight. If six of these throws are formed into one shaft with a bearing on each side of each throw, we can obviously have a conventional seven-bearing six- or twelve-cylinder crankshaft in complete triple balance.

If we omit a bearing between any two throws, one cheek and one counterbalance of each of these throws will lie in the same plane, as illustrated in the end view in Fig. 10. In this type of shaft the angle between each pair of adjacent crankpins, except the two center ones, is 120 deg. As in Fig. 9, P represents the center of the pin, A the axis of the shaft, and M and M' the centers of mass of the counterweights. Inasmuch as the specified included angle between the sides of each counterweight is 120 deg., these two counterweights when brought into the same plane by the elimination of an intermediate bearing, will have their adjacent edges in contact as shown along the line C. This means that the two counterweights can be merged into one having an included angle between the sides equal to the sum of the included angles of both weights, with the common center of mass lying in the line of union C of their adjacent sides, and having a mass equal to the sum of the two counterweights. Any form of counterweight can be used whose center of mass lies in this same line (C in Fig. 10), the centrifugal value of which is the same as the combined counterweights shown. For obvious mechanical reasons it will always be desirable to adopt a counterweight form with an included angle of less than 240 deg. between its sides, but the adoption of such a different form of counterweight in no way alters the mathematical fact that it is and must be the exact centrifugal equivalent of the two combined counterweights, as illustrated in Fig. 10.

Six-Throw Shaft with Two Center Throws

Now let us consider the special case of the two center throws in the conventional three-plane six-throw crankshaft. Fig. 11 shows these two center throws in the seven-bearing form of this type of crankshaft (that is, with a bearing on each side of each throw), in which A represents the axis of the crankshaft, P the center line of the pins, and M, M', M'' and M''' the counterbalancing masses. If, as in the four-bearing conventional three-plane six-throw crankshaft, the center bearing be omitted, this central portion of the shaft takes the form illustrated in Fig. 12, in which case complete triple balance can be secured for these two center throws with three counterbalancing masses instead of four, the center counterbalancing mass of the three obviously having a value of $2M$. An expedient that secures a close approximation to distortion balance is shown in Fig. 13, in which only two counterbalancing masses are required, each having the value of $2M$. In this case the distortion couple is two throws long and therefore not the minimum, but is a sufficiently close approximation for all practical purposes.

Fig. 14 shows a still further simplification (which has been used) of securing approximate triple balance of the two coincident center throws of a four-bearing three-plane six-throw crankshaft, in which these two center crankpins are counterbalanced by the use of a single counterbalancing mass, having a value of $4M$. The conventional four-bearing three-plane six-throw crankshaft in Fig. 19 was designed under the writer's supervision early in 1912. Approximate triple balance was secured by merging the three center counterbalancing masses in Fig. 12 into one, as shown in Fig. 14, and also by a mathematical merging of the three counterbalancing masses, theoretically necessary for each of the two end throws, into two counterbalancing masses as shown in Fig. 19.

To secure what I have described as complete triple balance in conventional three-plane six-throw crankshafts, the seven-bearing type requires twelve counterbalancing masses, and the four-bearing type obviously requires nine counterbalancing masses, in which case each of two of these masses is the centrifugal equivalent of two 120-deg. merged weights, and one of them is a coincident merged weight as in Fig. 12, the others being simply single-throw counterbalancing masses. The four-bearing crankshaft can however, as I have already pointed out, be in complete triple balance, except the center throws, with eight weights.

The conventional three-bearing three-plane six-throw crankshaft is in some ways the simplest crankshaft of this type in which to secure what I have described as complete triple balance. In this case only eight weights are required; that is, four single-throw weights on the cheeks adjacent to ends of the center line bearings and four 120-deg. merged weights on each of the four merged crankthrow arms where center line bearings are omitted.

Single-Throw Shaft Basis of Balancing

From the foregoing description of the fundamentals of crankshaft counterbalancing it becomes apparent that the science of counterbalancing a crankshaft of any number of throws, or of any form, is only the science of counterbalancing a single-throw crankshaft, inasmuch as the mathematical merging of two counterbalancing masses lying in the same plane of rotation, is an obvious mechanical expedient. Bearing this in mind, it is evident that we can examine the whole science of crankshaft counterbalancing by an analysis of correct counterbalanced values for a single-throw crank. In the remainder of this discussion of crankshaft counterbalancing, I shall therefore confine myself to consideration of the single-throw form of crankshaft.

We have so far considered the counterbalancing problem as regards the crankshaft itself. This is not sufficient, however, if counterbalancing is to achieve the desired result of minimizing pressure on the center line crankshaft bearings due to tendencies to distort under service conditions, espe-

Self-Tensing Springs for Varying Loads Compared with Adjustable

With Special Reference to the North Cantilever Spring with Adjustable Fulcrum

By Marius C. Krarup

ARGE variations of speed cause auxiliary devices to
play a prominent part in the spring equipment for
speedy vehicles, while adjustment of spring flexibility
constantly contemplated as an obvious improvement for
icles whose loads vary greatly. The best ultimate value
cantilever springs may perhaps be found in the readiness
h which they lend themselves to adjustment by varying
location of their fulcrums and to an effective combination
auxiliary devices at their free ends. These considera-
s form in themselves a very large subject, which is men-
ed here only to bring into proper perspective the rela-
y small and limited question as to whether it is prefer-
to adjust a spring in advance to load and speed varia-
or to have the variations of load, as they occur, auto-
ally result in different rates of flexibility. There could
doubt of the automatic arrangement being preferable,
vere demonstrated that the adjustments effected in this
er may be closely in accordance with the most important
rage requirements.

North cantilever spring with adjustable fulcrum,
was described in THE AUTOMOBILE of June 1 represents,
other hand, the conviction that adjustment by hand
es results which are sufficiently superior to warrant
ption of the system where adjustments are not so
tly required as, for example, for trucks and omni-
The claim for superiority over automatic adjustment
on the fact that, in case of road shock, the rate of
y of the North spring remains the same throughout
ection caused by the shock while the "compound"
eing *"incapable of distinguishing, in its mode of*
etween the deflection caused by a change of load
caused by a *brickbat lying in the road,"* shortens the
by its increasing rate of stiffness and at the same
avates the rebound by its increasing flexibility at
end of the spring stroke. There is added also the
in practice "compound" springs have never been
omfortable as ordinary springs working with the
d for which they have been designed, but this claim
narrow scope and is also, of course, not conclusive
long as "compound" springs have only been tried
riations of design and without suitable provisions
g rebound. In comparing the two types it should
so be kept in mind that adjustment by hand for
lated condition of operation is more practical for
onditions than for the rough streets and roads
d States, where one must always be prepared to
e unexpected.

e with Heavy Loads

to the North system a considerable advantage
entioned to which no reference is made in the
unt of it taken from *The Automobile Engineer.*
between axle and vehicle frame can remain ap-
he same at different adjustments of the springs,
ange of action with a heavy load is not mate-
d, and no special provisions need to be made in
f the vehicle for more than ordinary range of action. If a minimum load of 800 pounds produces, for example, an initial deflection of 4 inches at a flexibility rate of 1 inch per 200 pounds, and the maximum load is 600 pounds more, to which corresponds an adjustment giving an 80 per cent decrease of flexibility, which makes the rate 1 inch per 350 pounds, the total load on the spring of 1400 pounds supported at this rate produces again a deflection of 4 inches. It is learned that the designer, the late Mr. North, was strongly conscious of this advantage.

To be compared with the North system the automatic system must be viewed in its possibilities, rather than with reference to any form actually placed in the market, as the need of special construction or special auxiliary devices for use in conjunction with it has not been widely realized. To get away from the ambiguous terms "compound" or "progressive," which do not describe this system well, it is suggested that "self-tensing" springs might be adopted as a term designating springs whose rate of flexibility is decreased automatically to suit (though not necessarily in exact proportion to) the load they carry at any given moment; this leaving the question open as to whether it is a necessary feature—as claimed in favor of the North system—that the deflection caused by a jolt shall have exactly the same effect as the much slower action of a load change.

"Self-Tensing" Springs

As examples of simple self-tensing springs there may be mentioned: The coil spring with coils of varying diameter, which becomes self-tensing when the most flexible coils begin to collapse; the elliptic spring so curved that active length shortens by deflection; the cantilever spring whose free end shortens by deflection, as by automatic change of fulcrum.

Strong Rebound and Other Objections

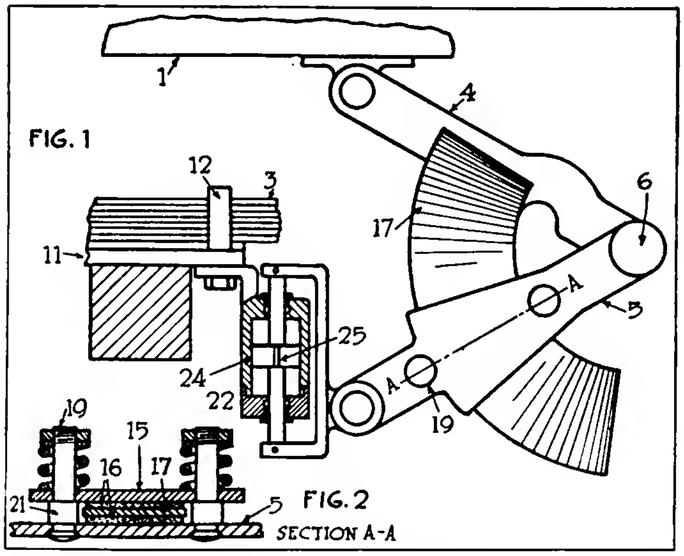
Beginning with the most serious objection raised against self-tensing springs, to wit, excessive rebound, it may first be mentioned that the need of rebound checks for all springs, and of course especially for rough roads, is becoming more and more widely recognized, and that the need of special rebound checks or shock absorbers in conjunction with self-tensing springs is therefore not a strong objection, provided they accomplish what is necessary in order to remove the principal objection to self-tensing springs under all circumstances of service. The other objection, relating to shortened deflection for a shock of given force, may be met by a higher rate of flexibility throughout the normal range of spring action in vehicles whose design admits of increased total range of spring action, while for other vehicles the objection must probably hold good. Too high initial camber of leaf springs and reduced spring range for heavy loads constitute other objections which must be taken up.

With regard to the means for escaping excessive rebound, attention may be called to two devices which can be used for limiting rebound with close reference to the position from which the spring action starts when a jolt is received, this position varying with the load, of course. The first device is patented by Loomis and assigned to the Packard Motor Car Company. The principle is shown in Figs. 1 and 2. (In another form of it, which is equivalent in principle, the appearance is improved by having the sluggish element operated by rotation around the free pivotal joint, 6, of the arms instead of by dashpot). Plate 17 is supposed to be secured to arm 4 and is thinnest at the middle where it is loosely grasped between friction linings 16 of arm 5 and plate 15, these being held in elastic mutual relations by pins 19 and coil springs 18, as shown separately in Fig. 2. The shape of plate 17 is determined by the rate at which it is desired that the friction of the device shall be increased when arm 5 is moved toward arm 4, by deflection of vehicle spring 3, or away from it, by rebound beyond the position of equilibrium represented in Fig. 1.

Arm 4 is pivoted to vehicle frame 1, and arm 5 to a bracket secured, as shown, to piston 24 in dashpot 22, the latter secured to spring pad 11 of axle 2 by clip 12. The dashpot is filled with a very thick fluid, such as graphite grease, and a small aperture 25 in piston 24 admits of a very slow relative movement between the piston and the dashpot.

When a shock is received on the road, arm 5 will be actuated from piston 24 as if the latter were securely attached to the axle, the duration of the shock being too short to get the dashpot into action. The device will therefore work in accordance with the plan followed in the shaping of plate 17. This would not be the case after changing the load of the vehicle, except for the compensating effect of the dashpot feature. If the load were increased, arm 5 would be moved toward arm 4 with the vehicle at rest, and, on receipt of a shock the friction acting against deflection would be greater than for a lighter load, while the friction restraining the rebound would be reduced. With the dashpot in action, an increase of load moves arm 5 toward arm 4, but the first few shocks afterward received move the piston, by means of the resistance encountered, down to the position which again brings arm 5 to grasp the thinnest portion of plate 17 when the vehicle is at rest, and the whole action of the device thereby becomes the same as it was before the load was increased.

If it is assumed that the thickness of the substance in the dashpot, the dimensions of aperture 25 and the shape of plate 17 are factors which can be brought into harmony with each other, it becomes evident that the device will have two effects which are of interest in this connection. First, the upper portion of plate 17 will act by reason of its shape as self-tensing auxiliary against shocks (but will not help the vehicle spring to sustain increased load, as a true self-tensing spring does), and, as the friction on the return of arm 5 to neutral practically equals the friction operating against deflection, the force of the rebound will not be as great as that which would be experienced with the vehicle spring unassisted and subject to a larger deflection from any given shock. Secondly, the lower portion of plate 17 can evidently be shaped so as to limit the rebound, below the neutral position, with any desired gradation or abruptness. The device is therefore an example, in conjunction with an ordinary vehicle spring, of an arrangement producing a self-tensing effect by means of friction, having automatic adjustment to load changes and involving no increase of rebound but, on the contrary, any desired checking of the rebound. Plate 17 can be shaped so as to leave the vehicle spring almost free of restraint for all small shocks, for which purpose the enlargements 21 on pins 19, Fig. 2, serve to space arm 5 and plate 15 apart. The principal theoretical shortcoming in comparison with the North system of adjustment by hand lies in the reduced range of action with heavy loads which the arrangement has in common with the use of ordinary springs alone if these are made flexible enough for light loads; and this shortcoming applies only to pleasure cars and omnibuses where the range of action is limited by a certain scant maximum distance between frame or body parts and axle parts.



Figs. 1 and 2—Packard company's patented shock absorber with compensation for variations of the vehicle load

Probably there are practical difficulties in the construction, such as in making the automatic adjustment operate reliably, in making friction elements conform to the best shape of plate 17, and in the method of checking the rebound by a friction which at first diminishes as the spring returns toward the neutral position, but the patent was applied for in 1908 and does not in these features represent the best that may be done to-day.

Another Rebound Check for Varying Loads

The other device showing that self-tensing springs may be combined with complete checking of the rebound irrespective of the load carried was designed by the writer for use with any type of spring suspension and is illustrated in Fig. 3, giving two sectional views. It can be operated with glycerine, oil or grease of any preferred consistency, this feature affecting only the adjustment and the size of the vent in the free piston 7, but as the degree of consistency or fluidity should not be affected much by the temperature of the atmosphere, a thin oil with or without graphite admixture is probably best. The base 1 is secured to the vehicle frame and the wing piston 2 is keyed to the annular central boss of the outer cover plate 3, which is connected by the usual jointed arm to the vehicle axle, so as to be actuated when the vehicle springs are actuated. The interior cover plate 4 (with holes for pins 10, 13 and 14) is closely fitted into a recess in the outstanding flange of base 1 and a corrugated copper ring 5 protects against leakage at the joint between the two cover plates. Stop 6 limits the downward movement of free piston 7. Nut 8 with washer holds the outer cover plate in alignment and may be secured by locknut arrangement. The one-way valve flap 9 on pin 10 in conjunction with plug 11 constitute the adjustment by which the whole rebound stroke can be moderated at any desired rate. Hollow plug 12 normally contains only air and provides for irregularities in the expansion or contraction of materials and fluid.

Damping Rebound Stroke Only

Deflection of the vehicle spring turns wing piston 2 downward, and the fluid driven before it raises free piston 7 a corresponding angle, the vent being so small as to have no appreciable effect in the case of a rapid spring movement. The fluid in the upper part of its circular path opens the one-way valve 9, passing practically unhindered. When the rebound stroke begins and wing piston 2 starts back, valve 9 closes and fluid is forced through space above it, which can be restricted more or less by adjustment of plug 11. The rebound stroke is thus retarded from its beginning as much as desired. Meantime the free piston 7 is being driven back toward stop 6 and reaches it at the same moment as wing-piston 2 reaches its starting position. Any further rebound movement of wing piston and vehicle spring must take place by forcing the fluid through the vent in free piston 7 and along its surfaces of contact in the device. The more the rebound is restricted from its start by the one-way valve 9 and plug 11, the less abrupt is the checking caused by free piston 7 and stop 6.

The action for load variations, which is the feature of interest for comparing the North system of spring adjustment with automatic self-tensing springs, is as simple as possible. If the load of the vehicle is increased, wing-piston 2 takes a new and lower neutral position, and free piston 7 is raised momentarily, but at once begins to gravitate back to the stop, the fluid passing slowly through the vent. Thereafter the action of the device is the same as it was with the lighter load, that is, spring rebound is again checked from its beginning, at a rate determined by the adjustment (which is constant for a given vehicle) and is finally checked at the moment when the vehicle spring reaches the position of equilibrium with its static load.

Similarly, if the load is reduced, the wing piston rises slowly to a new initial position, forcing the fluid through the vent in the free piston which remains at rest against stop 6. The action for shocks is thereafter again the same as before. The free piston is made sufficiently heavy to make its gravitation—producing the automatic adjustment to increased load—certain and definite, with the size of vent and the kind of fluid substance selected.

These two devices suffice to show that there are no great mechanical difficulties in removing North's principal objection to self-tensing springs; namely, that their strong rebound produces discomfort. The object of using self-tensing springs, being mainly to take equally good care of light and of heavy loads, which is also the object of the North cantilever spring with adjustable fulcrum, a simple device which takes care of the rebound in any desired degree independently of what the load is, becomes the first important element in favor of self-tensing springs for variable loads.

Camber and Spring Range

But other objections remain to be considered. It has been seen that, if the equivalent of self-tensing properties for shocks are produced by a friction device combined with ordinary springs, the deflection of the springs under loads will be strictly in proportion to their flexibility, and they must be either too stiff for light loads, or their original camber must be greater than desirable and the range of spring action will be reduced too much for the maximum load in the case of pleasure cars and omnibuses, in which the possible range is limited by the conventional vehicle design; and this objection will hold good even if the friction device operates with equal correctness for light and heavy loads. Also, the objection relating to the strong original camber of the spring leaves, holds good even for motor trucks having ample spring range as well as for pleasure cars.

With a true self-tensing spring that is load-supporting at all stages, these objections lose some of their force, as it always carries its load as high as an ordinary spring of the tension which would be chosen for a normal load corresponding to that momentarily carried by the self-tensing spring. But as a self-tensing spring should be considerably more flexible in its light-load range than an ordinary spring can be (being calculated for normal or maximum loads), the original camber of its leaves would necessarily be strong in order to have it come normal for light load, if it were not possible and practicable to make special provisions to avoid this objectionable feature.

Cross Springs for Minimum Load

Such a provision, and one of the most plausible schemes in this connection, is to use for the static support of the minimum load either an elliptic spring crosswise of the vehicle between axle and frame—as may be most suitable for trucks—or a semi-elliptic (perhaps two quarter-elliptics instead) secured at its middle to a frame transverse and at its ends shackled to the axle or to the rear of the brake beam, and to have this cross spring highly flexible. Evidently coil springs or air springs could be used similarly to hold the minimum load at the proper height—the height giving the needed spring range—and could be made self-tensing for all or part of their work, but this possibility lies farther afield than the use of light-load leaf springs.

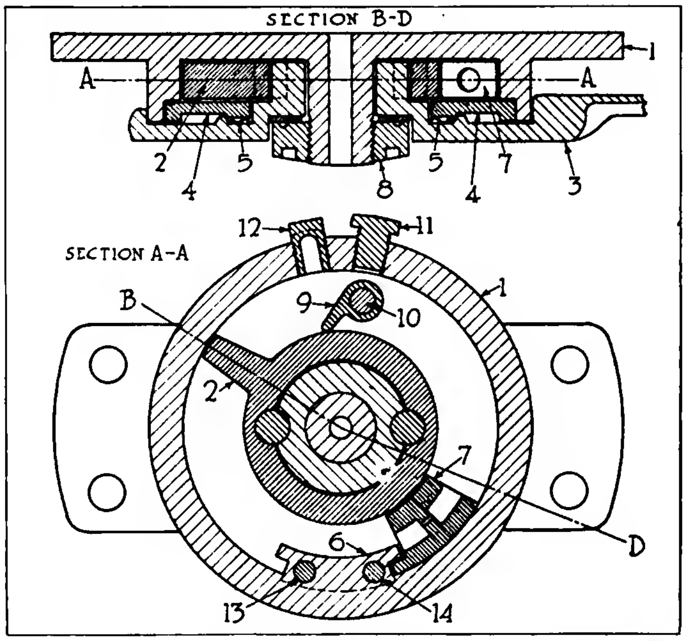


Fig. 3—Device for damping and checking rebound stroke correctly with any vehicle load

Self-tensing cantilever springs at the sides of the vehicle, used in conjunction with such highly flexible cross-springs for the static minimum load, could then be made straight, short and thin-leaved without getting bulky, having only to handle the difference between minimum and maximum loads plus their share of the jolts, and the frame support would be better distributed than with cantilever springs alone, while the lateral stability would also be better secured.

For pleasure cars a sufficient range of loads could no doubt be suitably sprung on this plan by having the cantilever springs alone self-tensing, while for trucks it might be better to arrange also the cross-spring on the self-tensing plan or to incorporate progressive friction in the rebound check or shock absorber, as in the Loomis device. Or, for pleasure cars, the cross-springs could be self-tensing and the cantilever springs normal.

One-Sided Loads

Comparing again with the North system, it is noted that the latter fails to compensate for one-sided load variations, which are especially important in omnibuses, while the plan mentioned differentiates properly between the heavy and the light side of the vehicle.

It should perhaps also be noted that, with the rebound check preventing all spring action below static equilibrium, the stability could not suffer, even when driving with a light load supported on the highly flexible cross-springs alone.

To finish the comparison with the North system (or, more broadly, with the plan of adjusting vehicle springs to a load variation by advance operation of an adjustment device) it should be shown in detail how a cantilever spring may be arranged to act on the self-tensing plan, and how other types of spring may be so arranged, but the purpose is here only to show that, in general, the self-tensing plan seems better worth developing than the plan of operative adjustment.

It seems incontestable, however, that the North system after all retains one advantage: With reference to pleasure cars, it makes a simpler provision for sufficient range of spring action at all adjustments than any which it has so far been shown can be incorporated in the self-tensing system, if the latter shall give an equally ample deflection for a given shock at maximum load. But a number of possibilities remain for overcoming also this superiority. A step in this direction would be taken, for example, if a shock absorber (with rebound check) could be devised in which the friction or other form of resistance, would be increased by an increase of the vehicle load but would remain constant during a deflection caused by a jolt.

In the whole subject, the use of dampers and rebound checks which are self-adjusting to load variations, and the use of separate minimum load springs of high flexibility, seem to the writer to be the leading ideas, which in the end should make self-tensing springs wholly practicable.

Paragraphs on Current Topics

By **Marius C. Krarup**

Motto: Radical Thought, Conservative Action

"Those who think that speed is the great cause of street accidents might do worse than consider the possibility of establishing their case by facts instead of relying upon vague enunciations," writes Francis M. Hugo, Secretary of New York State, and recommends "a critical scrutiny of the evidence given and verdicts returned at each of the hundreds of coroner's inquests held on victims last year." Such a scrutiny "ought to show how far the accidents were reasonably attributable to the speed at which the vehicles concerned were traveling." It might also show certain insufficiencies in the average coroner's inquest which would react upon the reasoning and leave us in the same uncertainty as before.

□□□□

Motor of Copenhagen writes that the radical Jacobsen design, which was described and illustrated recently in this journal, is now being built into a Benz racing car in Germany, and that the inventor is also negotiating with the Mercedes branch of the German Daimler company.

□□□□

The American Automobile Association, better known as A. A. A., plans to have a national Good Roads Convention held every year at Washington under the direction of the Federal government, and more particularly under the auspices of the United States Office of Public Roads and Rural Engineering in the Department of Agriculture. In this manner somebody may eventually rise to tell the world how the Good Road is built which shall finally convince taxpayers that it is worth paying for, and therefore worth building and maintaining on a large scale.

□□□□

"No machine made by man could penetrate into the roadless mountains or follow the troopers over their almost impassable trails," sings an editor in dithyrambic enthusiasm over the army mule. Give two inventors and a dozen engineers financial *carte blanche* and a modest reward at the goal, and the impossible machine will be produced in six months and will not only penetrate but will pull a good many troopers with it and shelter them against bullets from ambush besides.

□□□□

The *Motor World* of Melbourne, Australia (issue of April 28, 1916, being Vol. II, No. 12), gives over a few practical pages to "Woman and the Car," almost entirely devoid of millinery and dress goods display. "Chauffing" as a vocation for women is proclaimed, in accordance with recent British example, as patriotic and in line with improved national efficiency—the work being done well enough by the women and the men released for more exacting occupations. From all sides American women are being crowded, by example of their sisters abroad, into the motor and automobile field.

□□□□

One of the smouldering questions in aviation—ready to burst into flame at any moment—is: "Are two motors safer than one?" Quite knotty, too, with weight and distribution of weight duly considered. We vote for one, at least until aeroplanes get very much bigger. But this recalls an interesting old theory. According to it, when aeroplanes become as big as a cloud it should be possible to keep them floating with scarcely any use of power, on the principle that they cannot fall without moving such quantities of air under them that the same, when forced to escape at the edges, would reach a speed so high as to set up resistance greater than needed for sustentation. This weird explanation of the heavy floating cloud must soon be due to come under discussion, as it unfolds several surprises applicable to aeroplanes (and to large flocks of birds) when looked into.

Library Service for Aid in Research

Referring to the article on this subject in last week's issue, W. P. Cutter, librarian and secretary of the Library Board of the United Engineering Society, 29 West Thirty-ninth Street, New York City, imparts the information "that just such a service"—as outlined in the article—"is offered here."

A circular inclosed with the letter explains this service and records requests for information from 239 localities in the United States during one year. During that period requests have also been received from 58 localities in 17 foreign countries. "Our chief difficulty is in publicity for this service," writes Mr. Cutter in conclusion.

A contribution to the desired publicity is hereby freely tendered; so much more readily as the writer has often made use of the excellent facilities of the United Engineering Society's library and yet has never been made aware that any special organization, such as the Library Service Bureau, to which Mr. Cutter refers, was, and is, in operation.

The circular explaining this service shows that its purposes are indeed similar to those which prompted the article last week. The methods adopted, on the other hand, differ materially from those suggested. Those interested can probably obtain the circular by writing for it.

Possibly next to a national library for preserving the originals of interesting illustrations—which, unlike words, suffer in reproduction—the nationalizing of library facilities for research would seem to be the most interesting subject connected with libraries in which the automobile industry and its engineers are concerned, and it may be entitled to be viewed from many angles.—M. C. K.

Boillot—Chevalier of the Legion

Dramatic Death of the Speed King of Europe

GEORGES BOILLOT

PARIS, June 3—About 6 o'clock on the morning of Saturday, May 20, Flight - Sub - Lieutenant Georges Boillot reported for duty to the officer in command of squadron No. 49, in the neighborhood of Verdun, and a few minutes later went aloft aboard his single-seater Nieuport 100 m.p.h. scout machine. On his uniform Boillot bore the red ribbon indicating that he was a Chevalier of the Legion d'Honneur, a decoration which had been awarded him a few days before in recognition of his bravery in aerial encounters. But he was not perfectly satisfied. Speed King of Europe, he was only one of hundreds of aviators, and far from best known. Opportunities had not presented themselves of showing that he could be as brilliant in the air as he had proved in many a fierce competition on the road.

As a scout pilot, Boillot's task was to keep away enemy machines, thus allowing the French observation planes, with a speed of only 60 m.p.h. and slow in their movements, to carry on their work of photographing and observing the effect of artillery fire without molestation. Away to the northeast beyond the outer-forts of Verdun, where French and Germans had been struggling day and night for 3 months, Boillot dimly observed the outlines of three enemy machines. The numbers increased to five—Albatross biplanes each with a couple of men aboard, and each armed with two machine guns. The Frenchman was alone with a single machine gun, at a height of 9000 ft., with only one feature in his favor: his Nieuport was faster and quicker on its controls than the German aeroplanes.

A Daring Attack

Most men would have dived for home or given the enemy an exhibition of speed until reinforcements had come up from below. Boillot's only idea was to attack. He had been waiting for such an opportunity for weeks. What really happened 9000 ft. above the battlefield on that beautiful May morning cannot be told, for the leading actor in the drama is no more. Speeding out to meet the invaders, Boillot tackled the leading machine before the others could come to its support, and sent it crashing down to the French lines. A few seconds later the observers saw the four remaining machines deploy for a converging attack on the swift French biplane. The machine guns got into action; their smoke was visible, but no sound could have been heard even had there been no artillery bombardment at the time. Suddenly Boillot's machine staggered, then dived, then capsized. A human form was seen to fall clear of it: the pilot was dropping earthwards a distance of nearly 2 miles. As nearly as could be observed, the aviator fell into a forest surrounded by bog land to the northeast of Verdun, not far from Douaumont fort; the wrecked biplane came to rest in the branches of some trees.

Immediately two automobile drivers volunteered to go in search of the dead man's body. One of the cars failed to return: it was hit by a shell and its occupants perished. The other came back a couple of hours later with the almost unrecognizable remains of the man who had gone forth that morning rejoicing in life and confident in his power to overcome all difficulties. The medical examination showed that Boillot had received a bullet in the head and another through the heart; it was thus only a corpse which had been thrown into space as the aeroplane capsized. The following morning a simple military funeral took place at the village of Vadelaincourt, 4 miles to the south of Verdun. There were present only officers and men from the aviation corps. No civilians entered that rapidly filling cemetery; not even the dead man's wife, father, mother, and brother had been allowed to penetrate that death stricken zone. As the burial party moved out of the graveyard shells began to fall around the place.

There are men who have won as many automobile races as Georges Boillot, but not one who managed to bring himself so prominently before the public or to secure such an incontestable right to the title of Speed King. Boillot's beginnings were modest. Born in Paris 30 years ago of parents of moderate means, he first worked in the dry goods trade, but had an ambition to become a professional cyclist. He figured as an amateur, and ran in a few amateur bicycle races, but had to recognize that he had not the time or the means to train for the profession. He entered the Peugeot factory as a mechanic and was later transferred to the drawing office of the main establishment at Audincourt.

Soon after completing his compulsory military service, Georges Boillot joined the Lion Peugeot racing team, winning fame at Dieppe and Boulogne. In 1911 the Peugeot company decided to run in the big car races and Boillot became head of the team. Goux was his lieutenant, Paul Zuccarelli was called in, and technical matters were in the hands of Ernest Henry, a young Swiss engineer who knew everything about high-efficiency motors but little about chassis.

His Rise to Fame

This new team set to work building cars for the French Grand Prix of 1912. Boillot won that 2-day race at Dieppe, defeating, among others, Louis Wagner and David Bruce-Brown. Working in the same way, Boillot's team won first and second places in the 1913 Grand Prix. By this time Boillot was recognized as the best driver in Europe and the racing Peugeots were the most-copied cars in the world Mercedes team-work beat him in the 1914 race, his car going out with a broken valve toward the end of the race.

Boillot visited America only once, for the Indianapolis 500-mile race in 1914.

Preparedness and Motor Trucks—Part II

Special Military Vehicles Such as Automobile Searchlights, Kitchens, Ambulances and Repair Shops—Use of Motor Buses as Transports

By Donald McLeod Lay

PRACTICALLY all special army vehicles have twin pneumatic tires on the rear with a housing around them brought as low as possible compatible with clearance. In some cases band tires are fitted on the front wheels without protection, the wheels being either cast steel or steel disks. Other special machines are motor work shops, aeroplane tenders and trailers.

Use of Disk Wheels by Italians

A distinctive feature of Italian construction is the use of disk wheels for trucks up to 2-ton load. These are detachable by unscrewing five or six nuts and are easy and cheap to construct, consisting merely of a stamped steel disk riveted and welded to a steel rim.

The trucks most frequently used by the Italian army are 4-tonners, while the smallest are 1-ton trucks on pneumatic tires generally with twin tires on the rear wheels. The Italian army employs a much greater proportion of pneumatic trucks than any other European army due to the adaptation of touring car chassis to truck work instead of having special truck designs. This arrangement is not most economical because all Italian trucks are driven too fast and tire upkeep is enormous.

At the end of the first 7 weeks of the war the motor transport service had settled down to business, and the weaklings and unsuitable types which were pressed into service too hurriedly had been abandoned and replaced by new trucks from the English factories. Classification of the trucks had also been made so that it was no longer necessary for 5 m.p.h. machines to keep pace with 12 m.p.h. vehicles.

Originally, the plan was to make use of motor trucks for carrying supplies from the railhead to a point a couple of miles back of the firing line from which point distribution was made to the men by horse-drawn wagons. Before October, 1914, this plan had been altered, the trucks going right up to the firing line and delivering direct to the men in the trenches. This system exposed the trucks to fire and caused several to be lost, but the time gained was considered sufficient justification for its continuance.

A motor convoy under fire is in less danger than a number of horse-drawn wagons, and although the trucks are far from bullet-proof, it is surprisingly difficult to put them out of business, many of those at the front being speckled all over with shrapnel shot without having their running qualities affected in the least. Compared with the horse, the modern motor is a very small target, and unless a bullet strikes the cylinders or goes through the radiator the vehicle is not likely to be incapacitated. Automobile captures were rare during the early part of the war, the vehicles being wrecked when it was necessary to abandon them.

Ambulance removing wounded French soldiers from the front

Comparing the mobility of troops and supplies where automobiles and motor trucks are used instead of railroad trains, it was stated in November, 1914, that "it takes little to disorganize a railroad, while it is practically impossible to disorganize automobile service."

By the end of October, 1914, it was reported that 3000 American-built motor trucks had been bought for war purposes by the belligerent powers, the bulk of these being fitted with wagon bodies having sides and tail board hinged to swing downward, the sides being provided with chains to hold them in a horizontal position and to make loading and unloading easy. Usually these bodies were supplied with a tarpaulin top supported by a series of removable semi-circular metal bows fitting into brackets at the sides of the body, the whole top looking somewhat like a prairie schooner. Some of the trucks carried bodies of the Russian design in which the platform is not horizontal, the floor bowing down in the center so that it has an arc shape instead of being flat. This is done in order that the loads carried press toward the center, thus avoiding any tendency to slip off at the side.

A Difference of Opinion

All French purchases of American trucks were for 2 and 3-ton models, the orders for 4 and 5-ton trucks coming from English army authorities, showing the difference of opinion as to the value of the two types. Owing to the deteriorated roads, W. F. Bradley pointed out, in February, 1915, that the 3-ton load could be handled with greater advantage.

After the English impressed trucks were sent into France they were painted gray to cover the advertising matter which usually decorated them, and more attention was paid to the protection of the drivers, a high, curved dash surmounted by a leather apron on both front and sides, entirely covering the steering wheel, so that with the substantial wood roof extension the men were well protected from the weather.

French Buses Superior

The Paris and London motor buses were used extensively early in the war for transporting troops, the Paris buses carrying forty men apiece. The London buses were found to over-heat when put to heavy work while the vehicles were incapable of hauling others of equal load and weight. Springs broke frequently, and in fact the English bus chassis proved inferior to the French, which was designed with war service as a possibility. It was merely a case of over specialization.

Motor Ambulances Are Efficient

The motor ambulance most generally used early in the war was a 20-hp. touring car chassis fitted with a large capacity canvas body having mica windows. The body was of sufficient size to carry four stretchers in two tiers, leaving a space down the center for the ambulance attendant. These ambulances would go as close to the firing line as possible, load up with wounded brought in by stretcher men and carry them to the rail head or general headquarters, where they were attended in temporary hospitals before being carried to the rear by trains and finally distributed to the hospitals by more automobile ambulances. The great defect in the organization at that time was the inadequacy of the motor system for removing men from the hospitals just behind the firing line, wounded men frequently having to spend 15 to 20 hr. lying on straw in freight trains when touring cars could have brought them back in 3 to 4 hr.

Heating the Ambulances

The Ford ambulances used by the American ambulance corps in France did excellent service. These consisted of the standard Ford chassis fitted with an ambulance body of wood and canvas capable of receiving a couple of army type stretchers or to carry four wounded men sitting, thus making with the driver and attendant a maximum load of six. For heating these in cold weather a section of stove pipe, bound with asbestos and with the ends closed, was fitted around the exhaust pipe, a lead carrying the heat to a grating in the floor of the car.

Automobile Searchlights Employed

Automobile searchlights form an important branch of the French army, the electric searchlights being mounted on large touring car chassis, the current being generated by dynamo driven from the automobile engine. Six vehicles formed a working section, including a workshop and general stores truck capable of making repairs in the field. These machines were all painted grayish green, to render them inconspicuous. Some of the outfits were arranged so that the searchlight could be carried some distance from the automobile, one having a light steel telescopic tower permitting the light to be raised to a height of 40 ft.

Another way in which motor trucks were utilized was as traveling kitchens, being fitted with a stove and the cook preparing meals while on the road, thus saving time and increasing the comfort of the men.

Handling of Repair Work

After four months of war the repair department was shipping all kinds of vehicles, French, English, German, etc., to a big repair depot 100 miles from the front, where the uninjured parts of the vehicles were utilized in building composite machines if it was impossible to repair them. At this depot there were work shops but no machine tools, most of the truck repairs being undertaken by the car and truck factories.

Wreckage of motor trucks and cars at a repair depot

Mobile repair shops consisting of two or three trucks completely equipped with machine tools, etc., were found to operate most effectively 25 miles from the front, it generally being possible to convert buildings, at various points, into repair shops, the equipment being readily shifted from point to point.

Types of Mobile Workshops

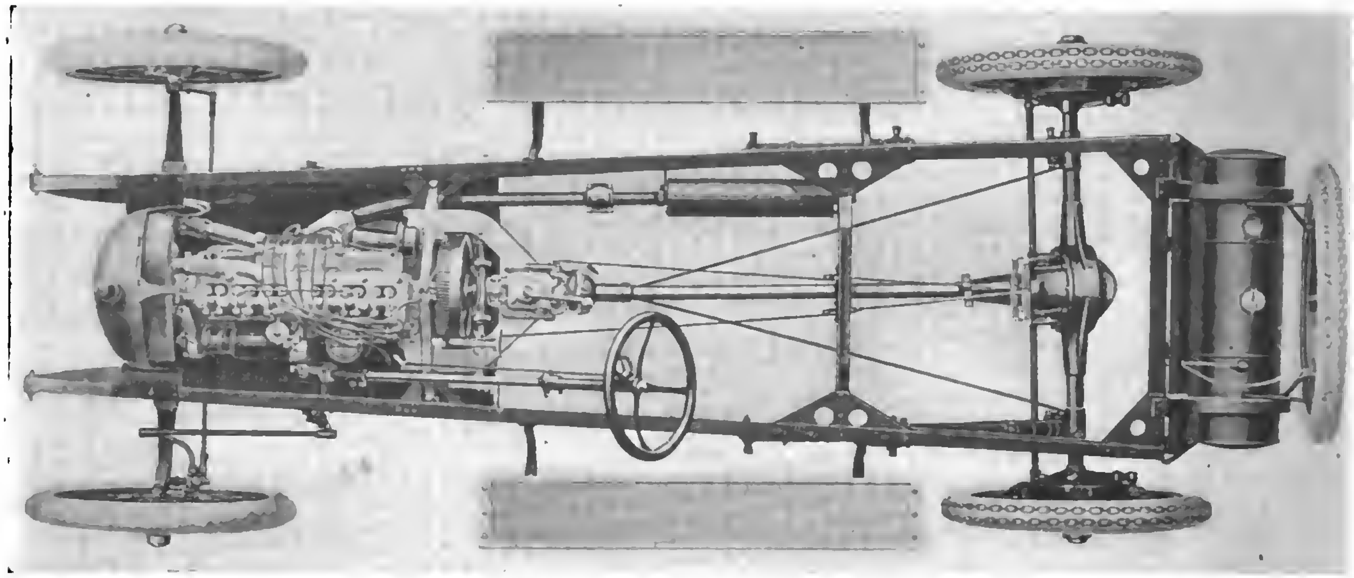
Each division of the British army motor service included three or four motor workshops kept in the open air garage at the depot town. These shops consisted of a heavily built high-wheeled van with sides opening outward on hinges so as to increase the floor space. The roof was made to open, being covered by a waterproof canvas blind on rollers which served to make the whole vehicle waterproof when closed up and also being capable of spreading out as a sunshade. These trucks were drawn by steam tractors and were completely fitted with machine tools, lathe, forge, drills, saws, etc., and obtaining its power from a single-cylinder motor on the ground under the workshop with a belt through the floor.

French Workshops Smaller

The French workshop was smaller than the English, being an automobile chassis with a workshop body, the motor serving both to drive the vehicle and to drive the machinery.

About 50 per cent of the truck casualties were caused by trucks bumping into the machine ahead when operating in convoy formation. Radiator protections must be very strong and fitted with powerful coil springs, the ordinary type of bumper being insufficient. Radiators on armored cars are especially vulnerable points and should be protected from bullets, collisions, etc., without impairing their cooling abilities. Of course, other motor vehicles are likely to be similarly injured and at least some protection should be afforded the radiators, especially if the machines are used anywhere near the firing line.

Left—Buick with a powerful searchlight for aircraft work. Right— Ambulance corps sheltered from aeroplanes in clump of trees



The Grant six chassis for 1917. Note that the valve rocker cover plate has been eliminated, as the car owner frequently failed to remove it to oil the valve mechanism. A Wagner electric system and a Stromberg carbureter are fitted for the coming season

Better Bodies Feature 1917 Grant

Fitting of Wagner Two-Unit Electric System and Stromberg Carbureter, Dropping of Valve Rocker Cover Plate and Quieter Operation Other New Developments

AMONG the first to make announcements of new cars for the coming season is the Grant Motor Car Corp., now located at Findlay, Ohio, but which is shortly to move to Cleveland. This concern has lifted the veil from what is undoubtedly the best-looking vehicle yet produced under the Grant name. It is model K, and is entering the moderate-priced six-cylinder field for the 1917 selling year.

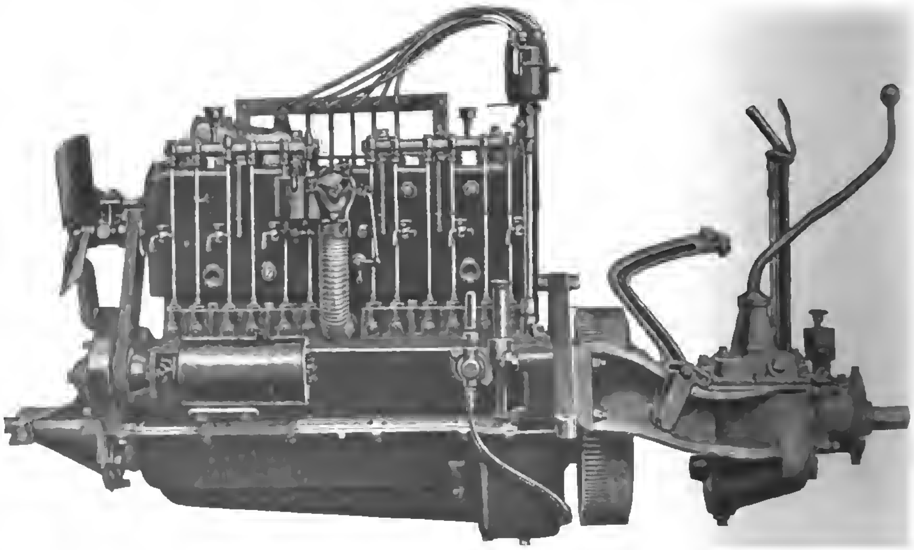
Although the most noticeable change over the previous Grant six is in the body lines, there are a number of other improvements that help to make it a better car. A Wagner two-unit starting and lighting system replaces the single-unit system formerly used, and likewise Remy ignition is fitted instead of the make employed for 1916. Stromberg carburetion is also given a place along with a change in the fuel system from the cowl tank to a reservoir at the rear from which the gasoline is drawn by Stewart vacuum feed. Larger brakes, minor changes in the instrument board arrangement, a larger steering wheel and a standard design of I-beam front axle are also changes of note.

Noise Is Minimized

The matter of silence has also been carefully looked into, and the Grant engineering department has gone over the entire chassis with the idea of making it quieter than its predecessor. This greater silence of operation has been brought about in the power plant, in the running gear and in the springs.

Practically no change has been made in the 3 by 4¼ overhead valve, block-cast engine with the exception of those minor differences due to the fitting of a separate starting motor and separate generator, and the use of a different carbureter. One unusual change is in the elimination of the cover plate that previously was fitted to the top of the cylinder block to house the rockers and valve stems. There is a good reason for this. It was found that in the hands of the average owner, the valve parts did not get the proper lubrication due to the fact that it was necessary to remove this cover plate to get at them. Although this was not a difficult thing to do at all, it was more trouble than some wanted to take, hence they neglected to lubricate the parts in question. So in order to make it as easy as possible to take care of the rockers and their bearings, it was decided to do away with the cover, and large and convenient oil cups are provided to take care of the proper lubrication of the rocker shafts, of which there are two.

The new Stromberg carbureter connects directly to the



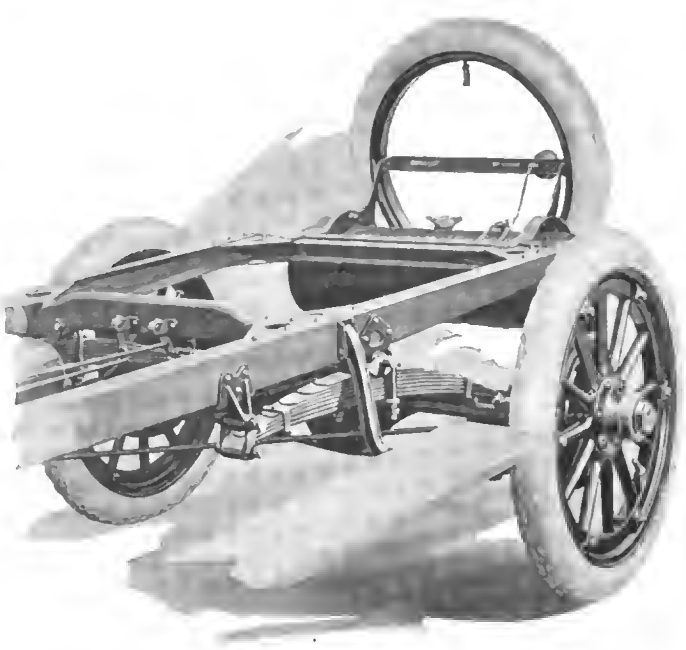
Intake side of Grant six for 1917, showing high carbureter mounting and ignition distributer. Note generator drive and hot-air connection for carbureter cylinder head, with the distribution of gas to the several cylinders done within the casting itself. In the previous design, there were two inlet connections in the head unit, and a double-branch manifold connected externally from these to the carbureter. Now there is no external manifold whatever so far as the inlet of gas is concerned, and the new attachment permits of the carbureter being placed higher on the engine so that it is more readily accessible, to say nothing of being conducive to better carburetion because the gas has less distance to travel. This higher mounting is of course made possible, in a large measure, due to the removing of the gasoline tank from the cowl and placing it at the rear of the chassis. It was necessary to have a good head on the gasoline when it was fed by gravity in the previous model.

Although the make of ignition apparatus is changed to Remy, the method of drive and the location of the distributer are not changed. Driven off the end of the camshaft, the vertical distributer shaft occupies the left rear side, and the distributer is high enough to make it easy to reach, at the same time affording plenty of room over the top of the valve rockers to allow the wires to be run without interference to the plugs on the right side of the head, a supporting bracket being fitted which carries each ignition lead well out of the way of the valve parts.

Starting Motor Is Separate

Because the starting motor is a separate unit, it is mounted at the right rear side of the engine and the driving connection is made through the Bendix centrifugal-action device to teeth cut in the rim of the flywheel. The separate generator occupies the opposite side from its location on the 1916 engine, being mounted so as to be driven by an extension of the fan-driving shaft on the left, a leather universal coupling allowing for any slight variation in alignment and making a noiseless connection.

Reviewing some of the salient features of the motor, for the benefit of those who are not familiar with the Grant power plant construction, it should be mentioned that the unit is suspended in the frame at three points, the front end resting freely on the front cross member, and the rear being hung from a forged cross member just back of the cylinder block. The main cylinder casting and the upper part of the crankcase are one piece, this making a rigid and compact unit that carries the crankshaft and insures alignment of the cylinders and the shaft. The head casting, which carries the valves and their operating mechanism, is bolted to the main unit, and it is therefore a simple process to reach the cylinder walls and the pistons for inspection, cleaning, etc., when occasion demands.

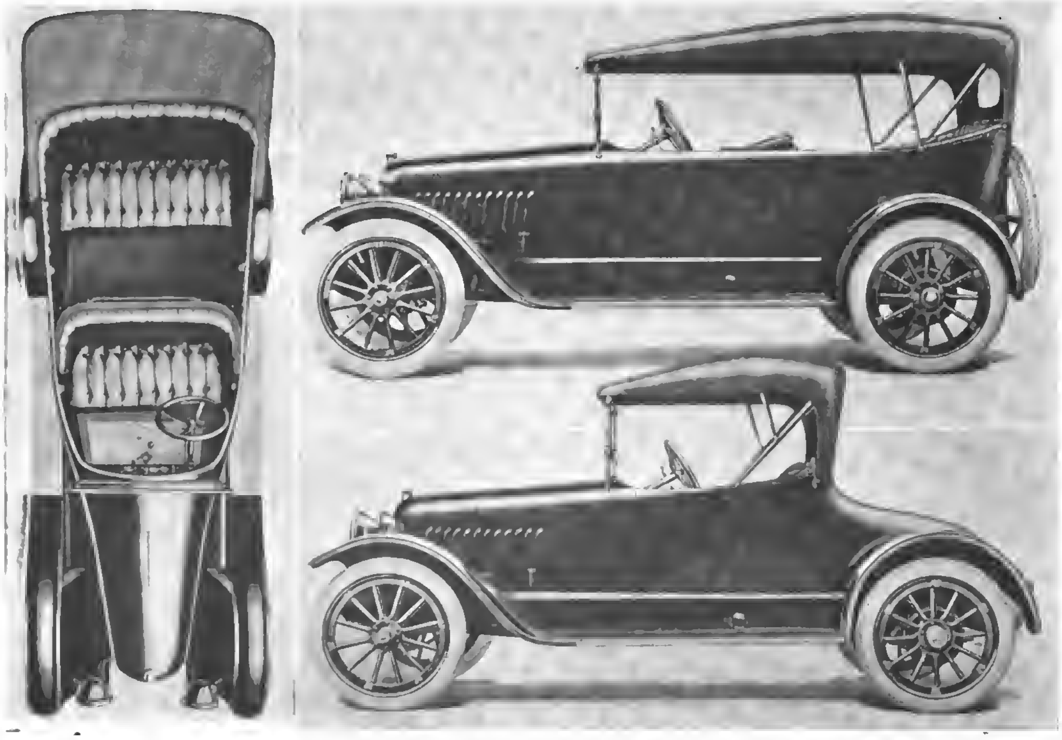


Rear construction of Grant six chassis, showing cantilever springs, gasoline tank mounting and tire carrier

Internally, standard practice has dictated the design throughout. There are three bearings for the crankshaft, these being of the ample diameter of 1 9/16 in., with the lengths 2 19/32, 2 and 3 in., from front to rear respectively. Pistons are made of cast iron and as light as is consistent, each carrying three rings. Three bearings are also provided for the camshaft, which has a diameter of ⅞ in.—ample for an engine of this size —and the cams are so shaped that quiet action is one of the first considerations. One nice feature of the valve assembly is the provision for removal of the tappets and their bushings from the top of the crankcase outside. The tappet assembly for three cylinders is made a unit so far as the mounting is concerned, and by the removal of six holding bolts this can be lifted out bodily.

Timing Gears Quiet

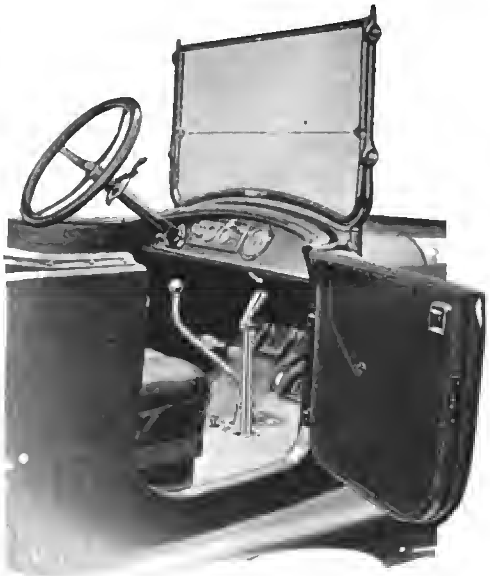
Timing gears are helically cut, the center gear being steel and the others cast iron, so that they run silently together.



Grant touring car and roadster for 1917, showing the new body lines. These models sell for $825 and there is also a cabriolet which lists at $1,050

Driven off the rear end of the camshaft is a plunger oil pump that draws the lubricant from the motor base after it has been strained, and delivers it through a dash sight feed and thence to the front gear case and to the rear of the engine. From this point it overflows into the successive connecting-rod troughs and eventually runs back into the reservoir at the bottom. An oil level indicator, which is neatly formed as a part of the oil pump case, tells the quantity in the reservoir. This is on the left side.

Thermo-syphon cooling is still advantageously adhered to in this car, the radiator being assisted by a pressed-steel six-bladed fan which is driven by a belt, as already mentioned, there being the customary adjustment at the fan mounting for taking up any slack that may develop in the leather. Grant is still using the characteristic rounded-front radiator, which is of a special tubular form, as in previous models.



Driver's compartment of the 1917 Grant, showing the wide door and the arrangement of the control levers. Note the simplified instrument board

The method of attaching the gearset to the rear of the motor by means of two drop-forged arms has not been changed. This mounting leaves the flywheel open, and is a factor for reducing weight to the minimum. The gear assembly is a compact unit having the usual three speeds ahead. To give an idea of its ruggedness, and to make the unit as compact as possible, the countershaft gears are cut integral with their shaft, the forging being blanked out as a single piece. The gears have ⅝-in. face and are of the stub-tooth shape, and in mounting their shafts a double-row ball bearing carries the front end of the mainshaft, a single ball bearing the rear end.

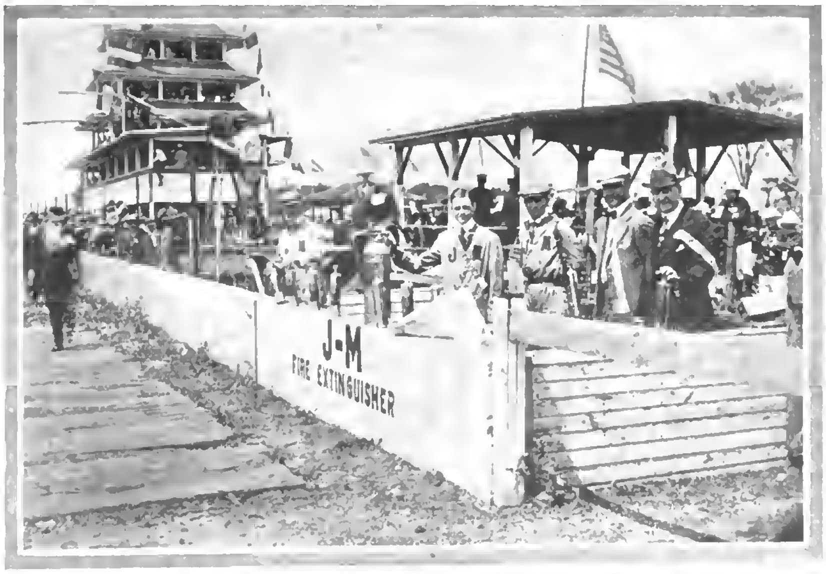
Grant maintains the form of final drive in which the power first goes through a cone clutch, the gearset, then a universal and eventually through an inclosed propeller shaft. The torsion tube inclosing the latter is light and strong to carry the drive and torque and presents a most compact appearance with the rear end swaged out to meet the axle housing. The axle is floating, with means for gear adjustment on removal of the rear inspection plate, this applying also to the driving pinion. A gear ratio of 4½ to 1 is used.

Although the diameter of the brakes has been considerably enlarged, from 10½ to 12 in., there is no other change of importance in the braking system. The equalizer bars are carried at the rear axle on the brake operating rods that are attached forward of the axle tubes. By bringing the equalizers all the way back, side brake operating rods are eliminated, only one control rod from each brake control running back from the supporting cross member.

In connection with the running gear, the previously used front axle, which, though it was of I-beam section, was fitted with some specially-designed steering knuckle mountings and features, is replaced by a standard form with strong and stout steering connections throughout. Nothing has been changed in the rear cantilever spring suspension. These members are 38 in. long by 2 in. wide and give free action due to the trunnioning of the center directly under the frame member and the shackling of the front end, with flexible mounting to the axle tube as well. No change has been made in the 112-in. wheelbase, nor in the tire size, which is 32 by 3½, with non-skids on the rear.

Besides the roadster and touring body types, Grant is offering a cabriolet model as well. The prices are $825 for the two open models and $1,050 for the cabriolet.

J-M Fire Extinguishers at Indianapolis Race



Headquarters of the J-M fire extinguisher brigade at the Indianapolis International Sweepstakes May 30. There were fifty-four J-M men distributed through the grandstands and pits and around the track

HIGH speeds and the hot weather which has come to be considered characteristic of Memorial Day, and the almost invariable accompaniment of the annual International Sweepstakes race on the Indianapolis speedway, constitute very favorable conditions for outbreaks of fire upon either the overheated cars or the track itself. The accompanying illustration shows the headquarters occupied by the extinguisher brigade of the H. W. Johns-Manville Co., New York City, at the recent Hoosier classic which was won by Resta in the Peugeot.

The Johns-Manville company had fifty-four men on the grounds during the running of the race, distributed through the grandstand and the pits and stationed at various points around the track armed with J-M extinguishers. Both the accidents which occurred took place near the J-M service station and, although the men were not called upon to use their extinguishers, they rendered aid to the injured drivers and their mechanicians until the arrival of medical authorities.

The History of the Pneumatic Tire—6

Efforts To Preserve Cushioning Effect While Protecting the Rubber—The Carmont Clincher Tire—Other Interesting Patents — First Pneumatic Tires for Bicycles

The History of the American Automobile Industry—33

By David Beecroft

THE wired method of construction in which the round rubber cord or tire was held in place by a sheet steel jacket, which jacket had ears that extended radially alongside the felloe and were provided with slots and pins by which they were held to the felloe but permitted movement as the rubber under the jacket compressed was one of many attempts to get the cushion effect but protect the rubber from the effect of the road. Inventors who seek this supposed advantage do not know that rubber is quite long-lived; sometimes more so than steel, when exposed to gritty service. The steel being unyielding is scratched or chipped by every contact with sharp stones, whereas the rubber simply yields, and if not loaded beyond its strength comes back to its original shape without losing any material.

The Carmont Patent

The Carmont tire, patented in June, 1887, was a clincher type, solid tire. It had a very wide base and was fitted into a rim much wider than the tire so that it could not roll out or turn over easily. In its center, at the base portion, was a V-shaped groove intended to permit the rubber to yield, the inventor seeming to have known what many experimenters at that time did not, that rubber is practically incompressible. Many later forms embodied this same idea, but the movement of the rubber within the rim often damaged it and eventually caused the tire to come off.

The year 1888 showed a number of patents which afterward became prominent in the pneumatic tire industry. The first of these, to Thomas B. Jeffery, late of the Thomas B. Jeffery Co., in May, was held in a clincher rim by little studs or projections of some harder material, such as metal rivets, which, engaging the overhanging edges of the rim, held the tire in place. In June, a half dozen or more patents were issued to A. W. Thomas and were strictly of the pneumatic variety. Their general principle involved the casing separate from the tube, which casing was held to the rim in some mechanical manner, such as by clamps. Two more patents were issued to Thomas in 1889. These Thomas patents were taken up by George R. Bidwell a couple of years later and the first real manufacturing of pneumatic tires in the United States was begun. Bidwell combined with the Thomas patents a license from the English Dunlop people which had been given to A. Featherstone of Chicago, and believed that he controlled the tire business in America. A factory was established at Sixty-sixth Street, near Columbus Avenue, New York City, and orders were placed with the New Jersey Car Spring & Rubber Co. of Jersey City, N. J., as well as with the B. F. Goodrich Co. of Akron, Ohio. These orders, given in March or April, 1891, were the beginning of the now enormous business of the Goodrich company.

Dubois Solid Tires

In 1888 the Dubois Mfg. Co., of Philadelphia, secured patents on solid rubber tires, one form being D-shaped, held in place by a flat band or wire placed in a hole near the base of the tire. The other was simply a rubber cushion of practically rectangular shape set into a flanged rim and having a groove in its outer surface. Into this groove a steel rim of T section was forced and held in place by the groove. This device was practically a copy of the Dietz device of 1835, excepting for the groove in the rubber and the stem on the metal for holding the two parts together. This stem undoubtedly stiffened the metal very materially and probably rendered the supposed cushioning action less evident. The form retained by the flat band proved more practical and was frequently seen in use in later years.

Other Cushion Types

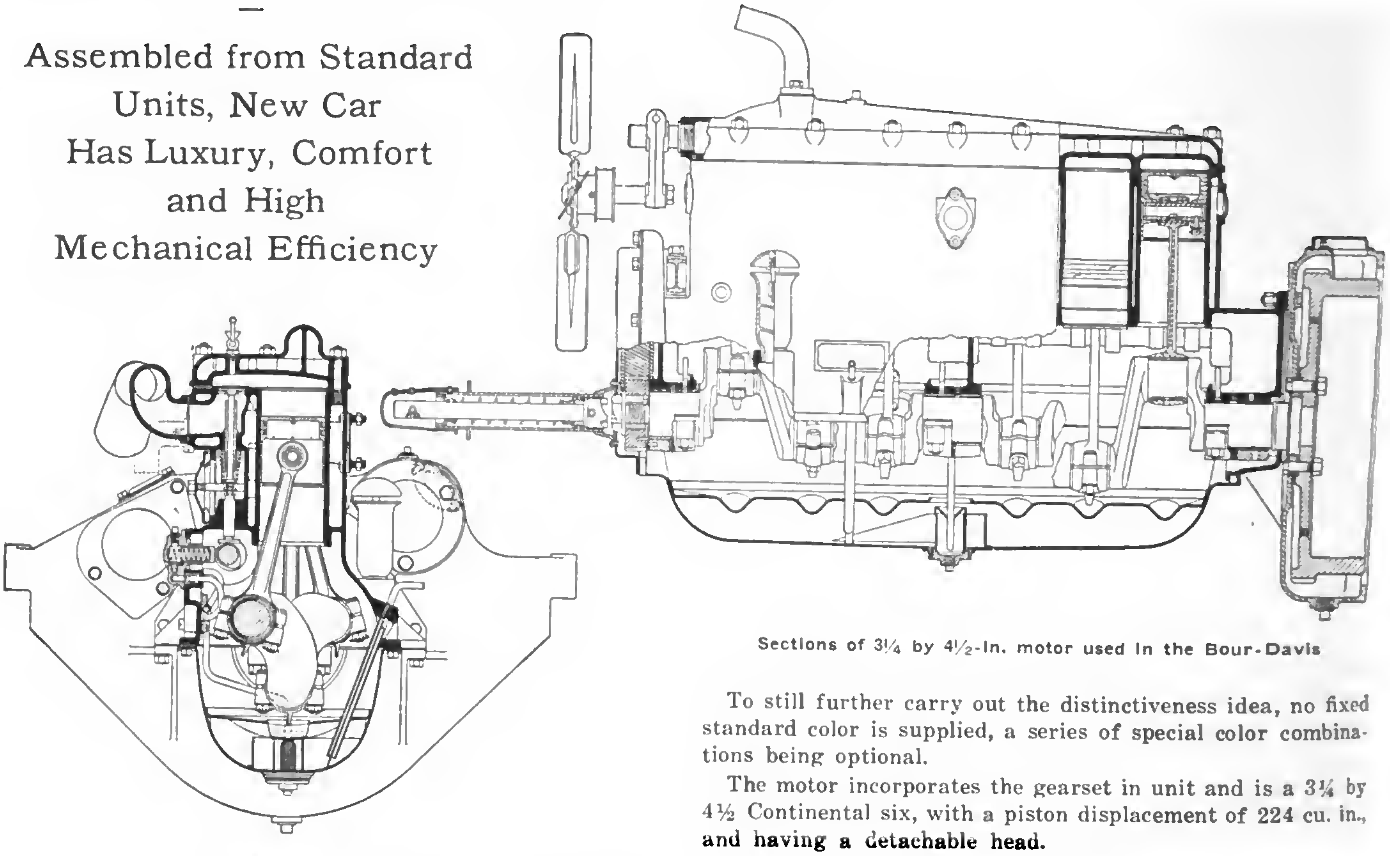
In 1889 we find a cushion tire having a thin sheet of metal in its base and adapted to be forced into a hooked or clincher rim. This was followed by a number of tires in which the crosswise stiffness of the base was expected to hold the tire beads in their places under the hooks of the rim after they were once placed there and until the central portion of the base should be lifted or pushed upward, which permitted the tire to be removed.

Pneumatic Bicycle Tires

In 1889 the first pneumatic-tired bicycles reached this country from England and their introduction was the first use of the air tire in America. This shipment was three New Rapids bicycles from the St. Georges' Engineering Co. to Samuel T. Clark, of Baltimore, Md.

Bour-Davis Six a Distinctive Design

Assembled from Standard Units, New Car Has Luxury, Comfort and High Mechanical Efficiency



Sections of 3¼ by 4½-In. motor used in the Bour-Davis

DESIGNED to meet the requirements of that class of buyers which demands luxury of appointments, finish and detail in a car, along with distinctiveness and individuality, in addition to efficient mechanical construction, the Bour-Davis, which is the product of the Bour-Davis Motor Car Co., one of Detroit's newcomers within the past year, is now formally placed before the public. The thought of the builders in producing the car was to fill the gap in the price class for the luxury type of car between the low-priced type and the high-priced vehicles. The price has been set at $1,250 for the touring car and $1,500 for the inclosed type, the only other form of body offered on the chassis for the present.

The car is a roomy vehicle, made up of standard parts. The motor is a Continental; the gearset is produced by the Detroit Gear & Machine Co.; Borg & Beck make the clutch; Remy supplies the ignition; Stromberg the carbureter, and Ward-Leonard builds the lighting and starting system. Some unusual equipment features are a roomy luggage trunk at the rear, Motometer for determining the water temperature, rear-vision mirror, windshield cleaner, in addition to the generally accepted requisites of the car of to-day.

Bour-Davis touring car which sells for $1,250

To still further carry out the distinctiveness idea, no fixed standard color is supplied, a series of special color combinations being optional.

The motor incorporates the gearset in unit and is a 3¼ by 4½ Continental six, with a piston displacement of 224 cu. in., and having a detachable head.

Crankshaft and camshaft are well mounted to insure minimum of vibration, and each has three bearings. The crankshaft bearings are bronze-backed and babbitt-lined, and their ample proportions are indicated by the dimensions: 2 9/32 by 2½ in., 2¼ by 2⅞ in., and 2 7/32 by 2 15/16 in., these being the front, center and rear respectively, and the first figure in each case representing the diameter. One of the essential features of efficient motor operation is a substantial camshaft that cannot be distorted, and in this motor the point has been well considered, for the dimensions of the bearings are quite large. The diameters are 1⅞, 1 13/16 and 1 11/16, and the lengths 2½, 2⅛ and 2 11/16 in., front to rear respectively. The cams have wide faces of ⅜ in., and the shaft is driven by helical gears.

To promote smooth running with a minimum of vibration, the connecting-rod and piston assemblies are all weighed and the six that enter into the construction of any one engine are of the same weight. The rod runs in bushings at both ends, that at the piston end being of bronze and at the shaft end of die-cast babbitt.

A cam-operated oil pump feeds the lubricant to the bearings and to troughs, from which it is splashed by the rod ends to the various other bearing surfaces within the engine. This is the conventional force-feed and splash combination with which Continental has been very successful. The oil capacity of the pressed steel oil pan that forms the bottom of the motor is 5 qt., the amount held at any time being indicated by a dial.

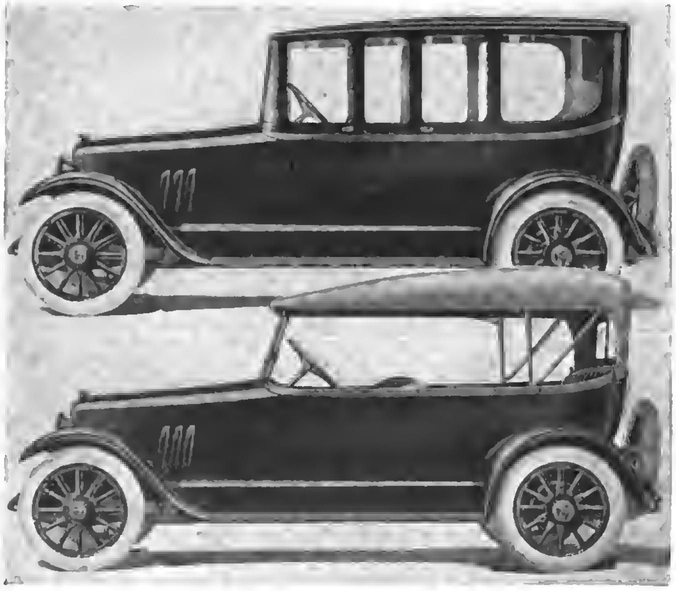
On the right of the engine and forward is the centrifugal water pump which is driven from the timing gears by a shaft. Between this unit and the cylinder block and the radiator the piping is therefore short, with obvious advantage. The water outlet is formed in the head casting and is also forward so that there is only a short pipe connection to the radiator. There is a belt-driven fan at the front, the belt tension being adjustable.

Ignition, starting and lighting units are separate. That is, a two-unit Ward Leonard equipment is provided for furnishing the lights and starting, while a Remy high-tension coil and distributer are used for ignition. The starting motor drives through teeth in the flywheel, meshing and demeshing of the starter pinion and the flywheel teeth being accomplished by the Bendix automatic device. It is only necessary to press the starting button, when the revolving of the motor armature automatically throws the pinion into mesh with the gear, and the operation is reversed when the engine starts under its own power. The generator is driven by the front gears, and connects to a 6-volt, 80-amp.-hr. battery.

In the gasoline system there is combined a Stromberg horizontal-outlet carbureter with a Stewart vacuum feed tank mounted on the front of the dash. The gasoline supply tank is carried at the rear of the chassis, and a very commendable feature of its mounting is the three-point suspension employed so that it does not have to take the strains resulting from any frame weaving, as would be the case were it rigidly mounted.

Back of the engine, the drive passes through a 10-in. disk clutch and the compact unit gearset, in which gears and shafting are of chrome-nickel steel, and the shaft mountings are annular ball and Hyatt roller bearings, there being provision for taking up wear. The spool type of countershaft with its stationary spindle assures smooth and noiseless action and prevents oil leakage. The speedometer gear is driven by the transmission shaft.

In the rear axle, which is of the three-quarter floating construction, nickel-steel spiral bevel gears are used to promote silence and smoothness of operation. Artillery wood wheels are standard equipment, and they carry 32 by 4 tires on demountable rims.



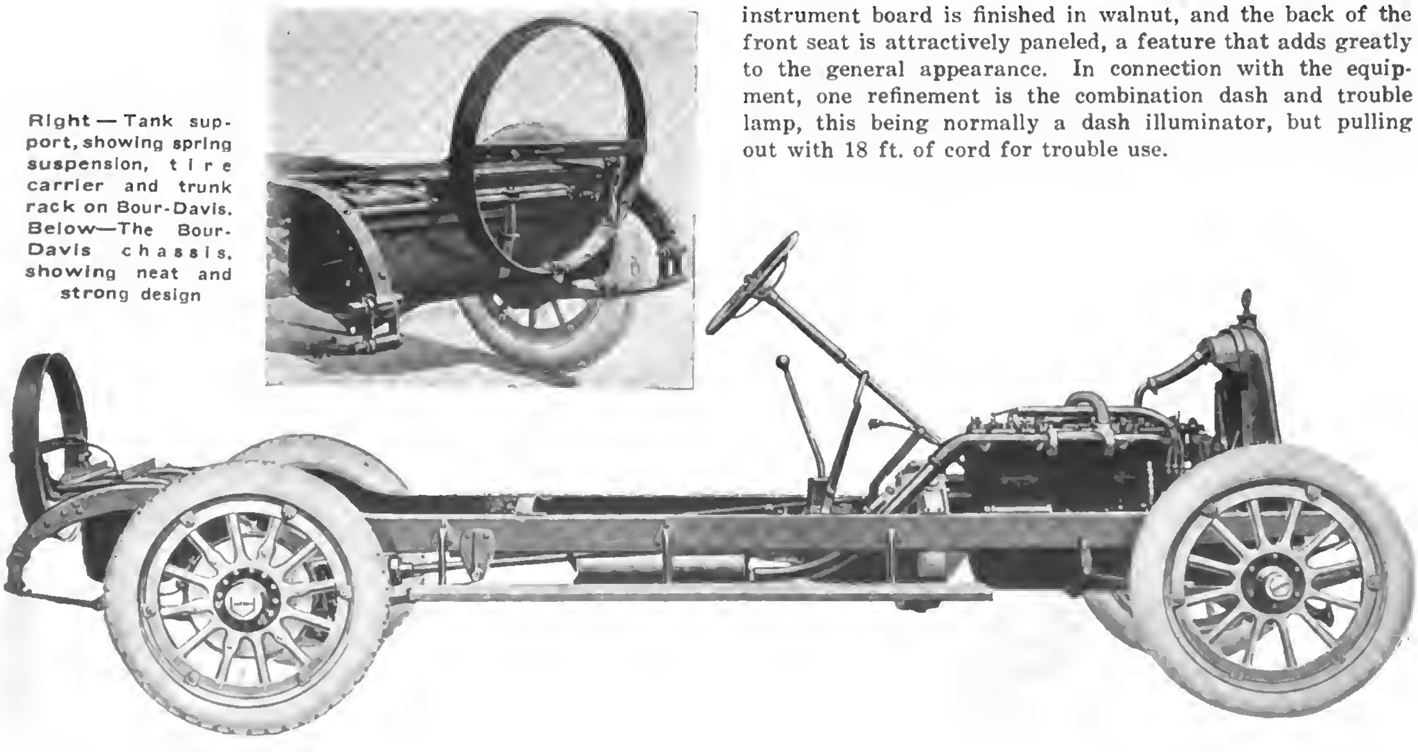
Above—Bour-Davis closed car which sells for $1,500. Below—Touring car model with the top up

Springs, both front and rear, are semi-elliptic and self-lubricating. The front pair is 37½ in. long, and holds the front end of the car in castor fashion, thus counteracting the road shocks. The rear ends of the frame rails are bent down to hold the rear ends of the springs, which are 52 in. long and underslung from the axle.

A tapered frame has been utilized, having a front width of 29⅛ in. and widening to an extreme rear width of 4½ in.

The wheelbase is 118 in. and there is plenty of leg room for comfort. The front seat is 14 in. high, 16½ in. deep and 42 in. wide, and the rear 14½ by 18 by 47 in. The angle that has been given the seats and the shaping is such that they are remarkably comfortable, the designers having this idea of comfort especially in mind when building the body.

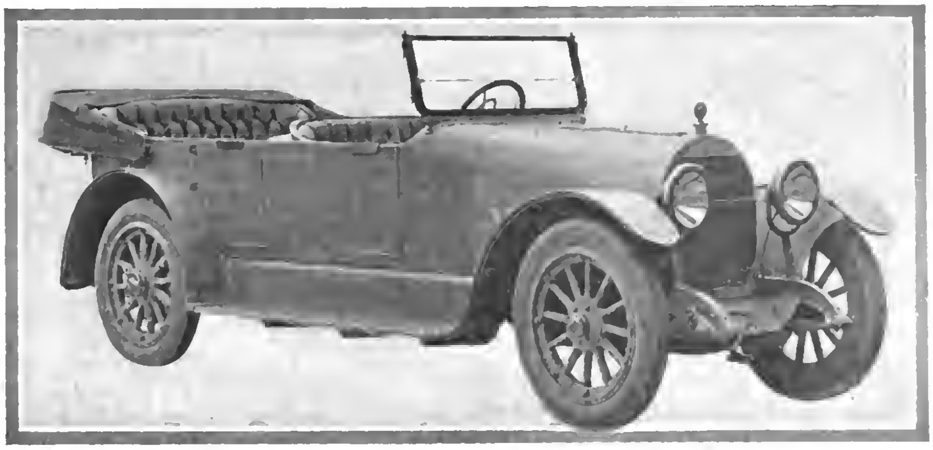
Very excellent coach work has been given the body. The instrument board is finished in walnut, and the back of the front seat is attractively paneled, a feature that adds greatly to the general appearance. In connection with the equipment, one refinement is the combination dash and trouble lamp, this being normally a dash illuminator, but pulling out with 18 ft. of cord for trouble use.



Right—Tank support, showing spring suspension, tire carrier and trunk rack on Bour-Davis. Below—The Bour-Davis chassis, showing neat and strong design

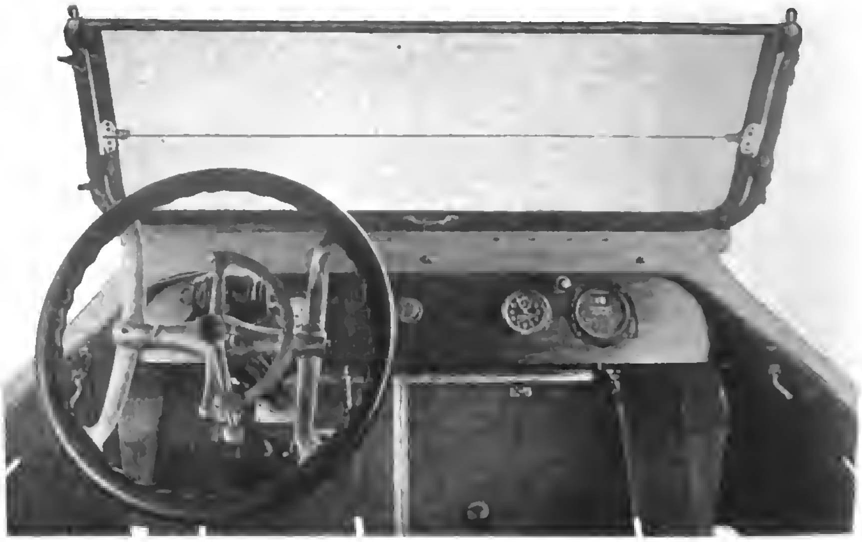
1917 McFarla Chassis—

Built 4 in. Nearer the Gro Wheelbase Is 4 in. Longe More Powerful and Live



The 1917 McFarlan selling at $3,200

MANY improvements distingush the new series X McFarlan, manufactured by the McFarlan Motor Co., Connersville, Ind., the company concentrating on this chassis for 1917 and discontinuing the model T chassis. The new car is striking in appearance, having a very low-hung effect, while the body is roomier than the previous model, being 4 in. longer and 4 in. lower with the top of the body panel only 48 in. from the ground. There are a number of refinements in the chassis also. A six-cylinder, 4½ by 6-in. motor is used similar in design to that employed on McFarlan cars for 6 years. Owing to the improvements embodied in the new car as well as to the increased cost of materials, all open models are now $3,200, instead of $2,990, or $210 higher.



Driver's compartment. Note the tilting wheel and control box on the column

A Teetor power plant is used, and this has several refinements, giving a higher-powered and livelier motor for the same displacement. This has been accomplished by reducing the combustion chamber volume, thus increasing the compression 10 lb., or from 60 to 70 lb., and by providing a new cam action which gives a quicker inlet opening; also the tappets are lighter. The valves are inclined and enter the cylinder at an angle.

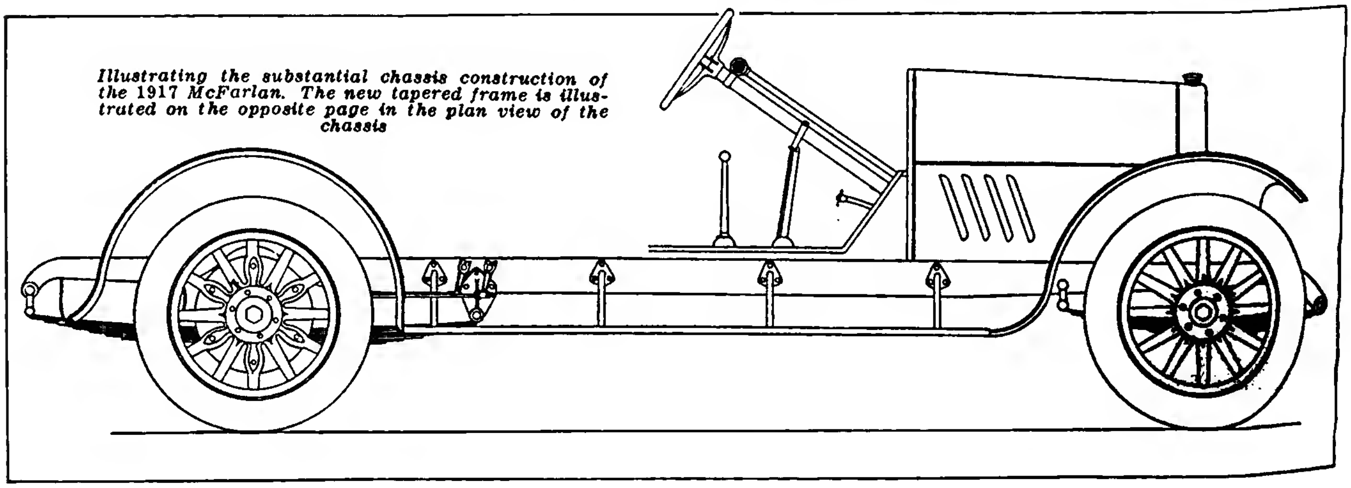
While the bore and stroke remain the same, the connecting-rods are now 12½ in. instead of 10 in.

The spark plugs are now in the centers of the cylinders, designed to act in conjunction with the higher compression in producing more efficient combustion. Another change in the cylinder block is that the cooling water enters at two places below the exhaust valves instead of one. The water pump is now on the right side instead of the left. The exhaust manifold is now a separate casting.

A three plate dry clutch has replaced the cone, requiring a pedal pressure of only 6 lb.

The Brown-Lipe gearbox is still used, but in place of the annular ball bearings it is equipped with Timken bearings throughout. The propeller shaft is now hollow and the universals are Spicers, with one between clutch and gearbox.

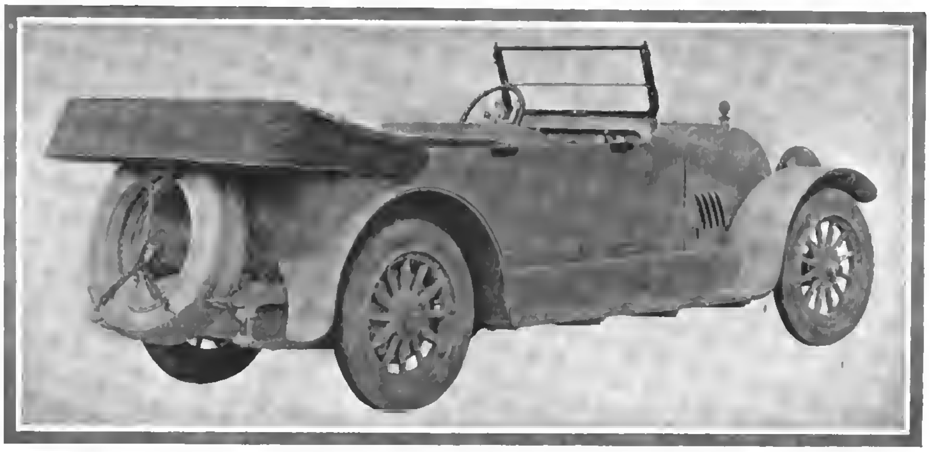
Both front and rear axles are Timken. The front axle carries a bearing in the knuckle and the rear axle operates through a splined shaft. On the rear system a change of



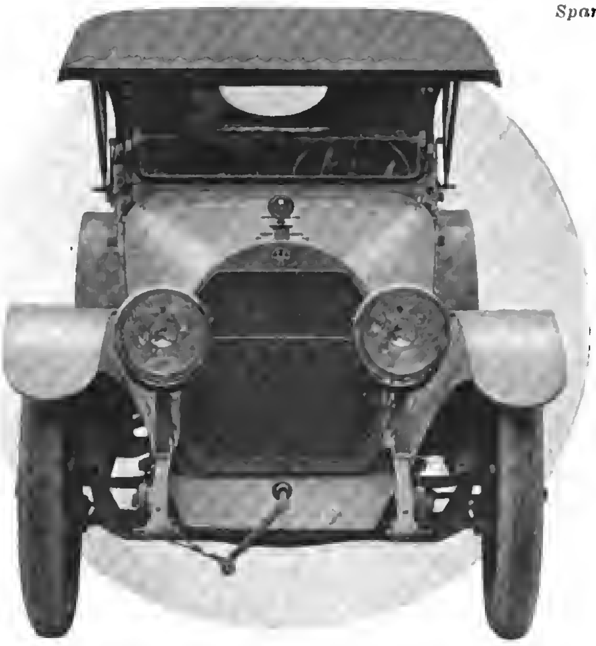
Illustrating the substantial chassis construction of the 1917 McFarlan. The new tapered frame is illustrated on the opposite page in the plan view of the chassis

uilt on Single
igger Car

an the Previous Model and
gher Compression Gives
tor—Elegance and Comfort



Spare tires are compactly mounted and the mudguard blends into the body



The 1917 McFarlan is built 4 in. lower than its predecessor

importance is in the brakes, which are 17 by 2½ in., instead of 16 by 2½.

The new frame is drawn in at the front in bottle-neck fashion to give a short turning radius. It tapers back to a width of 40 in., and there is a kickup over the rear axle.

The suspension of the car has been changed front and rear. In the front the springs are semi-elliptic, 40 in. in length. The rear has been changed from a 56-in. cantilever to a 62-in. underslung semi-elliptic. The new rear springs take both thrust and torque, giving a full Hotchkiss drive. Bronze bushings have been placed throughout the car at all wearing points. In spite of the changes, the car weighs 300 lb. less than for 1916. Also, the wheelbase is now 136 in., as against 132 in. Aluminum pistons are continued.

Curved cheek counterbalancing is used on the 2⅛-in.-diameter crankshaft, which is supported on four main bearings. The dimensions of these are 4¼ in. long by 2⅛ in. diameter at the ends, and 1⅞ in. long by 2⅝ in. diameter at the center.

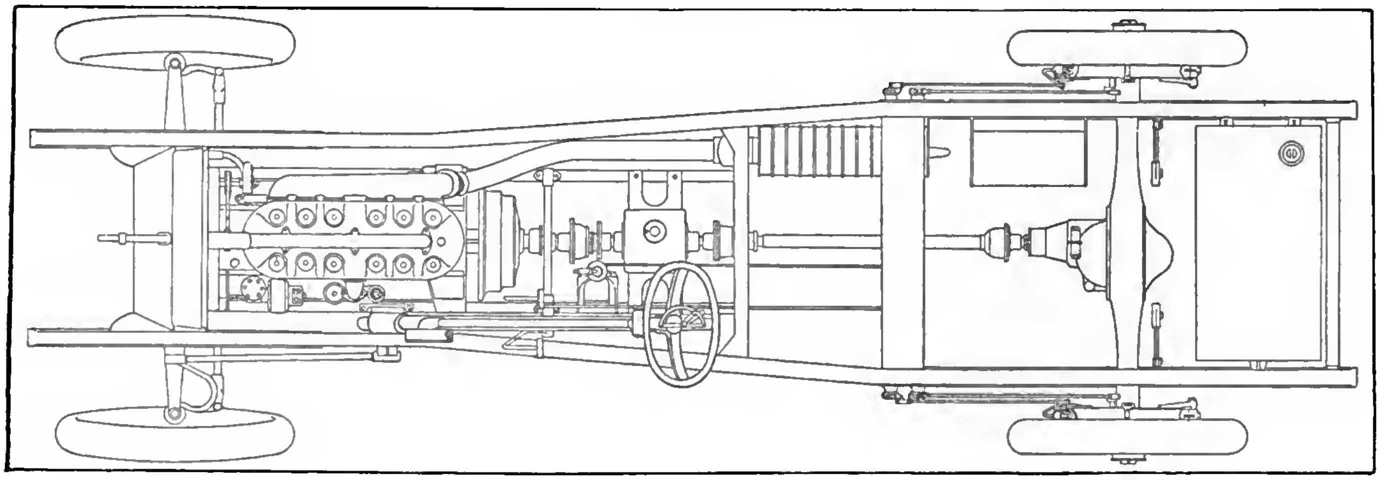
Lubrication is by combined force feed and splash. The oil is fed to the main bearings under a pressure which varies from 5 to 30 lb. under different engine speeds. The connecting-rods and cylinders are taken care of by the Teetor patented system, in which the splash level is variable and controlled by gravity.

The electrical system is centralized in a control box on the steering column, and all wiring is in the chassis, so it is only necessary to pull out two connectors when changing bodies. The steering wheel tilts and is equipped with an electric warming device for winter driving.

Electrically the entire car is Westinghouse. The generator and ignition unit is mounted on the left side of the engine and the starting motor is on the rear at the right side.

The body is of the true double cowl, streamline design, with the exception that the front backs are raised slightly out of this cowl to allow a higher and heavier upholstering than has formerly been used. The same scheme has been followed out in the rear seat; the raise, however, being completely hidden by the back curtain and back stays which are carried around the corner of the body.

The auxiliary seats fold into a cabinet and are hidden by flexible wooden curtains.



ACCESSORIES

Cozy Camp Trailer

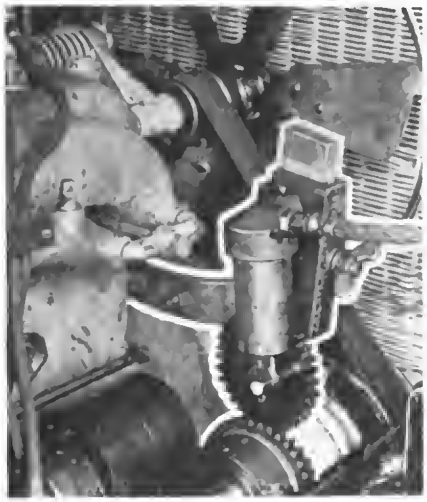
THIS combination trailer and camp outfit, as may be seen from the accompanying illustrations, is of neat design and strong construction while the equipment is very complete. The trailer is fitted with selected second growth hickory and solid rubber tires, the axle being 1¼ in. diameter of high grade specially tested steel with ball bearing spindles. Springs are of platform style with hard wood cross sills providing support for the body, which has high side and end panels strongly braced with wrought iron. It contains the built-in removable refrigerator and removable drawers for carrying accessories. The tent is of heavy, closely woven waterproof duck with screened skylights for ventilation and light. The equipment comprises two double spring beds for large bed mattresses, table, cook stove and the refrigerator already mentioned, the maker reserving the right to alter the specifications in the matter of improvements. The maker provides a swivel hitch for attaching to cars on which it is possible to reshape the rear irons to suit. When this is not practicable, an axle hitch is furnished at the same price, the entire outfit including the trailer, the equipment specified and a rigid weatherproof canopy deck selling for $165 f.o.b. Indianapolis, $25 with order, balance on receipt of shipment.—Cozy Camp & Auto Trailer Co., Indianapolis, Ind.

Adams-Williams Convertible Top

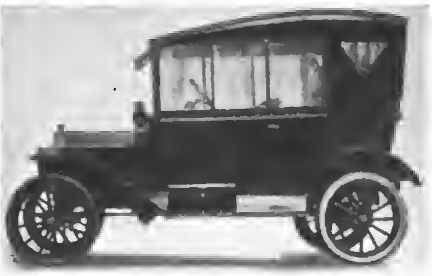
This top consists of a set of glass sides which cover over the open space usually closed by the side curtains. It may be put up or taken down in 3 minutes it is said, and from the inside of the car. It is made for all cars. Prices, $60 and up.—Adams-Williams Mfg. Co., New York City.

Alben Jack and Crane

While this device resembles a portable crane with a bifurcated base and ball-bearing caster wheels, it differs in that the boom or arm to which the chain is attached moves upward bodily, the upright part sliding in a hollow column and being actuated by a hand-crank, through gearing. The gearing gives two speeds, one for heavy loads and the other for light loads and quick lowering. Another feature is a jack arrangement, consisting of a pair of arms hinged to the sliding upright, so that they can be inserted under the load and the load raised by turning the crank. The arms can be swung to any angle and can be moved back out of the way when not needed. Minimum boom height, 6 ft. 4 in.; maximum, 9 ft. 3 in.; length of jack arms, 26 in.; weight of complete machine, 300 lb. It sells for $85.—Alben Co., Milwaukee, Wis.



Juleco power pump for Maxwells



Adams-Williams top for Fords

The Cozy Camp outfit open

Juleco Pump for Maxwells

This pump has been brought out to supplement the Juleco line for Ford and Metz cars. The new design for Maxwells is similar to the Ford type and its efficiency is said to be practically the same. It is quickly attached without drilling or mutilating the car or engine in any way, being conveniently located behind the fan on the forward end of the motor as shown in the accompanying illustration, slides in and out of mesh very easily. Some of the features are: Pumps tires in 2 to 3 min. at 425 r.p.m.; has a Wear-Better plunger; requires little attention, only a few drops of oil on the bearings occasionally; satisfactory operation and all parts are guaranteed. Price, $6.—Judd & Leland Mfg. Co., Clifton Springs, N. Y.

Potstada Shear

This bench shear for cutting metal will work steel plate ⅛ in. thick. The shear is of forged steel and the handles and stand of malleable iron. The stand has a lug for gripping in the vise. There are but seven parts in the tool and all are numbered for easy identification in case of breakage. Price, $7.50.—C. Groos, Racine, Wis.

Military Transport

THE establishment of the military transport committee of the S. A. E. makes America the first country to tackle the problem of arranging for emergency in this regard along really rational lines. The German methods of preparation were good, but they are possible only in a country not blessed with a democratic form of government. The British subsidy scheme was a good conception, but it was developed without proper reference to the opinions of the men in the industry who would have made the best advisers. The almost complete uselessness of the scheme when it was put to the test in August, 1914, provides a lesson that American engineers and the American army have not been slow to realize.

Just exactly what will be the duties of the new S. A. E. committee is impossible to tell as yet, but in the main its purpose is to form a connecting link between the army authorities who are experts on the requirements and the industry which is expert in the design and construction of trucks.

The effect of the work to be done may not be noticeable for some time to come, but after several years it cannot help but raise the efficiency of preparedness from the transportation angle. Transportation is a chain which binds together the army and the suppliers, neither is any good without the other, and in that great chain the S. A. E. committee is one of the most important links.

The Best Yet

THE trip which the S. A. E. started on Monday last is unquestionably the best organized as well as the most largely attended excursion in the history of the Society. Its program of papers and discussions has never been approached for variety or for average excellence, and the subjects chosen have never been more closely in accord with the vital topics of the day.

One of the most striking things is the fact that the breadth of outlook indicated by the papers program is so entirely representative of the increasing breadth of the responsibility of the automobile industry. To-day the word "automobile" is coming to be regarded more in its true sense. Not only passenger cars, but trucks, tractors, aeroplanes and even motor boats are automobiles in the dictionary definition; they are self-propelling machines. There is no fundamental difference between the tractor and the aeroplanes, and a great fund of common knowledge is necessary in designing either one of them. This the S. A. E. has realized, just as the engineers themselves have realized it, and the trend of present events shows clearly that the past work of the society is being appreciated by both extremes of the profession.

Small Output

DESPITE the enormously increased productions of the past few years, and despite the tendency to group factories together so that the aggregate output is immense, it is still easy enough to obtain capital for a very different sort of car making. There are a good many firms now in existence making small quantities of very high grade cars, selling them at a very high price and with a big profit per car, but there are not so many small firms making a medium price vehicle.

The man who wants a really distinctive car of good, sound construction and whose limit of price is about $2,000 has not a great many machines from which to choose. He can get a wide range of models around $1,250, but is often willing to pay an extra few hundred to get something that is *not* produced in large quantities. Mechanically an excellent chassis can be assembled from the best parts for under $1,000 and it is then possible to make the retail price anything from $1,200 or $1,300 upward, according to the degree of finish on the body and the quality of the accessories. Lasting good finish is still not cheap, and first grade accessories command a price commensurate with their durability and good appearance. For the first class body and the highest grade of fittings many people are willing to pay; and they will pay, too, for a car which they can recognize as theirs from a distance of a couple of blocks.

To suit this class of consumer only a limited number of cars can be built, for a large output defeats the purpose of the maker. Thus, however large the major concerns in the industry may become, there is always sure to be room for a number of small factories producing medium price cars.

N. A. C. C. Approves Service and Repair Parts Policies—Defines Standard Truck

Puts Service Standards on Fair and Definite Basis with All Purchasers of Passenger and Commercial Vehicles —Policies Are Outcome of Service Managers' Convention

NEW YORK CITY, June 13—The National Automobile Chamber of Commerce has approved a form of standard service policy to be put into effect between the members and the purchasers of their cars, and has also approved a standard repair parts policy to become operative between the manufacturers and their distributors and dealers.

These two policies are the outcome of the service managers' convention held in Detroit last year, and embody the results of careful study and recommendations made by the service managers' associations of Indiana and Michigan, organized last year, and of the two special committees appointed by the N. A. C. C., of which Percy Owen (Liberty) and E. T. Klee (Stutz) were the chairmen.

The service policy is as follows:

N. A. C. C. STANDARD SERVICE POLICY

The Blank Motor Car Co., through its dealers, aims to give all purchasers of Blank cars uniformly fair, courteous and businesslike treatment and to assist them in every reasonable way to keep their cars in good running condition.

The principles of this policy are:

First—To fulfill the obligations assumed under the manufacturer's warranty.

Second—To furnish repair parts as promptly as possible at our current prices.

Third—To maintain facilities for making repairs, adjustments and do general overhauling in a prompt and competent manner at reasonable charges.

Fourth—To make inspections and adjustments, not necessitated by neglect or abuse, free of charge for 1 month following delivery of a new car to purchaser, and thereafter at our regular prices.

Fifth—To furnish printed instructions in the operation and care of our cars.

Sixth—Service to be rendered does not include furnishing repair parts or labor without charge, except as provided in the warranty and in the following specific clauses of this Service Policy.

Replacement of Defective Parts

(a) Within 90 days after delivery of a new car to purchaser the Blank company will furnish, free of charge at the factory, duplicate parts to replace any parts as covered by our warranty that are returned to the factory with shipping charges prepaid and which are determined by the company to have been defective in material or workmanship, or it will put such parts in condition as good as new without charge.

(b) Within 90 days after delivery of a new car to the purchaser the dealer will install, free of labor charges, any parts that the factory furnishes or repairs free of cost to replace any parts determined by the factory to be defective, the purchaser to assume cost of replacement parts and installation of same pending factory decision.

(c) The party returning the parts will be notified promptly of the decision of the factory regarding allowance of a claim for replacement or repair of parts returned.

Inspection and Adjustment

(d) Cars brought to service stations maintained by factory, branch or dealer will be inspected and all necessary adjustments will be made as in paragraphs (e) and (f) without charge during the first month after delivery of a new car to purchaser, provided the car has not been tampered with or injured by accident or neglect. After the first month adjustments will be made at the regular charges of the service station.

(e) Inspection includes examination and report of the condition of the car.

(f) Adjustment includes only such adjustments as inspection has found necessary to put the car in good operating condition.

(g) Every dealer is expected to give the same inspection and adjustment service on the cars made by this company without regard to the territory in which they were bought.

Repairs, Replacements, Etc.

(h) All work not included in inspection and necessary adjustment during the first month, or installation of replacements under the warranty, will be charged for at regular rates.

(i) When any charge work is to be done and the cost can be estimated in advance, the owner, upon request, will be advised of the amount of charges before the work is begun.

(j) When it is necessary, for the convenience of the owner, to render service at a distance from the service station, the time spent by employees going to and from the job will be charged for at the regular rates of the station, together with all proper expenses of making the trip, cost of shipping parts, if any, and other necessary incidental expense.

Overtime Work

(k) Any overtime, holiday or Sunday work done upon the request of the owner will be charged for at the regular overtime rate.

Instructions in Care and Operation

(l) Instructions in printed form regarding the care and operation of the car and its accessories, and proper method of ordering and returning parts, will be given the purchaser upon the delivery of the car.

(m) Personal instruction will be given in accordance with the agreement between dealer and customer at the time of purchase.

General

(n) For service and replacements on engine starters, batteries, magnetos, generators, lamps, carbureters, tires, rims or other trade accessories that are not made by the manufacturer of the car, application may be made direct to the nearest service station maintained by the maker of such accessory. Dealers will be provided with a list giving names and addresses of the manufacturers of said accessories.

(o) No promise of service, free repair work, inspection or adjustment, except as herein specified, given or made by the dealer, shall be binding on the manufacturer of the car.

(p) To help the dealer carry out the intent of this Service Policy, the owner is requested to furnish all information necessary to the prompt and proper filling of orders and issuing of credits and to observe the requirements regarding return of parts with claims for replacement.

(Signed) THE BLANK MOTOR CAR CO.

N. A. C. C. STANDARD REPAIR PARTS POLICY

The purpose of this policy is to place the relations between the Blank Motor Car Co. and its dealers on a definite, fair, uniform and businesslike basis.

1. STOCK OF PARTS—The dealer will be required to maintain a minimum stock of both "current" and "service" parts as specified by manufacturers, to be paid for by the dealer on or before the 20th day of month following delivery.

2. CENSORING OF ORDERS—To prevent the overstocking of inactive parts by the dealer or the purchasing of an excessive stock of any parts, the right is reserved by the manufacturer to reduce in quantity the number of pieces of any part or parts ordered by the dealer.

3. INVENTORIES—The dealer will be required to furnish an inventory of current and service parts upon request. The manufacturer reserves the right to send an auditor to verify inventories and reduce or increase stock as he sees fit in accordance with clause No. I.

4. SHIPMENTS TO DEALERS' TERRITORY—So far as possible, the dealer will be required to see that all orders for parts from his territory are placed through him.

5. DISCOUNTS—Discounts to garages or repairshops will be at the discretion of the manufacturer.

6.—DESIGNATION OF PARTS STOCKS—Stocks of parts shall be designated as follows:

(a) **Current Parts**—All parts used in cars of models being produced by the factory.

(b) **Service Parts**—All parts for models no longer being produced by the factory and which have not been superseded by other parts that are interchangeable with them.

(c) **Obsolete Parts**—Parts that have been superseded by other parts that are interchangeable with them.

7. RETURN OF PARTS—

(a) **Defective**—Parts claimed defective under the 90-day warranty must be returned to the factory, with shipping charges prepaid, within 30 days from time defect claimed manifests itself.

(b) Obsolete parts shall be returned only as ordered by manufacturer.

(c) Surplus parts may be returned only by individual arrangement with the manufacturer.

All parts shipped to the manufacturer by dealer shall have transportation charges prepaid and be properly tagged.

8. NOTIFICATION OF OWNER—The manufacturer reserves the right to communicate direct with owners concerning replacement and disposition of parts returned.

9. DISPOSITION OF RETURNED PARTS—The manufacturer reserves the right to dispose, within 30 days, of parts returned without assuming liability unless covered by shipping instructions or adjustment is accepted.

10. PARTS PURCHASED OR MADE OUTSIDE OF TERRITORY—The manufacturer will refuse to consider claims for or accept for adjustment any parts not supplied by him.

(Signed) THE BLANK MOTOR CAR CO.

Definitions of standard truck chassis have been approved by the National Automobile Chamber of Commerce.

The object of these definitions, suggested by Windsor T. White, chairman of the commercial vehicle committee, is to indicate what minimum parts, finish and equipment constitute the standard chassis for gasoline and electric commercial vehicles. The definitions are expected to simplify the compilation of catalog specifications, etc. They read as follows:

WHAT A GASOLINE TRUCK CHASSIS IS

A standard chassis of a commercial vehicle to be propelled by an internal combustion engine shall consist of an assembly of all essential parts of a truck chassis with protective housings, ready for operation on the road, including set of tires attached to wheels; driver's seat with padding or cushion on all chassis rated at 1-ton capacity or more; front wheel fenders; runningboard or mounting step; tool campartment; priming coat of lead on all parts to be painted; pair of front lights and one tail lamp; license brackets; warning signal, jack and a set of tools commonly used for making adjustments and minor repairs on the road.

WHAT AN ELECTRIC TRUCK CHASSIS IS

A standard chassis of a commercial vehicle to be propelled by electricity shall consist of a running gear, motor, battery cradle or box, driving and control mechanism and wiring, with all essential parts, fittings and protective housings thereof, assembled complete ready for operation on the road with the exception of a battery; a priming coat of lead on all parts to be painted; set of tires attached to wheels; pair of front lights and one tail lamp, with necessary wiring installed; license brackets; charging plug and cable; odometer; warning signal, and set of tools commonly used for making adjustments and minor repairs on the road.

Skinner Joins Liberty

DETROIT, MICH., June 9—G. S. Skinner has joined the sales division of the Liberty Motor Car Co. Mr. Skinner has been connected during the past few years with the Canadian distributors of the Hudson company.

Brunning and Benedict Join Oakes

INDIANAPOLIS, IND., June 8—W. H. Brunning and H. M. Benedict have joined the engineering department of the Oakes Co., this city.

French Import Ban in Effect

Barring of American Automobiles, Bodies and Chassis Affects Dealers

PARIS, June 3—On the ground that shipping was required for articles of greater national importance, the French Government has prohibited the importation of automobiles, automobile bodies and automobile chassis. Other articles barred in the same decree comprise such uxuries as pictures, photographs, jewel- y, cameras, etc. Within 48 hr. of the aw being passed, the decree had been igned putting prohibition into force. his rapid action came as a surprise to me dealers who were ill prepared for . It was obvious, however, after Eng- nd's action in imposing first a 33 1/3 r cent duty then prohibition that rance would not be long in following it. Careful observers were aware, too, at the French automobile industry was ing its best to influence the govern- nt toward prohibition of automobile ports.

st Close Agencies

All the agents affected are handling erican cars, the makes of cars being rd, Overland, Buick, Dodge, Maxwell, vrolet and Saxon. These were the y ones doing active business in nce. Generally sufficient stocks are l to keep business going for a couple nonths. After that the agencies may vell close, for they will have nothing e to sell. Although the law is in e, an attempt is being made by deal- to get it repealed. It is pointed out the demand for cars comes from ons who need automobiles in their ess. This is shown by the fact that on as French cars are requisitioned the military American cars are ht in place of them. These pur- s would not be made at the present if the cars were not really neces- By shutting out American cars at e when the home factories are un- to supply, dealers will be ruined eir business connections lost. Thus rench manufacturers are doing elves harm, for they are destroying sses which are essential to their rity in normal times.

s very doubtful if the protest t prohibition will produce any im- e result. The influential leading acturers are enraged at the pos- of America getting hold of the market, and will bring very pressure to bear against any at- at repeal. It is obvious too, that this protective measure becomes ssary at the end of the war, they will not be satisfied to return to their old tariff rate, but will ask for a substantial increase.

Much of the opposition is directed against Ford; yet it is significant that Ford is now building a big factory in England and in the future will supply the Continental market from that source. Thus any preferential tariff among the Allied powers will necessarily admit Ford into the French market on the same terms as cars of entirely English origin. Some members of the industry are inclined to look upon the Ford as a missionary car which will extend the motoring movement. The majority, however, look upon it as a direct competitor.

White Domestic Orders Gain 45 Per Cent in 4 Months

CLEVELAND, OHIO, June 9—Domestic orders of the White Motor Co., this city, have gained 45 per cent during the first four months of 1916. It is reported that 4000 White trucks are being used by the Russian army and that further orders from that country are expected. At the French army's headquarters, 1000 White trucks are held for emergency service, so that not less than 5000 White trucks are in use by the Allied army.

As of Dec. 31, the company's buildings, machinery and current assets amounted to $12,537,275, and total liabilities other than capital stock amounted to $2,013,120, leaving a balance of $10,524,155 in net tangible assets, which is equivalent to 66 per cent on the capital stock.

The net profits for 1915 were $8,700,000, equal to 54.3 per cent on the $18,000,000 stock, and the output was 8100 cars.

The company recently received an order for 800 trucks from the French government, and it is stated that negotiations are now pending for the purchase of 500 more from that company.

465 Packards Shipped to Allies

NEW YORK CITY, June 14—The first trainload of ten will arrive in the freight yards of the Pennsylvania Railroad this week loaded with one of the largest shipments of trucks ever made in this country. The entire shipment consists of 465 Packard trucks, valued at $2,000,000, purchased by Gaston, Williams & Wigmore, for immediate shipment to Russia, England and France. As only two trucks can be loaded to a car, the shipment will consist of 233 specially built freight cars.

Evans with United Truck

GRAND RAPIDS, MICH., June 13—E. C. Evans, formerly with the Packard Motor Car Co., Detroit, has been appointed production manager of the United Motor Truck Co.

Monster Merger Is Abandoned

Complications Arise Causing Entire Plan of $250,000,000 Combine to Be Dropped

NEW YORK CITY, June 14—Quite unexpectedly comes official announcement from John N. Willys, that owing to the failure of the parties concerned in the $250,000,000 merger to come to a definite agreement, the plan has been abandoned. Rumors have up to this time been coming from Wall Street of a hitch in negotiations, but details were not available.

During the latter part of last week an official statement from Mr. Willys had it that a new corporation was to be organized by him and associates in the Willys-Overland Co., which would acquire their holdings of the stock of that company and the entire capital stock of the Auto-Lite Co. The new corporation was to be controlled by Mr. Willys. Among the properties under consideration were those of the Hudson, Chalmers and Fisk companies.

These companies will continue to act independently. It is understood that there were legal difficulties which it was feared might lead to serious complications.

It is stated that the bankers sought to impose certain obligations which the manufacturers refused to adopt and *vice versa*.

In well informed circles attention was drawn to the fact that since the first announcement of the proposed formation of the new concern there has been no definite statement issued as to the capitalization or the basis of stock exchange on which the different companies reported were to be taken over. In spite of this fact an underwriting syndicate composed of William Salomon & Co., J. S. Bache & Co., Dominick & Dominick and Laird & Co. of Wilmington, Del., had been formed.

Corcoran Mfg. Co. Formed

CINCINNATI, OHIO, June 12—Corcoran interests are represented in a new company to manufacture fenders, hoods and radiators for automobiles. Three of the five Corcoran brothers, who were in the recent merger of the Corcoran Lamp Co., the Victor Lamp Co. and the Victor Auto Parts Co., into the Corcoran-Victor Co., are represented in the new concern. They are John J., E. B. and William J. The first-named is president, E. B. Corcoran is vice-president, and William J. is treasurer. W. R. Hughes, formerly sales-manager of the Victor Auto Parts Co., is secretary and sales manager of the new company.

The company expects to be turning out 500 sets of fenders on or about July 1.

Lower Gasoline Prices Predicted

Federal Trade Commission Told of Coming Overproduction at 2-Day Hearing

WASHINGTON, D. C., June 13—Predictions of lower gasoline prices in the near future were made at the hearing before the Federal Trade Commission to-day, because of the recent discovery of oil fields, which, it was contended, will cause overproduction. T. J. James, secretary of the Assn. of Refiners of Kansas and Oklahoma, responsible for this statement, also exonerated the Standard Oil Co. from the charge of putting up the price, and said the upward tendency was wholly natural under the conditions of the oil market. At the time of the rise in price, he said, the Standard Oil Co. held probably 51 per cent of the production properties, but now he thought that the independents held about that proportion of the crude output.

At yesterday's meeting it was charged that the big companies originally started the increase in the price of gasoline through manipulation and through speculating in crude petroleum. It was also brought out, in answer to the preceding charges, that the big companies bought up crude petroleum not for speculation but because experts predicted a famine and the companies were seeking merely to protect themselves.

To Make P. D. Q. Spark Plug

DETROIT, MICH., June 10.—The Wolverine Spark Plug Co., a newly incorporated concern, with a capital of $100,000, has located at 45 Fort Street, East, in the Boydell Building. New equipment is now being installed to manufacture in large quantities a new spark plug called the P. D. Q.

The officers and directors of the company include C. H. Braselton, president; A. Kugeman, vice-president, and P. S. Linton, secretary and treasurer; also F. R. Pence and William Bohleber.

Ludwig Opel Killed at Verdun

NEW YORK CITY, June 9—According to advices from Copenhagen the well-known German automobile manufacturer, Ludwig Opel, was killed at Verdun in May.

3,000,000 Edmunds & Jones Lamps for 1916 Season

DETROIT, MICH., June 8—The Edmunds & Jones Corp., this city, will produce 3,000,000 lamps in the current year and arrangements are being made to handle an output of 4,000,000 lamps in 1917. The output in 1915 was 1,467,119 lamps, in 1914 it was 661,430 and in 1913, 442,646.

The company has $500,000 in cash and gross sales this year are expected to exceed $4,000,000, and net after preferred dividends, of about $15 a share on the 40,000 shares of common stock.

The Detroit plant is now turning out 20,000 lamps daily compared with 16,000 in 1915.

An addition will be made to its Chicago Electric Mfg. Co. plant which will double its output.

Hancock Represents Dort in Antipodes

FLINT, MICH., June 8.—R. J. Hancock, proprietor of the Colonial Trading Co., Melbourne, Australia, has been appointed direct factory representative of the Dort Motor Car Co. in Australia and New Zealand.

Batchelder Joins Dort Sales

FLINT, MICH., June 8.—C. F. Batchelder, for many years sales manager of the John Deere Plow Co., St. Louis, Mo., has become assistant general sales manager of the Dort Motor Car Co., this city.

Smith Is Argo Sales Director

JACKSON, MICH., June 8—W. L. Smith of the Smith Motor Sales Co., Washington, D. C., has been appointed director of sales for the Argo Motor Co., Inc. Mr. Smith has been the Argo distributor in the East and South since the first car was put on the market.

Hilts Joins Puritan Machine

DETROIT, MICH., June 12.—The Puritan Machine Co., Detroit, has appointed M. R. Hilts as assistant to Frank M. Eldridge, advertising manager, appointment to take place immediately. Mr. Hilts was formerly connected with the advertising department of the Oakland Motor Car Co., and of the Paige-Detroit Motor Co.

Morehead Heads N. Y. Goodrich Branch

NEW YORK CITY, June 9.—H. J. Morehead has been appointed manager of the local branch of the B. F. Goodrich Co. Mr. Morehead entered the service of this company in 1905 at its Detroit branch as a salesman. In 1908 he succeeded H. C. Miller as manager there.

Durst Is Delco Publicity Mgr.

DAYTON, OHIO, June 10.—J. E. Durst has succeeded W. O. Waldsmith as publicity manager of the Dayton Engineering Laboratories Co., this city.

Mr. Waldsmith will be general agent for the Delco-Light, the new farm lighting plant. His territory includes the Eastern half of Missouri and about fifteen counties in Illinois.

Gasoline at 11 Cents a Gal.

Rittman Process Enables Production at That Price with Use of Oil Residue

NEW YORK CITY, June 12.—Gasoline may be produced for about 11 cents per gal. by the Rittman process when fuel oil sells for about $1.40 per barrel, the average current price. This oil is the residue from the crude, after the gasoline and kerosene have been subtracted from it. Its price varies throughout the country, averaging at the present time $1.20 to $1.30 in Chicago, and $1.50 to $1.60 in New York. At $1.20 the price is 10 cents and at $1.60, 12 cents. With oil at 50 cents per barrel the cost would drop to 7.8 and with oil at $2.10, the price would be 13.9 cents. These figures are for a $20,000 plant which would have a monthly capacity of about 5000 barrels. Seventeen per cent of the fuel oil becomes gasoline, 10 per cent is lost in the process, and 73 per cent remains fuel oil and may be sold at the same figure at which it was purchased.

COST OF FUEL OIL 50 CENTS PER BBL.

Expense		
5000 bbl. fuel oil at 50c. per bbl.		$2,500
Production cost—

Net Cost

Net cost 850 bbl. (35,700 gal.) gasoline. $4,955
Cost of gasoline per gallon, 13.9 cents.

Houk To Increase Production

Completes New Sheet Metal Stamping Plant—Large Scale Operations Start Sept. 1

BUFFALO, N. Y., June 12.—With the addition of a new sheet metal stamping plant and the installation of Bliss presses, the Houk Mfg. Co., this city, will be on a larger scale of production by Sept. 1. This addition will provide a production of 5000 hub shells per day besides its own production of 50,000 spokes per day.

A contract has been placed with the Standard company of Torrington, Conn., for a minimum of 1,000,000 spokes per month beginning Sept. 1. Arrangements have been made in Detroit and Chicago for factories to assemble a minimum of 1000 wire wheels per day.

Ford Tractor Plants in Foreign Countries

DETROIT, MICH., June 10—Gaston Plaintiff, New York manager of the Ford Motor Co., sailed last week on the Scandinavian-American liner Frederick VIII for a general tour of investigation of all countries of Europe. Mr. Plaintiff will lay the lines for an investment of many millions of dollars, perhaps eventually $25,000,000 in manufacturing plants for the Ford tractor.

General charge of the European tractor business is to be vested in Mr. Plaintiff, who will ultimately establish permanent headquarters in one of the foreign capitals. R. S. Neely accompanied Mr. Plaintiff.

The first purchase of land will be in Norway, Sweden or Denmark to supply those three countries. Thereafter Holland, England, France, Germany and Russia will be visited.

The latter country will be toured extensively.

Essex Motor Truck Co. Formed

NEW YORK CITY, June 8.—J. T. Rainier and P. N. Lineberger, who have been associated in the automobile business in this city since 1901 as Eastern distributors for passenger cars and commercial vehicles, have organized the Essex Motor Truck Co., with a capital of $600,000.

The company will produce only one model, a 1000-lb. truck, the chassis of which will retail for about $750. It will be composed of standard units, including Timken worm drive in the rear axle, a Light 3¼ by 4½-in. motor, rated at 16.9 hp.

Among the stockholders and directors are Gottfried Piel and William Piel of Piel Bros., brewers; C. W. Feigenspan, president of the Feigenspan Brewing Co. and of the Federal Trust Co., Newark, also Adolf Kuttroff and Carl Pickhardt, both of the Badische Co., importers of dyes and chemicals. The engineering and designing will be in charge of Carl Neracher, formerly chief engineer of the Willys-Overland and Garford companies.

The offices of the company are at present located at 299 Madison Avenue, this city, pending the completion of a factory in Long Island City.

Emerson Four at $395

NEW YORK CITY, June 9.—The Emerson Motors Co., recently incorporated with offices in this city at 1328 Broadway, announces a five-passenger four-cylinder car, selling at $395, f.o.b. New York.

The specifications include a 3¾ by 4-in. block motor, thermo-syphon cooling, selective three-speed gearbox in unit with the motor, multiple disk clutch, center control, rack and pinion steering gear on left, floating rear axle, forged I-beam front axle, 30 by 3-in. front tires and 31 by 3½-in. rear, pressed steel frame, semi-elliptic front springs, 110-in. wheelbase, steamline body, one-man top, 10-gal. gasoline tank, crowned fenders, two head lamps and one tail, electric horn and complete tool kit.

Lancaster Wiregrip Tire Litigation Brought to an End

LANCASTER, OHIO, June 8.—Announcement has been made by the Lancaster Tire & Rubber Co., Lancaster, Ohio, manufacturer of Wiregrip pneumatic tires, that patent litigation, which practically took the original wire tread tires, formerly manufactured in Hartford, Conn., off the market, has all been satisfactorily concluded. In the future these tires will be known and marketed as the Wiregrip, with headquarters at Lancaster, where they will be manufactured on a large scale.

The Wiregrip differs from other makes in that it has imbedded in its tread to a great depth four endless triangular coils of spring steel. A little wear develops hundreds of little steel prongs which serve the purpose of holding to the road with a vice-like grip, thus preventing skidding on wet or slippery streets.

Blair Resigns from S. K. F. to Form Own Company

HARTFORD, CONN., June 8.—F. R. Blair, formerly secretary, treasurer and sales manager of the S. K. F. Ball Bearing Co., has resigned and has become president of F. R. Blair & Co., with offices at 50 Church Street, New York City. It is understood that Mr. Blair is engaged in developing motor efficiency devices.

Motometer Secures New Plant

Boyce Organization Will Start Manufacturing in L. I. City Factory July 1

NEW YORK CITY, June 9—With standard equipment on forty makes of cars and with business increasing each day, the Motometer Co., this city, maker of the Boyce Motometer, a motor heat indicator, has been forced to find larger factory quarters. A large three-story plant in the center of the automobile district in Long Island City has been taken and manufacturing will be started in it about July 1.

The new plant will put the company on a larger scale of production, about triple the present, and the floor space will be increased five times the present, about 20,000 sq. ft.

The local plant will not be given up, operations in it being confined to light assembly work.

Bell Purchases Factory

YORK, PA., June 9.—The Bell Motor Car Co., which was organized in this city less than a year ago for the purpose of manufacturing automobiles, has increased its capitalization to $1,000,000.

It has just purchased a 15-acre factory site in East York at Rockburn Station, upon which it proposes to erect, between now and the first of next year, modern factory buildings.

This firm has been placing upon the market this season two models—a pleasure car and a light 1000-lb. commercial car.

As soon as the new factory buildings are completed this concern expects to be able to provide employment for 500 to 1000 men.

Lauterbach To Build Cars

NEW YORK CITY, June 13.—H. Lauterbach, manager of sales for the New York branch of the Chevrolet Motor Co., has resigned to enter the manufacturing field. With others he has purchased the plant of a manufacturer in the Central West and will market a passenger car and a light delivery vehicle to sell for about $700.

Gundrum Joins Bell

YORK, PA., June 9.—H. F. Gundrum of York, formerly connected with the traffic department of the Pullman Motor Car Co., has been made traffic manager of the Bell Motor Car Co. Prior to his going with the Pullman company he was the agent for the Western Maryland Railway Company in York.

April Exports Total $11,692,945

1790 Trucks, Value $5,294,801; 6242 Cars at $4,998,350— Parts at $1,399,794

WASHINGTON, D. C., June 10—American makers of trucks, pleasure cars and parts continue to expand in foreign fields, according to official figures compiled by the statistical bureau of the Department of Commerce. In April last the number of trucks exported was 1790, valued at $5,294,801, while the passenger car exports totaled 6242 machines, the value of which was $4,998,350. The exports of parts, not including engines and tires, were valued at $1,399,794. For the 9 months' period ended April, 1916, the exports reached these tremendous totals: Commercial cars, 18,135, valued at $48,898,380; passenger cars, 45,048, valued at $34,269,158; parts, not including engines and tires, $18,223,401.

Turning to the figures for last year it is found that during April a year ago 2267 commercial cars, valued at $5,240,481; 3078 passenger cars, valued at $2,804,741, and $1,807,567 in parts, not including engines and tires, were shipped abroad, while during the 9 months' period of 1915 the figures were: Commercial cars, 8580, valued at $23,977,968; passenger cars, 14,641, valued at $12,356,472; parts, $5,258,175.

While the warring nations of Europe, with the exception of Germany, continue as heavy buyers of American-built motor cars, it is interesting to note that countries like South America and the British possessions in Oceania are constantly growing in importance as markets for our cars.

In April last France imported 1056 cars, valued at $3,086,601, from this country, while in April a year ago the number was just one less, but the value was only $1,710,702. The exports to France during the 9 months' period increased from 3951 cars, valued at $10,035,842, in 1915, to 6203 cars, valued at $16,290,264, in 1916.

Russia's purchases of American cars in April last amounted to 178 machines, valued at $433,825, while during the 9 months' period of 1916 the number was 4774 and the value $14,868,354. Russia did not figure in the export returns last year, so there are no comparative figures available.

Germany did not import any American machines in April of this and last year, but during the 9 months of 1915 the returns show that twenty cars, valued at $20,164 were shipped there.

Seven hundred and thirteen cars, valued at $870,184, was the United Kingdom's contribution to American motor car makers in April last, which is a decline from last year's figures for the same period, which were 1455 cars valued at $1,925,280. However, during the 9 months' period the exports there rose from 7652 cars, valued at $10,840,309, in 1915, to 16,820 cars, valued at $22,959,602, in 1916.

There were seventy-three cars, valued at $55,452, shipped to Denmark in April last, while during the 9 months of this year the number was 597 and the value $411,708. No comparative figures for these periods of last year are available.

Italy's share in our automobile export trade in April last was only 4 cars, valued at $3,073, as against 23 cars, valued at $9,983, in April a year ago. During the 9 months' period the exports there increased from 88 cars, valued at $58,368, in 1915, to 256 cars, valued at $172,731, in 1916.

"Other Europe" imported 395 cars, valued at $922,988 in April last, as against 855 cars, valued at $2,535,169, in April a year ago, while the shipments for the 9 months' period fell from 2118 cars, valued at $6,129,392, in 1915, to 1745 cars, valued at $2,259,142, in 1916.

On this side of the Atlantic the figures show that Canada contributed largely to our export trade during the periods under consideration, the exports in April last totaling 2130 cars, valued at $1,371,108, as against 696 cars, valued at $611,797 in April a year ago. During the 9 months' period the exports to the Dominion increased from 2768 cars, valued at $3,165,739 cars, in 1915, to 7433 cars, valued at $5,156,373, in 1916.

Large Demand from South America

A striking feature of the automobile export trade is the constantly increasing demand for American cars in South American countries. Formerly the department grouped all the automobile exports to South America under one head and last year's returns show that 98 cars, valued at $60,437 were shipped there in April, while during the 9 months' period the number was 906 cars, and the value $494,488. In April last Argentina alone imported 505 cars from this country, the value of which was $245,984, while during the 9 months of this year the shipments amounted to 3497 cars, valued at $1,630,943. Chile bought 125 cars from us in April last, the value being $86,814, while during the 9 months' period the number was 704 cars, and the value $464,555. Only 20 cars, valued at $12,318 were shipped to Brazil in April last, but during the 9 months of this year the number reached 204 cars, valued at $127,247. Venezuela's contribution was 47 cars, valued at $24,718, in April, and 416 cars, valued at $264,470, during the 9 months of this year, while all other South American countries purchased 40 cars, valued at $21,419, in April, and 453 cars, valued at $256,288 during the 9 months' period.

Resta and De Palma Matched

To Meet June 18 on Chicago Speedway in Three Heats—$5,000 Prize Offered

CHICAGO, ILL., June 13—Resta in his Peugeot and De Palma in his Mercedes, first and second in Sunday's 300-mile race on the Chicago speedway, have agreed to a match race to take place on the local track Sunday, June 18. They will race to determine which driver and which car is supreme, as the claim has been current that Resta's winning was a matter of luck and that De Palma's Mercedes is a faster car. Arrangements call for a series of three heats, one of 10 miles, one of 24 miles and a third of 50 miles, the two best out of three declares the winner. A prize of $5,000 has been offered by the speedway management, and A. A. A. sanction is already filed.

Neither of the drivers wishes it to be understood that this is a challenge race. De Palma wants to show his friends who have claimed that his traditional hoodoo lost the race that their assumptions are justified, and Resta's plans are to give proof that the race was won because he drove his blue Peugeot faster than any other pilot and could have done even more. According to the statements of both drivers the agreement was reached when the ten prize winners appeared yesterday at the speedway office for their checks.

250-Mile Speedway Race for Arizona

PHOENIX, ARIZ., June 10—A 250-mile automobile race over a three-mile speedway will be the principal event of the Arizona State Fair. It will be staged on the afternoon of Saturday, Nov. 18, the last day of the fair.

This plan, originated by Secretary Tom Shaughnessy, has been approved by the fair commission, which has set aside $7,500 for prizes. Steps have been taken to secure a sanction from the A. A. A., the idea of holding outlaw races having been dropped.

1917 Velie Six-Cylinder Cloverleaf Roadster Added to Line

MOLINE, ILL., June 9.—The Velie Motor Vehicle Co., this city, has announced for 1917 its model 22, a cloverleaf roadster, seating four, at $1,065. The chassis remains the same as the 1916 model, the only changes being in the body. A 40-hp. Continental motor is used. Other features include: multiple dry disk clutch, automatic ignition, Hotchkiss drive, special gears in rear axle, 50-in. underslung rear springs, Stewart vacuum feed, two-unit Remy electric system, deep tufted upholstery, double bulb headlights, 15-gal. gasoline tank with gage, one-man top, 32¼-in. tires, with non-skids in the rear.

The top furnished is made to fold down closely around the outside of the backs of the rear seat, and the dust cover, when in position, is closed over the two rear seats, making them invisible. This arrangement gives the car the appearance of a two-passenger roadster with an ordinary top cover on.

This roadster has unusually large space for luggage aside from the space in rear and under the seats. There is a compartment back of the front seats with doors opening from the inside; these doors are padded on the top and act as a rest for the arms of those sitting in the rear seats.

Two Wheelbases for 1917 Chalmers

DETROIT, MICH., June 12.—For 1917 the 3400 r.p.m. Chalmers will be made in two wheelbase lengths, 115 and 122 in., the latter being for seven-passenger bodies—the touring model will sell for $1,280. The wheelbase of the five-passenger will remain at 115 and the price at $1,050 for the open model; roadster and cabriolet models will be made as heretofore. On the larger chassis will be mounted three closed body designs, a touring sedan, limousine and town car. All three seat seven.

Vanderbeck Leaves Timken Bearing

DETROIT, MICH., June 8—H. Vanderbeck, chief engineer of the Timken Roller Bearing Co., Canton, Ohio, will sever his connection with this company in the near future. His successor has not yet been selected.

Allen Enlarges Bucyrus Plant

FOSTORIA, OHIO, June 9. — The Allen Motor Co. has broken ground for an addition to its motor and transmission plant in Bucyrus. The addition will double the size of the plant.

Reynolds with Paige-Detroit

DETROIT, MICH., June 9—F. H. Reynolds, Jr., has joined the Paige-Detriot Motor Car Co., this city, in the capacity of special representative. Reynolds comes from the Champion Ignition Co., Flint, Mich.

Ask Receiver for Lauth-Juergens

FREMONT, OHIO, June 9—A receiver for the Lauth-Juergens Motor Car Co., is asked in a suit filed recently to obtain judgment of $526.74 for labor and material. Recently stockholders of the company voted to transfer the company to the H. G. Burford Co.

Studebaker Convention Closes

Demand for Cars Expected to Last Throughout Year—8000 Cars a Month

DETROIT, MICH., June 10. — That the present unprecedented demand for automobiles will continue throughout the year instead of showing the customary slack during the summer and fall months was the message brought by Studebaker branch managers who attended the semi-annual branch managers' convention of the Studebaker Corp. in Detroit June 6-9. The predictions made by the branch managers were based on a study of conditions in their territories. Heads of the Studebaker branches in all parts of the country were present at the sessions during the week, as were also the assistant branch managers, district managers and retail sales managers.

Orders now on hand, the nation's prosperity and the fast swelling ranks of people who recognize the motor car as a utility and in many cases a necessity rather than an expensive luxury — these were given as the chief reasons for the prospect of a continuing demand of even larger proportion than ever before known.

According to J. G. Heaslet, vice-president, in charge of engineering and production, factory additions and enlargements of facilities will soon make possible a normal output of 8000 cars a month and a forced output of 10,000. July 1, despite the materials situation, it was announced, will show shipments for the preceding 12 months of more than 65,000 cars, which is approximately double the best previous year.

L. J. Ollier, vice-president and director of sales, who presided at the various sessions at the convention, announced that the Studebaker dealer organization has grown in 2 years from 2000 to 6500.

The opening day was occupied with group conferences with the sales officials, followed by tours through several of the plants, where an opportunity was afforded to see the additions that have been made since the last convention in December.

In addition to Messrs Erskine, Ollier and Heaslet, talks were made by C. C. Hanch, treasurer; C. D. Fleming, assistant treasurer; H. E. Dalton, general auditor; R. T. Hodgkins, general sales manager; G. L. Willman and W. T. Bush, assistant general sales managers; H. T. Myers, commercial car sales manager; H. A. Biggs, advertising counsel; Max Hagelstine, service manager; C. L. Hemphill, secretary of the Commercial Investment Trust Co. of New York, and Walter Robbins, vice-president of the Wagner Electric Co. of St. Louis.

Clifton Heads N. A. C. C. for 1917

Shipments for Year Amount to 237,523 Carloads—Eleven New Members

NEW YORK CITY, June 9—Charles Clifton, treasurer of the Pierce-Arrow Motor Car Co., Buffalo, N. Y., was re-elected president of the National Automobile Chamber of Commerce, Inc., at the annual meeting held here yesterday, which was characterized by a record attendance of members of the chamber. The other officers were all re-elected, as follows: First vice-president, W. C. Leland, vice-president and manager of the Cadillac Motor Car Co., Detroit; second vice-presidents, Hugh Chalmers, (gasoline passenger car division), president Chalmers Motor Co., Detroit; Windsor T. White (commercial vehicle division), president of the White Co., Cleveland, and H. H. Rice (electric vehicle division), president of the Waverley Co.; secretary, R. D. Chapin, president of the Hudson Motor Car Co., Detroit; treasurer, George Pope, receiver Pope Mfg. Co., and general manager, Alfred Reeves.

The directors elected were J. N. Willys, president of the Willys-Overland Co., Toledo, Ohio; C. C. Hanch, treasurer of the Studebaker Corp.; H. H. Rice, Waverley, and J. Walter Drake, president of the Hupp Motor Car Co., Detroit.

Oppose Tavenner Bill

The automobile makers placed themselves on record as opposed to the Tavenner bill now before Congress, which has for its purpose the prohibition of the use of time studies and premium or bonus payments in connection with work of the government. The makers feel that such a bill or any similar measure is dangerous class legislation which would prevent efficient methods in private manufacturing industries and be directly opposed to the interests of the whole population of the country and to the working men themselves, by placing a premium on inefficiency besides reducing the production capacity of manufacturing plants.

There are now ninety-seven companies holding membership in the N. A. C. C., eleven of which were admitted since last June, including the Argo Motor Co.; Consolidated Car Co.; Denby Motor Truck Co.; Dort Motor Car Co.; Empire Automobile Co.; Grant Motor Car Corp.; International Harvester Corp.; Lewis Spring & Axle Co.; Milburn Wagon Co.; Monroe Motor Co.; and the Mutual Motors Co.

Shipments Gain

Substantial gains in automobile shipments for the month of May were reported by the Traffic Committee, as stated in THE AUTOMOBILE for June 8, the figures showing that more than 24,000 carloads were as against 15,392 carloads for the month of May last year. The shipping conditions have become more normal and makers are no longer obliged to use flat cars in shipping automobiles.

During the year the shipment of 237,523 carloads of automobiles was made and 9523 notices were sent to the railroads in advance of the arrival of shipments, so as to insure prompt return of freight cars to manufacturing territory.

The commercial vehicle convention decided that no truck show was necessary at this time. They decided against any change in the standardization of frame widths at this time.

For the protection of buyers of trucks, a standard definition for motor truck chassis, both gasoline and electric, was decided upon and the convention, together with the annual meeting, approved a form of service policy which is expected to supply even better service to the truck owner.

Now O-So-Ezy Products Co.

DETROIT, MICH., June 10.—The O-So-Ezy Mop Co. has changed its name to O-So-Ezy Products Co.

Hanlon Patent Invalid

Injunction Against N. A. C. C. Members on Use of Windshield to Be Lifted

CINCINNATI, OHIO, June 9—The United States circuit court of appeals for the sixth circuit has declared the Hanlon windshield patent invalid and will later lift the injunction against the National Automobile Chamber of Commerce members, after certain technical formalities have been observed. Until that time, the members will continue to respect the injunction.

The case in question is particularly important in that many manufacturers are using the Hanlon idea of windshield, which is a double glass with the outer or forward glass divided and the top adjustable so that it can be inclined forward to serve as a rain vizor if necessary.

The decisions just handed down involve the cases of Rauch & Lang Carriage Co., against William B. Hanlon and J. R. Wardrop and the Anderson Electric Car Co., and the National Automobile Chamber of Commerce, Inc., against William B. Hanlon and James R. Wardrop and the Anderson Electric Car Co.

These cases are separate appeals from the decision of the United States district court, northern district of Ohio, eastern division, in which the court held the Hanlon reissue patent No. 13,653, Dec. 2, 1913, valid and infringed and ordered an injunction against the Rauch & Lang Carriage Co. and the National Automobile Chamber of Commerce and its members.

The N. A. C. C. took a separate appeal in which it denied the legality of including the chamber and its members in the injunction. The decisions of the circuit court of appeals in reversing the lower court will cause the dissolution of the injunction against the chamber and its members and also the Rauch & Lang Carriage Co.

Market Prices Steady

NEW YORK CITY, June 13—Automobile material prices were steady last week. Those changes that occurred were drops caused by dull markets. Lead, which was weak and dull, dropped 15 points to $6.80 per 100 lb., and tin, which was in a similar condition, was 25 cents lower, closing yesterday at $44.25 per 100 lb. Copper remained unchanged at 28 cents a pound, with a quiet market.

Crude rubber was steady though lower in price. Fine up-river Para declined to 64 cents a pound, at a loss of 2 cents.

Yesterday Ceylon grade was more active with quotations at 64 cents a pound. The domestic demand is quiet. The arrivals in London last week were light, but the landings have proved a slow process due to inadequate labor, while the unsold stocks in London have reached dimensions such as have not been seen for a few years past. Meanwhile reserve stocks in manufacturers' hands are being used up to a large extent.

In regard to the gasoline situation, it is noted that the supply is catching up with the demand. Last month there was a cut of 1 cent a gallon in the price of gasoline from Texas. It was reported that some easiness was being felt in certain outlying New York districts, while this week it was stated that the price of gasoline in Minneapolis was quoted down 1 cent a gallon by independent dealers and half that amount by the Standard Oil. It is the consensus of opinion among oil men, however, that the gasoline market will be firm from now on and prices may go higher by the end of summer. In regard to the Texas decline of 1 cent a gallon, it is stated that the cut resulted from sharp competition among the four leading marketing interests.

Dividends Declared

Saxon Motor Car Corp., initial dividend of 1½ per cent, payable July 1, to holders of record June 20.

Electric Storage Battery Co., quarterly of 1 per cent on common and preferred, payable July 1.

Gray & Davis, quarterly of 1¾ per cent on preferred, payable July 1.

F. S. Fealy, of Motor Parts, Dies

PHILADELPHIA, PA., June 10—F. S. Fealy, president of the Motor Parts Co., was drowned on June 4 in the Delaware River. He is survived by his widow.

Security Prices React

Chevrolet, General Motors, United Motors and Overland Quotations Drop

NEW YORK CITY, June 13.—Though automobile securities made substantial gains yesterday, they did not fully recover from the general decline during the latter part of last week. Those stocks which have been features on the Exchange and the Curb were considerably lower on Saturday. General Motors dropped 73 points to 475; Chevrolet was 2 points lower; Goodrich 119 points lower and Willys-Overland 6 points under the previous week's quotations.

Violent changes in United Motors and other automobile issues featured speculation in the unlisted securities on Saturday. United Motors, for example, after selling at 80¼, broke to 71¾, only, however, to advance during the afternoon to 79¾. Perlman Rim, White Motors and Motor Products also recorded wide fluctuations pro and con. Shares of the new Durant-Willys motor combine under the name of the American Motor Co., were dealt in at prices ranging from 60 to 65. The name given this stock is only temporary and only for trading purposes. This stock was dealt on a basis of when, as and if named, a new trading basis.

In regard to the drop in United Motors Corp. issues, it is stated that this has been due to an announcement to be made in a week or so by the syndicate managers, releasing all members of the syndicate who withdrew their stock from their agreement not to dispose of it before Sept. 1.

The selling recently of United States Rubber common stock is believed to have been by interests who bought it some time ago in the hope that dividends would be resumed this summer. According to information, such action will not be taken until after the funding of the company's 6 per cent bonds and other short-term obligations is accomplished in 1918.

Chalmers common was very active with a 40-point advance as was Saxon and Chandler with 3½ and 30-point rises.

Lubricating Oil Price Advanced

CHICAGO, ILL., June 9—The Standard Oil Co. of Indiana has advanced prices of lubricating oils 2 to 5 cents a gallon in steel barrels, making Chicago wholesale basis ranging from 18 to 32 cents per gallon.

Prices in New York City and the surrounding territory remain unchanged. Polarine is selling wholesale at 30 cents a gallon in barrel lots and 28 cents in 5-barrel lots.

Prodium Is Republic's Newest

YOUNGSTOWN, OHIO, June 12.—The Republic Rubber Co. is now marketing tires constructed of a new rubber compound styled Prodium. The compound is black and is exceedingly tough. Both plain tread and non-skid are being supplied by Republic dealers and branches throughout the country.

Goodyear Plant in Toronto

TORONTO, ONT., June 8—The Goodyear Tire & Rubber Co., Ltd., is building a plant here, to be exclusively for the manufacture of pneumatic tires. The amount invested, which includes equipment costs, is between $1,250,000 and $1,500,000.

A Study of Modern High-Speed Engines

Abstract of Paper Read Before S. A. E. by A. P. Brush

(*Continued from page* 1074)

cially in high-speed engines. In the first place, the centrifugal effect of the crankpin and crank-cheek mass is increased by that portion of the lower end of the connecting-rod immediately surrounding the crankpin. In addition, the intermediate portion of the connecting-rod supplements the centrifugal effects of the crank-cheeks, the crankpin and lower end of the rod to distort the crankshaft; and further, the upper end of the connecting-rod and the reciprocating mass of the piston and piston-pin throughout certain portions of each rotation of the crankshaft also supplement these centrifugal effects toward distortion of the crankshaft. All of these tendencies combined can be lessened by the selection of proper centrifugal forces due to the added counterbalancing masses.

In order to secure the minimum tendency to distort the crankshaft, the counterbalancing mass must be greater than that necessary properly to counterbalance or neutralize the centrifugal effects of the crank-cheeks and crankpins. This is merely another way of saying that a crankshaft that alone is in the nearest triple balance possible will not have the minimum tendency to distort in service; and that a crankshaft properly counterbalanced, so as to have the minimum tendency to distort in service, will show a marked tendency to distort when run at high speed without the connecting-rods and pistons attached.

Correct Counterbalancing Masses

I shall close my discussion of crankshaft counterbalancing with a brief consideration of what are correct counterbalancing masses to permit the least tendency to displace the axis of any crankshaft under service conditions. As I have already indicated, when a method of determining these values for a single-throw crankshaft is worked out, the correct application of counterbalance to a crankshaft of any number of throws involves nothing but simple and obvious mechanical and mathematical merging of those crank-cheeks and counterbalances that, due to the omission of center-line bearings, lie in the same planes of rotation. Fig. 15 represents an end view of a single-throw crankshaft, in which A is the axis, P is the center of the crankpin, and R is the uniform radius, representing the uniform radial pull tending to displace the axis at any given rate of speed, and always acting in a plane passing through the axis A and the center of the pin P. If suitable masses whose centers of mass lie within the plane B are arranged as indicated in Fig. 4, R will be opposed by an exactly equal force acting in the opposite direction, and the value of R will become zero. Considering Fig. 16, which is identical with Fig. 15, except that the lower end of the connecting-rod immediately surrounding the crankpin has been indicated, we see that the value of R has been increased to some new value as R_1, and that the centrifugal force due to our counterbalancing masses must be increased correspondingly to eliminate all tendency to displace the axis.

In Fig. 17, representing the mechanical train, that is the piston and connecting-rod, attached to the crankpin, we find that the value of R_1 is increased and thrown into variable form, and that this variable form has two points of minimum value, as at R_2 and R_3, lying in the radial lines C and C' with radial values slightly greater than R', the lines C and C' making right angles with the center line of the connecting-rod when the center of the crankpin lies within C and C'. As the crank in its rotation approaches either of the two dead centers from the points R_2 and R_3, the resultant forces tending to displace A are increased, having (due to the finite length of the connecting-rod) a maximum value at the upper dead-center, as represented at R_4, and having still another value less than R_4, but greater than R_2 and R_3 at the lower dead-center, as indicated at R_5.

It now becomes evident that if through the addition of counterbalancing masses we are to secure the minimum tendency to displace the axis A, the centrifugal value of our counterbalancing masses must be greater than R_2 and R_3 and less than R_5. Since revolving counterbalancing masses attached to the crankshaft can have only a constant radial value for any given speed, it is at once seen that counterbalancing cannot entirely eliminate all tendencies in actual operation to displace the axis A due to the motion of the parts. There is, however, a counterbalancing value for every crank throw and for its mechanical train, which under service conditions will permit a minimum tendency to displace A.

In Fig. 18, A is the axis of the crankshaft, P is a plane of rotation about A, passing through the center line of the mechanical train and I is the intersection of A and P. At the point I the motion of parts sets up tendencies to displace A, and these tendencies can, as we have already seen, be reduced greatly by the selection of proper values of centrifugal force for counterbalancing masses indicated at M and M', whose resultant centrifugal effect due to their symmetrical arrangement on each side of the plane P lies within the plane P.

No matter how many throws or what the form of a crankshaft, there will be a point I for every throw, and the resultant tendency to displace A at each of these points will be identical, irrespective of the number of throws or their angular relation. It is entirely immaterial, so far as these effects are concerned, whether center-line bearings are interposed between the throws.

Author's Conclusion

If this were not already too long, it would be interesting to analyze further the forces occurring at I. However, the analysis as it stands is sufficiently complete for the practical purpose of computing the proper centrifugal values for counterbalancing masses for all conventional types of engines, in which only one piston and connecting-rod are attached to a single crankpin.

With V engines it is also true that the entire problem of correct counterbalancing is involved in the determining of correct counterbalancing values for a single crank throw.

I have not attempted to exhaust the subjects under discussion, and have omitted entirely several interesting phases of high-speed engine design, as, for example, the analysis of the valving train, various installations of electrical and other auxiliary equipment, carbureter location, and intake manifold sizes and forms as affected by increased engine speeds.

No Discussion on the Paper

There was no discussion of the paper by Mr. Brush, and the discussion of the other papers was rather brief, owing to lack of time. The paper by D. D. Ormsby on Differential Substitutes and that by Herbert Chase and A. Browne on Possibilities of the Constant Pressure Cycle, are reprinted in part on the following pages.

Substitutes for the Differential

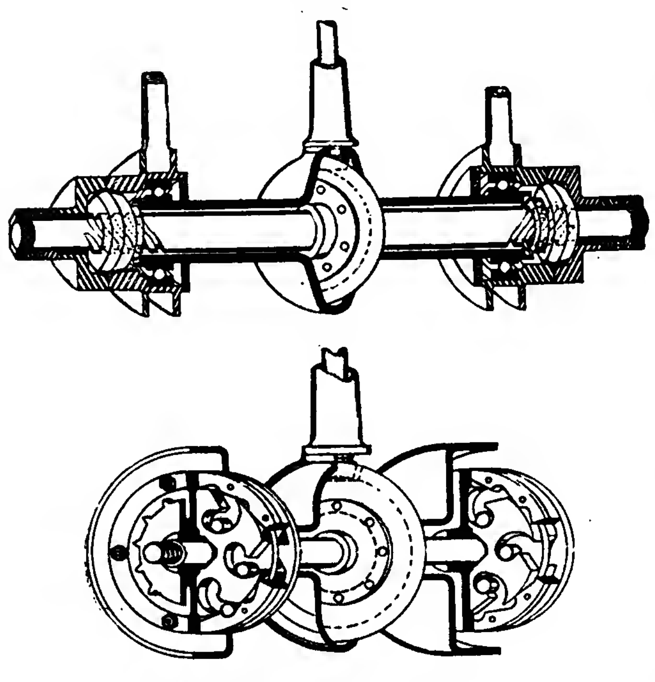
Divided Into Four Classes: Free-Wheel, Crank and Eccentric, Spiral Differential and Solid Axle Types—Advantages and Disadvantages of the Various Constructions

By D. D. Ormsby
Chief Engineer, Brown-Lipe-Chapin Co.

THE conventional differential rather than being inefficient is on the other hand too efficient in that it differentiates for all differences, whereas the automobile engineer wants it to take care only of the unequal velocities of the rear wheels. It becomes inefficient as a means of transmitting the power to the rear wheels if the wheels have unequal traction. It is to correct this defect of differentiating for unequal traction of the wheels that a great many intended substitutes for the present types of differential have been invented. I will describe a few of them briefly.

The substitutes can be divided into four classes: The free-wheel type, Figs. 1, 2 and 3; crank and eccentric, Fig. 4; spiral differential, Fig. 5; and the solid axle.

Fig. 1 shows the Hedgeland solid anti-skid automobile axle, of which little has been heard for some time. As the name indicates, this axle was constructed with a continuous or solid axle, having a thread cut on both ends. To these threaded ends were attached cone clutches having a double taper, so that when the power was applied to the axle these clutches were forced one way or the other by means of the thread on the shaft and they gripped a cup which was attached to the wheel, thus transmitting the power from the shaft to the wheels. When a car equipped with this device was making a turn or diverging from a straight course, so that the outer wheel was obliged to travel faster than the inner wheel, the outer wheel was automatically declutched and ran free on the axle around the clutch on the shaft. Fig. 1 is a sectional line drawing of this construction, and shows the mechanism clearly.



Above—Fig. 1—Hedgeland anti-skid axle. Below—Fig. 2—Free-wheel type of axle

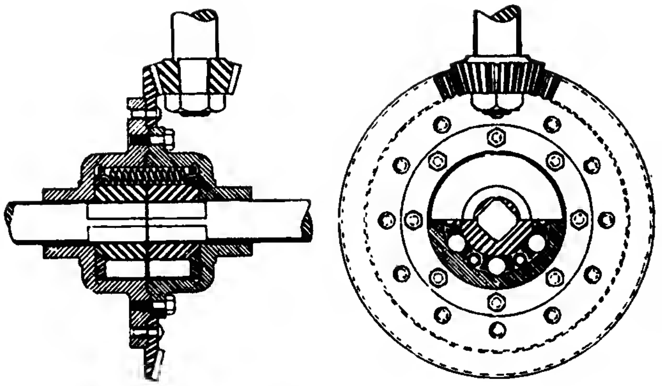
Fig. 2 represents a design similar to the one in Fig. 1, and the same principle is utilized, namely, having a loose wheel when the car is diverged from a straight line, so as to differentiate for the unequal velocity of the two rear wheels. Fig. 2 is a perspective view of a jackshaft equipped with this design. It is practically the same as the Hedgeland design, with the exception of the clutching mechanism, in that it employs a solid axle, to the center of which is fastened the bevel drive gear and on the ends of which the clutches are applied. In this case the clutches consist of two cams on each side, keyed or secured by some other means to the shaft; when driving forward or backward they force rollers out against a drum to which is attached the sprocket or rear wheel. By wedging these rollers against the drum the power is transmitted from the cam to the drum and thence to the rear wheels. Both wheels are gripped alike when the car is being propelled in a straight line but when the car diverges from a straight line, as in turning a corner, the outer wheel runs faster than the inner wheel, forcing the rollers back so that it is released from the cam and hence from the shaft, and allowed to rotate faster than the inner wheel.

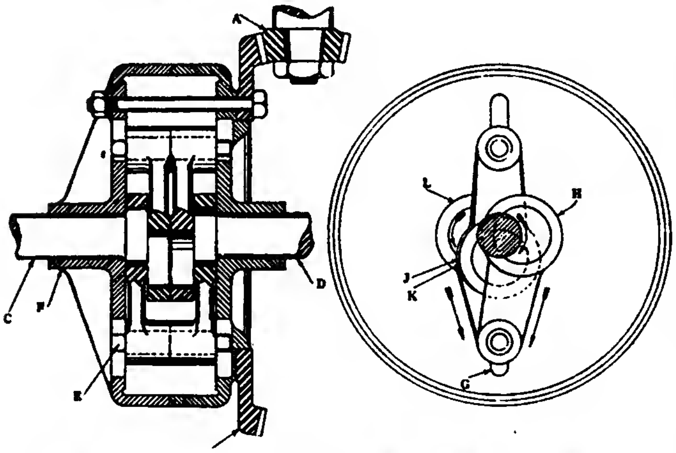
Another Substitute

The substitute shown in Fig. 3 is of similar design to the one shown in Fig. 2, in that cams and rollers are employed, but it is mounted in the conventional position instead of in the hubs of the wheels, and its action is the same, that is, when the car is being driven in a straight line both cams are clutched to the drum which drives both wheels at the same speed. When the car ceases to run in a straight line the outer wheel accelerates ahead of the inner wheel, declutching the cam attached to the shaft of the outer wheel.

Free-Wheel Differentiation

The action of the free-wheel type differential is such that it eliminates the inherent defect in the standard differential; that is, differentiating when the wheels have unequal traction. Yet there are some points in its action which are not entirely satisfactory. In the first place, with unequal size tires it drives more on the large tire, because the wheel with smaller tire has to rotate faster to make up for the distance traveled by the wheel having the larger tire. Secondly, in making a turn all the power is applied to the inner wheel and hence must be transmitted through one shaft. This throws an extra heavy load on the inner wheel, especially when making a turn on a steep hill. One other feature has, according to the experience of a car manufacturer, proved to be a serious defect. This is the shock of applying the brake when the car is not running in a straight line, for when making a turn the outer wheel, being free from the axle, is more sensitive to the brake than the wheel which is transmitting power. The outer wheel will be retarded





Above—Fig. 3—Cam and roller type of free-wheel mechanism.
Below—Fig. 4—Crank and eccentric type of differential

much more rapidly than the inner wheel. There is considerable shock when it slows down to a point slower than the inner wheel, and the differentiating mechanism is obliged to pick it up.

The Crank and Eccentric Type

The second type of differential substitute is shown in Fig. 4. For convenience I will call it the crank and eccentric type. I was unable to obtain the name of the inventor of this differential and believe it has not been tried out to any great extent. It is an interesting device composed of two axle shafts designated as *C* and *D* in the reproduction. At the ends of these shafts are turned two eccentrics, to which are attached four cranks, designated *H*, *K*, *J* and *L*; *H*, *K* being attached to the eccentrics on shaft *D* and *J*, *L* to the eccentrics on shaft *C*. These cranks carry bosses which are bored and through which are passed sliding pins *E* and *I*, upon which the cranks are centered and oscillate. The cranks *L* and *H* are attached to sliding pin *E* and *J* and *K* to sliding pin *I*. These pins are allowed to slide in slots in the case *F*, which is made in two halves bolted together. The action is as follows: The power applied to the bevel driving pinion *A* is transmitted to drive gear *B*, which is attached to and therefore rotates the case with the gear. When the car is traveling in a straight line, the sliding pins *E* and *I* rotate with the case, and the whole differential mechanism is rotated. When the car diverges from a straight line and the wheels have unequal velocities, the outer wheel speeding up oscillates the cranks by means of the eccentrics on the shaft, the cranks being allowed to oscillate around the center of the axis of the shafts and the eccentrics placed at such an angle in relation to each other that the required reverse direction of motion of the shafts is obtained. This allows the outer wheel to speed up and the inner wheel to become retarded, but because the angles of the eccentrics are so sharp, when one wheel loses traction it does not spin. I have never seen one of these differentials tried out and do not know how efficient it is, but it is ingenious and unique.

The Spiral Gear

The third type, which has received considerable attention, is the spiral gear. This differential is similar to the conventional type, except that its differentiating gears are made up of a train of spiral instead of bevel or spur gears. Its action is the same in principle as that of the bevel or spur gear types, but the spiral gears are placed in such a manner as render the differential train inefficient, so that it is impossible to spin one wheel without rotating the other. Fig. 5 is a perspective sectional view of the type. It seems that a design of this nature should be the ultimate solution of the present differential problem, for it is evident that both wheels should be connected to each other at all times by some means and that the power should be applied to both wheels under all conditions, which is accomplished in this design. This type is being used with marked success by one company in four-wheel drive trucks.

Differential Eliminated

The fourth "substitute" consists of the elimination of the differential altogether. The advantages of this construction are that it obviates the spinning of the wheels, insures a positive drive of the wheels under all conditions and makes possible a reduction in cost. The disadvantages are, however, in my opinion, too great to be overcome. Writers in the trade papers seem to advance the theory that the slippage is greater in making a short turn than in making a turn of larger radius through a given angle. In the solid type axle with the differential eliminated there must always occur, when the car is making a turn, slippage of the inner or outer wheel, or both wheels. It is hard to demonstrate exactly what happens. I have figured just how much slippage there is in making a turn of 90 deg. with a certain light touring car and a well-known runabout. I found by measuring the amount the front wheels can be turned in steering, that the touring car can be turned in a radius of 17.13 ft. (205.6 in.). This is the radius at which the inner wheel turns. The standard gage being 56 in. the outer wheels would turn in a radius of 261.6 in. The distance traveled by the outer wheel in a 90 deg. turn is 410.9 in. The inner wheel would travel 322.9 in.; a difference of 88 in. to be compensated for by the slippage of the wheels. The total circumference of the touring car 32-in. tire is 100.53 in. The amount of slippage di-

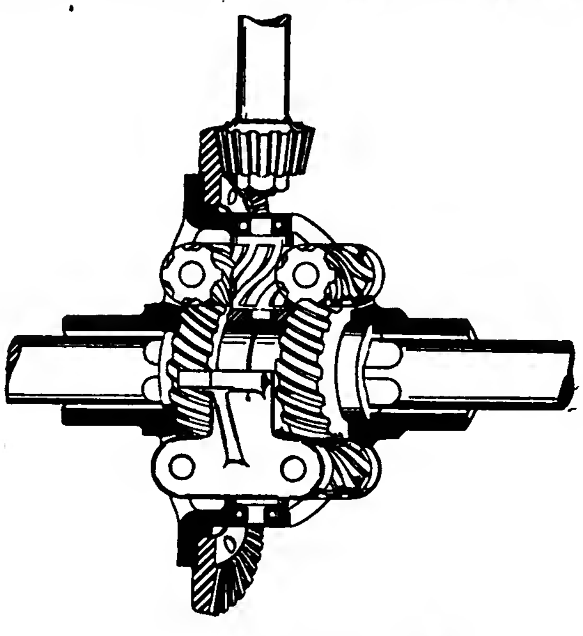


Fig. 5—Differential with spiral gears

vided by the circumference of the tire gives the proportion of revolution which the wheel has to slip in making a turn of 90 deg., and is 0.87.

The shortest radius at which the runabout examined can be turned is 13.9 ft. or 166.7 in. This is the radius at which the inner wheel turns. The outer wheel radius is 222.7 in. The distance the outer wheel travels in making a turn of 90 deg. with this radius is 350 in. The inner wheel travels 262 in. in making the same turn, the difference being 88 in., the same as with the touring car. I proved to my own satisfaction that the difference in travel between the inner and outer wheels in making a turn at a given angle depends upon the gage and not upon the radius of the turn. Taking the runabout tire diameter as 30 in., the circumference is 94.248 in. and the amount the wheel would have to slip 88 in. This divided by the circumference of the tire gives the part of the revolution that the wheel has to slip in making a turn of 90 deg., which is 0.93. No matter how great the radius, the amount of slippage through a given angle is always the same, for the difference in travel depends upon the gage and not upon the radius. Therefore with a solid axle no matter how slight the divergence from a straight line, an extra load, caused by the difference in travel of the two wheels, is always thrown upon the rear axle, wheels and tires. With a larger radius the slippage is not so noticeable, of course, as it occurs through a greater space.

S. A. E. On Record Summer Cruise

(*Continued from page* 1065)

material which had entered into a marvelous number of industries. When mixed with wood pulp and molded it is used for a great variety of purposes and can be molded to take any desired form. He told of how Mr. Hyatt started in search of a billiard ball which would be more resilient than ivory and as a possible result founded the Hyatt bearing company, the celluloid industry and finally kept on even after these two great by-products had been achieved until in conjunction with Dr. Bakel and Charles Burroughs he made the Bakelite ball which has a much greater elasticity than that of ivory. This was demonstrated on the scleroscope before the audience by Mr. Kettering.

A Study of Heat

The speaker then led his hearers into the mysteries of heat. The effects of heat are shown in the movements of the molecules of which a body is composed and hence the effect of a warm body upon a colder or *vice versa* is due to the collision of molecules moving at different relative velocities. Hot objects have rapidly moving molecules, cold ones have slower moving molecules. The effect of cooling a body is to slow up the molecules. Mr. Kettering demonstrated the condition of molecular cohesion in cold bodies by immersing several objects in liquid air. A rubber ball, a flower and a metal container were all shown to have their structural strength destroyed by the slowing of the molecules. A piece of mercury was frozen and cast in the shape of a hammer and Mr. Kettering drove several nails into a wood block with it, thus showing a strength increase caused by low temperature. Liquid air has a temperature of about 375 below zero.

Mr. Kettering then came to the subject of the earth's supply of energy. He gave as an illustration the bean, which is supplied with just enough energy to bring it through the crust of the earth, and he stated that the supply of petroleum was probably just enough to do the the same for the human race before it passed to other sources of power. The sun is the only source of energy, and until we can couple with it directly, we will not be perfect. As as illustration of the sun's power of pumping, he mentioned how the great lakes and the big rivers were kept perpetually full, entirely by solar energy.

62,000,000 Hp. in Automobile Engines

The enormous sources of water power which we have at our disposal were touched upon. He compared the 600,000,000 hp. available at present from water power to the 62,000,000 hp. generated by existing automobile engines, and stated that the ratio of supply to demand is greatly in our favor. We have available 25,000,000 hp. of animal energy. It takes 125,000,000 acres of land to feed these animals. Mr. Kettering said it would be a poor chemist that could not produce more horsepower than that from this huge area of ground. The speaker dwelt on the impractical suggestion of adding a few drops of material to water in order to produce energy by separating the hydrogen from the oxygen, as the amount of energy necessary in doing this is equivalent to that secured by combustion. It it were possible to change the air and have a greater percentage of oxygen we would be able to use fuels that are not now possible.

Radium and Its Possibilities

Mr. Kettering then spoke of radium as being one of the things about which we still know little and which might become very important. When this substance was first discovered scientists were puzzled by the fact that the air in a box containing radium was always warmer than the outside air. Eventually they found that the radium lost weight very slowly. Radium throws off particles of itself at an incredible velocity and it is the kinetic energy of these particles which causes the warming up of the surrounding container. The strength of a piece of steel is many thousands of pounds per square inch. If we could find means to let loose the energy which binds together the molecules of the steel we should have an inexhaustible source of power. As an example of this, the molecular forces holding together a grain of corn would provide over 2000 hp. for 24 hr. if we could find means for letting them loose.

The accuracy of measuring machines was touched upon and it was shown that with the interferometer it is possible to check within 1/1,000,000 part of an inch.

Mr. Kettering closed with a demonstration of the powers of the high frequency electrical current. He showed how a lamp could be lit through blocks of glass over 1 in. thick in spite of the fact that glass was supposed to be an excellent non-conductor. The frequency of the machine he used was 2,000,000 per second. In the meantime he had passed around samples of the various materials of which he had spoken, including several thousand dollars worth of radium.

Papers and Discussions

SS. NORONIC, Great Lakes, June 13 (*Special Telegram*)—To-day's proceedings opened with the reading of the paper on differential substitutes by D. D. Ormsby, Brown-Lipe-Chapin Co. The discussion was condensed somewhat to enable the morning's program to be covered. Secretary Clarkson first read a written communication from R. E. Wells, American Gear & Mfg. Co., supplementing Mr. Ormsby's arguments, and said that there seemed one difficulty in regard to the design of an ideal differential. What is wanted is a mechanism which will differentiate freely for corner turning and will not differentiate when traction differs in the two rear wheels through changes in the condition of the road surface. In other words, the differential substitute is required to distinguish between difference in traction due to road surface condition and difference in traction due to making a turn. The mechanism cannot be expected to do this.

Favors Free-Wheel Type

W. H. Diefendorf, New Process Gear Corporation, spoke in favor of the free-wheel type of mechanism, saying that 15,000 of these had gone into use during the past year. He said that the friction which is the feature of the spiral type differential must be objectionable, and as proof of its considerable magnitude he mentioned that a car with a differential of this sort exhibited a strong tendency to straighten out again after making a turn. With the free-wheel type, he said, no such action is observable.

Herbert Chase then read a letter from G. W. Smith, Thomas B. Jeffery Co. Mr. Smith gave it as his opinion that the ordinary rubber tire made a good differential as long as the radius of a turn was large enough to make the slip only from 2 to 4 per cent of the total distance traveled. The ideal would be a differential that would allow about 30 per cent but no more, which would cease to act as a differential when the difference exceeded this amount. This would prevent wheel-spinning and yet give perfect action on the sharpest turns.

A Year Without a Differential

A. Ludlow Clayden recited some experiences of his with a car of 90-in. wheelbase and 4-ft. tread, which he drove for a whole year without any differential. He said that on the whole the advantages and disadvantages were about evenly balanced. He didn't notice any increased tire wear, but there was grave risk of serious damage to a tire that became deflated if an instant stop was not made. He asked Mr. Ormsby what was the backlash in the spiral type differential and whether the internal friction provoked wear which increased this lost motion. The Hedgeland axle made experimentally years ago had a pronounced amount of backlash, and this caused a bump when the throttle was closed and the car commenced to drive the engine.

Ormsby made a short reply, at the request of President Huff, and said that the backlash in the spiral gear was about the same as in the normal type. He had driven a heavy car 12,000 miles with a spiral differential and could not observe any more lost motion at the end than at the beginning. He explained this by saying that the pinions in the spiral gear practically locked solid when any spinning tried to start.

Advocates Truck Formula

John Younger, chief engineer of the truck department, Pierce-Arrow company, submitted a written discussion on Professor Gallup's paper. This was read by K. W. Zimmerschied after he had read Professor Gallup's paper. Professor Gallup pointed out in his paper the fallacy of giving tests made under special condition as representative of stock car performance. He also dwelt on the advantage which would accrue from having a standard rating formula which would enable buyers to compare performance and price in making a choice.

Mr. Younger's communication dwelt on the desirability of a formula which would take into consideration something besides the mechanical measurements of the car. He particularly favored the sigma formula. This formula has been mentioned previously in THE AUTOMOBILE. It reads

$$\Sigma = \frac{0.0039\, d^2 \times S \times N \times G \times M}{D}$$

Where d equals bore, S equals stroke, N equals number of cylinders, G is gear ratio, M is gasoline consumption in miles per gallon, and D is the diameter of the wheels.

Mr. Younger gave some of the values of Σ, the highest being 4.7 under the most advantageous conditions.

British Railroads Use Motor Buses and Trucks

LONDON, June 8 — Nearly 500 motor vehicles were owned and operated last year by the principal steam railroads of the United Kingdom. The number was somewhat less than in 1914, owing to the requirements of the War Office, which requisitioned some of the vehicles for army purposes, taking, for example thirty-two of the London and North Western's fleet of fifty-two omnibuses. It is expected, however, that this year will show a considerable increase.

The British railroads collectively possessed 223 motor buses last year and more than 250 trucks and vans for hauling parcels, baggage and freight. The largest fleet were as follows:

Railroad	Buses	Trucks
Great Western	109	95
London and North Western	20	75
North Eastern	43	17
Midland	2	38
Great Northern of Scotland	36	..
London and South Western	2	27

The Midland doubled its fleet of trucks last year and the North Western increased its fleet 50 per cent.

These road vehicles are used principally as connecting links between the main lines and towns located some distance back from the railroads.

There is a big opportunity for similar use of motor vehicles by the railroads and interurban electric lines in the United States for serving communities too small to make the construction and operation of branch roads profitable.

United States Buys More F. W. D. Trucks

CLINTONVILLE, WIS., June 12—Another order for twenty-eight 3-ton transport trucks and five additional 600-gal. tank trucks has been placed with the Four Wheel Drive Auto Co., this city. An order was also given the Peerless company at the same time.

To Make Wheel for Fords

GRAND RAPIDS, MICH., June 8. — The Simplicity Demountable Wheel Co. has been organized by Frederick W. French and I. Bates and is operating at 412 Bond Avenue, N. W. The company manufactures regulation wheels for Ford automobiles.

Phelps Co. to Make Wire Wheels

COLUMBUS, OHIO, June 8.—The Phelps Manufacturing Co., incorporated several months ago with a capital of $100,000, has been organized by the election of H. C. Phelps, president; Dr. C. K. Wissinger, vice-president; T. W. Pickard, secretary, and L. M. Reif, treasurer. The concern took over the business of the F. & H. Wire Wheel Co., formerly of Columbus, but later of Springfield. The plant has been moved to Columbus and it is planned to manufacture 80 sets of wire wheels daily.

Pantasote Tops on Chalmers

DETROIT, MICH., June 10.—The Pantasote Co. has closed a large order for top material with the Chalmers Motor Co., and its product, Pantasote, will be standard top material on the new Chalmers model seven-22.

To Make Two-Speed Gears

COLUMBUS, OHIO, June 8.—The C. A. S. Products Co., incorporated recently with a capital of $100,000, is a reorganization of the Foster Gear Co., which holds patents on a two-speed gear. The company is preparing to manufacture the gears in large numbers. The rights to make the gears have been sold to several large automobile concerns, notably the Cadillac company. Incorporators are C. S. M. Krumm, C. D. Cutting, J. W. Graham, A. W. Tyler and Dorothy Loechler.

Constant Pressure Cycle Possibilities

Comparison of the Various Engine Cycles, Touching on the Advantages and Disadvantages of Each Type with Special Reference to the Constant Pressure Cycle

By Arthur B. Browne
Consulting Engineer
and Herbert Chase
Chief Engineer, Automobile Club of America

THE liberation of heat energy in a gas engine depends for its efficiency upon several conditions that may exist prior to ignition and during the combustion period. The efficiency is a maximum when the following conditions obtain:

(a) The density or compression of the charge is the greatest possible.

(b) The temperature prior to ignition is the highest possible.

(c) Oxygen is present in quantities just sufficient for complete combustion.

(d) The admixture of fuel with the necessary oxygen is perfect, that is, when the charge is absolutely homogeneous.

(e) Inert and diluting gases are absent.

Combustion may be divided into three main classes.

In *Class A* all the oxygen is furnished by the supporting atmosphere without admixture prior to combustion. An illustration of this is the luminous gas flame, in which gas issuing from an orifice finally comes in contact with the oxygen of the air and burns with a luminous flame of low thermal efficiency. It will be noted that Class A fulfills none of the conditions previously enumerated as making for efficiency because: (a) Both gas and air are at atmospheric pressure; (b) The temperature prior to ignition is low; (c) Much more oxygen is present adjacent to the combustion zone than is necessary and this excess is heated without useful purpose; and (d) There is no intimacy of the mixture, the gas molecules being forced to "seek" their proportions of oxygen before combustion can occur. Hence in the luminous gas burner the gas is caused to issue in a thin sheet, whereby its surface is made as great as possible in proportion to its volume.

In *Class B* part of the oxygen is mixed with the fuel, the remainder being furnished by the supporting atmosphere. This class is illustrated by the Bunsen burner and its thermal efficiency is, obviously, far greater than that of Class A. In this case the first three conditions are not complied with, the increased efficiency being clearly due to a partial compliance with condition (d.)

In *Class C* fuel and air are mixed in such proportions that there is just sufficient and no excess of oxygen, so that combustion ensues without regard to the gaseous medium in which it takes place. This is sometimes called "flameless" combustion, from the fact that the combustion is so rapid and so thorough that it takes place by concussive propagation between the molecules, in a very limited zone, almost a sheet, which is termed the "flame cap."

Class C, however, embraces combustion within the mass—a true molecular interchange confined to the sheet of flame cap only because at that point alone the rate of propagation between the molecules exactly balances the rate of flow.

In the case of flameless combustion there is no dilution of the unburned gases by the burned. The mixture of gas and air approaches the flame cap, complete and instantaneous combustion takes place and the products of combustion move away.

Comparison of Engine Cycles

Internal combustion engines may be classified as follows:

Class I.—Engines operating on constant volume cycle.

Class II.—Engines operating on constant temperature cycle.

Class III.—Engines operating on constant pressure cycle.

The Otto Cycle

To the first class belongs the Otto cycle, applied universally at the present time for internal-combustion automobile engines. Its chief advantages are its flexibility and adaptability to relatively lightweight and therefore to easily portable units. Its disadvantages are many and include the following:

(1) Poor thermal efficiency under the average condition of low compression pressure, which results from throttling of the charge and which (at maximum) must be relatively low to prevent self-ignition when a fuel rich in hydrogen (such as gasoline) is used.

(2) High explosion pressures occurring so suddenly as to deliver what practically amounts to a hammer blow on the piston head. To meet this condition the parts must be much stronger (and heavier) than they would otherwise need be to accommodate the relatively low mean effective pressure produced.

(3) Large clearance space required to admit of the low compression pressures necessary with rich and volatile petroleum fuels, which are practically the only fuels commercially available that will give reliable operation under varying load conditions. This clearance space is always filled with burnt gases, which dilute the incoming charge of unburnt gas.

(4) Impracticability (especially in light high-speed units) in cases where only heavy or relatively non-volatile fuels are available. This applies only to oil; that is, not to gas engines.

Combustion in the Otto cycle is superior by reason of its partial compliance with conditions (a, b, c and d) above. Combustion in this cycle clearly falls under Class C and would be highly efficient were it not for unavoidable losses and inherent limitations. But under condition (a) we find the density of the charge is limited by liability to pre-ignition, and under (b) the same limitation is placed on the pre-ignition temperature; as to (c) and (d) it is to be noted that the proportions and intimate admixture of the fuel and air depend on the efficiency of the carbureting device used. This is never perfect and is usually far from ideal. From condition (e) it is evident that the presence of burned gases in the charge not only serves to lessen the unit weight of charge taken in but entails a direct loss because of the heat delivered to these products of combustion.

The Constant Temperature Cycle

No engines practicable for motor vehicles have ever been developed using this cycle (Class II).

The Diesel Cycle

The Diesel cycle has several inherent advantages. High thermal efficiency, adaptability to use of heavy oils, variable cut-off (within certain limits) and high compression temperatures making ignition devices unnecessary, are foremost among these. Its disadvantages, on the other hand, are quite as numerous and in some cases insurmountable where small light-weight units are required. These disadvantages have to do largely with the high pressures encountered and include the following: (1) High compression and explosion pressures making necessary heavy and close-fitting parts, difficult to keep tight (engine may become inoperative if not tight); (2) Necessity for high pressure fuel injection pump, and separate air compressor; (3) Mechanical difficulties in regulating the minute quantities of fuel discharged by the pump to accommodate different loads; (4) Fuel admission line limited by the relatively small volume (entailed by the high compression necessary) to be heated by combustion; (5) Difficulties in starting with resultant complication; and (6) Low mechanical efficiency owing to close fitting parts (especially piston rings.)

The Semi-Diesel Cycle

The hot-bulb or so-called semi-Diesel engines possess most of the advantages of the Diesel type, although they are less efficient because of the lower compression pressure employed. They are limited as to power output per unit of weight on account of disadvantages similar to those of the Diesel cycle. This alone would preclude their adoption for motor vehicles.

The Constant Pressure Cycle

Let us now consider engines belonging to Class III. The advantages of this type are numerous and the disadvantages encountered in the past have had to do almost entirely with constructional difficulties. While the former have long been appreciated, not to say regarded as ideal, the latter have stood in the way of progress and have operated against the development of any commercially practicable* engine applying the principle of this cycle—this excluding, of course, engines operating on the Diesel or semi-Diesel cycles as not, strictly speaking, belonging to the constant pressure cycle class (see previous reference to Diesel cycle engines, under heading "Constant Temperature Cycle").

In order to have in mind exactly what is meant by the constant pressure cycle let us first consider the succession of events. A theoretical card for this cycle is shown in Fig. 1, in which AB represents adiabatic compression from atmospheric to maximum pressure; BC, addition of heat isopiestically; CD, adiabatic expansion from maximum pressure to atmospheric pressure; DA, cooling at atmospheric pressure. Note that heating is effected at constant pressure, and that this pressure is the maximum pressure of the cycle. There is no sudden rise in pressure at ignition as in the Otto cycle.

Advantages of the Constant Pressure Cycle

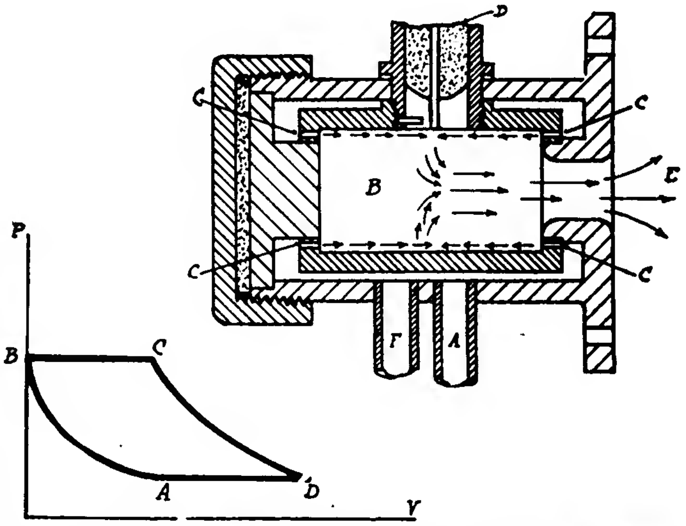
1—Inspection of the card given in Fig. 1 at once makes evident the two cardinal advantages of the cycle; (a) the large area indicating high mean effective pressure and (b) the low maximum pressure. In practice these are factors of utmost importance. They result in high and relatively uniform torque, large power output per unit of displacement and relatively low maximum bearing pressures and unit stresses on parts, with consequent light weight and length of life.

2—The possibility of varying the point of cut-off is practically the same as that in the ordinary steam engine. The variation can be made through such a wide range that the engine accommodates itself to most if not all variation in load. This fact is of utmost importance, since it operates to make the cycle practically as efficient at part load as it is at full load. No corresponding variation to meet changes in load is possible in the Otto cycle unless with "hit or miss" governing, which of course is not feasible for motor car engines. Variations in load are taken care of as a rule by throttling of the charge with consequent decrease in compression pressure. The thermal efficiency in any cycle falls rapidly with a decrease in compression pressure. In the automobile engine, for example, a maximum thermal efficiency of about 20 per cent is obtainable under full load conditions; the thermal efficiency can fall as low as 2 or 3 per cent under light load when the charge is throttled and the compression pressure correspondingly reduced. Since automobile engines run throttled during a large part of the time their thermal efficiency is necessarily low. Inspection of the card of the constant pressure cycle, Fig. 1, shows the feasibility of making the admission line BC so short (by means of an early cut-off) as to cause the expansion line CD to fall practically on the compression line AB. By this means it is probable that the lightest loads can be carried at the maximum pressure of the cycle with practically the same fuel efficiency as at full load. This being the case, throttling of the charge would take place only in starting.

Use of Low Grade Liquid Fuel

3—The importance of this factor in view of the constantly advancing price of highly refined petroleum distillates is readily apparent. The method by which low grade fuel can be utilized will be outlined later. But engines of this type can be made to run on quite as heavy an oil as can be utilized in any Diesel engine and with far better combustion conditions than are possible in the Diesel type. Self-contained constant pressure engines can therefore be expected to replace those of the constant volume type in the small size light weight class as rapidly as the Diesel engine has replaced the Otto cycle engine in the heavy weight class, where fuel cost is much in favor of the former. It is not at all unlikely that even the highly efficient Diesel engine will give place to the constant pressure type of engine when its advantages over the Diesel type are fully realized.

(To be continued)



Below—Fig. 1—Theoretical card for constant pressure cycle.
Above—Fig. 3—Representation of burner

---

*Messrs. Carpenter and Diederichs state in their book on the Internal Combustion Engine that the Brayton oil engine was a thoroughly practical engine and saw wide application. This was true in its day but the engine has long since been abandoned, partly because of its inefficiency as compared to the modern Diesel types, but more especially because of cumbersome design and failure of its inventor to grasp certain important details of construction that will be treated of later.

Factory Miscellany

Body Plant in Dodgeville—Schroeder Bros., Milwaukee, Wis., are contemplating the establishment of an automobile body plant in Dodgeville, Wis.

Findeisen & Kropf to Add—The Findeisen & Kropf Mfg. Co., Chicago, Ill., will build a 25 by 110-ft. foundry at 2519 West Twenty-first Street, that city.

Warner to Add—The T. W. Warner Co., Muncie, Ind., maker of automobile parts, has had plans prepared for the erection of an addition to its plant, 85 by 125 ft., for which it contemplates the purchase of new machinery.

Fulton Tractor Plant in Anderson—The Fulton Tractor Mfg. Co. has taken over a plant in Anderson, Ind., which it will adapt for the manufacture of farm tractors and possibly automobiles. The company was recently organized with a capital of $300,000.

To Make Lamps in Knoxville—The Safety Automobile Light Co., Knoxville, Tenn., has been organized with $25,000 capital and contemplates building a plant to manufacture a special lamp for automobiles. J. G. Buchanan, A. M. Treadwell and others are the incorporators.

To Manufacture Fan—With orders from a number of large automobile companies, including one of 50,000 instruments from the Smith Form-A-Truck Co., the Pitter Fan Co. has started the manufacture of the Pitter automobile fan at 111 North State Street, Elgin, Ill. The company is specializing at present on a fan for Ford cars and trucks.

To Make Folding Berths—The Bradley Mfg. Co., Tacoma, Wash., R. L. Bradley, president, will establish a plant in Steilacoom, Wash., for the manufacture of a patented folding berth for automobiles. The enterprise is being backed by the Tacoma Commercial Club and Chamber of Commerce.

Davis to Add—The Davis Mfg. Co., Milwaukee, Wis., has increased its capital stock from $300,000 to $500,000 to accommodate its increasing business. The company recently took occupancy of its new plant at Fifty-sixth Avenue and Mitchell Street, West Allis, erected at a cost of more than $250,000.

Ford Plant in Duluth—The Ford Motor Co. will construct a plant at Duluth, Minn., at an estimated cost between $500,000 and $1,000,000.

This company recently took title to a parcel of land in Cleveland, Ohio, costing about $55,000. The property is 265 by 135 ft. in size. About half of it will be used for a two-story sales and service station.

It is also stated that the company is planning a factory for Des Moines, Iowa, on Grand Avenue.

Maxwell Starts New Castle Additions—Construction of the addition to the Maxwell plant in New Castle, Ind., has been begun. The new addition will take the shape of two large buildings, one to be used as a forge and hammer shop and the other to be used as a die shop. The forge and hammer shop will be in a large building, 550 by 80 ft., and will be constructed of concrete, brick and glass.

The building which is to contain the die shop will be erected between the new forge and hammer room and the main building of the plant. This building will be 220 by 90 ft. and of the same material as the other building.

Because of the call for additional power that the new addition will make, an addition to the present power plant is also under construction. The addition will be two stories in height and will be 54 by 45 ft.

Ill. Factory Items—F. G. Bain of Quincy, Ill., has purchased 4 acres of land near Bushnell, upon which he will construct a factory for the manufacture of automobile accessories. Bain has secured a number of patents upon various devices and will manufacture them upon a large scale. He will employ forty men at the outset. Originally Mr. Bain planned to purchase the plant of the Bushnell Tank Works and manufacture the latter's product in conjunction with his own inventions. He decided, however, to permit an option to lapse, preferring to keep the two lines separate.

The Barley Mfg. Co., Streator, has been given the central Illinois distribution for the Halladay car.

The Automobile Calendar

ASSOCIATIONS

June 12-16—S. A. E. Summer Trip on Great Lakes.
July 2-6—Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
Dec. 2-9—Electricians' Countrywide Celebration.

CONTESTS

June 17—Newark, N. J., Track Race, Olympia Park, Auto Racing Assn.
June 20—Galesburg, Ill., Track Race, 100 miles.
June 22-23—Chicago, Interclub Reliability Run, Chicago Automobile Club.
June 26 — Des Moines, Iowa, Speedway Race, Price Speedway Co.
June 28 — Des Moines, Iowa, Speedway Free - for - All, 300-Mile Race.
July—La Grande, Ore., Track Race, LaGrande Motor Club.
July 4—Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4—Tacoma, Wash., Speedway Race, Tacoma Speedway Assn.
July 4—Minneapolis 300 - Mile Speedway Race.
July 4—Sioux City Speedway Race.
July 4—Newark, N. J., Track Race, Olympic Park, Auto Racing Assn.
July 4—Visalia, Cal., Road Race, Tulare Co. Auto Club.
July 4—Spokane, Coeur d'Alene, Track Race, Reigel-Hiller Co.*
July 4—Benton Harbor, Mich., Track Race, F. E. Fitzsimmons.
July 4—Elmira, N. Y., Track Race, Elmira Auto and Motorcycle Racing Assn.
July — Burlington, Iowa, 100-Mile Track Race, Tri-State Fair.
July 15—Portland, Ore., Track Race, Northwest Auto Assn.
July 15—Omaha, Neb., Speedway Race.
July 15—North Yakima, Wash., Track Race, Hiller-Riegel Co.
Aug. 5—Tacoma Speedway Race, Tacoma Speedway Association.
Aug. 11-12—Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.
Aug. 12—Portland, Ore., Track Race, Hiller-Riegel Co.
Aug. 18-19—Elgin Road Race, Chicago Auto Club.
Aug. 26—Kalamazoo, Mich., 100-Mile Track Race.
Sept. 1-2—New York, N. Y., Sheepshead Bay Speedway, 24-Hour Race, Trade Racing Assn.
Sept. 4—Elmira, N. Y., Track Race, Elmira Auto and Motorcycle Racing Assn.
Sept. 4—Cincinnati, Ohio, Speedway, Cincinnati Speedway Co.
Sept. 4—Newark, N. J., Track Race, Olympic Park, Racing Assn.
Sept. 4—Indianapolis Speedway Race.
Sept. 4—Des Moines Speedway Invitation Race. Limited to six entries.
Sept. 4-5 — Spokane, Wash., Track Race, Inland Auto Assn.
Sept. 16—Providence Speedway Race.
Sept. 18—North Yakima, Wash., Track Race, Washington State Fair.
Sept. 29—Trenton, N. J., Inter-State Fair. H. P. Murphy, Racing Sec.
Sept 30 — New York City, Sheepshead Bay Speedway Race.
Oct. 7 — Philadelphia Speedway Race.
Oct. 7—Omaha Speedway Race.
Oct. 14 — Chicago Speedway Race.
Oct. 19—Indianapolis, Ind., Race, Indianapolis Motor Speedway.
Oct. 21 — Kalamazoo, Mich., Track Races, Kalamazoo, Motor Speedway.
Nov. 16 and 18—Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

GOOD ROADS

Sept. 6-7—St. Paul, Minn., Good Roads Congress, Auditorium.

SHOWS

Sept. 2-9—Columbus, Ohio, Fall Show, Ohio State Fair, Columbus Automobile Show Co.

TRACTOR

July 17-21—Dallas, Tex., Tractor Demonstration.
July 24-28—Hutchinson, Kan., Tractor Demonstration.
July 31-Aug. 4—St. Louis, Mo., Tractor Demonstration.
Aug. 7-11—Fremont, Neb., Tractor Demonstration.
Aug. 14-18—Cedar Rapids, Iowa, Tractor Demonstration.
Aug. 21-25—Bloomington, Ill., Tractor Demonstration.
Aug. 28-Sept. 1—Indiana Tractor Demonstration.
Sept. 4-8—Madison, Wis., Tractor Demonstration.
Sept. 11-16 — Milwaukee, Wis., Fall Show, Wisconsin State Fair, Milwaukee Automobile Dealers.

The Week in the Industry

Trade Happenings

Mountain Trade—The Adamson-Purinton Motor Co. is the name of a new concern at 1320 Broadway, Denver, which has secured the Dixie and Old Hickory truck agency for northern Colorado. Adamson is one of the proprietors of the South Denver Garage, 271 South Broadway.

The Colorado Motor Car Co., 1520 Broadway, Denver, Cole, Reo and Saxon distributor for Colorado and Wyoming, has opened a branch for used cars and service station in a new building at 801 Broadway.

The Chandler Motor Co. of Colorado, 1518 Broadway, Denver, Chandler distributor for Colorado and Wyoming and Stutz dealer for Denver and vicinity, is now in charge of G. W. Embrey, formerly of the Chandler factory. Embrey has been connected with this company from the time it started and held a service department position just before taking over the management of the Colorado branch.

The McQuay-Norris Mfg. Co.'s Denver branch, 528 First National Bank Building, handling piston rings and lyanite pistons, is now in charge of H. W. Sweeney. H. W. Knapp, whom he succeeded as local manager, has been transferred to the Kansas City branch.

De War Bros., new Denver agents for the Detroit Electric, have just completed a new building for salesroom and service station at 749-751 Broadway.

The Mid-West Rubber & Auto Co., 1606 Broadway, Denver, distributer of Pennsylvania Vacuum Cup tires for Colorado, Wyoming and New Mexico, has secured the Davis car distributing agency for these three States.

Trade News from Pa.—William Patten, of the Patten-Fleming Co., 1828 Market Street, Philadelphia, dealer in automobile accessories, has asked for a receiver for the business. Mr. Patten is withdrawing from the firm, but could come to no agreement with G. G. Fleming. The assets are $7,121 and the liabilities $5,677.

The Times Square Automobile Co., New York, has leased the entire first floor of the building at the southwest corner of Broad and Vine Streets, Philadelphia. The company, which has showrooms in a number of other cities, is having alterations made to the new one here.

The General Refractories Co., West Decatur, Pa., has awarded contracts for a one-story brick and steel factory building, 115 by 300 ft. The Johns-Manville Roofing Co. received the roofing contract.

The King Car Agency, 514 North Broad Street, Philadelphia, has taken additional quarters at Broad and Brandywine Streets.

The Industrial Bureau of the Philadelphia Chamber of Commerce is negotiating with several large manufacturers with a view to having them establish plants in this city. One of these is a group of New York and Detroit capitalists who are seeking a plant here to make kerosene for automobiles. The other is the Houk Wire Wheel Co. of Buffalo, which is also considering a branch factory here.

Ohio News Items—Papers have been filed by the Miller Rubber Co., Akron, for an increase of the authorized capital from $2,000,000 to $20,000,000. In filing the papers a fee of $18,000 was paid into the State treasury. The increase will be used for betterments and extensions.

J. M. MacDowall, formerly of Pittsburgh, has been made manager of the retail branch of the Ohio Electric Car Co., at 1220 Madison Avenue, Toledo.

The Willys-Overland Co. of Toledo has taken a lease on part of the former factory of the Columbus Buggy Co., on Dublin Avenue, Columbus, which will be used for the storing of cars for the present. Later, an assembling branch may be established.

Samuel Isaacs, formerly with the O. G. Roberts Co., Columbus, Overland agent, has taken a position with the Oscar Lear Motor Car Co., central Ohio agent for the Buick.

Gaston Goes to Lexington—H. W. Gaston, formerly assistant manager of the Eastern branches of the Reo Motor Car Co., has been appointed sales manager of the Lexington Motors New York Corp., with headquarters in the Circle Building. This corporation controls the Lexington output in New York, New Jersey, Connecticut and Rhode Island.

Ill. News—The Jennings Auto Sales Co., Springfield, has moved into a new building at the corner of Tenth and Adams Streets. A salesroom and all modern conveniences have been installed for the comfort of patrons. The rear will be devoted to a service station and the second story for storage purposes.

The Keyt-Erb Automobile Co., Rockford, has removed to the Countryman Building, corner of Main and Cedar Streets, due to the necessity for larger quarters, and the new plant will be utilized for a sales agency and repair department. The building will be devoted to a service station.

W. Y. Wayne, Decatur, has opened a paint shop for automobiles and motor vehicles of all kinds at 405 East Center Street. This is a new departure, as most of the vehicle paint shops have been taking care of cars as a side issue.

The Waite Tractor Co., Elgin, Ill., has taken over the entire manufacture of its tractor machine in the Kimball Street plant, Elgin. The machinery is now being installed in Elgin. Eight more men will be added to the Elgin plant by the change. Under the contracts in effect when the company located in Elgin the first of the year, part of the construction took place in Elgin and the remainder in Waukesha. By consolidating at Elgin better results are anticipated. About 250 tractors will be placed upon the market this year.

New England Trade Items—H. Strahan, S. A. S. Strahan and P. J. Dimond have formed the Crow-Elkhart Motor Co., Boston, Mass., with salesrooms at 1121 Commonwealth Avenue.

F. W. Paine and G. H. Russell have organized the Paterson Motor Car Co., Boston, for the Paterson six.

J. E. Cunningham, for 5 years with J. W. Maguire, Pierce-Arrow dealer at Boston, has resigned to become manager of the Republic Motor Truck Co., in that city.

The De Luxe Sales Co. has been organized at Boston, Mass., to build special bodies for Ford cars. H. H. Murphy is manager, and the salesrooms are at 1123 Commonwealth Avenue.

The B. F. Goodrich Co. has opened a new factory branch at Burlington, Vt., with L. E. Stone as manager.

The E. E. Wentworth Co., agent for the Overland in Maine, has outgrown its quarters at Portland and has moved into larger ones there.

C. R. Culver, who now has the Pierce-Arrow agency at Springfield, Mass., is planning to erect a new sales and service station at Hancock and State Streets. The Stoddard Motor Co., that handled the line for years, will take on another well-known make.

G. W. Geiger, formerly selling Kissel-Kars and Mitchells at Springfield, Mass., has resigned to join the Stearns-Knight agency there.

C. M. Stone, agent for the Davis line at Providence, R. I., has moved.

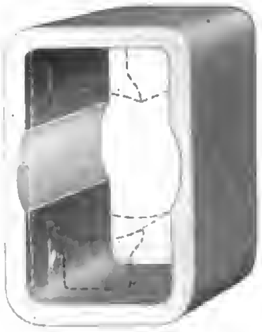
GRAY & DAVIS

STARTING
LIGHTING
IGNITION



QUALITY

STRENGTH

ACCURACY

As the Light House, *founded on a rock*, throws its distant beam in calm or storm, so Gray & Davis starting and lighting units, *built fundamentally right*, give uninterrupted service.

QUALITY. The frames are formed from flat bars of soft high grade dynamo steel. The ends are electrically welded together.

STRENGTH. The commutator end bracket is formed into channel section of tough steel for *added* strength. The frame and brackets are then fashioned into one piece by electric welding, thus permitting dis-assembling of units without disturbing bearing alignment.

ACCURACY. The units are so designed that all work operations are easily made accurate. The frames, bored in one operation, bring field poles and bearings into absolutely true alignment and give perfect magnetic balance which affords smooth, continuous operation.

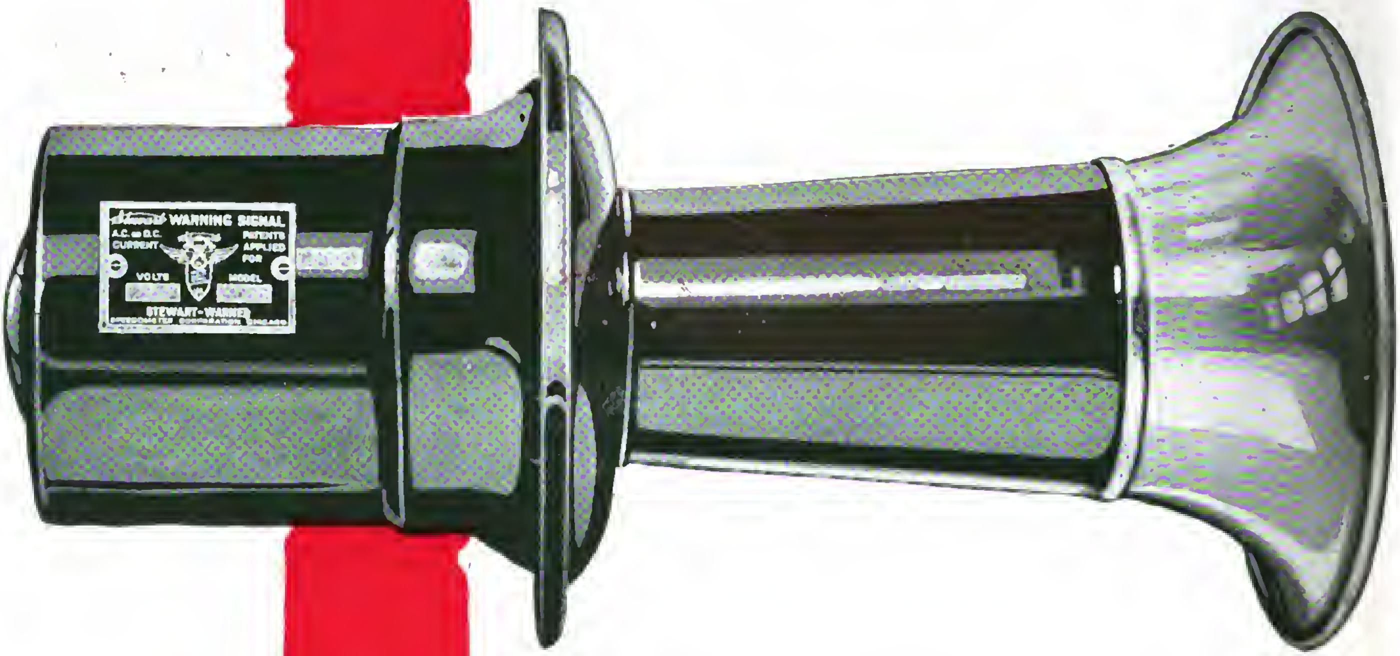
This is why Gray & Davis units consume so little of the engine's power.

Every instrument is *the same!* Every instrument is *right!*

GRAY & DAVIS, Inc., Boston, Mass.

Stewart $6

Motor Driven Warning Signal



Some Orders—

Last week we took an order for 10,000 Stewart Warning Signals.

Only a couple of weeks ago we took another order for 40,000.

Several days ago we received one for 8,000.

And so it goes.

The Stewart Warning Signal is the recognized standard signal of the industry.

It has the quality and the "staying powers."

It's the fastest selling signal in America.

"No car is better than its accessories"

Steamship Waubic, at Killarney, from which point the S. A. E. made a trip through the islands

S.A.E. Decides To Change Title

To Include Aeronautic, Tractor and Motor Boat Engineering—New Name Society of Automotive Engineers

THE S. A. E. may change its name without changing its initials. In consequence of the wish of the United States Government to get all the help it can, especially for army and navy purposes, from the engineering societies, the summer meeting on board the S. S. Noronic was asked by President Huff, by Henry Souther and by Howard E. Coffin, whether it would enlarge its field and take steps to become of as great a value to the other engineers mentioned above as it has been to the passenger car and truck industry. Such an enlargement, according to President Huff, would mean an extension of the membership list to huge proportions. To-day there are 2000 members, and the bigger total of 5000 should be easily reached.

It is obvious that the development of aviation and tractor engineering is very rapid at the present moment and it has been suggested that the society ought to make quite clear the fact that its scope includes these branches of the automobile industry. It has been suggested by prominent men in the world of aeronautics that the society should immediately start work on standards for aircraft. The tractor manufacturers have need for certain standards and on these the S. A. E. and the National Gas Engine Assn. have been in close touch.

Meanwhile, a large number of motor boat engineers have intimated a wish to become members of the Society if it is possible to care for the standardization of certain special things used in motor boat construction. Consequently, it is suggested that the title of the Society be changed from "automobile" to "automotive" engineers; that the Society shall be managed by a board of fifteen directors, there being one president, one first vice-president and five second vice-presidents; the council

As the boat approached the shores of Mackinac

being enlarged correspondingly to include the new interests.

In order to change the constitution of the Society it is necessary to obtain the approval of the general meeting, then to circularize the information to all the members and take a final vote by letter ballot before the next semi-annual meeting, which in this case will take place in January.

This is the most important business done on the 1916 summer cruise. The only other business matters discussed besides those necessary amendments to the constitution for altering the name, were a new method for choosing the nominating committee and the creation of a new class of membership; both being accepted with but little discussion.

The subject of the constitution of the nominating committee came up at the January meeting, and the problems then appearing are now solved by a resolution that the nominating committee shall have a member appointed by each section, and three other members, no two of whom may be resident in any one sectional district.

The other motion made was to alter the constitution of the Society so as to include a new grade of membership known as the United Service Engineer. The qualifications necessary are the same as those for full membership in the Society, but the initiation is reduced to $10 and the annual dues to $5, without the privilege of voting. This is done in order to allow engineers in the United States army, navy and other departments whose work brings them into close touch with transportation problems, to enjoy the benefits of S. A. E. membership at a price which will coincide with the relatively low incomes of such engineers.

Trip Brilliantly Successful

That the four day scheme is adopted for good, if indeed there is not a move to add yet another day next year, has been settled by the unanimous vote of those who took part in the cruise this year. The only fly in the ointment was the limited time available for discussion, and there was considerable regret that the full program of papers could not be covered, several being left over at the close of the meeting on Friday afternoon when within hailing distance of the dock. It would seem almost worth while to hold a session in Detroit, later on, to take up some of the papers again and discuss them more fully.

The papers committee did their work nobly. Never has so fine a collection been got together, never has so wide a field been covered.

Taking up the itinerary from the time of sailing from Mackinac Island on Tuesday afternoon; the first event was the entertainment features provided by the Pennsylvania and Cleveland sections. The former arranged with Henry Hess to give a lecture on color photography, and he held the convention salon crowded while picture after picture illustrating the newest of the arts was thrown on the screen. Apart from the artistic value, Mr. Hess showed that color micrographs were going to be of great value in metallurgy, showing many things that did not appear in monochrome.

Cleveland had an operatic entertainment to offer of an extremely high order of merit with songs and music of a quality seldom encountered off the concert platform.

Sports Enjoyed Greatly

All day Wednesday was spent at Killarney, a diminutive fishing island inhabited by some 250 Chippewa Indians. Fishing, athletic sports and an East vs. West baseball game were the main features of the day. At night the Detroit section produced a five-act melodrama which was universally voted one of the funniest performances ever put on the stage. It had very little to do with automobile trade matters but was just a farcical

A professional session of the engineers on board tne Noronic

rendering of the old-time drama in the most approved manner.

Thursday was to have contained a stop at Owen Sound in the afternoon, but the Noronic lay fogbound at Killarney all night and, on getting away about 9 o'clock Thursday morning, headed direct for Detroit. Practically every available moment of Thursday and Friday was filled with the reading and discussion of papers and Thursday evening the Metropolitan section produced a revue which, while shorter than the Detroit play, was quite as much appreciated. The "book" consisted almost entirely of trade jokes, mainly at the expense of the Detroit section membership which were greatly enjoyed by the latter.

Discussions Limited

With Detroit in sight on Friday afternoon it was found that quite a number of papers remained, for the reading of which no opportunity had offered. It appeared to be the general opinion that the papers committee had provided ample on the program for an extra day or more of professional sessions. Even to cover the papers which were discussed it was necessary to read them in abridged form, and the speakers in the discussions were limited to a very few minutes each. This meant that many of the papers were not discussed as fully as they would otherwise have been and obviously next year it will be essential to make some arrangements whereby two papers on quite different subjects can be read simultaneously in different parts of the ship. This was the original scheme on this occasion, but the lower deck accommodation, fitted up as a theater for the entertainments, had very inadequate lighting, making it distinctly unsuitable for a meeting held in the daytime.

One of the outstanding characteristics of the trip this year was the absence of any new special topics of paramount interest. Last year every few yards along the deck would be found small groups of engineers discussing the eight- and twelve-cylinder engine, or if this were not the subject of the conversation it would be light weight. This year the burning questions of 1915 seem to have been settled and no others have, as yet, quite taken their place.

Future of the Tractor

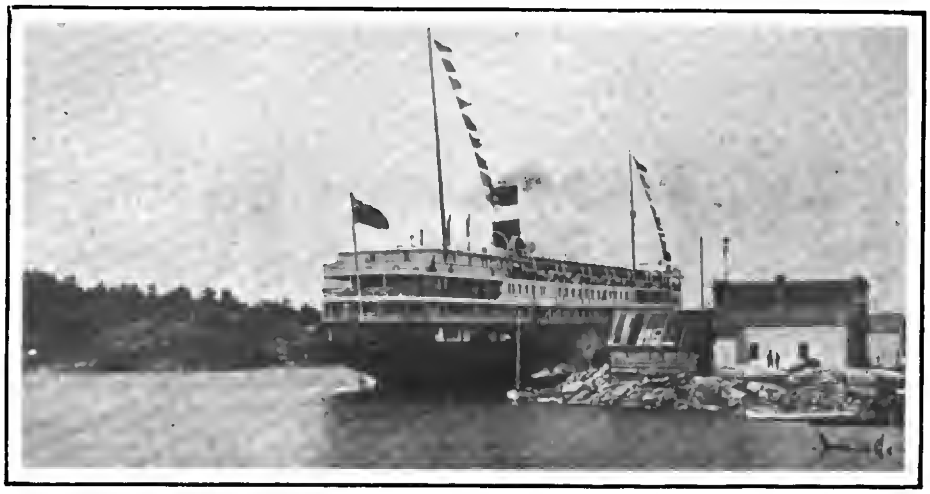
The future of the tractor is one of the most frequently discussed subjects, or rather the exact place which it is going to take in the automobile world. The general opinion is that there is a better market for a thoroughly well-made machine than for one which is merely cheap. Furthermore, that careful design and good workmanship mean economical operation which is really more important to the farmer than low first cost.

The pros and cons of differentials are also a subject to which some attention is being given, and it seems likely there will be a general move to try out some of the differential substitutes on a large scale in the 1917 cars.

Aeroplane Paper Provokes Big Discussion

Neil MacCoull opened the Thursday session with his paper on aeroplane engines, in which the recent developments are reviewed. Discussion on the paper was short as far as the original subject was concerned, but it opened up the question of the participation of the Society of Automobile Engineers in aeronautical work. G. M. Muffly said that the rotary type of motor, for which credit is generally given to foreign engineers, originated in this country in the old Adams-Farwell automobile. Rotary engines were equipped with double ignition on account of the belief that one set was apt to fail. What failures there were, however, were generally from the sooting of the plugs due to feeding too much oil.

"Aeroplane engines," continued Mr. Muffly, "are continually operating under racing conditions and hence care must be used in the speed for which they are designed, as they are run at full speed all the time. I also predict that rotary valves will be used to a greater extent and in fact am work-



The Noronic docked at Killarney, the Indian fishing village

ing on one now which will be distinctive in that it will be muffled.

"The advantage of twelve-cylinder motor installation is that it is possible to keep a constant torque and hence a constant speed on the propeller, thus reducing the tendency towards fluttering of the propeller. Where the rotary motor has fallen down is in the lack of economy of gasoline and oil. The reason for the great oil consumption is in the method of application of the oil and the greater clearances used with the steel pistons working in the steel cylinders.

"The rotary motors have also had a shorter life, which has been due to the attempts of the designers to secure abnormally light weight. Such a motor is naturally lighter than a reciprocating type and there is no necessity for cutting down life for the sake of the saving in weight. I prophecy that the new types of rotary will have higher efficiency and economy then the reciprocating engines."

Suggests Change of Society's Scope

Howard E. Coffin then spoke upon the widening activities of the Society. He said that the organization was originally intended to go beyond its present scope. In fact if the definition of the word automobile is looked into closely it will be seen that it covers any mechanism which is self-propelling.

It is necessary that cognizance be taken of the labors in other fields—high-speed motor boats aircraft, both heavier and lighter than air; and the S. A. E. should make itself responsible for this development. The time has come, he explained, for the Society to make itself active in all lines that are really covered by the term automobile in its broadest sense.

Mr. Coffin called on Henry Souther, who has just been made consulting engineer in the government aeronautical service, to talk on the aeroplane question. Mr. Souther said there is so much to the subject that it is difficult to select the high spots. The art is changing so rapidly that every 2 months makes a vital difference in practice. "We must all get together to accomplish something," said Mr. Souther. "In years past there were restrictions between the governmental departments and the industry, but on the other hand, the engineering problems in connection with military work were very few and unimportant. Now they have been multiplied tremendously, therefore it has become necessary to remove the obstacles. A body of men has recently been formed, which reports only to the president; its title is the National Advisory Committee on Aeronautics. Some of the members are Dr. Walker of the Smithsonian Institute, Mr. Marvin of the weather bureau, and Dr. Stratton of the Bureau of Standards. Others comprise professors of important subjects from seats of learning and all operate in conjunction with several officers representing the army and navy.

"Last week a conference meeting was held and they brought together members representing the entire air industry, having a very illuminating discussion regarding the state of the art from the standpoint of the user, flyer and engineer. An active committee has been appointed to co-operate in carrying on the work. Dr. Dickenson represents the Bureau of Standards on the committee, Lieutenant Young the navy, and myself, the army.

"The whole course of action has been tentatively laid out. For the present the army and navy will be the principal users and must take the initiative and the first work of this sub-committee will be to draw up a set of specifications. The army, navy and Bureau of Standards will come to agreements on the specifications and these will be brought to the

The Indian band which met the Noronic at Killarney rendering a selection

attention of the engineering body most active in this work, and there is no reason why the S. A. E. should not be this.

"The standards committee of this body can then meet with the committee of the United Services, to clear up the specifications. These should be particularly valuable because they will be backed by the government departments and they should be developed rapidly.

Introduces "Automotive"

"Mr. Coffin has broached the subject of national alliance with bodies that are active in the motorboat, air machine and tractor fields. There seems to be no reason for hesitation. The name of the Society of Automobile Engineers has gone around the world and carries as much if not more weight in manufacturing circles than any other society I know, because it is a society whose work is practical.

"It is unfortunate that the word automobile, in the name of the society, is restricted by common usage to pleasure cars, but, if the name is restrictive, the difficulty is not insurmountable as some other word such as automotive could be used. If that were the only obstacle in the way of uniting the societies with common interests it could readily be overcome."

Howard Coffin then spoke of the importance of the air service abroad. He said that there were 30,000 men behind the lines training for positions as aviators. This is on the Western front alone, and does not include those who are already fighting. He said that Glen Curtiss had told him, in a recent conversation, that not one of the several thousand aeroplanes shipped to the other side by his concern has gone to the front, as it takes two weeks to get the latest practice and by the time they get to Europe they are fit only for school purposes.

"The object of Mr. Kettering's talk the other evening was to make us think, and this is the object of this talk on the subject of industrial preparedness."

Mr. Coffin then read a large part of the address on industrial preparedness and the automobile industry which he made on May 29 at Indianapolis (reported in THE AUTOMOBILE for June 1).

Afternoon of Business

A. J. Slade's paper on Mechanical Transport Mobilization concluded the Thursday morning session and the afternoon was given to a meeting to accept the reports of the standards committee and to pass the constitutional amendments. The standards reports are printed on page 1116 and the details of the other business have already been mentioned.

On Friday, the ball was opened by B. Liebowitz with his paper, The Dynamics of Vehicle Suspensions. This is a lengthy treatise on the mathematics of springs and the principal speaker in the discussion was Henry Hess, who stated that a better suspension could be obtained from a single spring leaf backed by solid "cams" than from springs with multiple leaves. The paper in an abridged form will shortly be published in THE AUTOMOBILE, together with the scheme sketched by Mr. Hess.

Professor Lucke's paper, Kerosene versus Gasoline in Standard Automobile Engines, was digested by K. Zimmerscheid, Dr. Lucke not being on the boat, and this also is reserved for a future issue. Time did not permit much discussion, P. S. Tice speaking at some length, however, and promising to submit a written discussion on the subject, going fully into the points on which he differs.

Standards Divisions Report Progress

Standard Nomenclature Now a Fact—Several New Standards Accepted—Electrical Equipment Division Has Majority of Recommendations Ready—Standard Piston Ring Grooves Accepted

AT the opening of the session devoted to receiving the reports of the standards committee which took place Thursday afternoon, the chairman, A. Ludlow Clayden read the condensed report of the work of the past 6 months which follows:

On this occasion, the standards committee has but a few things which it asks you to accept as recommended standard practice. The divisions of the committee have been extremely active and we have some excellent progress reports to lay before you. I am going to ask you to regard the few reports presented for acceptance as a tribute to the thoroughness of my predecessor. Mr. Zimmerschied saw to it that before he relinquished the reins of office he had practically everything cleaned up.

At the end of February there was some reorganization of the standards committee; several committees whose work seemed to be at an end or who were for other reasons inactive were discontinued.

Recently, within the last 2 weeks, a new division has been created, and in the light of the interest which the society is certainly going to take in aviation and also possibly in motor boat engineering, it is probable that still more divisions will be added.

I wish briefly to review the work of the different divisions since the January meeting in New York. Taking them in order, the Ball and Roller Bearing Division has followed out its original plan and prepared a suggested series of standard sizes for taper roller bearings. Certain matters relating to ball thrust bearings are now under consideration.

Carbureter Fittings

The Carbureter Fittings Division has arrived at the stage when the bulk of its work appears to be done, at least for the present, whatever may happen in the future. The division has been engaged in the consideration of various details, such as throttle lever throw and threads on the rod ends. Various matters in connection with gasoline and other pipe sizes are also under consideration. Similarly the double outlet carbureter used for V engines will offer opportunities when it is certain that a definite practice can be recommended without in any way restricting the development of design.

Standards Recommendations

Nomenclature for all parts of an automobile. Standard Words accepted for chassis and body parts.

Standard sizes for flexible metallic tubing from 3/16 in. to 1 in. inside diameter, inclusive.

Three standard forked type lamp brackets of 7¼, 8¼ and 9¼ in. span.

Resolution that head lamps should be mounted at least 3 ft. from the ground, measuring to the center of the lamp.

Resolution that dimming devices which operate by reducing the current to the head lamp bulbs are of no value FOR THE PURPOSE OF ELIMINATING GLARE.

Resolution that focussing devices should not revolve the bulb nor cause it to move out of center.

Resolution that the slots in the bulb socket should be set so that the pins on the bulb stand vertical.

Resolution that bulbs for use with three cell batteries shall be known as 7 volt bulbs, and those for six cell batteries as 14 volt bulbs.

Resolution that the storage battery should be grounded by only one conductor and that the switch for the starting motor should be placed on the ungrounded side between battery and motor.

Standard throttle lever rod end to be 3/16 for carbureters from ½ to 1 in. and ¼ for larger sizes.

Carbureter throttle lever throw to be 1¼ for ½, ⅝ and ¾ in. carbureters, 1¾ for 1 to 2 in. carbureters inclusive, and 2½ for larger sizes.

Standard charging plug receptacles for electric vehicles.

A new high carbon nickel steel.

New table of physical properties of sundry S. A. E. steels, and some new recommendations relating to test specimens.

Formula and table of standard sizes for piston ring grooves covering every size of piston used in automobiles.

Increase of ¼ in. in the length of thread on the standard S. A. E. bolts.

Series of standard sizes for taper roller bearings making for interchangeability and following the previously accepted standards for ball bearings.

The work of the Chain Division has been interfered with to some extent by the war, since the co-operation of the foreign manufacturers is sought to aid the division's endeavor to standardize dimensions so that chains of different kinds can be used on the same sprockets with equal success. In this connection, F. L. Morse, chairman of the division and president of the Morse Chain Co., has offered to allow other companies to use one of his patents if this assists standardization.

Electrical Equipment

The Electrical Equipment Division has been the most active this year. It has before it some of the most difficult questions which have yet been offered to the standards committee for settlement and the progress which it has made is excellent. At the present time it has two main objectives; one is to lay down some really scientific rules for the construction of lamps which shall give the right sort of light. A sub-committee of the division has been conducting actual tests of a very careful kind, and in a very short time it will be possible to recommend specific dimensions for the different parts of a headlight which will give a light strong enough for safe driving, yet so disposed as to overcome glare.

Another sub-committee of this division is dealing with the other difficult subject of starting motor generator and ignition unit standardization. Here the situation is as follows:

The aparatus is in course of development. It is admitted by everyone that electrical equipment is a long way from being in final form. This makes standardization difficult because it is not easy to be sure of the shape, size or disposition of generators and starting motors, say 2 years hence. Simultaneously, we see a great number of needless patterns being made to suit the idiosyncracies of various engineers. There may be excellent scientific and engineering reasons for a generator maker to have seven or eight patterns, but there can be no possible sense in making seventy or eighty differing from each other by very small degrees. It is the hope of the division to be able to strike some sort of happy mean between a standardization which might cramp development and the present chaos.

The division is also dealing with a number of matters of detail such as standardization of flexible metallic tubing, of tail lamp glasses, of headlight brackets, etc.

Electric Vehicle

The principal matter before the Electric Vehicle Division is the evolution of some scheme whereby vehicle batteries of different makes may be readily interchangeable, thus facilitating the running of fleets of electric trucks. The basis of such a standardization is to be found in the jars of which the battery is composed. These are made in a great variety of sizes, and many matters of scientific correctness of design have to be agreed upon in addition to the questions raised by the equipment with which different manufacturers are now working. The division has been investigating the subject very thoroughly, as it is felt that hasty action would probably be disregarded and that it is only of use to establish standards when there is a reasonable hope that they will be respected.

Engine and Transmission

The Engine and Transmission Division is paying close attention to the work of the Electrical Equipment Division with respect to starting motors and generators. The subcommittee appointed to deal with this subject contains members from both the electric equipment and engine and transmission division. The compilation and comparison of engine characteristic curves commenced last year is progressing. Arrangements have been made for elaborate tests of V belts, for driving fans, etc., and there are sundry other matters upon which action may be expected during the fall.

Foreign Co-operation

The Foreign Co-operation Division has found its work brought to a standstill by international conditions. At the commencement of its activity early in 1915 such correspondence was conducted with England and the outlook was very promising. Since that time the British engineering standards committee has had its personnel almost entirely absorbed by other work and consequently no committee can be got together on the other side and nothing can very well be done. There is no doubt, however, but that progress will be rapid as soon as the tension eases.

Miscellaneous

The Miscellaneous Division has always an extremely lengthy program. At the present time there are some fifteen or sixteen items before it. A recent attempt to standardize fittings for the attachment of the speedometer drive to the transmission has had to be abandoned owing to the extremely wide variations in practice discovered. It may be remarked that this type of standardization which seems so easy at the outset is really one of the most difficult and the explanation to my mind is that there is no fundamental reason why a speedometer should be driven in any particular way. There are a number of methods, each equally good, and the gain in selecting one of them for universal adoption is scarcely great enough to make it worth while at the present time for automobile manufacturers to depart from their pet ideas.

This division offers for your consideration a suggested series of piston ring standards, these being based upon both theory and practice insomuch as an empirical formula has been worked out which appears to give good results.

Another item before this division which may be mentioned as indicating the ever-growing character of the work of the standards committee is the additions which are suggested through the S. A. E. standard yokes and rod ends. This, one of the earliest S. A. E. standards, has been found to require extension in order to cover the sizes necessary for truck work.

Nomenclature

The Nomenclature Division has been something of an experiment in that its procedure has not followed the regular rules of the standards committee until quite recently. The idea of selecting standard names for readily recognizable parts of an automobile chassis is an old one and several attempts were made to bring it to fruition. A meeting was called in Detroit last summer at which a number of service men, not necessarily members of the society, were asked to be present and a start was made. Since then there have been many informal meetings and, finally, a sufficient number of members were appointed to make a division of the standards committee in accordance with the constitution of the society.

Within the year the whole chassis has been covered from end to end, owing to the strenuous labors of Mr. Zimmerschied and the recorder, A. C. Woodbury. To these two gentlemen the thanks of the whole world is due.

In his paper on the use of automobiles in the great war, which will be read on board the Noronic, the author comments on the fact that endless confusion has been caused through different American manufacturers adopting different nomenclature for the main portions of their trucks. I know from personal experience that in the early weeks of the war the confusion in the spare parts department at Aldershot was indescribable. This means that the amount of time wasted by manufacturers, dealers and users of automobiles through lack of clearness regarding the meaning of any particular name, must in a year total up to a sum of staggering magnitude. The list of names which the division has compiled does not include every small detail. Obviously such things as the internal parts of a carbureter must have different names depending upon the details of its design, but the list covers the vast majority of the parts which go to making a complete machine.

I would wish to lay stress upon the fact that many of the names chosen are debatable. Doubtless many of you who see this list for the first time will feel disposed to ask the wisdom of choosing such and such a particular word to describe a particular part. I have personally been able to attend a number of the meetings and have no hesitation in saying that not a single one was chosen without the most careful consideration of many alternatives. When the work was commenced it appears that it might take years to complete. By the end of the second meeting it was obvious that a generous give and take would bring matters to a speedy conclusion and it has indeed done so. It is suggested that the list submitted and the method of grouping the different parts should be followed by automobile manufacturers as completely as possible, and we have the support of many of the most powerful firms. I think it is quite probable that in years to come this list of names will show up as one of the most important and valuable things for which the S. A. E. has ever been responsible.

Research

The Research Division has been occupied exclusively with the elaboration of a test which will show the ability, economy; in fact, the all-around efficiency of a car taking the word efficiency in the widest sense possible.

At the January meeting this division submitted a suggested form for a fuel economy test. This was not accepted, owing to the fact that the standards committee considered the conditions were insufficiently rigid. Consequently, the division arranged a far more elaborate test from which it would scarcely be possible to read false conclusions. This was sub-

(Continued on page 1145)

Constant Pressure Cycle Possibilities—II

Further Advantages of Constant Pressure Cycle—No Starter Required—Description of a Proposed Engine

By Arthur B. Browne
Consulting Engineer
and Herbert Chase
Chief Engineer, Automobile Club of America

THE first installment of this paper, which was read at the Summer meeting of the Society of Automobile Engineers during the cruise on the SS. Noronic, June 12 to 16, appeared in part in THE AUTOMOBILE for June 15. The balance of the abstract of the paper follows:

Excellent Scavenging Properties

4—The scavenging in a four-stroke constant volume engine is never complete because of the large clearance space required. This results in several drawbacks, among which is a loss in volumetric efficiency and a dilution of the incoming charge with inert gases. These faults are not present in constant pressure engines, because an excess of air can be forced through the cylinder while the piston is at or near the lower dead-center.

5—*Volumetric Efficiency.* In the constant pressure engine using the working cylinder for a compressor, losses from decreased volumetric efficiency are precluded by the nature of the cycle. The air that may be normally pumped is in excess of the requirements of the working stroke on account of the subsequent expansion by heat. Hence there is always an excess of compressed air from which to draw on the working stroke. The piston cannot move until the volume behind it is sufficient to afford the necessary pressure. For peak loads the normal maximum pressure can even be temporarily increased, so that volumetric losses do not exist. This is in marked contrast to the constant volume cycle, in which the volumetric efficiency is not high, even at low speeds, and usually decreases as the speed increases.

Operation on the Two-Stroke Cycle

6—Constant pressure engines will operate much more satisfactorily on the two-stroke cycle than will engines of the constant volume cycle, because scavenging in the former can be more nearly perfect, through the use of an excess of air to remove the products of combustion, whereas unless fuel injection with its inherent difficulties is resorted to, engines of the constant volume two-stroke type must depend upon the incoming charge to scavenge the combustion chamber. This inevitably results in a loss of fuel. Under these circumstances not only is a four-stroke cycle unnecessary in a constant pressure engine but all the advantages of the two-stroke cycle without any of its disadvantages are realized. The four-stroke cycle with its two idle strokes is an engineering anomaly that need be no longer tolerated when the constant pressure cycle is employed.

Low Operating Temperatures

7—The specific heat of air at constant pressure is 0.2375, while at constant volume it is 0.1689. If a given weight of fuel containing a certain number of heat units be mixed with a sufficient weight of air for complete combustion, and the fuel ignited, the temperature attained will be much higher if heating takes place at constant volume than if the volume be allowed to increase at such a rate as to hold the pressure constant, although the work that can be done in either case is the same since the energy liberated is the same in both cases. In practice, however, it is probable that the longer continuance of the lower temperature of the constant pressure cycle will offset the higher temperatures of short duration and the greater flame-swept area in the constant volume cycle so that the heat losses through the cylinder walls will be approximately the same. The temperature of the exhaust gases in the constant volume engine will also be higher at the same exhaust pressures and this will represent a greater *total* heat loss than that in the constant pressure engine.

No Fuel Injection Pump Necessary

8—The operation of engines of the constant pressure cycle is not dependent upon any fuel injection pump as is that of engines of the Diesel and semi-Diesel type. Aside from the purely mechanical difficulties and complications of such pumps, the metering of the fuel for varying loads presents some exceptional difficulties, especially in small units. From all such difficulties the constant pressure engine is free, an advantage worthy of special mention in comparing the strictly constant pressure engine with one of the Diesel or semi-Diesel type.

No Starter Necessary

9—In practically all types of Diesel engines some form of high compression air starter is necessary on account of the high compression pressures attained. No such complication is necessary in the constant pressure engine. A small quantity of air under a pressure of perhaps 1 to 5 lb. will be sufficient to start the engine. When once started the engine will quickly pump air up to the predetermined maximum of the cycle and the pressure will then remain constant.

Combustion in the Constant Pressure Cycle

The constant pressure cycle comes closest to fulfilling all the conditions for efficient combustion. Combustion takes place under Class C conditions. It is highly efficient because: (a) The density of the charge is limited by structural considerations only; (b) It is possible to raise the temperature of the compressed air to a high degree, prior to the introduction of fuel, by utilizing the exhaust heat (which is commonly wasted); (c) The proper proportions of fuel and air can be automatically maintained without mechanical complications; (d) On account of the appreciable time that elapses between the entrance of the fuel and its final combustion, its complete vaporization and diffusion, even though it be of low grade, is assured by its introduction into the highly heated air, noted in (b) above, and (e). As was seen under heading of "scavenging properties" little if any dilution is due to presence of burnt gas in the mixture so that except for the presence of atmospheric nitrogen, which of course cannot be excluded, dilution is at a minimum.

Proposed Constant Pressure Engine

Cylinders *1*, Fig. 2, serve as both compression and working cylinders in which move the differential pistons *2*. Air first enters the compression spaces *3* of the larger diameter of the pistons through pipe *4* on the in-stroke and is compressed on the out-stroke. This air need never be raised to more than 5 lb. pressure, and this may be accomplished by other means than a differential piston if more desirable. The air thus compressed serves to scavenge the adjacent cylinder, entering the latter via port *5*. The products of combustion leave the cylinder through port *6* (unless some other valve be provided in or near the cylinder head as a better means of exit). As the pistons move on the outward stroke, ports *5* and *6* are closed and the air remaining in the cylinders is compressed and discharged through the valves *7* into the receiver *8*.

Since the clearance space between piston and cylinder head is practically zero, substantially all the air is expelled on the outstroke. Just as the crank passes top-center the admission valve *9* is opened and the mixture is admitted to the burner through piping *10* (where its temperature has been raised by contact with the hot inner piping *11* through which the exhaust gas, discharged after the previous working strokes, has passed). The mixture, still under high pressure, passes into the burners *17*, which are in reality a part of the combustion spaces, as the pistons are forced downward. In the burners (the construction of which will be fully described later) ignition by spark from plugs *19* occurs and *complete combustion at constant pressure* ensues until the mixture is cut off as a result of closing the admission valves *9*.

During the admission period the heat gradually liberated as a result of combustion enables the products of combustion to expand *without loss of pressure* and thus do work on the piston. After cut-off the hot gases expand, with decreasing pressure, and continue to do work until the exhaust port opens. The burned gases, still at high temperature, then pass through the pipes *11* provided for this purpose, and give up to the walls of these pipes and the compressed air surrounding them a large portion of their heat before escaping to the atmosphere. Thus there is saved to the succeeding cycle much heat that would otherwise be entirely lost, as it is in most if not all other types of internal combustion engines. Furthermore, the addition of heat to the air in the piping *10* takes place *after* the air has been compressed. Thus its temperature is raised with corresponding increase in ability to do work.

Suppose now the compression pressure decided upon as most desirable be assumed, for the moment, to be 150 lb. Even at normal full load with cut-off at say one-third stroke it is evident that *all* the air compressed in the working cylinder cannot be utilized. Hence the pressure in the receiver will build up rapidly unless some relief valve be provided. To put this on the receiver would, of course, mean the loss of much of the work of compression. Hence a single unloading valve *15*, operated by piston *14*, is provided. When the pressure in the receiver rises above the 150 lb. desired, the valve *15* is forced open against its spring and the air in the cylinder is simply discharged to atmosphere with only slight loss of power.

If for any reason a momentary overload is to be carried by the engine some device such as *16* for increasing the tension on the spring that normally holds the unloading valve closed, can be brought into play. In the case of a motor car engine such a device could be operated by a simple dash control.

Fuel is supplied to the engine as follows: The pump *13*, positively driven from the engine, draws the fuel from the main supply tank and delivers it to the reservoir *18* in which a float or some other device maintains a constant level. Any surplus fuel pumped is by-passed or returned to the main supply tank. The small tank *18* is maintained at a pressure somewhat less than receiver pressure, depending upon the air velocity through the restricted area *22*. From this tank the fuel is drawn through the spray nozzle *12* by the injector action of the air passing the nozzle. The flow of fuel will of course cease immediately when the air flow ceases on account of the closure of the admission valves *9*. A correct proportioning of fuel to air may be accomplished by proper adjustment of the regulating valves *23* and *24*, Fig. 2. As the velocity through the atomizer *25* increases the natural tendency toward over-richness is counteracted by the proportionately diminished pressure in the restricted area at *22*.

The admission valves *9* can be made of the Corliss, slide or

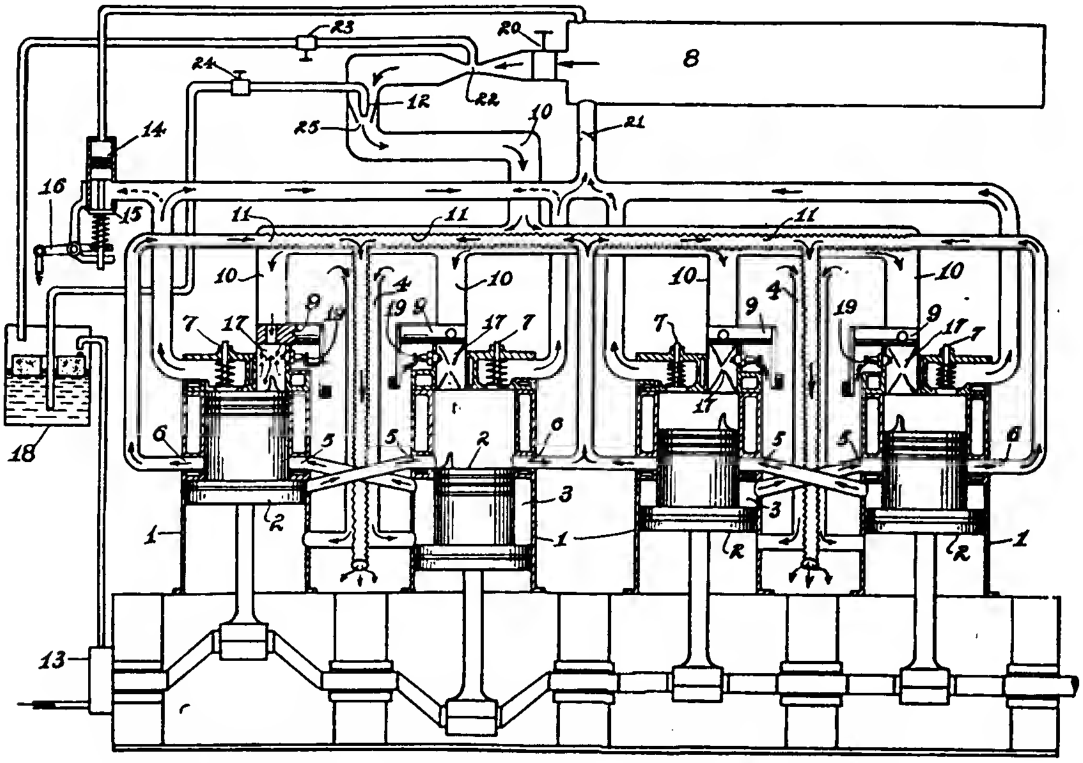

Fig. 2—Diagrammatic representation of four-cylinder engine operating on proposed cycle

poppet type, as proves most desirable, and be operated by any conventional cut-off device such as, for example, is used in steam engine practice. In the case of a motor car engine the point of cutoff would be varied by a device operated in precisely the same manner as is the throttle on an ordinary Otto cycle engine. The throttle valve *20* shown in Fig. 2 would be used only in starting.

The check valve *21* prevents air in the receiver escaping to atmosphere when unloading valve *15* is open. The admission valve can, if desired, be left open during practically full stroke when a heavy torque is required. The card would then be practically square and resemble closely a card from a steam pump. Under this condition the fuel consumption would of course be much increased because the gases would not be allowed to do work in expanding after cut-off. The periods when such a late cut-off might be used would be short in an engine properly proportioned to the load.

The striking similarity of the constant pressure cycle to that of a steam engine is at once apparent. But while the results are equal in every way to those accomplished with the steam engine, the engine is self-contained and does not require the boiler, condenser and other elaborate external apparatus necessary in the case of the steam engine. An engine operating on the proposed cycle has all the advantages of the steam engine without any of its disadvantages and at the same time possesses characteristics that should render it much more efficient and practicable for motor vehicles and many other types of service than is any type of internal combustion engine now in use.

Description of the Burner

The operation of the proposed cycle is dependent to a large extent upon the functioning of the burner marked *17* in Fig. 2 and shown in detail in Fig. 3. To understand the operation of this burner it is necessary first to have clearly in mind certain fundamental laws governing flame propagation. Imagine a tube composed of material that is a non-conductor of heat, this tube being closed at one end and open to atmosphere at the other. Now suppose the tube be filled with a highly combustible mixture of air and gas. If the mixture be ignited near the open end of the tube the flame will travel toward the closed end at a rate of speed dependent chiefly on the quality, temperature and pressure of the mixture.

Suppose now a vessel containing a combustible mixture under pressure be connected to the open end of the tube. If the end of the tube formerly closed is then opened the combustible gas in the vessel will flow out through the tube at a rate dependent upon the pressure. If now the mixture be ignited at a point midway of the tube the flame will propagate itself either toward the vessel or away from it according to the relation between the velocity of the gas and the rate of flame propagation. If the rate of flame propagation be greater than the velocity of the gas through the tube the flame will travel against the flow of the gas and ultimately enter the vessel from which the mixture is issuing. If the velocity of the gas is greater than the rate of flame propagation the flame will travel with the flow of gas and ultimately blow out at or near the open end of the tube. If, however, the rate of flame propagation is equal to the velocity of the gas the flame cap will remain stationary, the combustible gas approaching it from one side and the products of combustion leaving on the other.

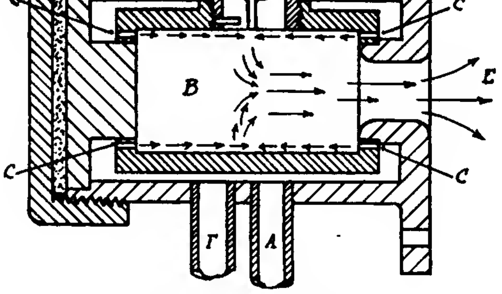

Fig. 3—Representation of burner

In the case of the burner shown in Fig. 3 the combustible mixture enters under pressure through the pipe *A* and fills the annulus (called the diffusion chamber) surrounding the combustion chamber *B*. Entrance to the latter is afforded by openings *C* so arranged that the streams of gas come from opposite directions and meet at a point where their velocity is zero. The velocity at the point of entrance to the combustion chamber of the burner will depend upon the pressure difference between the combustion chamber and the chamber from which the gas issues. Suppose now the pressure difference is such that the velocity at the point of entrance is 100 ft. a second and that the rate of flame propagation in the particular mixture under consideration is 50 ft. a second. If the gas be ignited by spark plug *D* after entering the combustion chamber, the flame cap will travel against the gas current until it reaches a point where the velocity is the same as the rate of flame propagation, in this case, 50 ft. a second.

Such a point must exist between the point where the velocity of the gases is zero and the point of entrance. Otherwise the flame will travel through the opening through which the gas is entering, and ignite the mixture approaching the burner. To confine the flame within the burner it is therefore necessary at all times to maintain at the point of entrance a velocity higher than that of the flame propagation. This will result in maintaining the flame within the burner and the products of combustion will issue from the outlet *E* of its combustion chamber.

In practical application of the burner already made it has been found that the burner can be operated over a wide range of pressure differences without adjustment and it has also been found possible to use the burner with the heaviest and cheapest grades of oil obtainable and still secure complete combustion, at least so far as the eye and nose can detect.

Heating the Air

In case liquid fuel of low volatility is used it is of course necessary to heat the air in which the fuel is mixed and see that the latter is finely divided. In practice this is done as follows:

The air, passing through the atomizing device *25*, Fig. 2, becomes impregnated with fuel mist and is immediately conducted through tubes where its temperature is raised by contact with the hot walls of the inner tubes *11*, carrying exhaust gases. This exhaust heating at constant pressure, not only effects the material increase in efficiency already noted, but serves to make a fixed gas of the mixture, which may thereafter be safely conducted to the point of combustion without fear of condensation. With gasoline this fixation is unnecessary. Hence a ready means for starting a cold engine is available.

In applying the burner to an engine it is necessary simply to see that the conditions outlined for properly mixing and volatilizing the fuel are met. If the temperature of the air passing the nozzle *10*, Fig. 2, is sufficiently high to cause immediate ignition of the fuel, two alternatives are open. The first is to maintain a velocity in the mixing chamber that is always greater than the rate of flame propagation in the mixture. The second is to make provision as by valves *23* and *24*, Fig. 2, whereby the mixture while on its way to the burner is too rich to ignite, that is, until sufficient air entering through auxiliary inlet *F*, Fig. 3, is added to this over-rich mixture in the space surrounding the combustion chamber so as to secure complete combustion.

The degree of rapidity at which the heat is liberated in the burner is indicated by the fact that it has been found possible in tests already made to melt a bar of steel inserted in a burner made of brass. The design of the burner is such that the gases entering insulate the walls so that the latter remain comparatively cool.

High-Lights of the Discussion

Hiram Percy Maxim:—In the opinion of the writer, the Society is to be congratulated upon having a paper on the Constant Pressure Cycle at this time. When the Otto cycle engine is offered in units having no less than twelve separate cylinders, such as our modern twin sixes, the question of casting about for a better cycle becomes a matter of necessity.

Engineers look at this question of a better cycle than the Otto in two different lights. Those of us who must design and build something this month, which can be sold next month, with 2 per cent for cash in 10 days, one of the very important factors, regard anything other than the Otto cycle as partaking of the fanciful or hare-brained. On the other hand, those of us who are not actually dependent upon the immediate sale of the design are keenly interested in anything which promises better thermal efficiency than the Otto cycle. They even date the obloquy of their associates to the extent of going back as far as the old Brayton engine, which we all studied when we first bought all the gas engine books. This is just what Messrs. Browne and Chase have done, and they are to be complimented for their courage.

The writer frankly states that he belongs in the same group as Messrs. Browne and Chase. He had an active part in the early development of the gasoline engine, and is one of those who are not yet over wondering that it works as well as it does. Its status in his mind is anything but that it is the final type of engine. Rather than this, the writer feels that the Otto cycle engine has succeeded in spite of, and not on account of, its principles.

The tremendous losses at the exhaust, the losses due to the adulteration of the fresh charge of the large quantity of burned gas from the previous charge and those resulting from ignition at lowered compression, as when running throttled, cannot long go on. The only way we can admit them is by having no other alternative. But this only places a premium upon developing an alternative, and this is just what Messrs. Browne and Chase are trying to do. They present the diagram of a reciprocating engine in which the explosive mixture is burned in the new flameless burner which Dr. Lucke has told us about in the past, instead of being burned on a gauze, as was done by Brayton.

A Continuous Rotary Design

The losses in the principle laid down in the diagram shown by Messre. Browne and Chase, would be undoubtedly very much less than the losses in the Otto principle, and the writer has no comment to make upon the analysis of these losses which is given. He believes, however, that the authors go only part way when they pick up the old constant pressure cycle and apply it to a multiple-cylinder reciprocating engine.

Answer to Mr. Maxim

Herbert Chase:—We heartily agree to most that Mr. Maxim says in his discussion. The possible development of a turbine operating on the constant pressure cycle has long been predicted. By utilizing the burner described in the paper such a turbine can doubtless be made to operate, providing the problems involved in cooling can be solved. The chief obstacle seems to be that of compressing the air necessary for combustion of the gas. We hear that some moderately efficient rotary air compressors have been developed in France, but I have yet to lay hands on any thoroughly reliable data regarding these. Of course if a reciprocating compressor must be employed there would seem to be no object in using a turbine in which to do the work of the cycle, since this may be done to better advantage in the compressor cylinder exactly as shown in the paper. Granting, however, that an efficient turbine will be developed, it does not follow by any means that it will replace engines of the reciprocating type. Witness conditions in the steam engine field, where in the smaller units the reciprocating type is not only more efficient but is more readily adaptable to most conditions of service. Unfortunately the turbine, whether steam or gasoline, is essentially a high-speed machine. On this account its application to motor vehicle service where comparatively slow speeds and high torques are ultimately required is no simple problem and it is by no means certain that even a highly efficient gas turbine will, if developed, replace the reciprocating engine for this class of work.

Smith Suggests Use of Fan

George W. Smith, Thos. B. Jeffery Co.:—I believe it possible for you to throttle the intake of pipe 4 as shown in Fig. 2, in such a way that you can regulate the amount of air drawn in in direct proportion to the amount of air injected into the cylinders during combustion. There would be a slight saving in power in so doing but the principal advantage, I think, would consist in eliminating the noise of the exhaust that might result from ejecting the air past regulating valve 15. I have also considered the advisability of a multiple sirocco type of fan in place of the truncated piston as shown in Fig. 2. The fan would lend itself very readily to the varying requirements of the engine in regard to volume of free air at the different speeds, and I believe possesses sufficient merit to be considered at least in the discussion.

Wilkinson Doubts Engine's Efficiency

John Wilkinson, H. H. Franklin Mfg. Co.: — I have always been very much interested in possibilities of the constant pressure cycle. First, because I was familiar with the old Brayton engine which was used at Cornell University for many years. While I never remember seeing it running, it was a very familiar sight in the days when I attended the university. Secondly, in 1900, I attempted to build an engine of this type. It was not any sort of a success, principally, I think, because we were not able to handle the ignition question satisfactorily at anything except very low speeds. Also, most of us remember the efforts of the Association of Licensed Automobile Manufacturers in connection with the Selden patent to build an engine of this type which would run. Many thousands of dollars were spent and it would be interesting to get the experience of the men who worked on this development.

There should be nothing inherently difficult about producing a satisfactory engine of this type, although doubtless some inventive ability will have to be displayed for some of the features.

I very much doubt the statement that the theoretical efficiency of this engine is as high as 84 per cent. In fact, as used under full load in an automobile I doubt if the efficiency would be as high as in our present engines, although perhaps it would be considerably higher at the light loads.

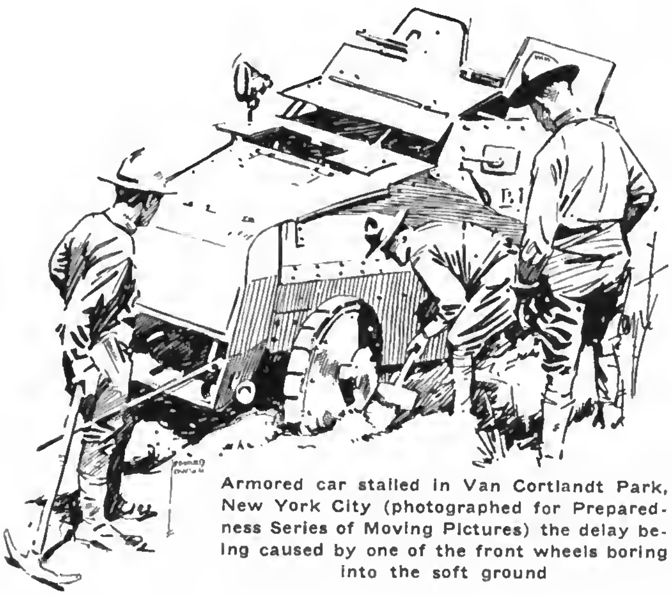
Answer to Professor Diederichs of Cornell

Herbert Chase:—We of course realize that it is exceedingly difficult to predict just what the thermal efficiency of the proposed engine will be. We fail to see, however, why the mechanical efficiency should be much, if any, lower than that of an Otto cycle engine. We believe that the thermal efficiency should be a good bit higher partly because higher compression pressures and better conditions of combustion prevail, and partly because a good bit of the heat which ordinarily would go out with the exhaust is utilized.

The Search for the Army Truck Wheel

The Composite Type of Wheel (1) as Front and Trailer Wheel, (2) as Driving Wheel—An Examination of Its Possibilities

By Marius C. Krarup



Armored car stalled in Van Cortlandt Park, New York City (photographed for Preparedness Series of Moving Pictures) the delay being caused by one of the front wheels boring into the soft ground

LESSONS from war service with regard to automobiles and motor trucks emphasize traction troubles and troubles due to injury from bullets and shells. They are probably usually accepted with a large grain of reservation as to their importance for average civilian motor vehicles. But it is realized that, aside from the need of guarding against projectiles, the military requirements are after all little more than civilian requirements for very rough and variable service. Ability to get from one place to another with maximum load, with regularity and without injury to the vehicle, rapidly if roads are good and less rapidly, but still reliably, where roads are bad or don't exist—covers in general terms what is wanted for the hardest kind of commercial work as well as for war. But only few vehicles need to measure up to these requirements under peace conditions, while all war vehicles should do so to the last letter.

One of the main questions with regard to the possibility of fitting a large number of ordinary automobiles and commercial motor trucks for military work on very short notice, therefore takes the form: Can the ordinary motor vehicle by some simple change in its equipment be made fit for operation under the most adverse road conditions, while still retaining its suitability for the easier, but much faster, service on fair roads?

Naturally, the first thought in this connection is aimed at improvement of the driving wheels. If a type of wheel having the desired effects may be devised and may be substituted for the type of wheel ordinarily used, it might be called the Wheel of Preparedness, to fall in line with the current phrase. But even simpler means are tried.

The use of traction chains on the wheels is the most obvious and convenient provision of this nature, but according to all reports from the war correspondents, it is of small benefit with heavy loads on soft ground or snow, and does not prevent a vehicle from being mired, while on rough and hard roads the chains wear out too rapidly. Their advantages are insufficient for military work. The large, pivoted traction blocks, on the other hand, with which ordnance and heavy tractor wheels are equipped, reduce the speed on fair roads unduly. The differential lock is useful and helps out in combination with the traction chains, but of course only if the difficulty does not apply to both driving wheels. With regard to the special wheels said to be used on Italian trucks, the reports which have been published have not been explicit, but these wheels seem to be mainly designed with a view to securing traction on hard but slippery mountain roads at low speed.

In addition to these efforts for improving traction, front wheels have been arranged with enlarged surfaces, in various forms, to prevent them from sinking into soft ground, and the principal objection to this provision lies in poor steering and inconvenience of the attachments, while it can also not be combined suitably with armoring of the vehicle.

On the whole, little has been done to make the front wheels pass over obstructions and over soft ground in such a manner as to help in reducing the traction work to be done by the driving wheels, excepting only the four-wheel drive and steering system, which however represents a complication not required for the majority of commercial motor vehicles, and one which cannot be introduced offhand when these are to be used for military or other emergency work.

With all these considerations in mind, the advantages of a wheel construction based on the principle shown in Figs. 1 and 2 seem to be so pronounced as to suggest that it should be tried out, especially where war is in progress or preparedness for war under discussion. The bearings of the hub, the drive and the means used for locking the wheel on the axle, and holding the components together, are omitted, as they can be anything desired and customary.

The construction is merely an improved form of the compound or composite wheel in which the vehicle wheel proper rolls upon a circular track formed as part of a separate road wheel, but it is so compacted that the whole wheel is not necessarily of larger diameter than an ordinary motor truck wheel, and its components are so aligned that no other relative movement is possible than the rolling movement of one component upon the other. The road wheel component rolls on the ground without tractive relations to the latter, whether the vehicle wheel component drives the road wheel component or only rolls on it. The large thrust bearings, (in conjunction with the customary means for holding the wheel on the axle) hold the components in lateral alignment but have little work to do, as the road wheel component has almost the same angular velocity as the vehicle wheel sheaves. The central device maintains constant contact between the components, so that the wheel must act as a unit on the roughest road.

The advantages of this construction for front wheels and trailer wheels are perhaps less important but also less subject to doubt than those relating to its use for driving wheels, and may therefore be referred to separately and first.

For Front Wheels

It may be said that the simplest manner of improving front wheels (to make them surmount obstacles more readily, make them less liable to sink into soft ground and more easily pushed out of a hole) is to make them larger, and there can be no doubt that it always would be an advantage for driving on rough or soft ground to have the front wheels as large as proper regard for the steering permits, but any change in size, as compared with the front wheels of ordinary commercial vehicles would mean a higher front axle and a change in general design and lines of the vehicle. If sufficient to be of much value the change would be a radical one. The composite front wheel, on the other hand, can have the axle at the normal height with its road wheel component only 1½ to 2 in. higher than a normal wheel and extending only ¾-in. to 1-in. farther back than the normal wheel does at the middle portion which determines the sharpest possible steering angle. And it has some advantages which a considerably larger front wheel would not possess.

When a road obstacle is struck, the vehicle wheel with its loads runs forward and smoothly upward on its road wheel track and tips the road wheel over the obstacle without abrupt shock, the momentum of the vehicle assisting, and the components of the wheel adjust themselves afterward to their normal relations, in which the vehicle wheel is supported in the road wheel track slightly forward of its lowest point—somewhat more forward the faster the vehicle is moving and the lighter the front axle load is.

On soft ground there are two important considerations: To obviate the sinking of the wheel and to push it out if it is in a hole or is mired. When a front wheel of ordinary type begins to sink, the push from the rear axle is likely to aggravate the situation unless it is immediately effective. With the composite wheel the track on the road wheel component remains clear, and the vehicle wheel in moving forward on this track turns the road wheel over the danger spot by gradually increasing pressure from the load and without boring forward in the soil. The momentum of the load moving gradually upward on the track should be sufficient to turn the road wheel over even if the resistance is so great that the vehicle wheel finally strikes the track of the road wheel directly in front of the front axle and at dead center with the thrust from the rear axle; for at such a moment the lowest portion of the road wheel would be released from the vehicle load, and the momentum of the impact would only have to turn the weight of the road wheel component alone around the resisting front edge of the hole, whereafter the relations would at once be favorable for progressing.

The whole action can be easily perceived, though a complete description becomes lengthy and tiresome. Under all circumstances, on miry as well as on rough ground, all futile pushing of the wheel against the soil is minimized, being resolved into a gradual climbing of one wheel component in the other, thereby storing the propulsive power of the vehicle momentarily and making its accumulation assist in effecting rotation of the wheel and progress of the vehicle.

That a wheel of this type is naturally armored against rifle fire should mean a valuable weight reduction for the front of armored cars with machine guns, and, as dangerous stalling of such vehicles seems to be mostly ascribed to miring of the front wheels due to excessive front load, the advantage of the composite wheel type may in this respect be two-fold and important.

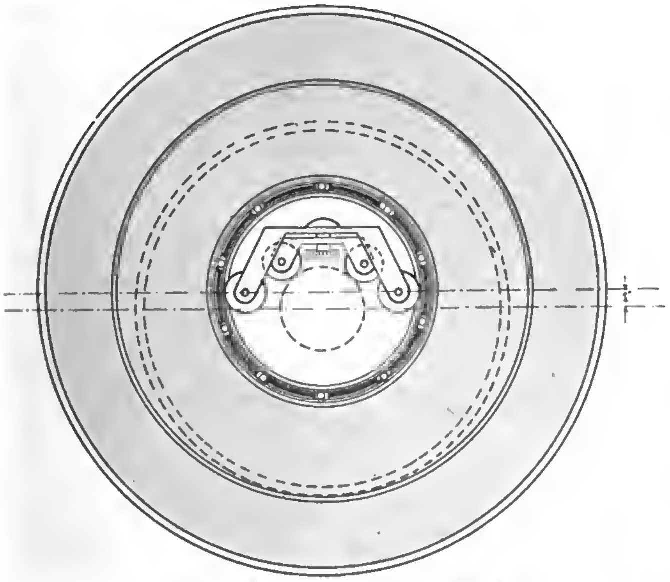
The type also offers an opportunity for doubling the cushion effect of solid rubber tires by having both the vehicle wheel component and the road wheel so shod, and this arrangement may permit dispensing with pneumatic tires in cases where these otherwise would be preferable. The vehicle wheel tires, being of small diameter and width and removed from contact with the road would be inexpensive and would perhaps protect the road wheel tire sufficiently to offset their own cost.

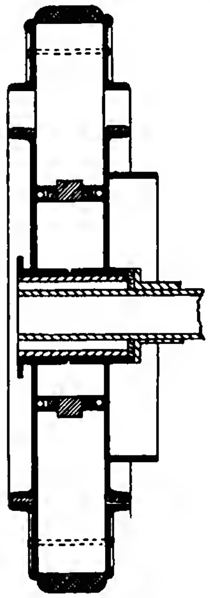
For Trailers

It is understood that the use of trailers for military transportation and hauling was practically discontinued in the European armies before the war began, mainly because the additional load which could be safely hauled by means of them was found to be greatly reduced by difficulties in starting them whenever they had been left standing for a short time on any ground not absolutely unimpregnable. The same objectionable feature naturally reduces the utility of trailers for commercial work. Springy couplings have not so far been found a sufficient or desirable remedy for this shortcoming, largely because they reduce the safety of the coupling on hills and at sharp stops, and any great increase in the diameter of the trailer wheel militates against a short turning radius, so much more as the trailer at a turn is pulled around on a shorter curve than the tractor unless special mechanism is installed to the contrary effect.

It seems evident, on the same principle as with regard to front wheels, that the composite wheel would reduce the power and traction requirements for starting the trailer over a considerable range of unfavorable conditions, the maximum within this range being always that needed for making the vehicle wheel travel over the gradually rising curve of its artificial track until it begins to slip. The change in the location of the load pressure must be sufficient to turn the road wheel over before the point of slippage is reached.

As the load cannot gravitate at any other than a certain rate, determined by the load, the resistance and the general laws of gravitation, and the tractor may not pull at a rate of progress agreeing exactly with this action, it is clear that some see-sawing may take place between the vehicle wheel component and its road wheel mate, but the start at all events can be effected if it can be begun,





Figs. 1 and 2—Diagrams showing principal features in wheels of composite type

Fig. 1—Side view of the middle or road wheel component with tracks and thrust bearings. Device for maintaining contact of wheel sheaves with the tracks is shown in the central circular opening. Relations to axle and hub carrying the wheel sheaves are indicated in dotted lines

Fig. 2—Vertical section of assembled wheel, with omission of hub details and the central device. Without brake drum the diagram would also represent front wheel construction approximately

while only experience can devise the best means for making the acceleration smooth and unobjectionable. In this respect the nature of the coupling between tractor and trailer may be important, since it might tend to suppress or accentuate irregular movements, according to its mode of uniting the two vehicles.

With due allowance for the uncertainties of this or similar nature that may be involved in the use of the composite wheel type for trailers, there does not seem to be room for doubting that it would increase the average and permissible load for this class of vehicles, partly through assisting in overcoming large starting resistances and partly through the same sort of action on rough or soft ground that makes it desirable for front wheels. As the relative movements of the wheel's component parts take place in the plane of the wheel, no appreciable effect on steering movements should result, except to make them safer in case an obstacle in the road tends to interfere with them.

Although the advantages of the type for front and trailer wheels always depend in part upon the vehicle wheel component assuming the functions of a driving wheel in relation to the road wheel component, the use of the type for driving wheel purposes nevertheless brings factors into play which must be considered separately. It will not function properly at high speed as a driving wheel, though as a front wheel it can operate at any desired speed, and it is necessary to figure out just how fast it can be operated as a driving wheel under given suppositions of loads, dimensions and resistances.

Another chapter must be devoted to this task.

(To be continued)

Paragraphs on Current Topics

By Marius C. Krarup

Motto: Radical Thought, Conservative Action

Invention of motor fuels has reached the popular stage. In addition to the Burton process used at S. O. refineries, the Rittman process acquired by the Government and already peddled out in licenses to about a score of concerns, and the Charles S. Palmer process which has just been announced as capable of putting gasoline—real gasoline—back to a cost of 9 cents and a sales price of 15 cents per gallon, three gentlemen of Greenville, South Carolina, have discovered a chemical by means of which three parts of kerosene mixed with one part of gasoline are made into just what the motorist wants. Frank Watson of Iowa has a water mixture at four cents per gallon which drives a Ford car 20.6 miles (note the decimal) without adjustment of the carbureter. There is also a promise that 85 million gallons of benzol will be thrown upon the market annually as soon as the war is over, at whatever price it will command. Charles Jason Greenstreet of Saint Louis, with three refineries at his command, has a "Gasoline Corporation" under way which will make gasoline from crude oil at one cent per gallon and from distillates at 4½ cents, thus being liable to get into an interesting competition with itself, than which there is nothing more stimulating, it is said. From the Indiana gas fields we hear that 1000 cubic feet of gas will yield five gallons of gasoline by compression and can yet be used afterward for fuel and light, and that three plants are being erected to take advantage of these practical arithmetics whose conflict with specific gravity figures is a detail. Hine Smith, a farmer of Sparta, Michigan, has an attachment to his motor which makes kerosene alone all right. Frank R. Blamey, a grain and feed dealer of Bloomfield, N. J., is on the same track as the South Carolina men, having found a chemical that makes a kerosene-gasoline mixture just the thing. T. S. Causey, of Dallas, Texas, has a "Thermal Generator" which utilizes the heat of the exhaust and, after starting on gasoline, makes crude oil an acceptable fuel.

□□□□

Turning from these more or less optimistic engineering projects to the latest batch of S. A. E. treatises, we find the possibilities of the constant pressure cycle for automobile motors confidently but carefully discussed by Arthur B. Browne and Herbert Chase and don't read very far before we have the proposed motor identified with everybody's dreams, and we have yet to make sure that the presumable flaws really exist in the conception of it which is here presented; the first one without apparent bias in any direction. It makes use of almost any hydrocarbon fuel, kills off the suction-carbureter and makes us understand that the reason why the vacuum gasoline feed system tarried so long in coming, though so nearly self-evident, was because all suspected, without exactly knowing why, that it might soon be superfluous. Anticipating things a trifle, it may be suggested that the new motor, when the time for baptismal rites arrives, shall be called neither the constant pressure cycle motor nor the carbureter-less motor, but something euphonious, such as the All-Fuel or the Browne-Chase. Meanwhile there is an alluring pastime in trying to specify the reasons why it will never come into existence. It is at least good enough to justify such an effort.

□□□□

Hush! The S. A. E. is going to change its name to S. A. E. with a different spelling for the A, or has already done so. The difference between Automobile and Automotive is nothing to speak of etymologically, both being hybrid words and both suggesting anything with "self" and "motion" in it, but in practice it means about 1000 more members, whereas it also confers with one stroke new capacities in aeroplane and motor boat engineering upon all the old merely automobile members. Just as before, however, each one will have to disprove or sustain the allegation by his own unaided activities. Societies have ceased to be endorsements. They are only opportunities. That is, they are worth more for the right man and less for the wrong one than they used to be.

□□□□

No sooner has the Society of Automobile Engineers finished the work of finding names for everything that anybody could possibly desire to mention in connection with automobiles and of sticking these authorized names on to stay, in the form of a long list soon to be published, than the Society of Automotive Engineers has to take up the same work for the added crafts and issue a new edition. It would only be fair to posterity—since posterity always suffers from too much nomenclature—to appoint a committee to conduct proper burial services, from time to time, over the words which fail to survive, dying from lack of red corpuscles or because enterprising inventors and designers introduce new realities which make them superfluous. We notice words which have been dead for years spooking around in new books and daily papers—and other ones which a properly constituted committee could kill quietly and bury publicly without anybody weeping. Oh, for a list of proscripted words with the next S. A. E. effort in the field of nomenclature! In the meantime, private lists of 50 to 100 useless automobile words are welcomed for an eventual bonfire in these columns.

□□□□

F. W. Lanchester studies the best proportions of streamline bodies, with sole reference to air resistance, in *Engineering* of May 19. When length is 5 or 6 times the diameter or more, exact shapes are unimportant, he finds, but with the length relatively smaller "we get to a point at which streamline flow becomes unstable, and when this point is reached the resistance responds in an acutely sensitive manner to the slightest change of shape." And yet the racing cars with the longest tails have not always won.

□□□□

"The weight of the entire axle builds up around the driveshaft diameter," says H. D. Church with a happy turn in the phrasing, and this is his reason for keeping the shaft slender despite high stresses. "Also a good reason for taking the shaft out of the axle," comments the advocate of internal gear drive. Both are right, and so one is reminded that even the best reasoning has to make good in practice. Mr. Church has many another phrase in his S. A. E. paper which appeals to a broader public than the bulletin readers. For example, he has "never seen any grease cup having sufficient power to force grease into the loaded side of the bearing, even with no load on the truck," and he shows how oil can be made to do the work better than grease, as many truck owners need to know. The argument could also be used in favor of a graphite addition to the oil, since a little of the graphite will always get under the load.

□□□□

A few blossoms from Mr. Bradley's paper will also bear repetition as examples of expressive diction full of meaning in a few words. "Any military type of truck that can be developed," he writes, "is bound to be swamped by the thousands of purely commercial models that will have to be enrolled when the nation goes to war." And in another place: "A 3½-ton truck is not so light as to be constantly threatened with overloading," which makes us reflect again upon the peculiarity that the factor of safety with regard to overloading, though it is in the hands of the public, is so much smaller than the factor found advisable against stresses which can be closely calculated. Summing up war experience, Mr. Bradley also writes: "Brake rods should be regarded as organs needing protection" and "Engines under the seat will no longer be accepted" in the French army, omnibus chassis excepted. One may be inclined to quarrel about the latter conclusion, so long as the general truck type may yield to something better any day, but scarcely about the needed protection for brake rods, which may be hit by any board that is tripped up.

□□□□

From the same paper one gleans the idea of a new accessory of value for all hauling work that may leave the vehicle exposed to low temperature at night. It refers to a pail for draining water from the radiator and motor. This pail should have a filter-funnel at the bottom for slowly refilling the organs in the morning while the motor is heating up, and, by means of this funnel, it should be able to stand alone on top of the radiator, so as to engage the driver's attention and time as little as possible.

□□□□

Cottoning to the supposed prejudices of car owners or the automobile industry is an art requiring skill and up-to-dateness. As the prejudices have practically vanished the sly art is most safely cultivated by saying nothing, and here the skill lies in using an extravagant number of words for saying it.

□□□□

Should the chauffeur be a servant? A momentous sociological problem, Madam, yet we solve it offhand. The answer is: Perhaps, but it is easier to make the servant a chauffeur; also cheaper.

□□□□

Optimism always wins in the long run, for the simple reason that pessimism can't win anything, aiming for nothing that is not already there. Hence, when we have downed a proposition, engineeringly speaking, we may well be prepared to find out later that it won't stay down.

Of all that has been said to explain why the great projected merger did not materialize only one remark is entirely fit for publication. According to this version all the parties concerned were too intelligent and wideawake. When 90 per cent brains is added to more 90 per cent brains, the sum still becomes nothing better than 90 per cent brains. The waste of human capacity for directing big affairs that was involved in the contemplated amalgamation was too appalling to contemplate.

—

Car Control for Legless Persons

WITH the deplorable increase in the number of mutilated persons in France, new means are being devised for adapting the control mechanism of automobiles to physical deficiencies in the drivers. Among these arrangements one proposed by R. C. Baudry for the use of persons whose legs have been amputated or paralyzed has received an award from the *Société d'Encouragement pour l'Industrie Nationale* and is shown in the accompanying diagrams. For operating, it, only the hands and the back of the driver are engaged. Braking is effected by backward movement of the body.

The clutch pedal is operated by means of a second handwheel which slides on the steering pillar and is connected with the clutch pedal as shown in Fig. 1. The steering wheel A carries the accelerator P. The clutch wheel B with tubular hub C terminates with an annular shoulder V which abuts against collar D fixed upon the steering pillar. The square-section rod X is mounted to slide in this collar D and the similar collar D1, lower down, and its upper end S hooks over shoulder V. The cable F with adjustment Y is attached to lug R on rod X and passes over the grooved pulley K, secured to the steering gear box M, to clutchpedal L.

To unclutch, wheel B is raised toward wheel A, while to engage the clutch it is allowed to be pulled down, and, as the wheel B can turn on the pillar, following any steering movements of wheel A and the hands guiding it, simultaneous steering action does not interfere with any desired gradation in the engagement of the clutch. The shoulder V may be provided with a ball bearing to reduce friction under the hook S, thereby further assuring the smoothness of operation, and the cable may be replaced by a mechanical articulation.

The brake control, Fig. 2, comprises the adjustable rod K attached to brake pedal H at one end and at the other to lever D which is pivoted to seat A at E and carries at the top the backrest C which is normally held forward by retractile spring L. To operate the brake, the driver thus simply leans back against C with more or less force.

The designer, both of whose legs are paralyzed, has this equipment on a light car and experiences no difficulty in exercising complete control over the vehicle. — From *Le Génie Civil*, April 29.

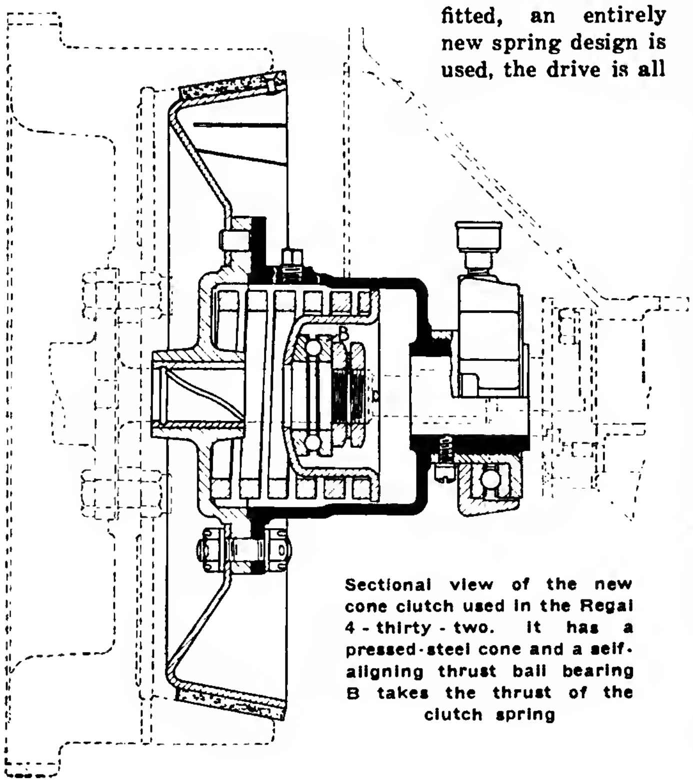
The new 3½ by 4¾-in. engine used in the Regal for 1917, showing the mounting of the electric units

Better Engineering in New Regal Four

3½ by 4¾-in. High Speed Engine Develops 32 H.P.

SELLING at $695, the new four-cylinder Regal is an entirely new design throughout and is undoubtedly one of the best in engineering detail on the market at this price. Certainly it is a better car than Regal has heretofore offered in this price field, and a great deal of thought has been paid to every detail, more of the parts being designed and built in the concern's own shops than ever before. For instance, the clutch and universal joints, parts that are very often bought from specialists in these units, are designed and manufactured wholly under the Regal roof for the new model, which is styled the 4-thirty-two.

Its engine is new throughout; the frame is of tapered form instead of being straight as in previous cars, the gearset is in unit with the engine, a new starting and lighting system of Heinze make is fitted, an entirely new spring design is used, the drive is all changed, a better rear axle has been adopted, the gasoline tank has been removed from the cowl and placed at the rear and a new body and hood of tapered form have been fitted. With all these differences over previous construction, the new Regal is therefore not a refined edition of any previous model, but may be regarded as a brand new car from stem to stern.



Sectional view of the new cone clutch used in the Regal 4-thirty-two. It has a pressed-steel cone and a self-aligning thrust ball bearing B takes the thrust of the clutch spring

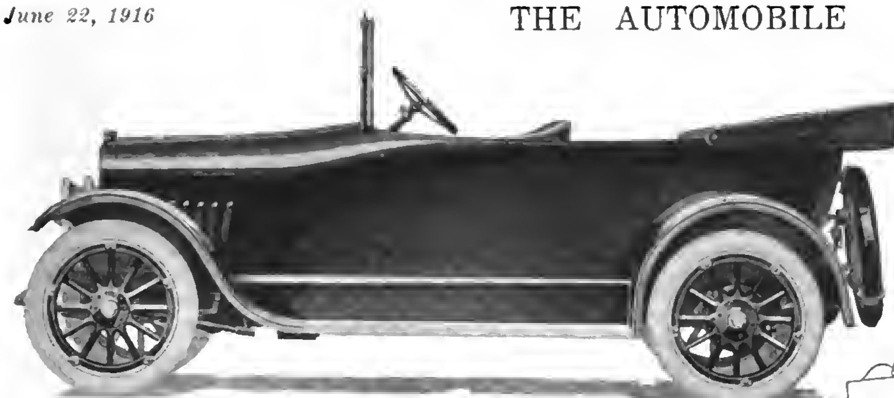
The new motor, which is designed to operate at higher average speed than previous power plants, in accordance with engineering dictates of the day, normally develops 32 hp. It has a bore of 3½ in. and a stroke of 4¾ in., giving a displacement of 183 cu. in., and a formula rating of 19.6 hp. A rigid engine is obtained by casting the upper half of the crankcase in unit with the cylinder block, this construction calling for a detachable head so as to make it easy to get at the interior for adjustment or repair. By making the cylinders and that part of the crankcase carrying the bearings of the crank and camshafts in one piece, it is possible to secure correct alignment of all the cylinders and the bearings, a feature which does its part in the securing of a smooth-running motor.

Valve Adjustments Accessible

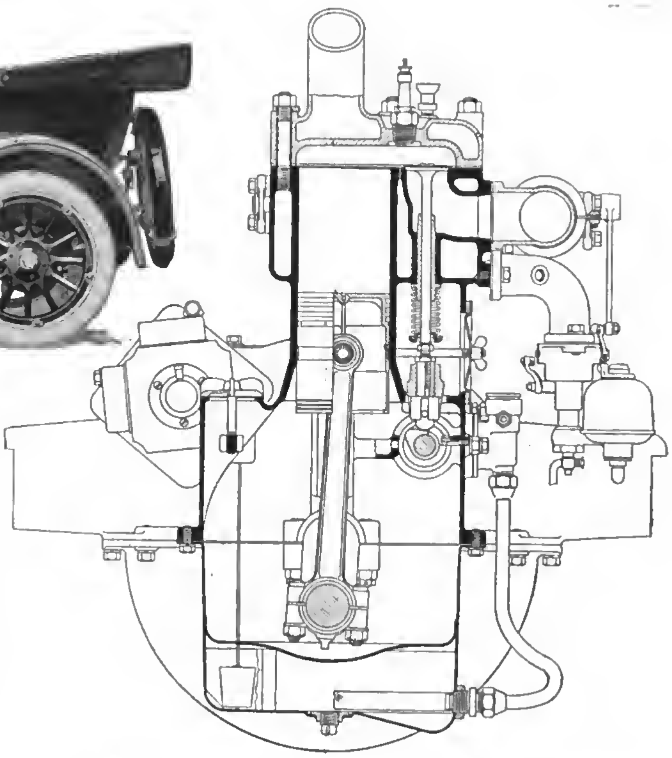
Valves are on the left and by a judicious placing of the exhaust manifold, carbureter and generator, which are the main units on this side, it is no trouble to get to the valve adjustments, after having removed the covers that inclose them. In connection with the valve adjustment, a refinement is noted that is bound to be appreciated by the man who has to take up the valves. The tappets are secured in their holders in such a way by means of a pin that they cannot revolve, but simply have up-and-down movement. Thus when a valve must be adjusted, it is not necessary to hold the tappet portion with one wrench while turning the adjusting nut with another wrench. Only the tool necessary to turn the one nut is needed, and after the right clearance has been secured, a lock nut sets it. The tappet assembly for two cylinders is removable from the top as a unit.

Very Long Pistons Used

Special mention should be made of the unusually long pistons that are used. These are made of cast-iron, but the section is very light and well proportioned so that there is



Regal 4-thirty-two five-passenger touring car which sells for $695



Transverse section through the new 3½ by 4¾-in. Regal engine

no excess weight. They measure 4½ in. from top to bottom, affording a long bearing surface that distributes and reduces wear and also practically eliminating any chance of slap. Three eccentric rings are fitted, and there are oil grooves at the bottom of the skirt to carry the oil down, besides a chamfered groove below the last ring slot, this being provided with a number of oil holes to return any excess lubricant to the crankcase. Thus, practically every possible precaution has been taken against oil getting into the combustion chambers to smoke and carbonize. The piston pins are also quite large —¾ in. diameter—and are secured to their pistons by tapered dowel screws.

The rotating members are of ample proportions, the crankshaft being 1⅝ in. in diameter and having three die-cast babbitt bearings that are 2⅝, 2¼ and 3¼ in. long, front to rear, respectively. The flywheel bolts in place by a flange of large diameter, and the camshaft and generator shafts are driven from the mainshaft by helically-cut gears, the crankshaft gear being steel and the other two cast-iron for reasons of silence, since steel runs quieter against cast-iron. These are in a separate case from the crankcase and inclosed by a pressed steel cover.

Oiling System Well Worked Out

Special attention seems to have been given the oiling system in this new motor, for it possesses several commendable refinements in addition to the special provision in the pistons against leakage into the combustion chambers. A plunger oil pump, operated from the camshaft, draws the oil from the pressed-steel oil pan at the bottom of the engine, and after it has been strained it is led to the splash troughs in the usual way. A special lead runs to the point of mesh of the camshaft gear with the generator gear, but to insure its also getting to the mesh point of the camshaft and crankshaft gears without undue complication, a simple and effective scheme was hit upon. A little baffle plate was placed on the inner side of the inclosing case, and the oil, when thrown off by the camshaft gear, strikes this baffle and is directed straight onto the mesh point desired. Breathing is obtained through space provided around the tappet assemblies, and a large filler and oil gage are placed on the right side of the crankcase in convenient position.

One thing that has been especially looked to in the design of this motor is the clear valve passages. These have been

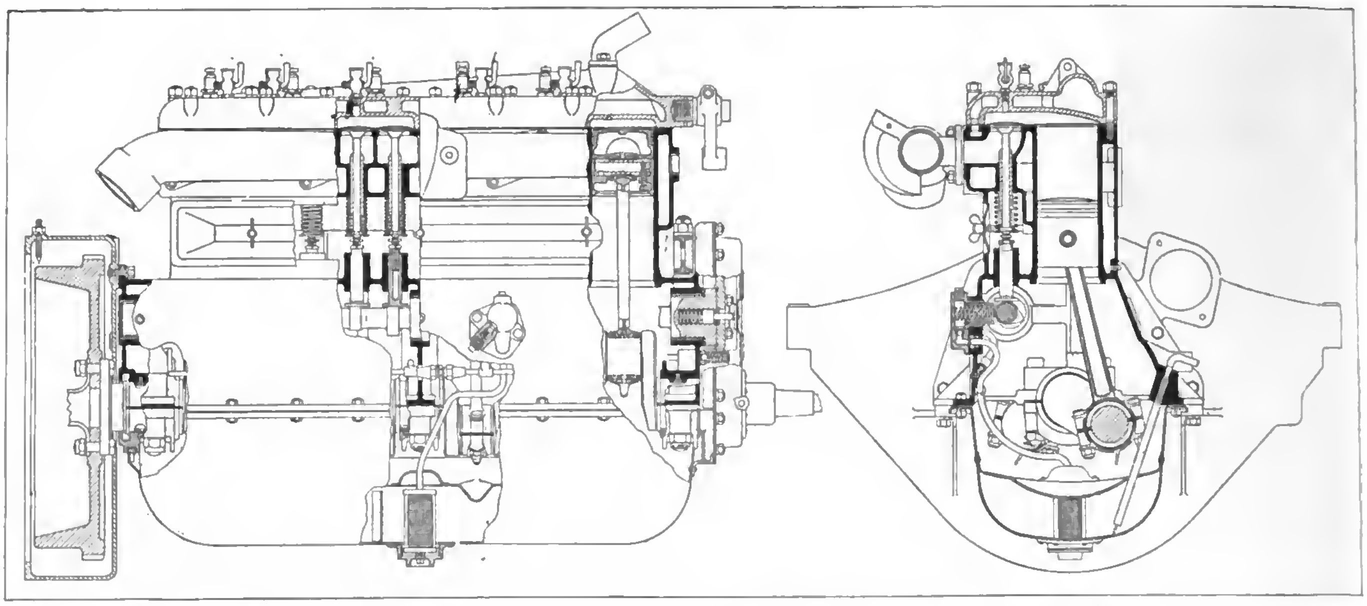
Chassis of the new Regal model, showing the tapered frame, unit power plant, rear mounting of gasoline tank, etc.



Sectional views of the new light six motor used in the Kissel Hundred Point model, showing details of design

Kissel Brings Out Light Six

3¼ by 5-in. Motor, 117-in. Wheelbase, 32 by 4 Tires and Light Weight Render New Car Very Economical

THE Hundred Point six recently brought out by the Kissel Motor Car Co., Kenosha, Wis., as reported in THE AUTOMOBILE for June 8, is the smallest six-cylinder car which that company has produced and sells at the lowest price, both touring car and roadster listing at $1,095. The 6-42 model is continued.

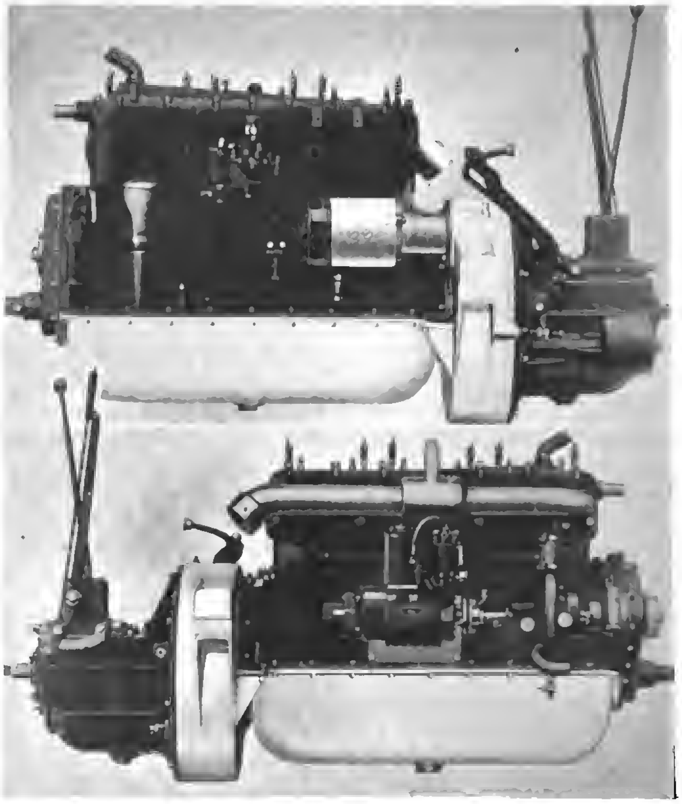
An Economical Car

The motor used in the new car has a bore of 3¼ and a stroke of 5 in. and develops 52 hp. The bore is ⅜ in. smaller than that of the model 42 and the stroke is ½ in. shorter. The wheelbase is 117 in., or 5 in. shorter than on the 6-42, rendering possible a considerable reduction of weight throughout the chassis so that 32 by 4-in. tires are of ample size for the load. This is one of the features of economy of the Hundred Point six which are made possible by the general weight reduction, smaller motor and other refinements of design.

Features of Motor

The motor is, in several ways a departure from former Kissel practice. The block cylinder casting forms the upper half of the crankcase and a pressed steel case completes the assembly. Bore is 3¼ in. and stroke 5 in. The valves are completely housed and have a 1⅝-in. clear opening. Special lightened annealed iron is used in the pistons and they are balanced to one-half an ounce before grinding. Leak-proof type rings of gray iron several degrees softer than the cylinders minimize wear on the cylinders.

The crankshaft is 34 5/16 in. long and operates in Fahrig metal bearings of the following sizes: Front, 2¼ by 2 1/16 in.; center 2¼ by 2½ in.; rear 2¼ by 3 in. Cams, bearings and all parts of the camshaft are machined from a one-piece drop forging. Camshaft bearing sizes are: Front, 2⅛ by 1 3/16 in.; center, 2 1/16 in. by 1 in.; rear, 1¾ in. by 1 in.



Exterior views of the new Kissel unit power plant, showing the neat and compact design. Note the high mounting of the carbureter. The starting motor is carried at the left rear to engage the flywheel, and the ignition and lighting unit on the right with the water pump

The timing gear construction makes use of one pressed Fabroil gear working between two steel helical gears. The Fabroil gear is instituted both to give the highest degree of wear and guard against noise. Lubrication is by combination force feed to the main crankshaft and splash to the connecting-rods and pistons. The number of grease cups on the motor is reduced to two as oil cups are substituted at all lubricating points except at the circulating pump. An entirely new Kissel-Stromberg carbureter has been designed for use on this particular motor. The carbureter is fed by a Stewart vacuum system.

The differential case is a malleable casting and all differential parts are interchangeable. High carbon strip steel is used in the side rails of the frame, which is designed to give absolute rigidity and freedom from weave. Rattling and sprung doors are eliminated by this construction. The side members are narrowed to permit a short turning radius.

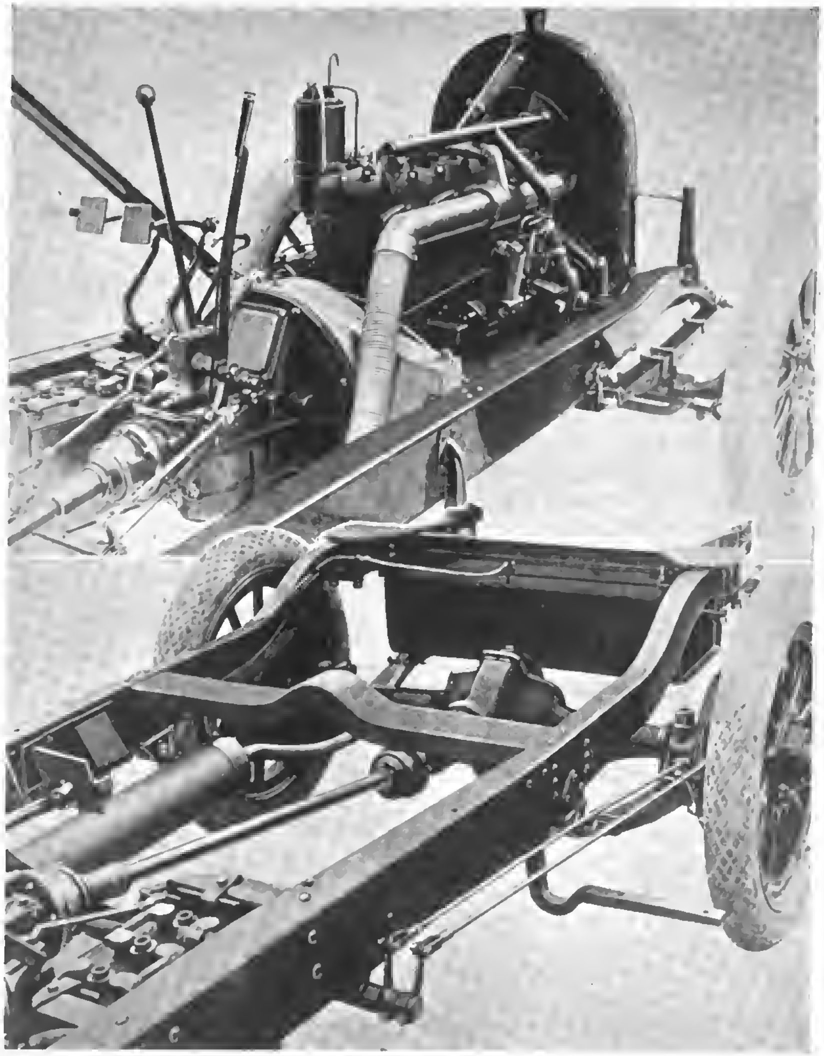
Double External Brakes

The distinctive floating rear axle with its design permitting easy adjustment of all bearings and of the pinion and ring gears is retained without change except for size reduction. The Kissel type of two sets of external contracting brakes, with 14-in. race and 2-in. diameter, is also evident. The elimination of internal brakes has as a purpose the riddance of rattling rods and levers.

A new feature for the 1917 six is the institution of oil bolts throughout the chassis in place of the conventional grease cups. These bolts are wicked from the bearing surface to a drilled hole through the center. The end is capped with a steel grease cap in the side of which is an oil hole. To lubricate the bearing, wherever it may be, it is only to twist the cap until the holes in the cap and the bolt match up, and squirt in lubricant from an oil can. There are only two grease cups to fill on the chassis.

An Easy-Riding Car

Due to its long, wide three-quarters elliptic springs the new car is as easy riding as the larger model 6-42. In the touring car the front seats are divided, a feature Kissel claims to have originated. Every feature of the body design savors of roominess. Black finish of all metal parts in the body interior gives a distinctive richness.



Two chassis views. Note the mounting of the Stewart vacuum fuel feed system, the flexible exhaust line and the deep section frame. Also the battery mounting and the speedometer drive off the rear of the gearbox

Remy ignition, Remy generator and starter with Bendix drive screw inclosed in a housing, in conjunction with a Willard battery, make up the electrical system. The clutch is integral with the transmission and is a leather cone with two adjustable fiber-faced spring plungers acting as brakes against the rim of the clutch when disengaged. The clutch spider is a steel stamping. The transmission is of the selective type with three speeds forward and reverse. The main shaft is mounted on larger annular ball bearings. Gears are drop forged of nickel steel. The driving mechanism between the gearset and the rear axle consists of a set of two universal joints with a connecting shaft. The floating rear axle has spiral bevel gears. Pinion and driving gears can be adjusted without disassembling the other parts. Timken bearings are used throughout. Drive and torque are taken through the rear springs with the Hotchkiss principle of drive.

Some of the other features of the new Kissel model are: Big door openings, extra deep upholstery of leather, cushion springs and curled hair. The driver's seat is adjustable to any length of reach and the indicating instruments are mounted in a straight line on the cowlboard. A pedal button is used to start the engine. The body is mounted over a felt packing on the frame which is very deep and constructed in such a way that it will not deflect and cause the doors to work loose and rattle. The body is given twenty-two finishing operations, being of 20-gage, silver finish sheet steel.

Sedan, coupé and town car tops are furnished for the new model, all being built in connection with an extra-strong lower body called the Gibraltar. The town car may be transformed into a victoria in fair weather, the sedan being quickly converted into a touring car and the coupé into a roadster.

Five-passenger Kissel touring car with individual front seats and selling at $1,095. The motor is 3¼ by 5 in. and tires are 32 by 4

Preparedness and Motor Trucks—Part III

Troubles, Weak Points and Requirements in Vehicles for Military Work as Revealed by the Great War

By Donald McLeod Lay

MAGNETOS cannot be relied on for more than 6 months average under war conditions. At the end of that time they have lost much of their magnetism and various screws have begun to work loose.

English trucks using force-feed lubrication had trouble with the external pumps breaking due to vibration and causing burned out bearings resulting from the loss of oil. It was found that frequently the ignition system was not adequately protected from water, this giving much trouble. Insufficient clearance caused the steering gear tie rod to strike the ground, throwing the gears out of line. Cooling and lubrication were found the greatest difficulties. Fan belts were too light and fans too heavy. Another trouble was in adjusting brakes, the adjustments being frequently inaccessible or requiring special tools which were invariably lost. Load platforms were of varying heights from the ground and tail boards were of many different designs, causing much trouble in loading and unloading.

Springs Frequently Broken

In the German campaign in Russia the bad roads frequently broke front springs either at the front end of the first leaf or just in front of the clips. Solid rubber tires gave out rapidly. Radiators were frequently pierced by bullets and shrapnel although protected from collision by fender rods. Carbureters frequently gave trouble and dual tanks suspended at the rear of trucks were always dented and frequently broken from striking stones, etc.

With the Allied armies there have been many cases of axle housings failing due to heavy loads shifted to the right side of the truck. Loads of shells are particularly liable to slip this way. Shackle bolts and springs gave considerable trouble under the stress of war conditions while the poor driving frequently made short work of clutches of all kinds.

Solid tires were found to wear well although there was a tendency to pulp up in certain parts, the wear seeming to be irregular, and large pieces breaking off. Owing to dense traffic behind the lines, convoys frequently had to get off the crown of the road to allow others to pass, this alternate contact with the dirt service and the edge of the granite blocks used in Northern France and Belgium causing a lateral frittering away of the solid rubber tires. Wheels with twin tires sometimes have the inner tire worn completely away while the outer one is in comparatively good condition. Trouble was also experienced with tires stretching and pulling off the rims due to the strains to which they were subjected when pulling out of a difficult position with wheels skidding violently.

An important feature of the automobile and motor truck branch of the service is the proficiency of the drivers. Inexperienced and poor drivers cost the French and British armies a tremendous amount of money and time, while the men who were really fitted for this work were digging trenches or in some other branch of the service where their special abilities were of no value.

Early in November, 1914, W. F. Bradley reported that the most suitable type of truck for war purposes is a vehicle carrying a useful load of 2½ to 3 tons and driven by a four-cylinder motor of 3¾ to 4-in. bore. This vehicle is illustrated in the accompanying diagram, which shows the necessity for certain features which was evident even during the first 3 months of the war. These are adequate clearance, stout sprags to prevent running backwards, towing hooks front and rear, four-speed gearboxes with a low emergency gear, interchangeable carbureters and magnetos, gasoline tanks of large cruising radius which are easily filled and emptied, drain cocks for cylinders and radiators and the ability of each truck to tow another of equal weight over ordinary roads. Provision should also be made for a reserve supply of fuel and oil. Towing ability is very important as trucks are frequently temporarily disabled and if they cannot be towed back to the repair shop at once it may be necessary to destroy them or allow them to fall into the hands of the enemy.

Touring cars on war duty should have space without littering the body for carrying 2 gal. of reserve fuel, 1 gal. reserve oil, two spare shoes, five or six tubes, a more complete set of tools than usual and a small selection of spare parts.

For military work controls should be simplified. The ideal is fixed ignition with magneto only and accelerator pedal. A lever on the dash should regulate minimum throttle opening and cut off the ignition when fully closed. The use of a motor governor is preferable, the war having converted the European manufacturers to this viewpoint.

Very useful if not indispensable accessories are differential locks and towing hooks, front and rear. Despite careful driving, a truck would sometimes get off the road into the mud; with hooks, a rope and differential lock, the other vehicles in the convoy could quickly extricate it, whereas without these accessories serious delays often ensued.

Detachable Wheels Valuable

Detachable wheels are valuable, as sometimes tire changes must be made under fire and time is precious under such conditions. For military work it is important that tires be the same size all around, the use of different sizes on front and rear wheels necessitating the carrying of spares for each while in the event of an excessive number of punctures or blowouts the available supply of spares for that particular size is insufficient.

Many trucks, especially the De Dion ammunition wagons, were fitted with powerful winding drums with steel cables, making it possible for the vehicles to haul themselves out of tight places. Electric starting systems have been found unnecessary, the batteries being generally removed from the vehicles and used for lighting trench quarters.

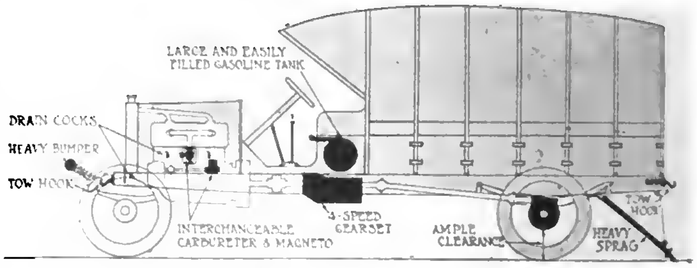


Diagram of important features of ideal truck for military purposes

The FORVM

BLANK DIFFERENTIAL IS BEST APPLIED ON SOLID TIRES—ONLY OBJECTION TO IT IS POSSIBLE USE OF UNEQUAL DIAMETER REAR TIRES—STEERING MECHANISM PRACTICE IS UNSCIENTIFIC

Facts in Favor of the Blank Differential

By Arthur M. Laycock

Chief Engineer, Sheldon Axle & Spring Co.

I HAVE read with great interest the comments with regard to the abolition of the differential. There is evidently considerable misunderstanding in regard to my meaning and the summary was undoubtedly overlooked altogether, which reads as follows:

"After considering all the various points, it is well not to become too enthusiastic, as the introduction of a blank differential on the face of it is so drastic that one must of necessity move with extreme caution."

While I do not wish to retrench from what I have said in one iota, I think that it is out of the question for anyone to take this type of drive to meet all conditions. For short wheelbase, wide track, and trucks which have to maneuver a good percentage of their total running time it would be out of the question, but for bus work, army service work and for contractors' wagons it has decided advantages.

In going over the good points in my previous article, it might be well to mention the disadvantages which we have encountered in this drive through extended experimentation.

Best with Solid Tires

So far as we can see, the blank differential is best applied on solid tires.

Where pneumatics are used, proper inflation of the rear tires is absolutely essential—in other words, it is very necessary that not only should both tires be the same diameter, but the pressure in each should be about the same. This, of course, might be looked upon as a disadvantage, but it has its good points as well.

Even with the conventional differential it is very necessary that these conditions exist if the maximum efficiency be realized.

In high-speed pleasure car work, the car cannot be held as steady when running over rough roads. However, side skidding from braking is greatly minimized—in other words, it is infinitely safer to apply the brakes on a greasy pavement with the blank differential than with a conventional one. This, of course, applies to bus work and heavy trucking as well, and gives one confidence in city driving, which is readily appreciated.

Only One Real Objection

In all the correspondence the only real objection brought against the blank differential is the probability of using unequal diameter of rear tires. This, of course, would be very objectionable, but does not apply in ordinary service as much as one would think.

In a good many instances, where tires on one side of the truck are worn off first, the truck is kept in operation until both sides go before making the change. This is very general practice.

It is well to remember that the best design is only a compromise, and this is no exception to the rule, but with so many things in its favor, we are very certain of a large following in this direction.

General Steering Mechanism Practice Is Unscientific

By Theo. D. Stanley

General Service Engineers Co.

WITHOUT any purpose to extend further the argument on the methods of installing the steering mechanism in a car than to point out in the article of Leon A. Chaminade, in THE AUTOMOBILE for April 27, he seems to have overlooked the main point in my statement of the flexibility in the spring producing a degree of influence on the steering mechanism which applies to all forms, including his own, of fore and aft mounting.

The method submitted by Mr. Chaminade in shortening the link, also accentuates the influence of changes in the wheelbase as indicated by A. L. Clayden in the issue of Sept. 2, 1915. This changing of the wheelbase of a car is particularly noticeable in a truck, on which it may amount to as much as 3-in. difference in the wheelbase betwen a loaded and an unloaded truck, owing to the flattening of the curvature of the spring forms affecting both the brake and steering mechanism.

The theory and practice in steering and steering mechanism is receiving considerable attention and the general practice is found to be unscientific. The fore and afte method of installation is the least scientific or practical in several particulars. This method requires an extra knuckle steering arm or lever which has only one point of highest leverage, which is when the car is moving in the straight forward direction. It is the turning condition which requires an increase in leverage in steering a car, for the straight forward direction is more or less automatic.

The steering-link also is in an objectionable position and often has to be bent to clear the wheel movements. True, this curvature gives certain flexibility, but that should be provided for by other construction forms, and, theoretically, the more rigid the steering mechanism throughout, the greater the efficiency.

Deflection, especially under high speed, is responsible for the larger per cent of wear on all parts of the car, and to be provided against as far as possible.

If the roadway was of a fluid nature the feel of the helm might be interesting, but still far from ease of operation, and any sailor knows the feel of the helm is a hardship as the speed increases, and, with power-driven vessels useless for efficiency, Mr. Clayden to the contrary notwithstanding.

It is probable the latter part of the first paragraph of the contribution by Mr. Chaminade is accidentally misstated, since it appears rather contradictory, as "advantages" should not "cause bad wobbling" logically.

The History of the Pneumatic Tire—7

Invention of Pneumatic Tire by Dunlop in Ireland —Difficulty of Repairing Inner Tube—The Thomas, Bartlett, Overman, B. & C. and Other Cushion Types

The History of the American Automobile Industry—34

By David Beecroft

EARLY in 1890 the Sweeting Cycle Co. of Philadelphia received a shipment from England of bicycles with pneumatic tires. At first received with derision, the success of the bologna tire on the track as well as its comfort on the road quickly made it popular. The first ones were about 2¼ to 2½ in. in diameter, which made them look almost balloon-like as compared with the ⅞, ¾ and even ⅝-in. solid tires then in use, and as a result they advertised themselves very rapidly.

Dunlop Invents Pneumatic Tires

These first pneumatic tires were the invention of John B. Dunlop of Dublin, Ireland, and while following the general idea of Thompson, as laid down in 1845, seem to have been an independent development, and in some respects, not so well worked out. Dunlop's tubes were inclosed in a jacket of Irish linen which was held to a rim almost flat by linen flaps pasted with rubber solution to the inner surface of the rim. The linen jacket was then protected by a tread of vulcanized rubber pasted on its circumference and lapping down almost to the rim or even up on it as did the linen flaps. This material was found unsuited for tire manufacture by reason of inability to stand flexion and the working of warp and filler threads in use, resulting in mutual destruction.

Inner Tube Inaccessible

When in place, this tire was rather wider than deep, and being of large size did not need high inflation, so that it rode very easily over any rough road. When permitted to stand for some time after being made up, the rubber solution held quite well, but if used quickly, it softened under heat and some parts were likely to come loose. Its particular defect, however, was the difficulty of getting at the inner tube for repair purposes. The casing or cover had to be loosened by soaking the solution with gasoline, followed by opening the linen jacket which afterward had to be repaired by sewing and solutioning a patch over the opening. Naturally, such difficulty displeased users and hindered buyers, but so busy were the makers supplying orders that they did not stop to concern themselves with improvements.

The Thomas patents controlled by Bidwell seemed to offer a more satisfactory arrangement, while other inventors began to get into the field with other devices. The Dunlop patent of March, 1890, was followed almost immediately by the Wilson patent, in August, which showed an arch of rubber with its ends abutting between the sides of the rim and which could contain an air tube or some yielding material, like sponge or hair. In the same month, the Bartlett tire appeared in England. This was very similar to the Wilson, in that it was arched in shape, the base of the arch being its widest portion and the tire being rather V-shaped instead of cylindrical, as modern tires are made. Bartlett's tires attained some prominence on the market in England, probably because they were properly pushed.

The Overman Cushion Tire

The A. H. Overman patent on a cushion tire was brought out in the early fall of 1890 and the Banker & Campbell tire quickly followed. The former was arched in shape but contained no fabric, and was introduced as a substitute for the pneumatic, instead of falling in with the public's fancy and attempting to supply it. It was marketed on Victor bicycles for several years until the insistent demand for pneumatics suppressed it. The Banker & Campbell tire was circular in section but instead of the single hole in the center such as the earlier carriage types used, it had seven holes with fairly strong walls between them. This was offered as a substitute for the pneumatic but did not prove to be such. The resiliency of an all-rubber tire is less than that of an air tire; the weight is more for a given size, and in most tires, having the holes running lengthwise, the constant bending along a certain line eventually cracks the rubber on the inside. Just why rubber will stretch on the outside of a bend without damage but breaks on the inside where it is compressed seems difficult to understand but such is the fact, and many tire makers were obliged to learn this simple thing by costly experience.

Another Cushion Type

Early in 1891, the A. Strauss cushion tire, held in place by bolts, having their heads in the central hollow and their stems passing outward through the open base, was brought out by the New York Belting & Packing Co.

The Rostrum

No Lag in True High-Tension Magneto

EDITOR THE AUTOMOBILE:—We have noted in THE AUTOMOBILE for April 27, your reply in the Rostrum to L. L. S. of Columbus, Ohio, stating that the spark is advanced on an automobile, when cranking on the magneto, to take care of mechanical and electrical lag, and to make the explosion occur as nearly as possible to upper dead center. You also advise your correspondent that "set ignition is used simply in order that the explosion resulting from the spark will occur as near upper dead center as possible."

Please be advised that in the true high-tension magneto no lag whatever exists, either mechanically or electrically speaking. When starting on the magneto, where manual advance and the independent type of magneto are resorted to, it is customary to advance the spark about half way, this giving about 17 deg. advance before upper dead center, for the reason that the spark in that position is stronger than in full retard and cannot cause a back kick on account of the fact that if the engine is turned over at a speed sufficient to cause the magneto to overcome the resistance of the spark plug gap the flywheel will also be turning at sufficient speed to carry the engine over center.

Set spark magnetos giving from 17 to 20 deg. advance ahead of upper dead center are used to a considerable extent on motor trucks in order to eliminate the possibility of low efficiency or damage to the engine resulting from irresponsible drivers leaving the spark control levers in either full advance or full retard positions, paying no attention to spark position at any speed or load.

Set spark ignition in such work insures about as good average results as does the manually advanced magneto on the average pleasure car when handled by the owner.

New York City. ALBERT H. ZIEGLER,
Technical Dept., Bosch Magneto Co.

Likes Horn on Cadillac 8

Editor THE AUTOMOBILE:—What make is the horn used used on the Cadillac eight?

2—Is it vibrator or motor-driven?

3—Its price?

Battle Creek, Mich. W. H. G.

—The type 53 horn is known as the Auto horn and is manufactured by the Dayton Engineering Laboratories Co., Dayton, Ohio.

2—It is of the vibrator type.

3—The price of this horn is $12, purchased at the factory of the Cadillac Motor Car Co., Detroit, Mich.

Information on Charging Batteries

Editor THE AUTOMOBILE:—Kindly inform me of the cheapest and most efficient way of charging six 6-volt storage batteries or a total of eighteen cells where the only available current is 110 volts A. C. and 235 volts D. C. I am figuring on an average of six batteries per day.

Also kindly give me the comparative costs of charging with rectifiers, motor generators, resistances and lamp banks.

Newark, N. J. R. C. R.

—The 110-volt A. C. is absolutely of no consequence, unless it is converted by means of a rectifier or motor generator set, and in view of the tremendous loss in efficiency, we would not recommend the use of 235 volts D. C. to charge an average of six batteries per day. The average voltage of six 6-volt batteries arranged in series would be 48.

The following table will give you a very good conception of the efficiency of charging through mercury arc rectifiers and motor generator set as compared to resistance in the form of a rheostat, or bank of lamps:

	Battery Voltage	Charging Voltage	Efficiency of Charge	Efficiency of Gen.	Total Efficiency
Arc Rectifier	48	48	100	85	85
Motor Gen. Set ...	48	48	100	88	88
Resistance	48	110	42.5	100	42.5
Lamp Bank	48	110	42.5	100	42.5

A Special Paint from Japan

Editor THE AUTOMOBILE:—In THE AUTOMOBILE for Jan. 20, 1916, page 118, I saw that the Fleetwood Metal Body Co. exhibited a car painted green in which brush marks are plainly left using a special paint that does not need either dryers or varnish applied with the brush and not rubbed smooth and in use it wears smooth and gives a dull finish that has the most durable wearing qualities. What kind of paint is used?

2—Where can it be bought?

3—How is this paint mixed?

4—How many coats are applied and how long does it take to dry?

Kansas City, Mo. J. W. A.

—This car was painted with a green color called E. R. H. Special No. 2000 and No. 1051.

2—Manufactured by Egan-Ronan-Hausman Co., Brooklyn, N. Y.

3—This color is ground in Japan, thinned to a paste with turpentine and then linseed oil added to obtain the proper working quality.

4—Two coats are applied with an ox-hair brush, then lightly rubbed with pumice and the last is applied in the same way, very lightly rubbed again. It is then brightened up with linseed oil rubbed on with cheesecloth and thoroughly rubbed dry. Each coat will air dry in about 24 to 30 hr.

Pressure Required to Close Brakes

Editor THE AUTOMOBILE:—Relative to the answer to my inquiry entitled Pressure Required to Close Brakes, I am afraid I did not make my request quite plain enough. About the direct pressure necessary to throw the emergency brake on so as to stop a car within twice its length going at approximately 25 to 30 m.p.h., I was told that it would take 1000 lb. The 20 lb. you speak of refers to throwing on the service brake gradually through the medium of levers.

Springfield, Mass. C. M. E.

—The exact amount of pressure applied on the drum will, of course, vary with the co-efficient of friction of the brake material and the weight of the car as well as with the other factors you mention. Your question can be answered most

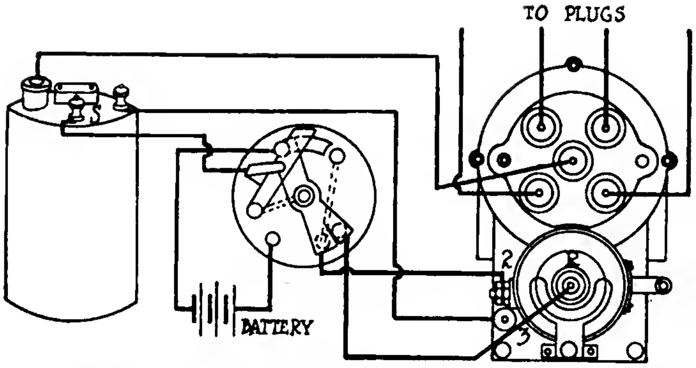

Fig. 1—Wiring diagram of the Splitdorf ignition system used on the 1910 model Cadillac, showing the various connections from magneto to coil and switch and also battery connections

clearly by giving an explanation of the work done by brakes. Where W is equal to the total energy absorbed in accelerating the mass M from zero to V ft. per sec; w = energy per second absorbed under the above conditions $= \frac{W}{f}$ where f = time required for acceleration in seconds. θ = tangent of the grade angle, or the per cent of grade; F = accelerative force applied by the propelling system; g = gravity = 32.2. Also

$$W = MV\begin{pmatrix} Q & V \\ F & 2 \end{pmatrix}$$

where $\theta = o$ and

$$f = \frac{MV}{F}$$

Energy required to be absorbed by the brakes when stopping a motor vehicle, on the level, from full speed is equal to

$$E = \frac{MV^2 + Mg\theta fV}{2}$$

$$f = \frac{MV}{F - Mg\theta}$$

using the same symbols as for the clutch formula but applied to retardation instead of acceleration.

The brake size and pressure is figured out in this way mathematically for the size and weight of car and then a reasonable factor of safety is allowed.

Regulating the Timing on a Magneto

Editor THE AUTOMOBILE:—In regulating the timing of a magneto on what point past dead center on the power stroke of the piston should the explosion take place when the magneto is fully retarded. In other words, when the magneto is retarded should the explosion take place before piston reaches dead center or passes on the power stroke, and if so, what distance before or after dead center?

Newark, N. J. C. N.

—In regulating the timing of a magneto the spark should occur on upper dead center in the full retard position.

Gear Ratios of Several Cars

Editor THE AUTOMOBILE:—What is the gear ratio of the 1916 Oakland six, 1916 Saxon six and 1916 Hudson 40?

Kellogg, Minn. J. D. C.

—The gear ratio of the 1916 Oakland six is 4.25 to 1. Of the 1916 Saxon six it is 4.75 to 1 and on the Hudson the gear ratio is optional although there is a standard which is generally furnished of 4.45 to 1.

Plug Points Too Far Apart

Editor THE AUTOMOBILE:—Please tell me the cause of an Eisemann dual magneto spark jumping across the safety gap when idling. The wiring is in good condition and it does not cause the motor to miss.

2—Please publish wiring diagram of a Splitdorf ignition system such as used on 1910 Cadillac.

Wilmington, Ill. M. L.

—The cause of an Eisemann dual magneto spark jumping across the safety gap when idling is that the spark plug points are too far apart. For general guidance we suggest that the gap be made 1/64 to 1/32 in., but never more for a high-tension magneto. Then the cable connections from the distributer plate to the spark plugs may be burned at either end or somewhere along their length, which would inhibit the spark from jumping in the spark plugs and it would be referred back to the safety gap. Then too, unless the carbon brushes in the distributer arm should make good contact either the spark may jump at the brush or be referred back to the safety gap depending upon where the greatest resistance is. Likewise the mixture, its consistency or density at times plays a part in causing the spark to jump the gap.

2—Wiring diagram of Splitdorf ignition system used on 1910 Cadillac is shown in Fig. 1.

To Prevent Overcharging Battery

Editor THE AUTOMOBILE:—How can a switch be put on different makes of starting and lighting systems to keep from charging the battery when fully charged, or is it only necessary to place a switch so as to open one side of your generator line? Does it harm the generator?

2—I would like to know how to tell platinum points from tungsten points and what difference it makes with the running of the car when you use tungsten magneto points or genuine platinum points.

3—Is there a good substitute for platinum?

4—What amount of voltage does a Ford magneto have when engine is speeded up? In using two 9-volt bulbs in series it must produce 18 volts to light them brightly.

Parker's Prairie, Minn. H. S.

—With the majority of equipment a switch put on the open side of the generator line is all that is necessary. It cannot harm the generator in any way.

2—The only way to make certain of a composition of sparking points is chemical analysis. Tungsten magneto points are claimed to give at least as good service as platinum points.

3—There are many substitutes for platinum, but absolute proof regarding their quality is at present lacking.

4—Approximately 21 volts.

Wiring Diagram of Deaco System

Editor THE AUTOMOBILE:—Kindly publish wiring diagram of Deaco lighting and starting system on a 1914 Maxwell special Model A-35.

Scranton, Pa. L. J. S.

—Diagram of Deaco lighting and starting system on 1914 Maxwell model A-35 is shown in Fig. 2.

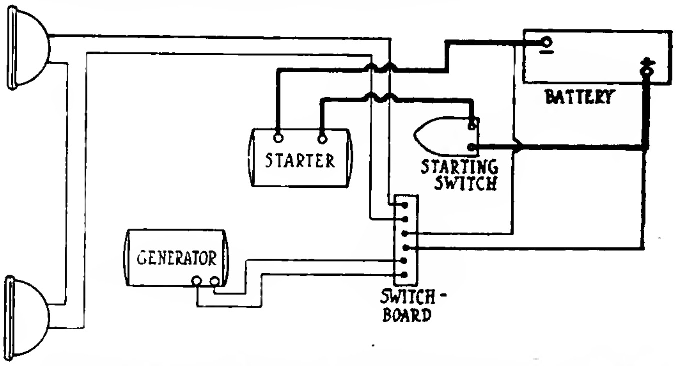

Fig. 2—Diagram of the wiring of the Deaco starting and lighting system used on the 1914 Maxwell model A-35, including connections to generator, starting motor, battery and switches

ACCESSORIES

G-P Muffler Cut-Out

THE quiet running which characterizes modern automobile engines and especially those of the multi-cylinder type renders a muffler cut-out particularly useful in detecting missing cylinders or other irregularities in operation. The G-P muffler cut-out, illustrated herewith, has been brought out to meet the requirements for such work as well as for use where it is desired to relieve the engine from any back pressure which the muffler might cause. The construction of the valve tongue and its seat is such that when the cut-out is opened the line to the muffler is completely shut off and a correct angle is obtained to deflect the exhaust gases freely without back pressure. The cut-out is made in two parts, allowing ready access to its interior. When it is closed the pressure of the exhaust gases cannot open it and the course the escaped gases must take tends to prevent carbon accumulation on the valve or its seat. The area of any section of the cut-out is at least 25 per cent greater than that of any section of a corresponding size exhaust pipe. The cut-out is not attached by means of flanges, the ends being bored to the exact size of the exhaust pipe with shoulders at each end while set screws, as illustrated, prevent shifting and insure rigidity.

A table of exhaust pipe sizes of various makes and models of cars has been compiled and embodied in a convenient wall hanger which can be had for the asking.—Cut-out is manufactured by the G. Piel Co., Long Island City, N. Y. Cut-out and hanger are distributed by the Edward A. Cassidy Co., 30 East Forty-second Street, New York City.

G. P. muffler cut-out in section

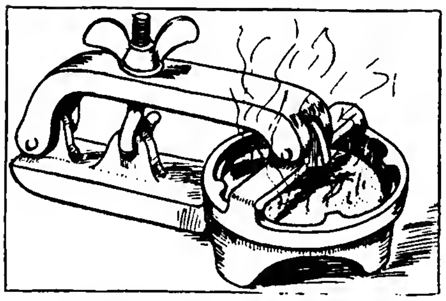
Brugan Economy Valve

Auxiliary air is automatically supplied to the manifold by this valve. The valve casing is screwed into the intake pipe and houses a valve which is closed by a spring. At low speeds, the valve remains closed, but as suction increases the valve opens and air enters through the small ports in the end of the valve housing. Price $4.—Brugan Co., Bangor, Me.

Left — Brugan economy valve. It gives additional air Below — Red-I-Cut body for Fords. Car weighs 1150 lb.

Marvel, Jr., Vulcanizer

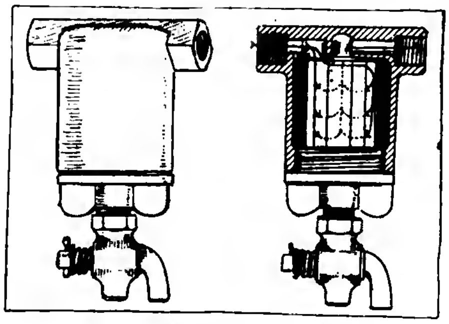
Simplicity is a leading feature of this little vulcanizer. It consists of a pair of arms terminating in a stationary disk and a swiveled disk with a cupped upper surface; the cupped piece is on the upper arm and the two disks are pressed together with the tube to be repaired between them by means of a thumb-nut. The heating medium is a disk of prepared fuel which is placed in the cup of the upper disk and ignited with a match. It burns, or rather glows, without flame and produces exactly the heat required. Patches are applied without cement. The process is to clean the tube, apply the patch, clamp it in the vulcanizer, light the disk and let it stand for eight minutes after lighting. A patch so vulcanized cannot be removed without tearing up the tube. Fuel disks and patches are supplied with the vulcanizer. Price, $1.50.—Marvel Accessories Mfg. Co., Cleveland, Ohio.



Marvel, Jr., solid fuel vulcanizer

10 in 1 Gasoline Strainer

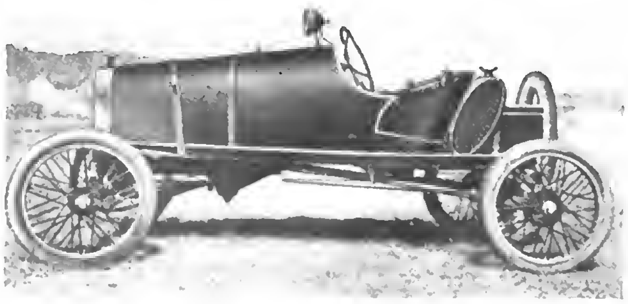
In this device a series of cylinders of straining gauze offers such a large surface that clogging is practically eliminated. The cylinders are set up on the sediment cup, which screws out for cleaning. A drain cock at the bottom is provided for draining off water or getting gasoline. An arrow on the pipe connection shows which way the device should be attached. The strainer sells for $2.—10 in 1 Strainer Co., Inc., Brooklyn, N. Y.



10 in 1 gasoline line strainer

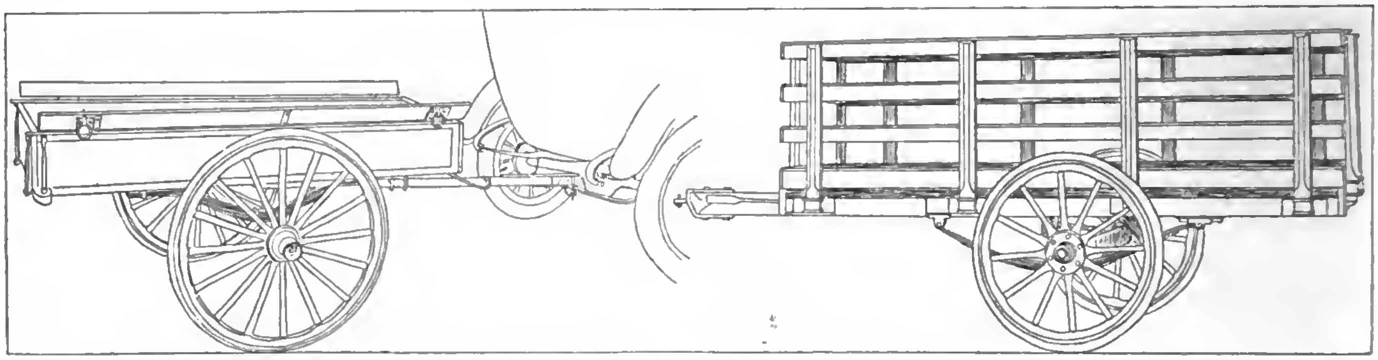
Red-I-Kut Ford Body

Complete directions and drawings are furnished for equipping a Ford with a racing body, all the material required may be obtained at any hardware store and no tools are required other than a hammer, saw, tinner's shears and ordinary wrenches. The weight is 300 lb., bringing the total weight of the car to 1150 lb. Improved appearance, increased speed and hill climbing ability are the particular features claimed for this body construction. Speedster body patterns for all makes of cars together with complete instructions are furnished for $10. Price of patterns, $5; complete body, price on application.—Kuempel Co., Dubuque, Ia.



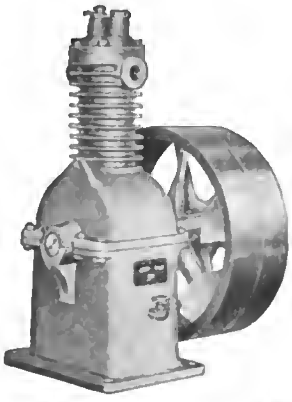
Stinson Tire

The product of 10 years' work, study and experiment, the Stinson tire has been developed and tested under all sorts of road and season conditions. It consists of a broad, flat outer rim and a narrower flat inner rim connected by coil springs under slight tension, the springs being set in sufficiently from the edges of the outer rim so that, while they are



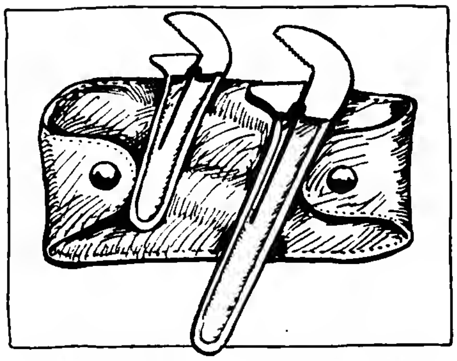
Bettendorf trailer which is made in 800 and 1200-lb. capacities, method of attachment being shown at the left

easily accessible for replacement, no amount of lateral displacement of the outer rim will expose them to thrusts from the road. The springs are set sufficiently close together to form circumferential screens at each side of the tire to exclude the larger pebbles. To prevent over-stretching the springs, a continuous rail or buffer is fastened to the inner periphery of the outer rim and extends toward the inner rim, restricting the motion of the wheel toward the outer rim to ⅛ in. As this tire is a suspension type and all values are figured from the top instead of from the bottom, this limited motion does not destroy its resiliency. In striking an obstruction the tire does not take a thrust direct to the spokes but a torsional movement is set up between the inner and outer rim, this torsional resiliency being of great value in starting and braking. The driving power is transmitted to the top of the tire, the weight of the car tending to increase the tension at the top and to decrease it slightly at the bottom. The tire can be painted as easily as the car and is very durable.—Stinson Tire Associates, Gardner, Mass.



Curtis air compressor for garages

Stinson spring-cushion tire



Shaw wrenches and leather case

Curtis Air Compressor

This single-cylinder, air-cooled compressor is offered with a variety of mountings to suit various garage needs. The intake valve is a poppet and the exhaust a cone valve, spring-seated. Lubrication is by splash, and is so controlled that no oil will be carried out through the air-discharge valve. One pint of oil is ample for 100 hr. There is a high and low level gage, the flywheel has fan blades to assist in cooling, and the head is removable without breaking pipe connection or bending any pipes. There is only one gasket. The crankshaft is drop-forged and the bearings are die-cast. A hand unloader permits starting against pressure. The pump is made in five sizes, from 1⅝ by 2 to 4½ in. square, corresponding capacities being 1.2, 1.8, 2.99, 4.32 and 10.4 cu. ft. per min. Prices, less 10 per cent, are respectively $19, $21, $26.50 and $60, with tight pulley only. The style W comprises a compressor driven by belt by an electric motor, the whole being mounted on a cast-iron base. The price, complete, varies from $72 to $253, depending on the size of the unit and whether A.C. or D.C. current is required.—Curtis Pneumatic Machinery Co., St. Louis.

Bettendorf Trailer

Bettendorf trailers are two-wheelers, with wood wheels and solid rubber tires. The specifications of the smaller model, which has a capacity of 800 lb., are as follows: Body, solid panel, 72 by 51 in., 10 in. high with 6-in. flareboard; springs, semi-elliptic, underslung; axle, ¼-in. square; bearings, ball; wheels, hickory with 30 by 1¾ solid clincher tires; painting body red and wheels yellow with black striping; weight crated, 375 lb. The 1200-lb. model specifications: Stake body 8 by 4 ft.; side and end gates 18 in. high, all removable; springs semi-elliptic, underslung; axle truck type, I-beam section, 2 by 1½ in.; bearings, Bower or Timken roller; wheels hickory with 32 by 2 solid clincher tires; painting black; weight crated, 445 lb. Automatic couplers are fitted, and these can be attached and detached in a few seconds. The 800-lb. trailer sells for $75 and the 1200-lb. for $100.—Bettendorf Trailer Co., Bettendorf, Iowa.

Shaw Automatic Wrench

This wrench has a V jaw with one part toothed and the other flat. The two jaw members are split so that when a pull is applied to the handle the jaws take firm hold of the work, whether it is square, round or hexagonal. It is thin, enabling it to go into tight places, requires no adjusting, is in one piece, lets go instantly, light and strong. The 4 and 6-in. wrenches are supplied in an imitation seal case at $1, and $1.25 in pigskin and morocco. These sets are especially for the use of motorists. Price, 4-in., 35 cents; 6-in., 60 cents; 8-in., 75 cents; 10-in., $1; 15-in., $1.25.—Shaw Propeller Co., Boston, Mass.

Zit Dry Wash

Zit is a body polish which is designed to take off the dust and restore the original luster. The body is sprayed with the liquid and then polished with cheesecloth. The sprayer is also furnished.—Westfield Chemical Co., Westfield, Mass.

More Discussion

BRILLIANTLY successful as the recent convention of the Society of Automobile Engineers was, there are always some thoughts of constructive criticism which arise after a meeting of this kind. This time the thought which stands out above all others is that there should be longer and better discussions on the papers that are presented.

It would be hard to improve on either the program or the papers that were given at this last session of the society. It would be a mistake to curtail the number of the papers and it would also be wrong to shorten the papers themselves, yet the discussions, in order to bring out the full value of the session, must be longer.

With the general public and the industry at large, the question which naturally springs to the mind is, "What is the use of having all these engineers together in convention unless they comment freely on the subjects under consideration?" and truly, this thought is but natural and right, for if the discussions are not full and thorough, the great potential value of a gathering of this kind is lost and the natural tendency is toward a drop from the level of an engineering session to a non-commentative lecture audience.

It may seem that the remedy would be difficult if the program were not to be curtailed and the time of the convention lengthened, but this is not necessarily so. The activities of the S. A. E. can be readily classified into different fields and there would be no difficulty, even on a vessel such as the *Noronic*, to have two sessions under way at once. Perhaps while tractors are being discussed on the upper deck, aeroplanes may be under consideration in the hold, and men who were roaming the deck because the particular paper under consideration did not interest them, would be in active attendance and, perhaps, stirred by the impulse of animated discussion to shed illumination on a topic that would otherwise remain obscure because of the lack of opportunity or time to properly warm up the arguments.

Mobilization

DEVELOPMENTS in the controversy with the de facto government of Mexico will be watched very closely by the automobile and motor truck industry which would be one of those most affected if actual hostilities should begin. Already the United States Government has placed several orders for motor vehicle equipment which is needed on the border for the use of the troops already there and if the militia forces now mobilizing all over the country are sent to these points further orders will doubtless be placed.

Aside from the necessity of co-operating with the Government authorities in making quick delivery on orders received, which the factories have already demonstrated their ability to do, the automobile and motor truck industry can be of assistance in many other ways in the present crisis. Some of these are: Co-operating with the industrial preparedness committee of the naval consulting board; facilitating mobilization by protecting employees on military duty from financial worries; supplying trained men and comprehensive information for transport work of all kinds; preparing for future requirements of the government, etc.

S. A. E. Expansion

THE proposal to widen the scope of the S. A9. E. and to make it include all sorts of automotive activity comes as a natural step in the progress of internal combustion engineering as applied to motive power. Gradually the aeronautical, marine and tractor fields have acquired the same tendency toward standardization and economic production that has made the automobile what it is to-day.

With this state of affairs existing it would be uneconomical and against that very spirit of standardization which is so desirable in these arts, to have more than one parent organization which fosters the development of design and manufacture. There are certain basic principles in all these kindred industries which are so closely alike that it would be wrong to set up a different set of standards for each when it is so readily possible to unify these departments of the same development and to allow them to march side by side down the same avenue of progress.

Civilian Trucks for U. S. Army

Truck Club Has Plan of Pledging Vehicles for Purchase by Gov't.

NEW YORK CITY, June 21—*Special to* THE AUTOMOBILE—A plan for obtaining civilian motor trucks for the United States army along the Mexican border, should war eventually result from the present strained relations between the two countries, will be discussed at the meeting of the Motor Truck Club of America to be held in this city to-night. The calling out of the militia of all States is expected to result in an additional need for several thousand trucks and the plan of the Motor Truck Club seeks to enroll civilian machines for this work, should the American commercial vehicle manufacturers be unable to supply the demand within the required length of time.

If the procedure followed by the foreign governments of commandeering all civilian vehicles at the outbreak of war is adhered to in this country, it will cause great hardship to the owners of the vehicles and perhaps failure, due to the fact that the motor trucks now in use in this country are now carrying on a large percentage of the nation's transportation. The plan to be discussed by the club would seek to eliminate any such possibility by having a large number of owners pledge a certain proportion of their trucks to the government in case of war. The plan at present outlined contemplates the placing of a certain price on each vehicle by its owner, this price to be the original cost of the vehicle, its body and equipment less a certain sum due to depreciation of the vehicle over the number of years it has been in use. After this has been done and the vehicle pledged to the government in case of war by means of a special form filled out by the truck owner and a representative of the club these forms will be grouped according to the make of vehicle and sent to Washington to the Secretary of War. If after this has been done, war should be declared and it is found impossible to obtain the requisite number of trucks, the War Department will then take over the trucks, issuing bills of purchase.

Another Gasoline Hearing

WASHINGTON, D. C., June 17—A special hearing has been set by the Federal Trade Commission for next Wednesday to enable the Standard Oil Co. of Ohio to explain why it is able to charge several cents more a gallon for gasoline than is charged by its competitors.

At a hearing a week ago the commission reached the conclusion that the failure of the Standard Oil Co. of Indiana to compete in the Ohio territory permitted the higher prices there, and was one of the underlying causes of the demoralization of the oil industry.

Investigations have shown that there is a decrease in the production and an increased demand that justifies part of the increase in price, but the commission is convinced that there is no economic justification for the enormous raises that have been put into effect.

Chrysler Buick General Mgr.

DETROIT, MICH., June 21—Walter P. Chrysler is not to leave the General Motors organization. He has been advanced from the position of factory manager of the Buick Motor Co. to general manager, filling the vacancy occasioned by the resignation of President C. W. Nash of the General Motors Co., who was also president and general manager of Buick. Mr. Chrysler has been prominent in Buick affairs for several years, and to him must be given a great deal of the credit for the wonderful growth of the Buick organization.

Macauley Packard President—Joy Heads Board of Directors

DETROIT, MICH., June 16—At to-day's meeting of the board of directors of the Packard Motor Car Co., H. B. Joy was elected chairman of the board and Alvan Macauley was formally elected president. The 50-per cent. stock dividend on the common stock was ratified. In an interview following the board meeting, Mr. Macauley denied current rumors to the effect that the Packard company had entered, or was about to enter, any of the prevalent combinations or consolidations.

Cole Earnings for 1916 Estimated at $360,000

INDIANAPOLIS, IND., June 20—Earnings of the Cole Motor Car Co., this city, for the fiscal year ending June 30, 1917, are estimated at $360,000, or 36 per cent on the stock, which would allow a dividend of 12 per cent per annum, and leave a surplus of $40,000.

This company is offering an issue of common stock at 120 and announces that there are no bonds and no preferred stock. The capital is $1,000,000. Earnings in April were $52,243.13.

Emerson-Brantingham to Build Bodies

ROCKFORD, ILL., June 17—The Emerson-Brantingham Co., this city, for 62 years manufacturers of farm implements and who are the builders of the Big Four and Emerson farm tractors, plan to install, about Aug. 1, a department for the manufacture of automobile bodies and fenders.

Auto Body Capital $1,000,000

Increased from $500,000—209 Per Cent Stock Dividend Declared

LANSING, MICH., June 13—The Auto Body Co. will increase its capitalization from $500,000 to $1,000,000, the increase having been authorized at a meeting of stockholders Monday afternoon. A 209 per cent stock dividend was authorized for distribution among stockholders of record July 1, with a cash dividend of 5 per cent June 30.

Increase in business for 1916 has necessitated another addition, now in process of building, which will double the shop capacity, and add several hundred men to the present force.

Canadian Corporation to Use Greenstreet Gasoline Process

PORT HOPE, ONT., June 18—The Canadian Gasoline Corp., with a capital of $3,000,000, has acquired the Canadian patents for the Greenstreet process of gasoline manufacture. The company will be opened as a subsidiary of the Gasoline Corp. of the United States, according to the present plans. The syndicate financing the proposition is headed by H. T. Bush, president of the Standard Ideal Co., this city. Sir Donald Mann and Nathaniel Curry, president of the Canadian Car & Foundry Co., are represented in the syndicate.

Changes Name to Bound Brook Oil-less Bearing Co.

BOUND BROOK, N. J., June 19—The Graphite Lubricating Co. has altered its title to Bound Brook Oil-less Bearing Co., the better to indicate the nature of its business. Some confusion had resulted from the old title, which gave the impression that graphite greases, lubricants, etc., were produced, whereas the company produces only graphite and bronze oil-less bearings and nigrum treated wood oil-less bearings.

Fenders on Chicago Trucks

CHICAGO, ILL., June 20—For the second time in the last 2 years, the Chicago city council passed an ordinance requiring fenders on motor trucks. The new ordinance becomes effective Jan. 1, 1917, unless it is again repealed before that time. The first law was held illegal.

Dealers' organizations and heavy users of motor trucks in this city who were first influential in proving the original ordinance unconstitutional are as thoroughly convinced of the unfairness of the new law and will probably strongly contest its adoption.

Body Features 1917 Dorris Six

Lubrication Is by Force Feed —Few Mechanical Changes —Price Unchanged

ST. LOUIS, MO., June 19—The Dorris IB-Six for 1917 is an entirely new car in appearance, having a body of better lines and a radiator which is a distinct departure from the former type. The mechanical changes are few; in fact no radical alterations have been made except in the oiling system, which is now of the force-feed type. The price of $2,475 remains unchanged.

The fundamental construction of the car has not been changed in 11 years. The motor is 4 by 5 in., in unit with the clutch and gearbox. The valves are in the head and the wheelbase is 128 in. and tires 36 by 4½ in.

The gear train drive of starter has been discontinued and the Bendix system is used in its place. The two-unit Westinghouse starting and lighting system and Bosch magneto ignition are continued without material change except in the starter drive as mentioned above, and the routing of wires from the new aluminum dash.

No Summer Changes by King

DETROIT, MICH., June 19—Artemas Ward, Jr., president of the King Motor Car Co., has issued a statement to King dealers that, following the policy of the King Motor Car Co. in preceding years, this company will make no mid-year announcement of new models or prices.

Walsh Joins Chalmers

LOS ANGELES, CAL., June 16—Christy Walsh, for more than 2 years advertising manager with the Greer-Robbins Co., Southern California and Arizona distributors of the Chalmers and Hupmobile, has resigned to accept the appointment of Pacific Coast advertising manager for the Chalmers factory. Mr. Walsh was a newspaper cartoonist before his début into the automobile industry.

Lie Joins Maxwell

DETROIT, MICH., June 17—Christian Lie, with an extensive knowledge of automobile activities in foreign countries, has joined the Maxwell Motor Co. He will represent that company in Scandinavia.

K. P. Mfg. Co. Formed

NEW YORK CITY, June 19.—The K. P. Mfg. Co., this city, has been incorporated and takes over all of the interests, including the trade name, trade marks, patents, good will, etc., of the former copartnership known to the trade as the K. P. Foot Rest Heater Co.

This new company will continue to make the K. P. foot rest heater as well as the K. P. universal rim tool and other specialties soon to be announced. It is incorporated at $25,000, the capital being fully paid in.

It is the new company's intention to make the heater in three sizes and prices; the $25 model for high-priced cars, another model at $15 and another one for the smaller car trade. The rim tool will be continued at $2 for the present.

Smith Succeeds Stewart

CHICAGO, ILL., June 15—The directors of the Stewart-Warner Speedometer Corp. have elected C. B. Smith president to fill the vacancy caused by the death of J. K. Stewart. Mr. Smith was secretary and treasurer. Vice-President T. T. Sullivan has been chosen to assume additional duties of treasurer, and W. J. Zucker has been elected a vice-president and secretary. Mr. Zucker has been elected a director to fill the vacancy in the board resulting from Mr. Stewart's death. L. H. La Chance has been elected chairman of the board.

Burdicks Leave New Era to Build Car

JOLIET, ILL., June 16—Winthrop and W. J. Burdick have sold their interests in the New Era Engineering Co., this city, and, backed by large capital, will introduce a new car in the near future. Winthrop Burdick was treasurer and sales manager of the New Era company and W. J. was purchasing agent.

Pennsylvania S. A. E. Meets June 22

PHILADELPHIA, PA., June 16—There will be a meeting of the local section of the Society of Automobile Engineers on June 22 at 8:15 p. m., at the Engineers' Club, 1317 Spruce Street. R. R. Abbott, metallurgical engineer, will lecture on Commercial Heat Treatments of Automobile Steels.

Aprahamian Returns to U. S.

RACINE, WIS., June 16—A. Aprahamian, who has been establishing connections for the past year in Australia and New Zealand for the Mitchell-Lewis Motor Co., Racine, Wis., has returned to America. On his return trip he investigated conditions in South America. He will sail soon to do similar work in South Africa, India and the Far East. Mr. Aprahamian has been unusually successful in this missionary work.

Roadaplane Is New Apperson

1917 Model Uses Eight- and Six-Cylinder Engines at $2,000 and $1,750

KOKOMO, IND., June 20—The Apperson Brothers Automobile Co., this city, is the maker of the Roadaplane, its 1917 model, which has been advertised so extensively with much secrecy as to the name of its manufacturer.

The Roadaplane is made in six- and eight-cylinder models, seven-passenger touring and the four-cylinder chummy roadster body being mounted on both chassis. The eight model, either touring car or four-passenger roadster, is $2,000. The six model, either touring car or four-passenger roadster, is $1,750. All prices are f.o.b. Kokomo.

Friction Is Minimized

This car is so built that friction has been reduced to a minimum and light weight is a feature. The six has a 3½ by 5-in. L-head block motor developing 48 hp., and the eight is a 3⅛ by 5-in., V-type, L-head 58-hp. motor in blocks of four. The wheelbase in both is 128 in. A float feed, automatic type of carbureter, positive pressure feed lubrication, hollow crankshaft, vacuum gasoline feed, dual system ignition with distributer and storage battery, two-unit 6-volt starting and lighting system, disk clutch of the dry-plate type, selective sliding gear transmission with three speeds forward and reverse, and worm and gear type of steering gear, are a few of the features of construction on both of the new models.

Other features include: tubular propeller shaft with two universal joints; shaft-driven, demountable floating type of rear axle; I-beam, drop-forged front axle; semi-elliptic springs on front and three-quarter elliptic on rear; service brakes, external contracting, and emergency, internal expanding; and left drive with levers in center.

Novel Top Arrangement

The colors for 1917 are mouse gray, Apperson special green or blue, coach finished with the metal parts in black or nickel. The equipment is complete including mechanical tire pump. The wheels are demountable and 34 by 4-in. non-skid tires are used on the rear. Upholstery is of genuine Turkish-type leather, the backs being made from a single hide.

If the roadster's rear seats are not used the top may be extended as a deck over them, affording protection from dust and rain. In this position it has the appearance of a two-passenger car.

Franklin Addition Under Way

Ground Broken for Extension of Plant Which Will Add 143,000 Sq. Ft.

SYRACUSE, N. Y., June 15—Ground has been broken for an extension of the plant of the H. H. Franklin Mfg. Co., this city, which will provide 143,000 additional sq. ft. of floor space. This is the fourth addition started by the company within 12 months. Upon completion of the building the plant will have facilities for the production of fifty Franklin cars a day. The structure, to be devoted to general manufacturing operations and the shipping department, will represent an investment of $500,000, including machinery. It will be three stories high and constructed of reinforced concrete. Provision is to be made for adding three more floors as requirements demand. The latest Franklin building will span four railroad tracks, permitting all loading under cover.

Perlman Building in Jackson

JACKSON, MICH., June 14—The Perlman Rim Corp. is completing a plant in this city. The new building is 360 ft. long and 100 ft. wide. A single line of columns down the center carries 50-ft. trusses and the roof trusses.

Schoeneck Plant for Tri-City?

ROCK ISLAND, ILL., June 17—The Owen-Schoeneck Automobile Co. of Chicago is planning to open a factory in one of the Tri-Cities and will select the one making the best site offer and which offers the best shipping facilities. The company has been manufacturing automobiles for 2 years, selling direct to the consumer and avoiding the wholesaler. The Schoeneck six was designed and constructed under the supervision of George Schoeneck. He has also designed a combination truck and tractor which has many novel features and which is designed to sell for $1,000. The Chicago factory has limited capacity, and it is desired to remove to an outside point where overhead expense can be kept to the minimum.

Studebaker Trust Formed

SOUTH BEND, IND., June 16—The Studebaker family composed of Clement, G. M., G. M., Jr., and Clement, Jr., have formed the Studebaker Bros. Trust for investment purposes. The capital of the trust is not given out, but it is announced that it is furnished entirely by members of the Studebaker family of South Bend, and that its business will be to hold and deal in investment securities exclusively on its own account.

Following are the directors and officers of the trust: Clement Studebaker, Jr., president; G. M. Studebaker, vice-president and treasurer; G. M. Studebaker, Jr., and Clement Studebaker are also connected with the trust.

Scott Brown, who was formerly general counsel and secretary of the Studebaker Corp., will be a director of the trust and have charge of its offices.

Comet Automobile Co. Formed with $1,000,000 Capital

ROCKFORD, ILL., June 17—The Comet Automobile Co., this city, has been incorporated with a capital stock of $1,000,000. The company will manufacture automobiles and commercial trucks. The former will be known as the Comet and will have six cylinders and a wheelbase of 112 in. The price will be about $800. The trucks will sell at about $1,000. The company has rented offices in the Rockford Trust Building. Several floors of this structure will be utilized for workout and testing purposes. Later, factory space will be secured with 50,000 sq. ft. of floor space. It is planned to put 100 men at work, increasing this number as business warrants. Following the acquirement of a temporary location, the company will construct a building with at least 300,000 sq. ft. of floor space. The officers of the new company are the following: President, Harry R. Sackett, Chicago; vice-president, Joseph Callahan, Chicago; treasurer and general manager, George W. Jagers. The secretary will be named later. He is at present engaged with another firm, but will shortly resign to join the Comet company. It is planned to place the first car upon the market Sept. 1. Mr. Jagers will be in active charge of construction. He is a practical engine man, also a body builder and will eventually build the bodies and motors in the Comet factory. The company has not asked Rockford for a bonus. The capital is being acquired from the sale of stock.

Bans Gasoline in Tank Cars

BOSTON, MASS., June 17—Fire Prevention Commissioner John A. O'Keefe, whose authority to regulate the storage and handling of gasoline in the Metropolitan district of Boston is supreme, has placed a ban on the hauling of the fluid through the streets in the big tank cars of the railroads. The commissioner made a very thorough study of the explosion that caused such tremendous damage at Detroit when some miles of streets were blown up, and then he began to look for possibilities of a like nature in Boston.

The complete official roster of the Bour-Davis company is: President, Chas. J. Bour, president of the National Railways Advertising Co., vice-president of the Chicago, Duluth & Georgian Bay Transit Co., and a director in several other large corporations; vice-president and operating director, R. C. Davis, head of the Chicago, Duluth & Georgian Bay Transit Co.; vice-president and sales manager, C. F. Stewart, who has long been connected with the sale of motor vehicles, principally as distributor for well-known makes in the Pittsburgh field; chief engineer and production manager, A. A. Gloetzner, well known in the trade through his engineering connections with several prominent companies, and lately assistant engineer of the Chalmers Motor Co. The directors are Bour, Davis, Stewart and W. J. Harahan, who is president of the Seaboard Air Line Railway and a director in other enterprises.

R. & R. Absorber Increases Output

ELGIN, ILL., June 17—D. A. Russell, president of the R. & R. Shock Absorber Co., Elgin, states that this firm will make 100,000 sets of absorbers this year. The plant has been enlarged until its present capacity is 500 sets per day. Due to a scarcity of raw material it has been impossible to keep pace with the orders.

Oakland Branch Managers Meet

PONTIAC, MICH., June 17—The managers of the six branches of the Oakland Motor Car Co. were in session at the factory Thursday, Friday and Saturday of last week. This was the annual "get-together" of the managers, to talk over past and future business conditions. While in Pontiac they were the guests of the Oakland officials. Those present at the gathering were: E. J. Kilborn, Chicago; A. B. Tenbrook, Kansas City; R. S. Shoup, Indianapolis; R. L. Losey, Minneapolis; Z. S. Vertner, Philadelphia, and W. R. Tracy, manager of the Michigan branch at Pontiac.

600,000 Chevrolet Bodies

St. Louis Plant Gets Order for 200,000 a Year for 3 Years

ST. LOUIS, MO., June 17.—The revival of river traffic, which recently has begun to loom large to automobile dealers and manufacturers here, received a decided impetus this week through an announcement of Russell E. Gardner, president of the St. Louis Chevrolet company, that he obtained the contract for 600,000 Chevrolet bodies because he was favored with barge freight rates on 100,000,000 ft. of lumber that will be used in their construction. Also that river barge freight rates figure largely in the distribution of these bodies to assembly plants.

The hardwood will be brought from southern points on river barges which average between 750,000 and 1,000,000 ft. load. The factories to receive bodies from the St. Louis plant are located at Minneapolis, Kansas City, Atlanta and Oakland, Cal. The Kansas City plant is reached by Missouri river barges, which are in regular operation and the Minneapolis plant by the Upper Mississippi barges. The Atlanta and Oakland bodies can be shipped by river to New Orleans and then transhipped by Gulf steamers and through the Panama Canal. The 600,000 bodies are to be delivered at the rate of 200,000 a year.

The St. Louis Chevrolet company is now completing additions to each of its two plants, at Broadway and Bulwer and Second and Rutger Streets, at a cost of $50,000 each.

Chevrolet Builds in Bay City

BAY CITY, MICH., June 14—The general contract for the erection of a new building for the Chevrolet Motor Co. in this city, has been awarded. The structure will be 50 by 122 ft. and when completed will be used for storage and shipping purposes. A one-story garage, 26 by 83 ft., is included in the contract, besides a shipping platform 18½ ft. wide by 183 ft. in length.

Willet Takes Over Rub-On Products

BUFFALO, N. Y., June 19—W. Willet, who originated the Rub-On Mfg. Co. of this city, has taken over the company's line of dressings and finish materials and is now manufacturing under the name of Auto Products Mfg. Co. at 40 Allen Street.

Du Pont Buys Fairfield Rubber

WILMINGTON, DEL., June 17—The Du Pont Fabrikoid Co. has purchased the Fairfield Rubber Co. with plants at Fairfield, Conn. The Fairfield company manufactures a coated textile similar to Fabrikoid, and which is used extensively by automobile and carriage manufacturers.

All the present employees will be retained, the change affecting only the owners. The company will not consolidate with the purchasers, but will continue as the Fairfield Rubber Co., endeavoring to uphold, if not better the present standard of its product.

J. K. Rodgers, sales manager of the Du Pont Fabrikoid Co., will act in the same capacity for the Fairfield company.

Bates Is King Commercial Manager

DETROIT, MICH., June 21—G. J. Bates, for the past 10 years prominently identified with the tire business, has resigned from the Firestone Tire & Rubber Co. to become commercial manager for the King Motor Car Co., this city. Mr. Bates for the past 3 years has handled the manufacturers accounts in Michigan for the Firestone company and for 7 years previous to this he was a department manager for the Diamond tire company.

Corliss Truck Enters Field

MILWAUKEE, WIS., June 17—The incorporation of the Corliss Motor Truck Co., Corliss, Wis., presages the establishment of a large commercial car factory at Corliss in the plant formerly occupied by the defunct Wisconsin Engine Co. The corporate articles are signed by members of a law firm of Milwaukee.

Albion Bolt Co. Formed

GRAND RAPIDS, MICH., June 13—The Albion Bolt Co., incorporated for $10,000, is to engage in the manufacture of bolts and nuts for automobiles, with the making of other car parts as a side line. The officers and organizers of the company are Mark Merriman, president; C. B. Hayes, vice-president; Otto Schwacha, secretary, and W. C. Morrey, treasurer.

Thermoid Coupling on Velie and Reo

NEW YORK CITY, June 16—The Thermoid Rubber Co., Trenton, N. J., announces that the Velie Motor Vehicle Co. and the Reo Motor Car Co., Lansing, Mich., have adopted for standard equipment the Thermoid hard fabric flexible coupling.

R. C. Durant Goes to Oakland, Cal.

LOS ANGELES, CAL., June 17—R. C. Durant, Los Angeles, Cal., son of W. C. Durant, has left Los Angeles and will make his headquarters at Oakland, Cal., where he will have charge of the Chevrolet assembling plant with Norman De Vaux. Messrs. De Vaux and Durant have the Chevrolet distribution throughout California, Oregon, Washington, Idaho, Arizona and Nevada.

Texas Farms Bring Prosperity

Automobile Business Stimulated and Record Sales Are Predicted for 1916

DALLAS, TEX., June 16.—That conditions in Texas are better at this time than they have been since the establishment of the Federal Reserve Bank system is indicated by the June report of the system at Dallas. It is estimated that 40 per cent. of the $4,000,000 worth of paper on live stock, etc., is held by the Dallas bank as the result of the operations with the smaller banks.

This prosperity is throughout Texas and is caused by the prospects of the farm outputs for this year. North and Central Texas is in the midst of the harvesting season and indications point to a great harvest. Prospects are also good for a big corn and cotton crop.

These indications, automobile dealers declare, are stimulating the automobile business. Last year Texas did $25,000,000 worth of business in the Texas field and indications are that the business this year will be even greater. L. B. Alford, Texas manager at Dallas for the Studebaker Corp., has just returned from a trip through Southern and Central Texas. "Business compared with last year is much better," he said. "However the Southern part of the State is badly in need of rain. The drought is making business dull in that section of the State. In other parts, however, business is much better than at this time last year. For example, last year we did practically nothing in East Texas. This year we are doing a good business. In several parts of the State conditions are the same. Of course we can't tell what may happen. People throughout Texas, with the possible exception of the Southern part of the State, seem to be in a more prosperous condition than last year. This is proved by increased business in the automobile field."

D. F. Anderson, assistant manager for the Buick Automobile Co. at Dallas, declared conditions are so much better than in 1915 that there is no comparison.

New Law in Porto Rico — Car-Operating Costs High

SAN JUAN, PORTO RICO, June 15.—Beginning July 1 Porto Rico will have a new automobile law which will affect the 2500 cars of all kinds now here. Heretofore each car has paid into the Insular Treasury $5 a year and a special internal revenue tax against the declared value of the car. Now, however, the legislative bodies have decided to increase the Insular tax to 50 cents a horsepower for each car below 40 hp., and $1 a horsepower above that rating, the horsepower to be ascertained in every case by squaring the diameter of one cylinder, multiplying the result by the number of cylinders and then multiplying that result by 0.4. This will give the official horsepower, according to the local laws and will take precedence over the manufacturers' rating.

In addition to the foregoing, every prospective chauffeur will have to pay into the public coffers $5 to secure his papers to drive a car, and in addition to this will have to give unequivocal reference as to his ability and personal respectability and responsibility.

Jitneys, of which there are about 100 in San Juan and suburbs, will pay a license of $25 per year over and above the aforementioned taxes and will be held responsible for accidents occurring in their vehicles.

Automobile tourists from abroad will pay a tax of $1 per month on each car during their stay on the island.

As gasoline here now costs 36 cents a gallon and is still going up, with no prospect of relief from the two only companies here, many people of moderate means are selling their cars.

—

Wolverine Capital Is $200,000

TOLEDO, OHIO, June 20—The Wolverine Automobile Co., capitalized at $200,000, will establish an automobile plant in this city, where it will manufacture a four-cylinder car. Manufacturing will be started about July 1.

The officers are: President and general manager, A. H. Collins of Detroit; secretary, E. W. Burg, Toledo; and treasurer, H. E. King, Toledo.

The Old Com-pakt furniture building on Dorr Street, with 9 acres of ground, will be used for manufacturing. About 1000 cars will be made the first year, it is said.

The company will make cars ranging in price from $1,500 to $2,500 in two, three and four-passenger roadster models, a four-passenger touring model, four-passenger sedan and a two-passenger coupé.

Stutz M. C. Co. of America

—

H. C. Stutz Retained as Pres.—75,000 Shares of No Par Value

NEW YORK CITY, June 21—The Stutz Motor Car Co. of America will take over the Stutz Motor Car Co., Indianapolis, as a result of a new plan of re-financing the permit of expansion. Allan A. Ryan & Co., this city, G. H. Saylor of the Chase National Bank, S. A. Fletcher of the Fletcher American National Bank of Indianapolis, H. C. Stutz, H. F. Campbell, and R. E. Maypole will serve on the board of directors. Mr. Stutz will remain as president, Ryan will be vice-president, Saylor secretary and treasurer and Campbell chairman of the board.

The capital will consist of 75,000 shares of no par value, of which amount 37,500 shares have been syndicated and sold to the public at $55.

The Stutz company has no preferred stock or bonded debt. Earnings for the current year are running between $600,000 and $800,000.

—

Copper Down ½ Cent

NEW YORK CITY, June 20—Copper and open-hearth steel featured last week's market quotations with drops in prices. Copper declined ½ cent on Thursday to 27½ cents a pound, and open-hearth steel went down to $40 a ton, a drop of $2. Both up-river Para and Ceylon rubber declined, supplementing the recession of the previous week. Para closed yesterday at 63½ cents a pound, a loss of ½ cent, while Ceylon closed ½ cent lower at 62.

The automobile makers continue actively in the market for special kinds of steel and automobile parts. The demand for rivets and bolts from this industry is especially pressing. One prospective contract covers 22,000,000 bolts and 20,000,000 nuts for shipment over the next 4 months. The general demand for rivets and bolts, however, has been well satisfied and manufacturers, with capacity well sold, are refusing to quote on some of the automobile manufacturers' inquiries.

Mosler Need Not Change Form or Size of ½-In. Superior

NEW YORK CITY, June 17—Under the decision of Judge Hand, announcement of which was made in THE AUTOMOBILE for May 25, A. R. Mosler & Co. may manufacture and sell the Mosler Superior half-inch type plug in the identical form and proportions which have always characterized it, the only requirement being that no plugs manufactured and sold by the Mosler company can have the black finish nor the brand printed in red. The case was that of the Champion Spark Plug Co. against A. R. Mosler & Co. in the U. S. district court for the southern district of New York.

—

Halts U. S. L. Stock Sale

NEW YORK CITY, June 16—F. A. Bagg, a stockholder of the United States Light and Heat Corp., yesterday filed in the Supreme Court an action to restrain the directors from selling preferred stock at $4.50 a share and common stock at $2 a share. He obtained a temporary stay.

Bagg charges waste and misuse of the company's funds by the officers and majority directors of the corporation. The defendants include J. A. Smith, president; E. H. Gold, vice-president; C. L. Lane, secretary, and A. H. Ackerman, treasurer. It is alleged they are about to sell $290,000 of preferred and $250,000 common stock at the above prices, which prices are about $1 less than the market.

—

Dividends Declared

Linde Air Products Co.; quarterly of 1½ per cent on preferred and 2 per cent on common. Preferred payable July 1 to stock of record June 20 and common payable June 30 to stock of record June 20.

Edmunds & Jones; initial dividend of $1 per share, payable July 1 to holders of record June 20.

Billings & Spencer; quarterly of 2 per cent and extra of 3 per cent.

J. I. Case Threshing Machine Co.; quarterly of 1¾ per cent on preferred, payable July 1 to holders of record June 12.

Packard Motor Car Co.: 50 per cent stock dividend on common, payable Aug. 1 to stock of record June 16. The amount of common now outstanding is $7,771,830.

Springfield Body Corp.: 3 per cent on preferred, payable July 1 to stock of record June 22. This dividend covers 1 per cent from period from Feb. 15 to April 1, and regular quarterly of 2 per cent for quarter ended June 30.

Hupp Motor Car Corp.: quarterly of 1¾ per cent on 7 per cent cumulative preferred, payable July 1 to stock of record June 20.

Motor Products Directors Announced

NEW YORK CITY, June 6—The board of directors of the Motor Products Corp. will be composed as follows: W. C. Rands, D. B. Lee, C. F. Jensen, all of Detroit; H. H. Seeley of Ann Arbor, and Sol Wexler of J. S. Bache & Co. W. C. Rands will be president.

The tangible assets of the corporation aggregate over $2,500,000, or equal to $35 per share of stock.

Chalmers Earns $300,000 per Month

DETROIT, MICH., June 15—The earnings of the Chalmers Motor Co., this city, it is stated, are running better than $300,000 per month. In 5 months the sales were more than twice the shipments of any one year's business. The sales department to date is several thousand orders ahead of the production.

Moon's May Business Doubled

ST. LOUIS, MO., June 14—The business of the Moon Motor Car Co., this city, for May was double that of May, 1915, in cars shipped and four times the same month last year in cars ordered. The additional output was handled with only an increase of 33 1/3 per cent in the factory employees. The company has been receiving materials in larger quantities so that it has been able to keep about a month ahead of the demand.

Security Prices Tumble

Possibility of War with Mexico Influences the Downward Movement of Stocks

NEW YORK CITY, June 20—A sudden drop in automobile security prices occurred yesterday on the Stock Exchange and Curb market. The whole list was influenced by the troublesome Mexican situation and some of the declines were violent. Chevrolet reflected the small demand for it by selling off 9 points yesterday and 38 points for the week. Willys-Overland broke 5 points; and General Motors 14 points.

During the middle of last week when announcement of the abandonment of the big merger was made, Willys-Overland dropped more than 25 points but recovered some of the loss later in the day. The fact that there was no wide open break in the motor shares showed an absence of alarm in speculative quarters at the news. Immediately after the announcement reports were current that bonuses in stock are to be given out by some of the leading concerns. The stocks at present are selling so high that ordinary traders will not touch them because of the wide fluctuations that naturally result.

By issuing new stock the market price could be brought down to a figure where brokers would encourage transactions.

The present high scale of prices brings to mind the great boom in automobile stocks on the Italian bourses in 1905 and 1906, when the shares of the Fiat company went from 25 lire par, to 2300 lire. Possibly to broaden the market, the par value was reduced to 10 lire, and sold in November, 1906, at 750. In May, 1908, they fetched 34 lire in the open market. The American panic of 1907, bringing a smaller demand for foreign automobiles, had much to do with the collapse of the Italian motor boom.

The scarcity of Firestone stock has brought it up to 880. Firestone lately has changed hands in small lots only; nothing is announced as to melon prospects.

Firestone's $3,000,000 common now has a theoretic market value as made by quotations of materially over $26,000,000. There is a $1,000,000 par preferred outstanding.

Goodyear stood well under fire this week and a small lot brought 233. The preferred interim certificates had fairly brisk trade at 106½.

Third Dividend for Milwaukee Motor Creditors

MILWAUKEE, WIS., June 17.—The creditors of the Milwaukee Motor Co., bankrupt, are about to receive checks for a third dividend of 20 per cent, amounting to $53,598.73, declared at a meeting on June 16. At the same time a 100 per cent dividend of $7,179.89 was declared on wage claims, and a 10 per cent dividend on unsecured claims, amounting to $2,068.40, making a total payment of $62,847.02. Final settlement of the bankruptcy is delayed pending the settlement of a claim of $13,062.35 made by A. J. Farmer, Detroit.

Pilliod Motor Petitioned

TOLEDO, OHIO, June 16—The Pilliod Motor Co., this city, has filed a bankruptcy petition in the U. S. court. The liabilities are $30,320.55 and the assets $9,559.92.

Resta Wins from De Palma

His Peugeot Establishes New 10, 24 and 50 Mile Speedway Records at Chicago

CHICAGO, ILL., June 18—Dario Resta in his Peugeot defended his title of speedway champion to-day by defeating Ralph DePalma in his Mercedes and besides, established new American records for 10, 24 and 50 miles. Setting a terrific pace, he captured all three heats, though the margin of lead in his favor was never large.

There was a popular feeling at last Sunday's race that DePalma's Mercedes was as fast as Resta's Peugeot and the expression was current that Resta's winning was more the result of luck than of speed or superior speedway generalship. It was to settle this that the speedway hung up a price of $5,000 for a match race between Resta and DePalma and it was agreed to run three heats—one of 10, one of 24 and one of 50 miles—the winner of two heats to take the entire purse and the loser to get nothing. Besides the $5,000 a trophy was also hung up for the winner of the day's contests.

De Palma Gets Pole

In the first heat of 50 miles DePalma won the pole position in a toss-up, but Resta jumped into the lead on the first lap and held it through the second, maintaining a speed of better than 100 m.p.h. although DePalma was close on his heels all of the time, and in the 5th mile, Resta was forced to stop at the pits to tighten a loose spark plug wire and DePalma took the lead. At the end of 28 miles, the same spark plug wire on Resta's Peugeot loosened and he stopped at the pits 53.6 sec. while DePalma put on more speed and by the time Resta got away from the pits was nearly two laps in the lead. He held the lead then until the end of the 42nd mile when Resta again took the lead, Ralph's speed having dropped appreciably each lap after the 28th mile. As Resta passed Ralph, the Mercedes was hitting on two, but the race was too near over to permit of DePalma stopping and changing plugs and he kept on finishing 21 sec. behind Resta.

Resta Made Two Stops

Resta made two stops and DePalma one and the trouble for each one came soon after passing the pits so that some of these laps were turned as low as 55 m.p.h., and this cut down the general average materially so that Resta's average speed for the 50 miles was only 96 m.p.h., or 2½ m.p.h. slower than his average for the 300 miles a week ago.

The lap by lap summary of the 50-mile heat follows:

Miles	Leader	Lap time	Lap M.P.H.
2	Resta	1:11 3/5	101
4	Resta	1:12	100
6	DePalma	1:12	100
8	DePalma	1:12 1/5	99 3/4
10	DePalma	1:13 2/5	98 1/4
12	DePalma	1:10 4/5	101 1/2
14	DePalma	1:09 1/5	103
16	DePalma	1:09 4/5	103
18	DePalma	1:09	104
20	DePalma	1:08 3/5	105
22	DePalma	1:09 3/5	103
24	DePalma	1:09	104 1/4
26	DePalma	1:08 4/5	104
28	DePalma	1:09 4/5	103
30	DePalma	1:16 2/5	94 1/4
32	DePalma	1:22 4/5	87
34	DePalma	1:25 1/5	84 3/4
36	DePalma	1:35 4/5	75
38	DePalma	2:10	55 1/4
40	DePalma	1:19	91
42	DePalma	1:10 3/5	101
44	Resta	1:09 2/5	103 3/4
46	Resta	1:12 3/5	99 3/4
48	Resta	1:12	100
50	Resta	1:23	87

Resta Takes Second Heat

After a 20 min. intermission the next heat of 24 miles was started, Resta winning the pole on a toss. DePalma had spark plug trouble on the preliminary lap and the heat was held 10 min. for DePalma to go to the pits. He came around the track to the starting line and the Mercedes seemed to be in good shape for competition. Ralph took the lead in the first lap setting a pace of 102 m.p.h., but Resta's spurt in the next lap carried him to the front, his pace being 106.5 m.p.h. DePalma never crossed the starting line in the lead except on the first lap but was very close and his speed was terrific. In the third lap Resta held to 105 m.p.h., then a 104 for two laps, then a 102 for the sixth lap and from then on he gave the Peugeot an open throttle and built up his speed so that his average for the ninth lap was 107 m.p.h. and at this point DePalma and Resta were both even in the back stretch, but on the next lap Resta's average was 109 m.p.h., while his average for the eleventh and twelfth laps combined was 109.75 m.p.h. His total time for 24 miles was 13:42.6 and his average 105.1 m.p.h. DePalma's time was 13:45.8 and his speed 104.5 m.p.h.

The lap by lap of the 24 mile race follows:

Miles	Leader	Lap time	Lap M.P.H.
2	DePalma	1:10 3/5	102
4	Resta	1:07 3/5	106 1/2
6	Resta	1:07 2/5	106
8	Resta	1:09	104
10	Resta	1:10	103
12	Resta	1:11 1/5	102
14	Resta	1:10 2/5	102 1/2
16	Resta	1:09 4/5	103
18	Resta	1:07	107
20	Resta	1:06	108
22	Resta	1:06	109
24	Resta	1:06 3/5	108

By winning the two heats in succession, Resta pulled down the $5,000 purse and cup, but inasmuch as three heats were scheduled the third was made an exhibition drive and Resta finished less than three car lengths ahead of DePalma, the former's time for the 10 miles being 5:51.2, an average of 102.5 m.p.h. Had not the first lap been rather slow—92.5 m.p.h.—the average for 10 miles would have been considerably higher since the speed for the second lap was 102; for the third 103; for the fourth 108 and for the fifth 104 m.p.h. DePalma led for 6 miles of the 10-mile exhibition but Resta's turn of the track in 106.4 in the fourth lap brought him to the front in which position he finished.

Immediately after the 50-mile event, Resta offered DePalma a set of plugs which Ralph refused rather than have the impression become current that he was aided by Resta in case he, DePalma, should win the next heat.

In taking the 50-mile heat in 31:57.4 Resta broke the 50-mile mark of 88.87 m.p.h., set by Christiaens at Indianapolis in 1914. Both drivers averaged 101 m.p.h. in the 10-mile event, the best previous record for this distance having been established by George Robertson in a Simplex at Los Angeles in 1910, when he drove 90.99 m.p.h.

Stutz Features Newark's Night Track Race Meet

NEWARK, N. J., June 17.—J. W. Dickinson, in a 110-hp. Stutz, featured tonight's race meet in this city on the ½-mile dirt track at Olympic Park. The meet was held by the Olympic Park Automobile Racing Assn., under the direction of T. B. Shoemaker, former secretary of the A. A. A. contest board.

In the ½-mile time trials, Dickinson bettered the former track record by negotiating the distance in 37 2/5 sec. An Adams Special, driven by G. W. Adams, won the 3-mile event for cars of 300 cu. in. and under, the time being 4:16 4/5. Dickinson won the next 3-mile event, his time being 4:13 3/5. He also won the 5-mile free-for-all in 6:46, with G. T. Theobald's Mercedes a close second.

The Australian pursuit race of 10 miles was featured by a close race between the Stutz and the Mercedes, so close in fact that a special match race between the two cars was run off and won by the Stutz.

In a time trial, the twelve-cylinder Sunbeam, imported by the Packard company for experimental purposes and recently bought by G. W. Adams of Brooklyn, caught fire and was saved from serious damage by quick work on the part of the driver.

Record-Breaking Chalmers Remy-Ignition Equipped

NEW YORK CITY, June 17—Due to a misunderstanding, it was stated in THE AUTOMOBILE for June 8, that the Chalmers Six-30, which broke the Chicago to New York record, was equipped with Atwater Kent ignition, whereas Remy ignition is standard equipment on this model.

S. A. E. Standards Divisions Report Progress

(*Continued from page* 1117)

mitted to the Cleveland meeting of the standards committee in April, 1916. The committee again considered that a test should not be accepted without further elaboration, so that many other qualities should be tested simultaneously with the fuel economy. At present, therefore, the Research Division is elaborating a similar scheme for testing acceleration and for determining certain other facts in connection with car performance. The object of this work is briefly summed up as follows:

We do not at present know exactly what constitutes a really scientific test. It has been the practice both here and in Europe to test one thing at a time. We all know that wonderful fuel economy can be attained if acceleration is neglected; that marvelous power at high speed is available by neglecting economy and low speed operation, and so on throughout the range. The formidable task before the Research Division is to consider all these things, forgetting nothing, and to find some test which will cover the whole series at once. The outlook is bright but a good many more meetings will probably require to be held before conclusive action can be taken by the society.

Springs

The Springs Division presented a very full report indeed at the January meeting and since then has been engaged upon matters of detail. Concerning spring clips, which it was thought would be readily amenable to standardization, unexpected difficulties have been encountered.

Truck Standards

The Truck Standards Division commenced the year with a number of subjects before it, of which several have been dropped. The division has also just been entirely reorganized simultaneously with the creation of a new division to be known as the Tire and Rim Standards Division. A very large part of the time of the Truck Standards Division has been given to matters in connection with solid tires and, at its last meeting, considerable progress was made toward obtaining a series of tire capacity tables to which all tire manufacturers would give their assent. Owing to changes in the pneumatic tire rim situation, it is believed that there is a good chance of obtaining agreement on this subject, which was previously considered by the Pleasure Car Wheels Division disbanded at the beginning of the present year. The Tire and Rim Standards Division will therefore take over all the tire subjects until recently for the Truck Standards Division. The latter have as their objective, standardization of the location of motor truck controls. The need for similar positions for gearshift and break levers, or pedals, etc., has been emphasized enormously by the Mexican campaign as well as by the European war. It is also believed that standardization of controls would tend to reduce the number of accidents in the ordinary commercial use of trucks. This is not a matter for averaging up existing practice so much as the question has to be decided on its merits. A great deal of data is being collected and action may be expected shortly

With respect to the reorganization of the Truck Standards Division, it may be explained that this is in part owing to the creation of the military transport committee of the S. A. E. and to the great variety of debatable subjects discussed at the recent meetings of truck engineers organized by the S. A. E. at the request of and in order to assist the War College. The military transport committee will call upon any division of the standards committee for assistance in working out problems which will have to be considered. A great deal of this work will naturally fall upon the Truck Standards Division and it is therefore a good thing the program of the division is fairly open.

Better Engineering in New Regal Four

(*Continued from page* 1127)

made as direct as possible, and with a single opening in the side of the casting to which the Carter carbureter attaches, the passages lead by the shortest paths to the valve chambers, the valves themselves being of large diameter for an engine of this size. Around them plenty of water space has been provided by so designing the cored places that there is no possibility of these being obstructed in the casting.

The new Heinze electrical apparatus has been compactly and efficiently applied to this motor, the combined magneto and generator being located forward on the left, and the starting motor adjacent to the flywheel on the right, to which it connects through the automatically-operated Bendix drive. This cranks the engine at about 175 r.p.m., which is proof of its sturdiness. A pilot arrangement insures proper realignment and resetting of both these units, if they have to be removed for any reason. The coil and regulating switch are mounted on the back of the dash, and the electric system operates in conjunction with a 6-volt, 80-amp.-hr. storage battery.

Passing to a consideration of the new clutch used, this is of cone type, using a pressed-steel cone and having a self-aligning thrust ball bearing to take the thrust of the clutch spring. The spring adjustment is obtained by nuts back of this bearing, threaded to the shaft, the inner nut forming the shoulder against which the thrust bearing acts. This makes a simple construction that is easy to take care of. Another thrust bearing back of the spring takes the load imposed when the clutch is thrown out of engagement, and this is also very simply mounted, with a grease cup provided for lubrication. Gears and shafts in the gearset, the case of which bolts to the flywheel housing, are constructed of nickel steel, and the mainshaft runs on ball bearings, with plain bearings for the jackshaft. To make removal of the gearbox a comparatively simple matter, the clutch throwout lever has been designed to swing down forward enough to allow the front part of the housing to clear.

Continuing back, the drive passes through a specially-designed universal that is of rugged construction made with yokes forged on the ends of the shafts, these yokes at right angles and having machined pins that fit into the two halves of a steel ring. To take it apart the steel outer ring halves have only to be unbolted.

A torsion tube incloses the driveshaft, hinging to a bracket on the rear of the gearcase by means of a yoke, the arms of which are designed to be strong, yet are of sufficient flexibility to take care of any strains that may be momentarily imposed upon them without damage. The axle is three-quarter floating, and uses Hyatts and New Departure bearings. Spiral-bevel gears are fitted, and afford a ratio of 4¼ to 1. Attached to the final drive assembly are the brake equalizers and the operating rods that parallel the axle tubes to the drums, which are 10 in. in diameter and have a face width of 1¾ in.

Much thought has been given the rear cantilever spring suspension to get away from any side sway that might tear out the spring brackets. The rear pair are 40 in. long and mounted under the frame rails, trunnioned at the center and shackled at the front, with a special mounting at the rear which prevents any axle shifting. The rear attachments are around the axle tubes, and the spring end goes below the axle. This makes a very strong attachment that gets away from a very objectionable feature of many cantilever spring applications.

The frame itself is new to Regal construction, in that it is designed primarily to follow the body line and give it good support, to have sufficient strength at the right places to take care of weaving strains and to forego any chances of breakage or bending. The section is 3½ in. deep, and the flanges have been so widened at the points of change in width that they are very strong. In addition, a substantial cross member is placed at the point where the front ends of the cantilever rear springs attach.

Five passengers are afforded comfortable accommodations in the body, which is given a straight slope from the radiator all the way back, this being the prevailing body fashion. The radiator sets the appearance off well by its sloping linc and being a pressing free from the core, is given a high enamel finish. A special point has been made of the fender fitting, to see that the fenders center the wheels as nearly as possible, a thing small in itself but large in its possibilities of increasing appearance. The doors fit snugly and have no moldings at the top; the instrument board is a hardwood panel and running boards are linoleum-covered. The wheelbase is 108 in.

Ninth Used Car Market Report Out

CHICAGO, ILL., June 20—The ninth edition of the National Used Car Market Report has been issued by the Chicago Automobile Trade Assn. From this edition, as not of much value, have been dropped:

Brush, Cameron, Cino, McIntyre, Parry, Rayfield, Richmond, Royal Tourist, Sampson, Vulcan, Warren-Detroit, Welch and Welch-Detroit. Otherwise the book is much the same as the eighth edition.

Added co-operating factories are: Detroit-Electric, Hudson, Hupmobile, Jeffery, Mitchell and Reo. Added co-operating associations are: Columbus Automobile Trade Association, Columbus, Ohio; Tri-City Auto Trade Association, Davenport, Iowa, and Peoria Automobile Trade Association, Peoria, Ill. It is stated that the Boston dealers have lessened their activity in regard to the report, although the association is still listed in the book.

—

Tune Up at Des Moines

DES MOINES, IOWA, June 17—Eddie Rickenbacher, captain of the Maxwell racing team, was the first race driver to arrive in Des Moines to start preliminary activities on the Des Moines speedway for the 150-mile sweepstakes on June 26. Mulford, De Palma, Henderson, Chandler, Christiaens, Galvin and other noted entries were not far behind and the speedway is now alive with the activities of preparation for the second annual speedway event. Ralph Mulford, who beat Ralph De Palma in a sensational finish for a distance of 300 miles here last year, will have the same task ahead of him again. Earl Cooper and his Stutz also were early arrivals to make proper preparation for the race. Fred Wagner, official starter of the American Automobile Assn., will give the men the word here. He is also negotiating with Resta to enter the local event. Elimination trials will be held on the 4 days preceding the race and several drivers will attempt to set a new record for the 25 mile distance. Rickenbacher, although an Iowa man, has never before competed in a speedway race in Des Moines and local fans are enthusiastic over the prospect of seeing him in action. Entries in the Des Moines race to date are: Earl Cooper, Stutz; Ralph Mulford, Hudson; Ed Rickenbacher, Maxwell; Eddie O'Donnell, Duesenberg; Josef Christiaens, Sunbeam; Frank Galvin, Sunbeam; Bill Chandler, Crawford; Wilbur d'Alene, Duesenberg; Tom Milton, Duesenberg; Pete Henderson, Maxwell; Dave Lewis, Crawford; W. J. Barndollar, Clergy. The program of race day will include a 50-mile free-for-all in addition to the championship race of 150 miles.

—

Pathfinder 12 to Cross Continent on High Gear

SAN DIEGO, CAL., June 17—The Pathfinder which blazed the first transcontinental trail started on its tenth transcontinental trip from the San Diego Exposition to-day. The car will travel over the Lincoln Highway, blazing the trail for the Pathfinder twelve, which is to leave the San Diego Exposition grounds July 3, on a run over the Lincoln Highway with the car sealed in high gear under supervision of the A. A. A.

If successful, the Pathfinder will be the first car to make the transcontinental high gear run.

—

Elgin Arrangements Completed

ELGIN, ILL., June 17—The Elgin national road race will be run over the Elgin course on Aug. 19. Final arrangements for financing the event were completed in a conference between representatives of the Elgin Road Race Association, and the Chicago Automobile Club. Prizes aggregating $8,000 will be hung up. Ralph DePalma, twice winner of the Elgin National trophy, is a sure entrant, and boosters of the event are confident that Dario Resta, winner of the Indianapolis and Chicago speedway events, will be among the contenders. Entry blanks will be sent out immediately.

—

Fifth Avenue Bus Adopts Moline-Knight

NEW YORK CITY, June 17.—The Fifth Avenue Coach Co., this city, will standardize the Moline-Knight engines for its new equipment exclusively. The company has been experimenting with various types of Knight motors, running over a period of years. All the new equipment will be Moline-Knight motored, and the company's plans are so laid out that production of this equipment will start in July. It now has a few of these machines running.

—

Apco Opens Prize Contest

PROVIDENCE, R. I., June 16.—A series of cash prizes is being offered by the Auto Parts Co., this city, maker of the Apco line of specialties for the Ford car, for the best short sales suggestion, story, joke, poem, photograph, shop kink, etc., containing the name of Ford. The first prize is $5, the second $3 and the third $2. There are fifteen $1 prizes. The only restrictions are that the name Ford is used and the copy written on one side of the paper.

—

Wolfe Pathfinder District Mgr.

INDIANAPOLIS, IND., June 16—Richard Wolfe has been appointed a district manager of the Pathfinder Co., this city.

—

Bay State A. A. on Outing

BOSTON, MASS., June 19—The annual outing of the Bay State A. A., which comprises the prominent motor and accessory dealers in Boston, ended last night when they motored back from Lake Spofford, N. H. after a 3-day trip. There were about 200 men and women present and they went in fifty cars.

Factory Miscellany

Inter-State to Add—The Inter-State Motor Co., Muncie, Ind., is planning an addition to its plant.

Dennsen Motor to Build—The Dennsen Motor Co., Cleveland, Ohio, will build a plant at Coltman Road and East 123d Street.

To Make Trucks—J. B. Barsdale, 618 Tower Avenue, Superior, Wis., is planning to build a $50,000 plant for the manufacture of commercial vehicles.

Gordon Parts to Build—The Chamber of Commerce, Muskegon, Mich., will erect a factory for the L. O. Gordon Co., maker of automobile parts, to cost about $10,000.

Continental Motor to Add—The Continental Motor Co., Detroit, Mich., has granted a permit for the addition to its plant at 3001 East Jefferson Street to cost about $104,000.

Covert to Add—The Covert Motor Vehicle Co., Lockport, N. Y., will add to its present plant a three-story and basement factory, 100 by 130 ft., of steel, concrete and brick, to cost $40,000.

Tube Co. to Build in Louisville—The Compressed Inner Tube Co., producing a solid rubber device for use inside automobile tires, will build a factory in Louisville, Ky., to manufacture this device.

Three New Buildings for Federal Rubber—Contracts for three new factory buildings for manufacturing, shipping and storehouse purposes have been let by the Federal Rubber Co., Cudahy, Wis. These buildings will be fireproof.

Fulton Tractor's Plant—The Fulton Tractor Co. has taken over a plant in Anderson, Ind., in which it will make farm tractors and motors. This is a new company, organized with $300,000 capital.

Pearce Tire Plant Progressing—Excellent progress is being made on the construction of the plant of the Pearce Tire & Rubber Co., Ashtabula, Ohio. It is expected that the building will be completed by Aug. 1.

Champion Equipment Makes First Shipment—The Champion Automobile Equipment Co., Wabash, Ind., made its first shipment of asbestos fabric recently to Fort Madison, Iowa, where it will be used in the manufacture of automobile tires.

To Make Gage—The Badger Crafts Shops, Sheboygan, Wis., has brought out a new type of gasoline gage designed especially for Ford cars and made to substitute for the tank filler cap. The indicator is graduated in gallons in etched letters of such size that they are easily legible, even at night. The apparatus consists of a hollow brass float which is fitted to a spiral upright that turns the indicator on the dial as the gasoline supply is raised or diminished. The gage is protected by a disk of plate glass ⅛ in. thick.

Curtis Plant Taken by Wagner—The Curtis Truck & Forging Co., Decatur, Ill., has sold its plant on North Woodford Street to A. W. Wagner of Terre Haute, Ind., who will open a malleable iron foundry for the manufacture of iron castings for automobiles. The plant will have a capacity of 45 tons daily. Wagner has been engaged in similar industries in Milwaukee and Racine, Wis., and for the past 11 years in Terre Haute. D. E. Willard will be vice-president and Irving Sibley secretary-treasurer of a new company to be formed, with Mr. Wagner as president. Willard and Sibley have been connected with the Allith-Prouty Co. of Danville, Ill. The Decatur plant will be enlarged and improved to the extent of $20,000. It will be ready for operation about Aug. 1.

Canadian Ford Shipments Large—It requires from twenty to thirty freight cars each day to handle the Ford company's shipments in Ford, Ont. As the average train is composed of from twenty to thirty cars, the Ford company's shipments average a trainload of cars a day.

The largest day's shipment so far this season was 314 cars. As most freight cars will only hold five Ford cars (a few of the larger freight cars hold seven), and many carloads go out containing three Ford cars, if the average number is placed at five cars, then it required sixty-three freight cars, or two whole trainloads, to transport this one day's shipment.

The Automobile Calendar

ASSOCIATIONS

July 2-6—Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
Dec. 2-9—Electricians' Countrywide Celebration.

CONTESTS

June 22-23—Chicago, Interclub Reliability Run, Chicago Automobile Club.
June 26 — Des Moines, Iowa, Speedway Race, Price Speedway Co.
June 28 — Des Moines, Iowa, Speedway Free-for-All, 300-Mile Race.
July—La Grande, Ore., Track Race, LaGrande Motor Club.
July 4—Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.
July 4—Tacoma, Wash., Speedway Race, Tacoma Speedway Assn.
July 4—Minneapolis 300-Mile Speedway Race.
July 4—Sioux City Speedway Race.
July 4—Newark, N. J., Track Race, Olympic Park, Auto Racing Assn.
July 4—Visalia, Cal., Road Race, Tulare Co. Auto Club.
July 4—Spokane, Coeur d'Alene, Track Race, Reigel-Hiller Co.*
July 4—Benton Harbor, Mich., Track Race, F. E. Fitzsimmons.
July 4—Elmira, N. Y., Track Race, Elmira Auto and Motorcycle Racing Assn.
July — Burlington, Iowa, 100-Mile Track Race, Tri-State Fair.
July 15—Portland, Ore., Track Race, Northwest Auto Assn.
July 15—Omaha, Neb., Speedway Race.
July 15—North Yakima, Wash., Track Race, Hiller-Riegel Co.
Aug. 5—Tacoma Speedway Race, Tacoma Speedway Association.
Aug. 11-12—Pikes Peak, Col., Hill Climb, Pikes Peak Auto Highway Co.
Aug. 12—Portland, Ore., Track Race, Hiller-Riegel Co.
Aug. 18-19—Elgin Road Race, Chicago Auto Club.
Aug. 26—Kalamazoo, Mich., 100-Mile Track Race.
Sept. 1-2—New York, N. Y., Sheepshead Bay Speedway, 24-Hour Race, Trade Racing Assn.
Sept. 4—Elmira, N. Y., Track Race, Elmira Auto and Motorcycle Racing Assn.
Sept. 4—Cincinnati, Ohio, Speedway, Cincinnati Speedway Co.
Sept. 4—Newark, N. J., Track Race, Olympic Park, Racing Assn.
Sept. 4—Indianapolis Speedway Race.
Sept. 4—Des Moines Speedway Invitation Race. Limited to six entries.
Sept. 4-5 — Spokane, Wash., Track Race, Inland Auto Assn.
Sept. 16—Providence Speedway Race.
Sept. 18—North Yakima, Wash., Track Race, Washington State Fair.
Sept. 29—Trenton, N. J., Inter-State Fair. H. P. Murphy, Racing Sec.
Sept 30 — New York City, Sheepshead Bay Speedway Race.
Oct. 7 — Philadelphia Speedway Race.
Oct. 7—Omaha Speedway Race.
Oct. 14 — Chicago Speedway Race.
Oct. 19—Indianapolis, Ind., Race, Indianapolis Motor Speedway.
Oct. 21 — Kalamazoo, Mich., Track Races, Kalamazoo, Motor Speedway.
Nov. 16 and 18—Santa Monica, Cal., Vanderbilt Cup and Grand Prix Races.

GOOD ROADS

Sept. 6-7—St. Paul, Minn., Good Roads Congress, Auditorium.

SHOWS

Sept. 2-9—Columbus, Ohio, Fall Show, Ohio State Fair, Columbus Automobile Show Co.
Aug. 2-9—Hollywood and West End, N. J., Show, Atlantic Exhibition Co.

TRACTOR

July 17-21—Dallas, Tex., Tractor Demonstration.
July 24-28—Hutchinson, Kan., Tractor Demonstration.
July 31-Aug. 4—St. Louis, Mo., Tractor Demonstration.
Aug. 7-11—Fremont, Neb., Tractor Demonstration.
Aug. 14-18—Cedar Rapids, Iowa, Tractor Demonstration.
Aug. 21-25—Bloomington, Ill., Tractor Demonstration.
Aug. 28-Sept. 1—Indiana Tractor Demonstration.
Sept. 4-8—Madison, Wis., Tractor Demonstration.
Sept. 11-16 — Milwaukee, Wis., Fall Show, Wisconsin State Fair, Milwaukee Automobile Dealers.

The Week in the Industry

Baush Machine Opens Detroit Office—The Baush Machine Tool Co., Springfield, Mass., has opened a permanent office in the Dime Bank Building, Detroit. W. Wetsel will be in charge.

N. Y. Marmon Moves—The Nordyke & Marmon Co. last week occupied a new building at 42 and 44 West Sixty-second Street, New York City. The building occupies a plot 65 by 100 ft. It is fireproof and five stories high.

Rives Pedal Pad's New Distributers—The George H. Rives Mfg. Co., New York City, manufacturer of the Rives Never-Slip adjustable automobile pedal pads, has established distributers throughout the country and also in Buenos Aires, Argentina, and Montevideo and Rio Janeiro, Brazil, South America. The company's offices are in the Woolworth Building, New York City, and its factory is at 171 Fulton Street, Brooklyn, N. Y.

Gorey Buys Chalmers Motors—J. C. Gorey & Co., 354 West Fiftieth Street, New York City, have bought over sixty Chalmers motors of the latest type and furnish all or any parts to fit Chalmers cars from 1907 to 1915.

Iowa News Items—The Fisk Tire & Rubber Co. has leased the northeast corner of Thirteenth and Locust Streets, Des Moines, as a site for a new branch house which is to be built there immediately at a cost of $30,000. The Des Moines branch will serve the entire State of Iowa.

A new business block now being constructed at Fifteenth and Locust Streets, Des Moines, will provide a new home for three service stations. These are the Diamond Tire & Supply Co., the Stewart-Warner Co., and the B. & B. Battery Co.

One of the biggest shipments of automobiles ever received in Des Moines was a recent trainload of Chevrolets. The train consisted of thirty-eight cars fully loaded with the Chevrolets. Because box cars were not available the automobiles were shipped on flat cars and covered with canvas. The trainload of Chevrolets made an impressive parade through the city.

Hudson N. Y. Service Building—The Hudson Motor Car Co. of New York plans to build a three-story garage and service building on a site it has purchased on West End Avenue between Sixty-eighth and Sixty-ninth Streets. It will house 600 cars. Ramps will be used instead of elevators and the aisles will be 18 ft. wide.

Packard Opens Accessories Dept. in L. I. City—The Packard Motor Car Co. of New York has opened a branch of its accessories department in Long Island City. A full line of tires, tubes, tire covers and other emergency stock will be carried at all times. The new branch is located in its service station at Thompson Avenue and Hill Street.

Cranston Succeeds Smith—J. P. Cranston has succeeded Gordon Smith as sales manager of the Vim Motor Truck Co., Philadelphia, Pa. Mr. Smith has gone to New York City, where he has taken a similar position in the Manhattan Motors Corp., Vim distributer.

Lolley Joins Timken—W. H. Lolley, formerly connected with the Simms Magneto Co. and the Remy Electric Co., has joined the selling force of the Timken Roller Bearing Co., Canton, Ohio, and will now represent the Timken company throughout the East.

Kansas City Items—The Rice-Sturtevant Motor Co., recently appointed distributer of the Elcar for Kansas and parts of Missouri and Oklahoma, has already established a few agencies.

R. R. Tenney, assistant office manager since February in the Kansas City distributing headquarters of the Maxwell, is now acting as distributing office manager.

Sewell Wheel Opens Baltimore Branch—The Sewell Cushion Wheel Co., Detroit, has opened a branch at 301 Continental Building, Baltimore, Md., and O. H. Jones has been appointed manager of the branch.

Columbus News Items—Plans are being prepared for an additional office building for the John W. Brown Mfg. Co., located on Marion Road near Columbus, maker of automobile lamps and parts.

E. F. Loeffler, one of the pioneers in the tire business in Columbus, has been made manager of the tire department of the Justus & Parker Co., local agent for the Swinehart tire.

The Hill Sales Co., Front and State Streets, has been made agent for seven counties in central Ohio for the products of the Automatic Carburetor Regulator Co., Detroit.

The Standard Motor Car Co., North Fourth Street, central Ohio agent for the Hudson and Milburn, has completed extensive changes to its salesroom. The service station is located at Third and Chestnut Streets.

The Double Tread Tire Co. has opened a retail store at 142 North Fourth Street.

The Columbus Cadillac Co.'s direct factory branch will complete its new building at Broad and Sixth Streets, to be used as a salesroom and service station, about Dec. 1. The structure will be 60 by 187 ft., two stories.

Omaha Retail News—H. P. Neble & Son, who have for many years been connected with Apperson sales in Omaha, have purchased the Omaha Apperson branch and assumed charge. Their territory includes Nebraska, western Iowa and the Black Hills district.

W. S. Barker, distributer of the Dixie Flyer, has opened salesrooms at 2107 Farnam Street.

The Overland Omaha Co. has leased the quarters of the Ford Motor Sales Co. and will take possession when the latter firm moves to the Ford branch factory building now nearing completion at Sixteenth and Cuming Streets.

Wadsworth Body to Build—The Wadsworth Mfg. Co., Detroit, will build a two-story factory, 95 by 350 ft., costing $60,000.

St. Louis Items—W. H. Anderson, for several years agent in St. Louis for the Kelly-Springfield trucks, has joined the local Locomobile Co. to take charge of the sales of Ricker trucks.

Ben Edwards, battery expert of the Willard plant, has arrived here to take charge of the service department of the Battery Service Co., which handles the Willard line.

The Reliable Auto Tire Co., 3117 Locust Street, has added a service department.

Sam Broadbent has been made sales manager for the Frye Motor Car Co. of St. Louis. Mr. Broadbent has been in the printing business in St. Louis for 27 years, and for 14 years was secretary of the Lambert-Deacon-Hull Printing Co.

F. J. Walsh, St. Louis, has been named sales manager of the M. & N. Auto Equipment Co. of that city, distributer of Olson Unit. Mr. Walsh comes from the Riefling Carriage & Auto Co.

Henry Hotze & Son, St. Louis, have been appointed agents in this territory for the Pilot car. The executive offices are at 219 Chestnut Street, the service station being on Magnolia Avenue near Grand Street.

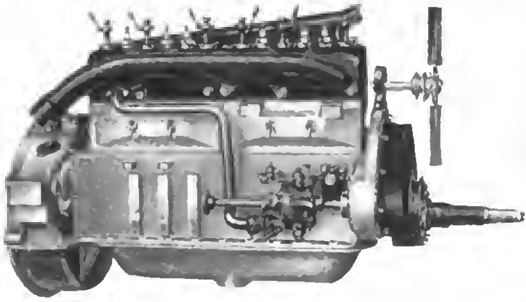
The Moon Motor Car Co. announces the opening of an air system for finishing its cars. R. L. Cleveland, superintendent of the finishing plant, says that, in addition to other advantages, the plant will give the needed increased capacity.

The AUTOMOBILE

Vol. XXXIV
No. 26

NEW YORK, JUNE 29, 1916

Ten cents a copy
Three dollars a year



Growing by Leaps and Bounds

It looks as if 1917 was going to to be a "complete equipment" year in the real sense of the word.

We judge this from the large quantity of Stewart Tire Pumps which have been and continue to be ordered.

Only a few days ago we booked the largest single order ever placed for pumps.

Each week our pump business grows larger and larger.

The survival of the fittest is the explanation.

If you want the best pump—get the Stewart.

"No car is better than its accessories"

The Stewart-Warner Speedometer Corporation, Chicago, Illinois, U. S. A.

Vol. XXXIV New York—Thursday, June 29, 1916—Chicago No. 26

A few of the many thousands of automobiles wrecked in war. All of these machines are capable of being repaired

Rejuvenating Wrecked Cars

French General Clearing Hospital Behind Lines Utilizes Every Part for Practical Purposes

By W. F. Bradley

"THERE must be a tremendous amount of automobile junk piling up behind the armies in France." Doubtless this is a surmise shared by many who have reflected vaguely on the destructiveness of war, but have had no opportunity of examining the methods employed to repair the inevitable loss of equipment.

A collection of radiators from all factories

This opportunity to examine the methods adopted in order to prevent the wastage of automobile material and keep the mechanical transportation service of the army working on the most economical lines came with an invitation of the French War Department to visit its huge centralized repair depot. First aid in automobile breakdowns is given by the traveling workshops attached to each convoy or group. More serious cases are dealt with by the general repair shop—a few miles behind the lines. The first-aid gang can deal with only a limited amount of work of a comparatively simple nature. Theoretically the army workshop can tackle any kind of a job; but when these shops have to be established in barns, under canvas covers on some market place; when they are in danger of being shelled by the enemy, and when they are obliged to maintain a certain degree of mobility, they are apt to be submerged and incapable of carrying out the work intrusted to them either rapidly or economically.

1—These motors have been taken out of condemned chassis. After cleaning they will go to the stores to be used again

2—A corner of the armored car repair department at French central motor depot behind the lines

3—No driver is allowed to throw away a tire or a tube, for in this central workshop provision has been made for repairing hundreds a day and returning them for service

Thus, back of the army workshops the French War Department has established its general clearing hospital. This unique establishment receives the whole of the overflow from the repair shops in the field. Cars and trucks which have been battered by shell fire, vehicles which can no longer be efficiently kept in repair, old models for which spare parts are not easily obtainable, the whole of the automobile wreckage of the battlefields, flows into this central establishment. This organization may be compared to the big hospitals which receive all the human wreckage of warfare. The automobile hospital, however, does not admit of a crematorium in the background, for under the wonderfully efficient system evolved by the French no vehicle, nor any wreckage of a vehicle, can ever be considered valueless.

80,000 Vehicles at Front

Along the French front there may be some 80,000 automobiles of all kinds. This figure does not claim to be accurate, but it is sufficiently near the truth to give an impression of the vast organization dealt with. The overflow and the hopelessly incurables from this vast army are brought in by rail to the central repair depot at the rate of about seventy or eighty per week, and about 60 per cent of these are capable of being rebuilt into perfect automobiles fit for service in the fields.

When this organization was decided on the war had already been in progress a considerable period and there had accumulated several thousand battered remains of motor vehicles of all makes, from all countries, of all ages—having only one feature in common, their inability to run. The law of the survival of the fittest decreed that these first wrecks should be the least valuable of the automobiles of France. They comprised old models which had been doing useful if not very efficient work in various corners of France when the net of the requisition agent swept them up; they were thrown pell-mell into the army, and the army a few months later threw out their cracked and rusty bones.

The officers placed in charge of the central repair depot had to decide what should be done with this old-world wreckage and also with the more modern material which came in from day to day with only slightly varying regularity. It is an invariable rule in the French automobile service that no war-worn cars shall be thrown on the market and that not an ounce of metal nor a plank of wood shall pass into civilian hands. This rule has been strictly adhered to and will continue to be adhered to, to the disappointment of those bargain hunters who are hoping to secure war-worn vehicles for an old song and to the foiling of the man who habitually presides over the junk heap. Speculators can make no money out of this branch of the French army.

Automobile Dissection as an Art

As each batch of wrecked vehicles comes in, a group of expert officers examines them and decides whether the vehicle shall undergo repairs or whether it shall be dismembered. In the former case it is towed or carried away to the repair shops to be dealt with in a manner which will be described later. If dismemberment is the order, the vehicle goes into the temporary cemetery and is dealt with in proper order. These French officers have developed automobile dissection into a fine art; there is not an ounce of material on an automobile which is incapable of being used in some efficient manner. First of all the carbureter and magneto—if these two auxiliaries still remain—are taken off and sent to the stores. A special gang strips off the body, and while one man puts the horsehair into a sack another takes the cloth or the leather, another rips off the sheet metal panels and still another pounces on all the woodwork. The man who is interested in seat stuffings knows the difference between horsehair and the many substitutes which pass under that general term—and he has a special sack for the real thing and another receptacle for the imitation. The same with upholstery and leathers. Real leather from a $3,000 touring car is not stored with the imitation from a $500 runabout. It takes no longer to classify them than to group them, and the saving on quantities is enormous.

The same system applies to the chassis. When the motor is taken out of the frame it is carried across to the cleaning

1—A fine stock of wood obtained from dismembered trucks and omnibuses. This can be used for repair work, shack building, etc.

2—The breakdown gang dissecting an old-time Berliet army truck. The men waste no time in taking the old machines apart but the work is done without breakage of parts.

3—A typical example of how automobiles are wrecked in warfare

shops. It may be found that this unit is in perfect condition, in which case it is cleaned and sent to the stores. It may be that the wreckage is so complete only one connecting-rod can go into service again, in which case that single rod goes into the stores. The gearbox, the rear axle, the steering mechanism, the brakes, all pass under the same examination. If a gearbox, for instance, is unfit for further service, it is not thrown into the junk heap and allowed to lie there. Its shafts are taken out, its ball bearings are separated, its gears, if of B. N. D., or other high-grade steel, are not thrown into the heap with cheap mild steels; the aluminum casting is not flung in with the cast iron.

A Card Index System

The card index system has been applied to this work in a very systematic manner. When a vehicle comes in it is given a number and classified according to its make, model, and year. All the parts saved out of this vehicle and sent to the stores for possible future service are noted on the back of the card. These parts vary considerably: they may be a complete motor, a complete transmission, a complete rear axle, or only a crankshaft, a set of connecting-rods, or a couple of cylinders. But whatever they may be, they are recorded.

How the System Works

As an example of how this system works, let us suppose the repair depot receives a Peugeot XZ model, 1912 type in good condition with the exception of a big hole in the cylinder waterjacket. The officer in charge of records looks up his dockets of Peugeot XZ 1912 models and finds that he has in the storehouse a set of cylinders saved from a previous wreck. He makes out an order for these to be delivered to the repair shop and records their departure from the stores. From time to time repairs will be given out to the factory having originally built the car, and it is the army which will provide the replacements to be used in that car. As European factories are generally working on munitions, the factory stock of spare parts is often low, and in many cases it would be necessary to make parts specially but for this complete system of classifying all parts taken out of condemned chassis. There are numerous cases also of old models still fit for service, but for which spares cannot be obtained owing to the factory being in the hands of the enemy, the firm having disappeared, or other causes. In these instances the army stock allows a good vehicle to be repaired. A particular instance noted during my visit was several Mercedes-Daimler trucks captured from the enemy or picked up on the battlefield. Several of these had been put into service entirely owing to the fact that spares had been secured from disassembled Mercedes-Daimlers. It is estimated that the French army is saving $5,000 a day on its spare parts bill alone by reason of the intelligent application of this system.

1000 War-Worn Cars

The big open-air garage in which considerably more than 1000 war-worn cars are awaiting treatment is one of the most picturesque sights in connection with the war. There is such a variety that it needs a life-long connection with the automobile industry of two continents to identify them without reference to the maker's nameplate. Every possible cause has helped to bring them to this common meeting place. Some are merely worn out from hard service; there are cases of collision, fire, water, high explosive shells, machine gun and rifle fire. A modern-looking gray Panhard limousine appeared to have little the matter with it—its tires were intact and its body carried only the scratches which come of hard service. But when the rear door was opened a silent tragedy was revealed, for a shell had burst inside and the blood of brave men had dried on the floor and seats of that once elegant limousine.

No Young Men

All the men connected with this depot are beyond the fighting age. The only one who could lay claim to youthfulness was the officer who had evolved the card index system. For years before the war he had been a salesman in Paris and London automobile showrooms and had been selected for this post on account of his organizing ability and his intimate

How rubber tires are received from the front

knowledge of the features of all makes of cars. In the various departments were to be found engineers, foremen and testers from the leading French automobile factories—men whose age or constitution would not allow them to undertake the rough work of the trenches, but who were capable of an honest day's labor.

Everywhere Economy

The system of economy was spread to the tools with which the men worked. Tubular chassis built by Renault about 1900, constituted excellent floats for moving material about the yard when stripped of all their organs but the steering gear. Wheelbarrows with a ball-bearing motorcycle wheel and a body made out of a truck's side panels cost practically nothing to produce and were more satisfactory than the usual article delivered by the stores. The rough sheds which serve as offices and will have to be pulled down when the war is over, had windows taken from derelict hotel omnibuses. Chain-driven truck rear axles and springs, of which scores could be saved from the wreckage, were almost ideal for field kitchens.

A Central Repair Shop

With this system in proper working order, a considerable amount of material is accumulated which cannot be used again in the rebuilding of automobiles. These comprise stocks of aluminum, copper, brass, sheet steel, high-grade steels, mild steel, etc., all of which are sold to the foundries working exclusively for the war department. The state monopolizes metals and eliminates private speculation.

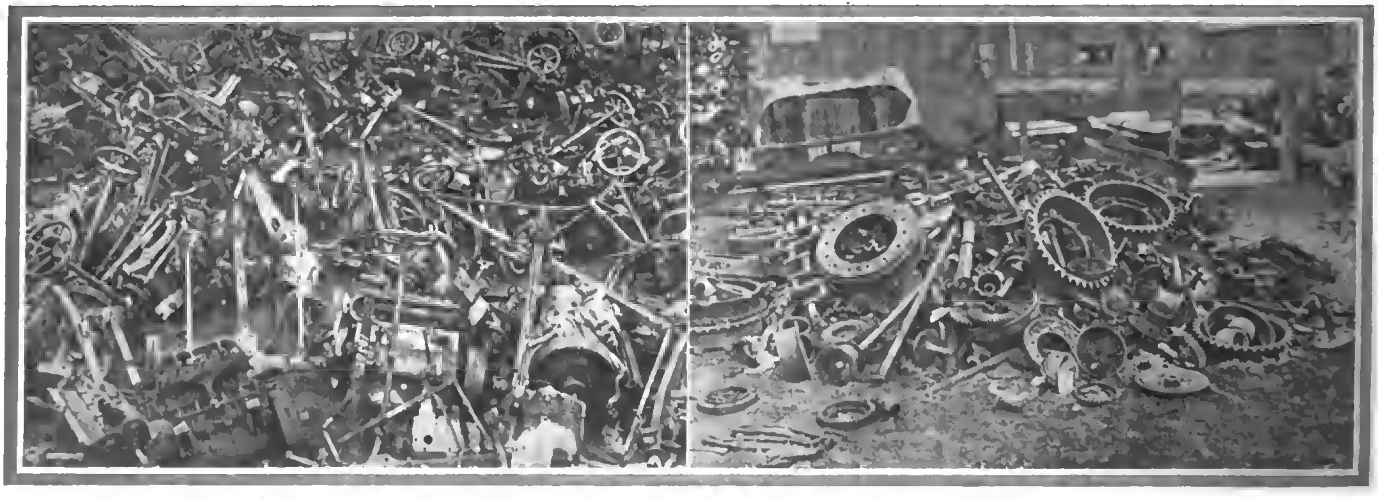
In conjunction with the central receiving and dissecting department is a central repair shop. When this work was begun the repair shop officers were given a wholesale wine merchant's storehouses and yards and told to make the best of it. Within a few months those empty buildings and deserted yards had been transformed into well-equipped shops filled with all kinds of automobiles undergoing or waiting repair. Technically this central repair department only differs from civilian repairshops by reason of its size and the variety of work undertaken. Thus, in addition to the usual divisions dealing with motors, gearsets, rear axles, etc., each of these is sub-divided according to makes. Men who have had experience of American motors, for instance, being kept on that class of work as much as possible, while Knight motor specialists are kept busy on sleeve-valve engines. The range of work covers everything from a heavy 60-hp. four-wheel-drive tractor to a light-weight motorcycle, while the individual repairs may be the changing of a steering gear or the complete reconstruction of chassis and body. Under such conditions a cast iron system is not possible of application, yet the general arrangement is wonderfully orderly and economical. At one end of the building the chassis are dismounted and frame, sheet metal and radiator repairs are carried out. The various units are passed into the engine, gearbox and rear axle departments and assembly carried out on the usual factory lines. Spares are obtainable from the stock of dismembered cars, by an order on the central supply stores, from the home factory, or in exceptional cases the parts may be made in the shops.

Road-Test Department

The road test department is similar to that of the big factories, for every chassis after assembly must go on the road to be passed by the tester. The authorities have at their disposal a remarkably good class of men for this work: several racing mechanics who had been through the whole series of Gordon Bennett events were noted among them, and the officers pointed out testers from such factories as Brasier, Panhard, and Delaunay-Belleville. After the road tests the chassis pass to the body shops, where they are completed, given a final road test, and then returned to the receiving yard from which they are redistributed to the army as required.

Repairing Tires

In the early stages of the war tire economy was considered a matter of no importance. Drivers of touring cars, having neither time nor means of repair, left their punctured tubes and casings by the roadside, and put in a claim for new ones, which claim was never refused. Now all that is changed. Every worn casing and every punctured tube must be returned to the depot from which the driver works. This depot



Left—This may look like junk, but every unit has been passed for service after cleaning and slight repairs. Right—Only high-grade steels are allowed to enter this group sends its damaged tires to the central repair department, and here, in a specially equipped shop, tubes and casings are made almost as good as new. Repaired and tested tubes are packed in boxes marked in big figures with their dimensions, and repaired casings are wrapped in the same way as new tires and labeled with maker's name and size. These repaired casings and tubes are given out to the army as required, the output after only a few months working of this department being several hundred a day.

Presses for Truck Tires

A similar method has been adopted for truck tires. Hydraulic presses are maintained with all the armies on the front, and the staffs in charge of these presses periodically return all the worn-out bandages to the central repair depot. Here machinery has been erected for paring all the rubber from the metal base, this worn rubber being sold from time to time as sufficient stocks accumulate.

So complete and thorough is this system that instead of wreckage being piled up, the automobiles of France are being rejuvenated and the end of the war will find that country with a smaller proportion of old-timers than it possessed at the outbreak of hostilities. Month after month the least valuable trucks and cars are disassembled and their parts sent to the melting pot. Old vehicles which might be good enough for individual service over well-paved city streets are of no use to the army and consequently are not allowed to exist. Only thoroughly sound automobiles are of any value in warfare. It is possible to state that, so far as France is concerned, the end of the war will find the country with a better and more modern automobile fleet than the beginning. Further, this change will have been made without loss to the nation.

Mobile Repair Shops

The mobile repair shops, which have already been described in THE AUTOMOBILE on previous occasions, have been found very valuable for quick repair work of all kinds, one of their special advantages being that they can be moved to any new position within an hour after an order has been received to the effect that such a change is necessary. Each tool is mounted on a special trailer truck and two or three of these trailers are made up into a train drawn by an automobile or a motor truck and this arrangement gives the shops a wide range of action. While they have to be capable of keeping pace with the body of the main army whenever an advance or retreat is under way, these shops do not have to operate absolutely in the open. In fact, they have been found most effective for all-around work when operated at an average distance of 25 miles from the front and at this range it is generally possible to find buildings of a type which can be readily converted for repair shop purposes. Abandoned factories, street car stations, barns or a farmhouse with a large courtyard are found very convenient for the establishment of repair depots. In fact, such extremes as a village schoolhouse and a slaughter house have been selected as places suitable for this sort of work, while a factory with electric power is looked upon as ideal.

A captured Mercedes-Daimler truck which will return to the front when it has received a couple of cylinders and a piston

The equipment of the automobile repair shops usually comprises lathes, drilling machines, grinding machines, a case-hardening plant, and all the smaller tools required for general repair work. Electricity is used for driving the machinery, a gasoline engine and dynamo carried on a trailer being provided for this purpose.

There is more repair work to handle under war conditions as found on the frontier in the north of France than is the case in civil service. But on some parts of the front the percentage of scrapped automobiles and trucks is only slightly higher than in times of peace. The more dangerous conditions, however, and the fact that drivers cannot be selected with as great care in such circumstances, go a long way toward making up the increase in repair work over normal conditions which is found at the shops. Still, it is surprising how hard it is to put a motor vehicle entirely out of running order by bullet and shell fire. The bodies of the machines are frequently wrecked by shells, but it requires a direct hit or very heavy shell fire to render a chassis unfit for further service. It is a simple matter to replace the body work and even trucks which have been under direct fire to such an extent that they had to be abandoned have been towed to a repair shop and put into serviceable condition once more.

Radiator Design a Neglected Factor

Lack of Appreciation by Car Engineer Makes Difficulties for Radiator Manufacturer—Pros and Cons of Various Designs

ORDINARILY, when the car designer gets to the point of determining the size and type of radiator he wants to fit to the car, he gives the radiator maker the dimensions of the front end of the frame and car, indicates the shape desired and provides the radiator maker with such other data about the car and engine as will enable the latter to fix upon the amount of cooling area and general construction of the radiator. If the radiator maker is not able to give sufficient cooling with the limitations imposed, he usually comes back at the car designer and such alterations and changes are generally made as will allow of the proper size and cooling possibilities. Thus, as a general thing, the average car engineer pays little attention to the matter of radiators and depends upon the builder of that part for a proper type to suit his car.

One reason for this lack of consideration of the radiator problem by the car engineer is that each different make of radiator has some differences over every other type. Due to variations in the methods of making tubular and cellular cores, and to other differences in methods of building them up, it is hard to find any formula or data which will work satisfactorily for more than one make of radiator. Each radiator producer has determined through long experiment and test with his particular construction just what it will do per unit of area and thickness and, as this varies for each make, the car engineer could only design the radiator after determining which particular core construction he was going to use.

The Engineer's Part

It does seem, however, that the engineer should have a better understanding of the general radiator problem and of considerations that affect this all-important cooling member, for even though he does leave it to the producer of the radiator to determine the size and type to be fitted to meet the conditions, he could better design the parts that govern its size and shape to give greater opportunity to make it more efficient. Oftentimes some slight change in the front shape could be made to allow a much better radiator shape or size, and this usually could be done without in any way sacrificing the good looks or construction of the car in general. Perhaps the car designer might lay out the contour of the hood and body all unconscious of the fact that he was imposing some heavy limitations upon the radiator, whereas some slight differences in this would make a big difference in the radiator effectiveness if he but knew what they are.

For instance, the placing of the louvres in the sides of the hood and the position of these are important considerations. The width of the radiator, governed by the contour of body and hood, plays a part in the cooling efficiency. Whether or not there is a clear air passage back of the engine is another point influencing the cooling results. Others are the height of the car, the size of the engine, kind and type of ignition, carburetion, fan design and operation, fan location, water jackets of the engine, and a great many other things. Having more or less control over many of these, the car designer, as has been said, can always have an eye upon the health of the cooling system and the radiator if he knows what effect each has.

Take the question of louvres in the hood. It almost goes without saying that the more there are the better the cooling, yet a great many cars have only a very few, while others have none at all. They do not detract from the appearance and therefore they should be used. Besides, these vents should be brought as high as possible on the sides of the hood so that no hot pockets can form at the top of the engine under the hood. The hot air goes up in the engine compartment just as it does in a room, hence vents in the part of the bonnet that is directly above the engine are an excellent thing, although very seldom found.

Price an Important Factor

The personal equation also enters into radiator design to a large extent in that what one man considers adequate cooling will not suit another. That is, the engineering department of one factory may be satisfied, for commercial reasons, with a radiator that will keep the water from boiling up to a certain point, although this same relative efficiency might not be at all satisfactory to another car builder who wished to have a more adequate cooling system. The price at which a car sells also has much to do with it, for the owner of a low-priced car does not object to the engine getting hot under conditions in which the driver of a higher-priced vehicle might think he had a right to expect the engine to keep reasonably cool.

As a general thing the popular high, narrow shape of radiator that is being fitted to a great many cars now is a more efficient shape than the older form with its greater width in proportion to height. One reason for this is the fact that a fan of moderate diameter extends the entire width of the core, cooling the entire flow of water as it passes down, as contrasted with the wider radiator which is too broad to allow the fan to extend its entire width unless the fan is of a diameter that in the average case would be too great to be accommodated in the space available. This is shown by the diagrams in Fig. 1. It will be seen that with the wide radiator at *B* some of the water at the sides does not get the effect of the fan, while at *A* all the water is given the benefit, although the fan is of the same size in both cases. Then, too, the high and narrow radiator gives a greater head and a greater distance for the water to pass from the top to the bottom, thus causing this water to be cooler when it again reaches the inlet pipe to the cylinder jackets.

In determining the type of radiator to use, the engineer is always confronted with the question of price. While it is generally accepted that the most efficient type of cooling unit on the market is the cellular radiator, nevertheless there are some very efficient tubular varieties whose builders claim almost as much cooling efficiency for them as for the cellular. The tubular core has a much smaller amount of seams that must be proof against water leakage than is the case with the cellular, but the tubular form is generally bulky. Being less costly than the cellular and in some forms giving an excellent account of itself, the tubular has seen wide use. Therefore, it is first necessary for the engineer to choose the type that presents the least number of possibilities for leakage with the best compromise with price and efficiency.

The thickness of the metal used in the core also has a bearing upon the efficiency, although for mechanical reasons it cannot be as thin as it should be for greatest radiation quality. Generally speaking, the amount of heat radiated varies inversely with the metal thickness, this fact forcing the compromise just mentioned. Copper is the best metal to use in the core construction, but brass finds a very extensive place because of its being stronger so as to add to the mechanical rigidity of the built-up core. Where possible, however, in tubular types, copper tubes should be used in preference to any other. Some makers used copper in the forming of the cells of their cellular types with most excellent results. The use of any other metals in the radiator makeup should be discouraged due to chances for corrosion and rust. Some of the fittings are made of malleable iron in certain of the radiators on the market, but brass is better. If iron is used, it should be well tinned to prevent the destructive rust. Most good radiators have brass or copper tanks at top and bottom, also. Due to the unusual condition of brass being even more costly than copper at the present time, many radiators at the moment are being made with copper tanks instead of brass, but this is even better than brass, although under normal conditions it would be a more expensive construction. Copper is also easier to form, resulting in less wear on the dies.

There is some difference of opinion among radiator makers as to the advisability of making the core and shell separate, assembling them with bolts instead of soldering shell to core as an integral part. Some hold that the bolting of the core into a shell relieves the more delicate part of the strains that are set up by the frame, while others are of the view that such construction does not give as substantial a radiator unit, it after all being a question of solidly mounting the core so that vibration will not have a chance to work on the core.

Soldered-in Core Is More Rigid

There can be no doubt that the securely soldered-in core is more rigid as a whole, and that if the shell is of sufficient strength, any frame weaving will not have any very deleterious effect upon the core, but there is one strong point in favor of the separate shell. That is the matter of enamelling, for with the separate shell it is possible to give it as high a bake as is given any other metal part, this resulting in a more lasting enamel finish than can be obtained where the shell is integral with the core. In the latter construction the whole thing has to go in the baking oven, and the baking temperature must be kept down to prevent melting the solder. Ordinarily the solder will commence to melt at about 250 deg. Fahr., hence the baking temperature must be kept well below that amount to allow for any possibility of the temperature being higher in certain sections of the oven. This means that the enamel used has to be a low-baking variety, which is softer and not nearly so durable as that which is baked on at higher heat.

The matter of the size of the upper tank is an important consideration, more particularly where thermo-syphon cooling is employed. The depth of this tank for the pump-circulation system varies somewhat; with the average about 3 to 3½ in. so as to afford sufficient water to always keep the top of the tubes or cells covered. It being one of the requisites of a thermo-syphon radiator that there be sufficient head of water covering the tubes or cells, the tank in this case must be even larger, and they are usually extended back with considerable overhang to increase the quantity of water for the purpose. Tanks are frequently 5 in. deep, but there is a limit to the amount they can be allowed to extend back, due to the troubles in adequately supporting them, there being considerable weight when filled with water. Probably about 4 in. is the maximum amount they should extend back for good practice.

A well designed radiator core does not rely upon the solder to do more than act as an effective seal to the seams against water leakage. Solder is a very weak material and cannot be relied upon as a strength factor, hence the seams should be so formed that they hold together firmly due to their inherent construction, the soldering merely being for the purpose of making watertight joints. Most modern radiators are built with this idea in view, and there is much less trouble through seam leakage than there used to be several years ago before the radiator problem had been given such extensive thought.

There are a great many lesser details in actual radiator design that are important, but are given little thought save by the radiator makers themselves. One of the first of these is the matter of disposition of baffle plates or similar pieces within the tanks so that the water will be distributed properly throughout the core with no excessive amount flowing through one section. Usually the water enters the radiator upper tank at the center, and there must be internal webs or plates that will insure an equal amount flowing down throughout the extent of the core bank. At the bottom, the outlet is usually at one side, which is also a point requiring provision for equal drainage from all parts. It is not a difficult matter to insure this equal distribution, but, of course, the more elaborate the provision for it, the more the cost, although this is not out of proportion to the very advantageous results obtained.

Refinement that is especially appreciated by the car driver is the method of threading the filler cap and filler tube now practised by a great many. What is referred to is the cutting of the cap threads on the inside, which prevents damage to them in case the cap is dropped. It also has the advantage that the filler tube threads are outside, which obviates any possibility of hurting these through the use of funnels, etc. Yet, the writer was surprised to note only recently a new car brought out with the tube and cap threads in the opposite relation on its new shape of radiator; that is, filler threads were inside and cap threads outside.

Although it is hard to find any very logical reason for it, there is a growing prejudice against the V-radiator. Many are of the belief that it is not so efficient. Certainly it does not admit of as great core rigidity, and there seems to be some difficulty to give the water equal distribution. As a tendency, it seems to be giving way to the high and narrow type, but whether this is merely because of a change in car fashion or to real mechanical superiority of the latter is difficult to determine.

Although the radiator of to-day is a very effective unit, it still admits of a great deal of refinement and improvement, and radiator makers and car engineers should get closer together on this very important matter. As a general thing, the radiator engineer knows most about the subject of cooling, what the causes of inefficient engine cooling are, and what factors make for the best all-around efficiency.

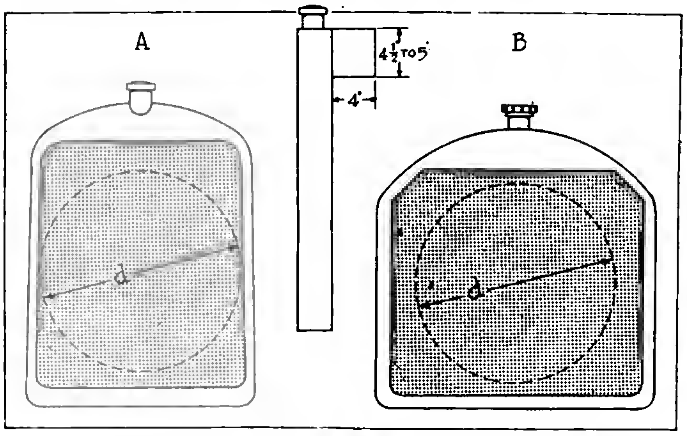

Fig. 1—Diagrams to show advantage of narrow radiator as regards fan diameter. Fan has same diameter in both cases, but it extends entire width of case in case A and leaves some space on either side of B

Fig. 2—Center—Size of upper tank for thermo-syphon should not be less than 4½ in. deep, nor extend back over 4 in.

Colonial Body Lines in New Liberty Six

Five-Passenger Touring Car To Sell at $1,095—Other Models To Follow—Standard Units Make Up Assembly—Transmission Emergency Brake a Feature

ALL speculation as to the design and appearance of the Liberty car is now dispelled by the coming of the car itself. The Liberty is to be manufactured in large quantity by the Liberty Motor Car Co., Detroit, Mich., one of the newcomers of last Fall, which is headed by Percy Owen, formerly prominent in the field as sales manager of the Chalmers company and later connected with the Saxon concern. Things have been moving rapidly since Mr. Owen organized his new company, and not only are the first cars on the road, but within a very short time the first production models will be coming through.

Standard Units Used

The Liberty might be considered as new in body and general design, though its parts are mostly known to the motorwise. It has a six-cylinder Continental engine, Delco electric equipment, Timken axles, Borg & Beck clutch, Detroit Gear & Machine Co. gearset, Rayfield carbureter and Stewart vacuum fuel feed, among other features. At present only a five-passenger touring model is to be supplied, and this is to sell for $1,095.

Built on a wheelbase of 115 in., the Liberty has sharper angles and straighter lines than are usually to be found in the body shapes of the day, but these have been blended into what might be a colonial tendency, the various curves being carefully proportioned to produce a harmonious effect. There is no bulge at the sides of the cowl, and simplicity at the front is brought out by the sharp edges of the rather high and narrow radiator, these being carried back by both the hood and the cowl. In addition, the car is hung low, and has a lengthy appearance, as shown in the illustrations.

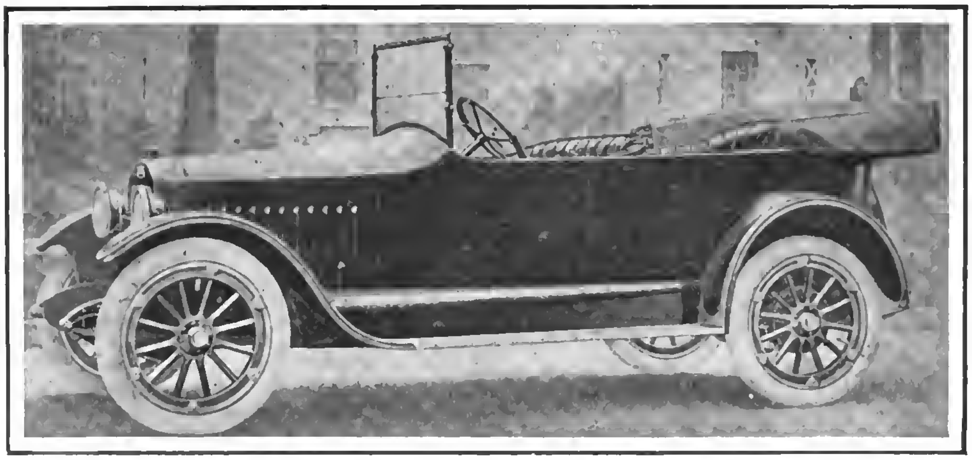
Front view of new Liberty six

In addition to this unique body design, there is another point that immediately becomes evident upon examination of the chassis—the extreme simplicity of the mechanism. By using the Hotchkiss type of drive through the springs, and by placing the emergency brake system forward on the transmission, a point that will be touched upon more in detail later, it has been possible to produce a chassis that is about the acme of simplicity. No rods of any kind nor other complications are to be found back of the power plant, with the exception of the one rod which controls the foot brakes on the rear wheel drums. An idea of this can be gained from a glance at the plan view of the chassis.

Cooling Is by Thermo-Syphon

The six-cylinder motor has a bore of 3⅛ and a stroke of 4½ in., which dimensions give a formula rating of 23.4 hp. with a displacement of 207.1 cu. in., making it evident that there is plenty of power for the chassis, which is really very light. This power plant follows usual Continental six-cylinder practice, with the single exception that the cooling system is of the thermo-syphon type instead of being by a pump. In changing to this simplified method of cooling, specially-designed waterjackets were formed and rather unusual precautions taken against any restrictions in the water passages due to core sand, core wires, fins or other foreign matter.

Built with the head detachable and the upper portion of the crankcase in unit with the cylinder block, a very rigid and substantial construction results. Being integral with the bear-



Liberty six-cylinder, five-passenger touring car which sells for $1,095. This car has a wheelbase of 115 in., the motor is 3⅓ by 4½ in., and 32 by 4-in. tires are used. Other features are the single dry-plate clutch, transmission emergency brake and reserve gasoline supply

ings that carry the crankshaft, there is no possibility of misalignment between the cylinders and the crankshaft—a feature that is conducive to smooth running and absence of vibration. There are three main bearings for both camshaft and crankshaft, and the moving parts are balanced accurately, pistons and their assemblies being of equal weight throughout.

Cast integral with the head is the large water outlet connection, and on the right are the valves and exhaust manifold as well as the generator and fan drive. The carbureter and starting motor are the main units on the left, the former bolting directly to the cylinder casting high up, with distribution of the incoming gas through cored passages within the casting to the intake ports on the other side. This feature not only makes a simpler motor, but assists in gas vaporization, due to the cylinder heat around the passages. Valves are completely inclosed by two pressed steel cover plates.

Oiling by Force Feed and Splash

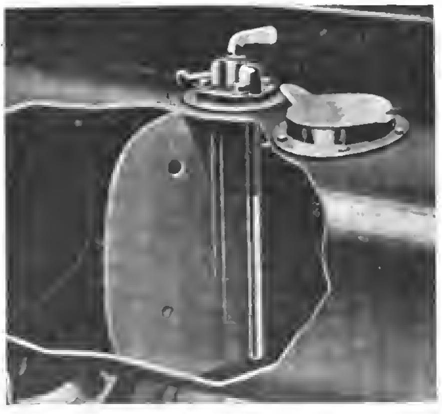
In line with standard Continental design, the lubrication system is a combination force-feed and splash arrangement, whereby the oil is forced through copper tubes direct to the main bearings and the timing gears by a horizontal plunger pump driven by an eccentric on the camshaft. This lubricant then drains back into the oil pan and maintains the splash troughs under the connecting-rods at a constant level. There is an oil pressure gage on the instrument board and a filler gage on the side of the crankcase.

Liberty is among the first to be fitted with the new two-unit Delco starting, lighting and ignition system, in which the ignition distributer and coil are in unit with the generator, the whole being driven by a horizontal shaft on the right, and the starting motor is attached on the opposite side close to the flywheel housing. Starter drive is through the Bendix automatic shifting mechanism, which meshes a pinion with the flywheel gear when the starting current is switched on by a pedal, and automatically demeshes when the engine gets under way and the speed of the flywheel exceeds that of the starter driving shaft. In connection with the control of the ignition distributer, a detail worthy of mention is the use of a flexible wire cable to turn the distributer on the principle of an antenous release. This does away with a complicated set of levers and rods ordinarily employed to actuate the distributer from the lower end of the steering column, especially when the distributer is on the opposite side as in this case.

Single Dry Plate Clutch

Clutch and gearset are in unit with the motor, and they are arranged to go together very compactly. This is due in large part to the simple single-plate clutch. The plate runs dry and is held in engagement by a pressure of about 2500 lb., which is obtained by stepping up the force exerted by a 200-lb. spring by means of a series of levers. Thus it is practically an impossibility to have clutch slippage with such a large force holding the engagement, and at the same time a reducing linkage makes the throwout very light, it being possible to depress the clutch pedal with the forefinger. The driven plate is held in engagement between two wire-woven asbestos disks, and due to the clutch design, these can be used until entirely worn out with no detrimental results. Adjustment is only a matter of removing the clutch cover plate and shifting two bolts.

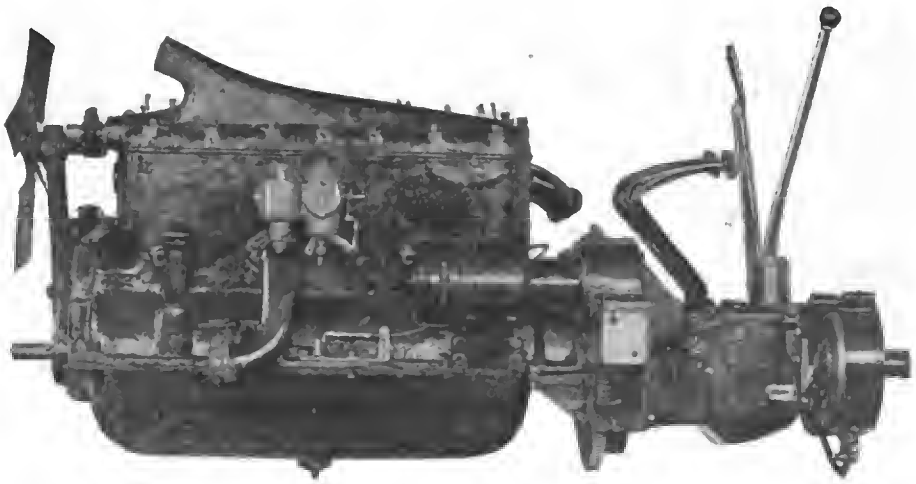
Roomy driver's compartment of new Liberty six



Partition forming 3-gal. reserve compartment in gasoline tank

A feature not often found on American cars is the emergency brake on the transmission shaft. This is just back of the gearbox and ahead of the front universal joint, bringing it about as close as it could possibly be to the brake lever. The brake consists simply of a drum on the shaft, with an external contracting band around it, this band carried by a yoke attached to the gearbox. The arm of the brake lever attaches directly to the brake rod, greatly simplifying the control. This type of brake, used extensively on foreign cars, simplifies the rear wheel system and obtains the added leverage of the rear axle gear reduction which multiplies the braking effectiveness and requires less effort to stop the car. Further, both rear wheels get an equal retardation, there is less chance for brake road rattling and by bringing the brake forward, adjustment is merely a matter of lifting the floorboard. The emergency drum is 8 in. in diameter by 2½ in. wide, giving a braking surface of 63 sq. in. The service brake drums on the rear wheels have external contracting bands, and are controlled in the conventional way, with the equalizer placed under the intermediate cross member of the frame. These drums are 12 in. in diameter by 2 in. wide.

Having incorporated most of the mechanism with the power plant, even to bringing the emergency brake for-



Intake side of unit power plant used in Liberty six, showing high carbureter mounting

ward, it is evident that the rest of the chassis admits of marked simplicity. The driveshaft, fitted with a universal at each end, is a tubular member that is light in appearance yet amply strong for its work. It conveys the power to a Timken semi-floating axle that has a pressed-steel housing with axle tubes that are swaged and electrically-welded to the housing. The driving gears are of spiral-bevel form, and a two-pinion differential is fitted. The whole mechanism is carried on Timken roller bearings; two back of the drive pinion, one either side of the ring gear and one at each wheel. The standard gear ratio is 4 11/16 to 1.

In order to take the drive and torque, as is required of them where the Hotchkiss drive system is employed, the rear springs are of ample size, being 50 in. long by 2 in. wide, with the master leaves plenty large to care for their additional duties. These springs go directly under the frame rails to give good support, and are semi-elliptic. The rear end of the frame rails are bent down to take the end of the springs, which go under the axle tubes. Thus the springs are almost flat normally and efficient spring action is obtained, while at the same time the body is hung low. The front springs are also of the flat type and measure 38 in. long by 1¾ in. wide.

Straight Taper Frame

Special mention should be made of the frame, which is not only of a deep channel to form a rigid ground work for the body and running gear, but is a straight taper from front to rear. This allows of a short turning radius of 20 ft., and at the same time makes a substantial support for the body along its entire length. The channel is 5 in. deep, has a width of 2¼ in. and is made from ⅛ in. metal.

Special attention has been paid the detail refinements that mean much for the convenience of the car owner. At the sides of the windshield, for instance, it is often difficult to make the side curtains fit snugly against rain or wind. To take care of this, rubber strips have been provided here as well as at the bottom of the shield, effectively sealing the compartment when the curtains are up. Then the door curtains are made to swing with the doors, making entrance and egress free without damage to the curtains.

Unusual Gasoline Tank

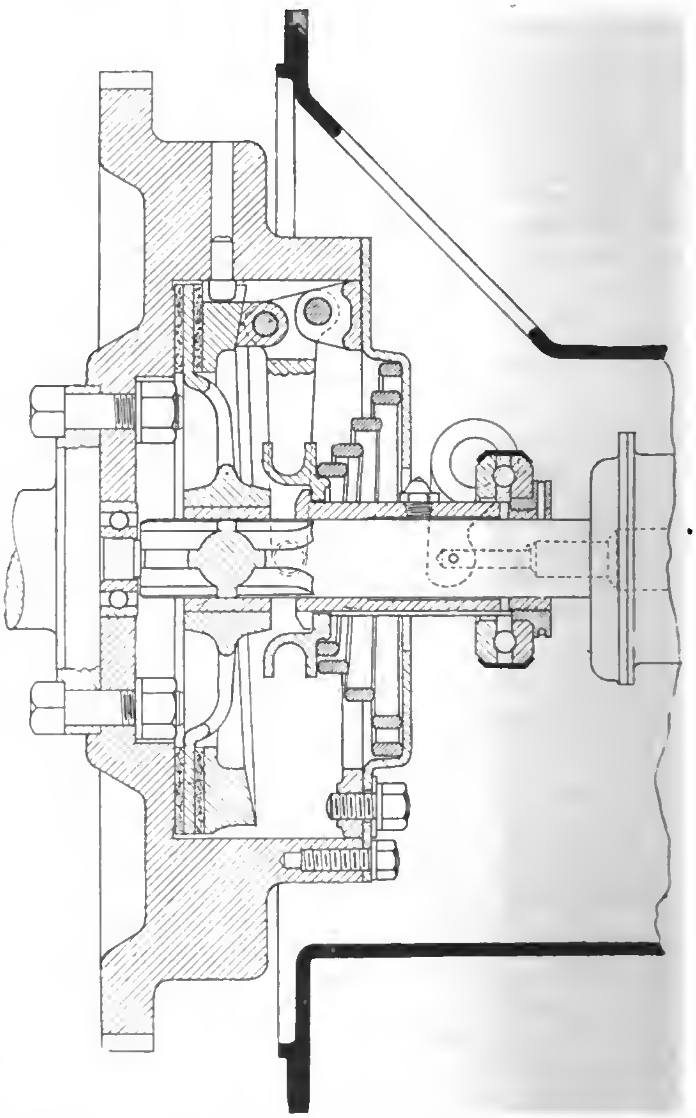
Another feature is the specially-designed gasoline tank at the rear of the chassis. It incorporates a reserve compartment that holds 3 gal., this being formed by means of a dividing wall perforated by two ½-in. holes located well up toward the top of the partition. When the main tank is filled to the height of these holes, gasoline flows in to fill the reserve compartment, and two tubes, one on either side of the partition terminating in a three-way cock and leading to the main gasoline line, constitute the simple control. Normally fuel is drawn from the main tank, but should this become empty, the control cock is turned and the reserve supply becomes available.

Other Bodies Planned

Grease cups on the spring shackles and at other chassis points have been discarded in favor of oil cups. As an example of the installation of these cups, all shackle bolts are drilled and two small wicks are inserted, the bolt being slightly flattened along the line of these wicks. It is explained that the cups are easily filled with oil, and that it has been found that lubrication is more satisfactory this way than where grease cups are used.

In addition to the five-passenger touring car, the Liberty company expects to build on the same chassis a number of open and closed type bodies. Among these is a close-coupled four-passenger open roadster, besides which there will be a town car that is promised to be of elaborate finish.

Tires are 32 by 4 in., non-skid in the rear.



Section of simple single plate clutch used in Liberty six. The plate is held in engagement by a pressure of about 2500 lb., being stepped-up through a series of levers from a 200-lb. spring. Thus the action is soft and the effect large

Dorris Oiling System Now Force Feed

Better Body Design and Racing Type Radiator Improve Appearance of 1917 Model—Top Has Also Been Re-Designed—Few Changes in Chassis Construction—Price Is Continued at $2,475

AN entirely new car in looks, the Dorris model IB-Six for 1917 has a new body of better lines and a radiator which is a distinct departure from the former type. The mechanical changes are few, in fact no radical alterations have been made except in the oiling system, which is now of the force-feed type. The price of $2,475 remains unchanged.

The fundamental construction of the Dorris car has not been changed in 11 years. Features of the design which have weathered the tests of time and are even at this date most up-to-date practice are: valve-in-the-head motor with valves actuating from one camshaft, unit power plant, multiple-disk clutch, Timken axles, platform rear spring and 22-in. fan-type flywheel. The car has a 128-in. wheelbase and is fitted with 36 by 4½-in. tires.

The 4 by 5-in. six-cylinder motor was introduced last year with practically the same elements of design as characterized the four. The oiling system for the 1917 model takes care of all motor bearings and the overhead rocker arm bearings from the pressure pump. Oil is forced to the wristpin bearings through a copper tube embodied in the crankshaft drop forging. The breather tube opens into the inclosed overhead valve compartment, utilizing what oil vapor is given off for a valve lubricant. Of course this is only an added source of oil supply as the rocker arms are hollow and oiled direct from the pressure pump.

An added feature in the oiling system which, although a very small item, is of unusual value to the car owner, is the petcock drain, in place of the usual pipe plug. This drain cock is easy to reach and permits the owner to drain his crankcase regularly without inconvenience. Dorris lays particular stress on this matter of cleaning out the crankcase, because of the poor grades of oil and gasoline now on the market.

Radiator of Racing Style

The new body is of striking originality. The radiator is patterned after that used on the Peugeot racing cars. Both the front and the back seats will comfortably carry three people. Body refinements are noticeable throughout. As another step towards simplicity and accessibility, an aluminum dash is fitted which is made a part of the chassis itself. All electrical wiring is carried on this dash and none of the fittings have to be disturbed when occasion demands that the body be removed.

The one-man top has been redesigned, with a view to creat-

Dorris six-cylinder touring car for 1917 which sells for $2,475 ing a conformity between the body lines and the top itself, with striking results. Although the height of the top is sufficient to give clear vision to the occupants of both seats and allow entry with but very little stooping, the design has been so worked out that the extra height is not noticeable.

Curtain Refinements

The Dorris idea of perfecting every item, no matter how small, is evident in the construction of the side curtains. Irons are provided which fit to the back of each door attached by the aid of thumb screws. The curtains fasten solidly to the top and body on one end and slide over these irons on the other, making an assembly which permits opening and closing the doors without unfastening the curtains. A flap is provided over the rear window of the top which can be let down during night driving when the glare of street lights throws a reflection through the rear window onto the windshield, hindering the vision of the driver.

Although the Dorris chassis design has been refined rather than changed for a number of years a résumé of the principal characteristics will show how thoroughly modern each unit is. The crankshaft is suspended on seven bearings, eliminating any possibility of a sprung crankshaft or a vibrating crankshaft. The camshaft is carried on the same number of bearings, and, according to the factory, this construction is invaluable in a large six to maintain rigid cams and thus establish perfect timing under any conditions.

Valves Easily Removable

Each valve is set in a cage which is readily removable with the aid of a wrench. The push rods, which float between springs on the upper and lower end, are actuated from the camshaft by the means of rollers. The assembly which contains the rollers is kept from revolving by the aid of steel pins sliding up and down in slots within a brass shell. Perfect action without noise and maximum reduction of wear are claimed for this design.

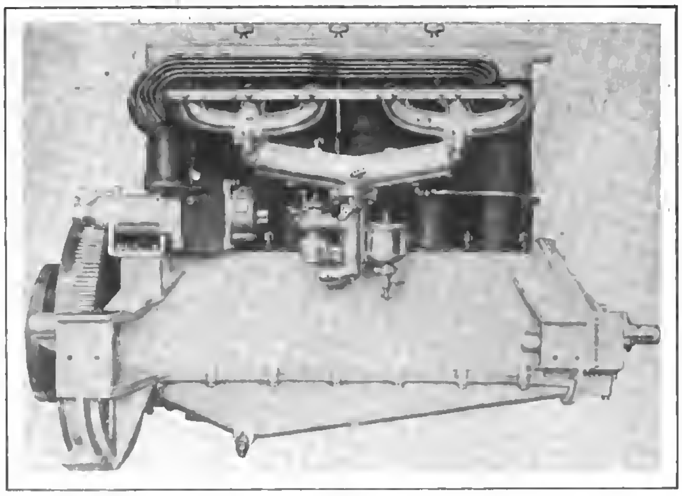
Although the power plant is a unit with the motor it is not inclosed in a housing integral with the motor as is usual practice. The reason for this is that the large flywheel contains fan blades which assist in the motor cooling and carry the heat away from the front seat floorboards. To enable the air to circulate from this fan, the gearset is fastened to the motor with arms which are a part of an aluminum casting.

The gear train drive of the starter has been discontinued and the Bendix system is used in its place. The two-unit Westinghouse starting and lighting system and Bosch magneto ignition are continued without material change except in the starter drive as mentioned above, and the routing of wires from the new aluminum dash described previously.

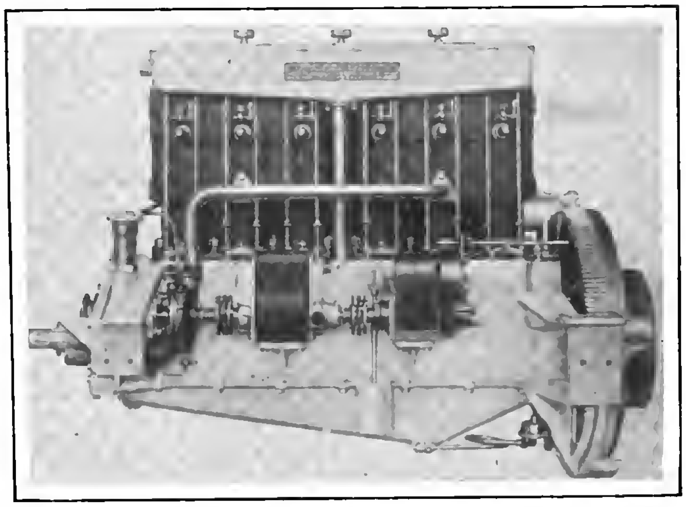
Dorris has long been an advocate of platform spring suspension. The new car is carried on exceptionally large springs, the rear side members being 50 in. long and 2½ in. wide, with eight leaves; the cross spring is 40 in. long by 2½ in. wide, with eight leaves, and the front springs are 42 in. long by 2½ in. wide with ten leaves.

For the rear axle a Timken product is again used with spiral bevel drive and 2½ in. wide brakes of large diameter. The torque is taken care of through a forged torsion bar suspended between the rear axle and a bracket on the center cross frame member.

A peculiar little detail that seems to make for convenience and better distribution of weight is the use of a pressed steel cylindrical gasoline tank located next to the left side member of the frame. This placing enables a filler and a gasoline gage to be arranged so that they stand almost flush with the front floorboard; the gage can be seen at any time by glancing downward, and the filler is accessible by merely opening the side door. A Stewart vacuum feed is employed for raising the fuel to the carbureter.



Right side of 1917 Dorris six-cylinder motor, showing arrangement of intake and exhaust manifolds and mounting of carbureter



Left side of the motor, showing the mounting of the ignition and lighting units. Note the inclosed overhead valve mechanism

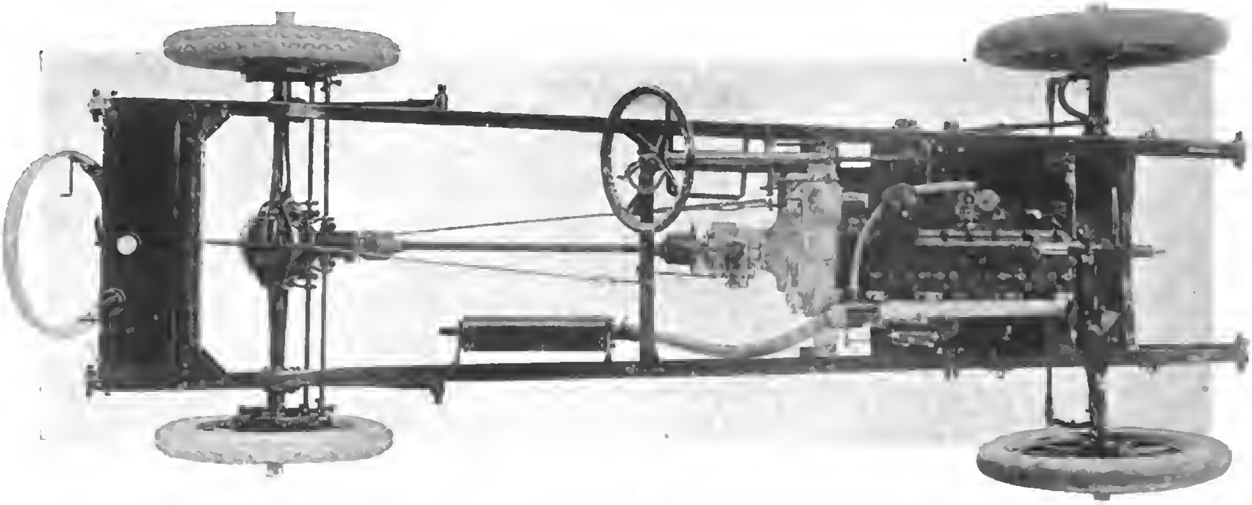
Every part of the car but the body and axles is Dorris built. The gearset retains the feature incorporating a locking device by means of which the gears cannot possibly be shifted until the clutch is released, and there is no possibility of more than one gear being engaged at a time.

The equipment of the new car is complete, including Stewart tire pump and horn.

Spending $22,605 for Shop Economy

FORD, ONT., June 24—Big economies sometimes cost considerable money. This was illustrated at the factory of the Ford Motor Car Co., this city, where the rearrangement of the machine shop cost $22,605. Four hundred new machines costing $325,000 were installed in the new machine shop opened recently, the floorspace being increased by over 2 acres. The progressive assembly system demanded that 1300 heavy machines be moved to new locations, so that successive operations might be performed on adjacent machines. To move these, Ford pony cars of the type used to haul material from one part of the factory to another were brought into service. These were attached to one, two and three and even four machines, which were dragged along the floor of the factory. In some cases the hauling was for almost the entire length of the machine shop. 705 ft. Labor and materials for putting in the new machines cost $13,375, and the expense of removing the old ones was $9,230.

Two-Unit Electric System in New Moons



Chassis of the 6-66 model Moon for 1917. Note the clean design and general simplicity of the assembly

Two Sixes Are Continued for 1917 as Models 6-66 and 6-43—Automatic Spark Advance Used—Four-Passenger Roadster Added for Larger Chassis

IN accordance with its plans to adhere strictly to the construction of high-grade six-cylinder cars, the Moon Motor Car Co., St. Louis, Mo., will continue its two 1916 chassis for the coming year. The model 6-40 is continued with but few changes as the model 6-66 and the car of later design known as the 6-30 in the 1916 production will be continued as the model 6-43. The price of each has been increased. The larger car which was listed last year at $1,475 now sells for $100 more and the small six has been increased in price from $1,195 to $1,250.

Two-Unit Electric System

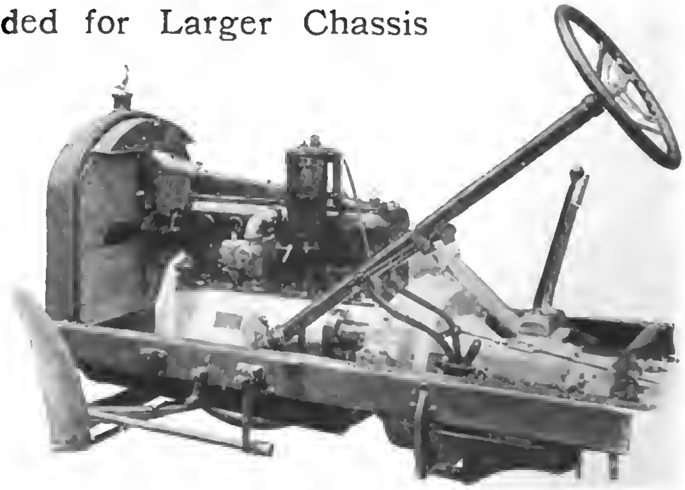
The most noticeable change in both chassis is in the electrical system, a two-unit outfit being used in place of the single starting and generator equipment of the 1916 models. The new Delco-Moon two-unit system embodies an automatic spark advance and a new switch with an ammeter in connection.

The bodies have also been refined and the 6-66 touring now has the tonneau cowl. The tops of the bodies have been tumbled in, creating a marked streamline effect. Acting upon the great demand for four-passenger roadsters, the larger six is offered with an unusually attractive body of this type at the same price as the touring car. A light six can be had in a three-passenger roadster at the same price as the five-passenger touring car.

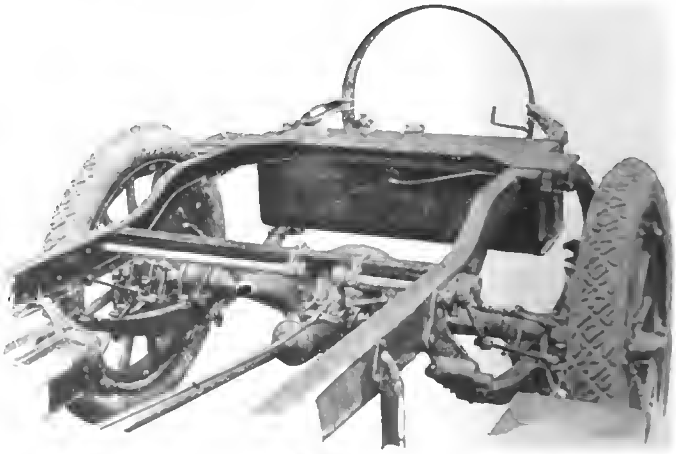
The two models are mechanically similar, the difference being principally in the size of the parts. Continental motors are used of 3¼ by 5¼ and 3¼ by 4½ cylinder dimensions fitted with Delco cranking, lighting and ignition units and the Stewart vacuum feed system. The clutch is disk in unit with the motor, the gearset a three-speed selective type and drive is by a hollow shaft to a floating axle. Timken axles are used, front and rear.

Bendix Drive Used

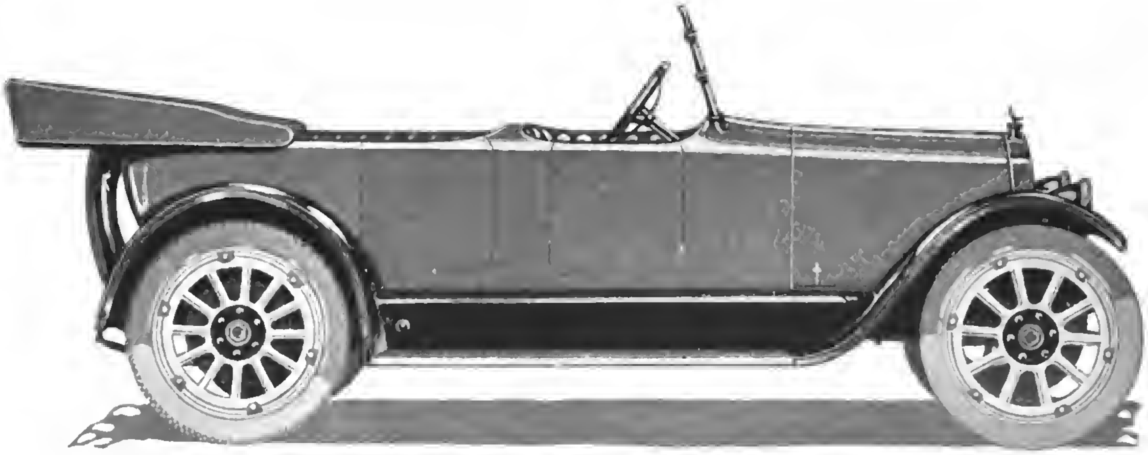
The adoption of the double unit Delco system is accompanied by the use of a Bendix system of drive on the starting motor which is now bolted to the left side of the crankcase.



Intake side of the power plant of the Moon 6-43 model for 1917. Note the absence of complications and the general accessibility. The carbureter is mounted high and the Stewart vacuum fuel feed tank is close beside it. Note the flexible exhaust pipe



Rear construction of the new Moon chassis, showing the rear springs slung under the axle, Hotchkiss drive being used. Note the strong brake linkage and the gasoline tank supports which are integral with the frame



Moon 6-66 touring car which has a tonneau cowl and slanting windshield. Ncte the smooth body lines

The generator is still located on the right side of the motor and is driven from the water pump shaft. On the right side also is the exhaust manifold which has attached a flexible tube instead of the non-flexible type commonly used for carrying off gases. The oiling system in both motors is the same combination splash and force feed as used in other large Continental power plants.

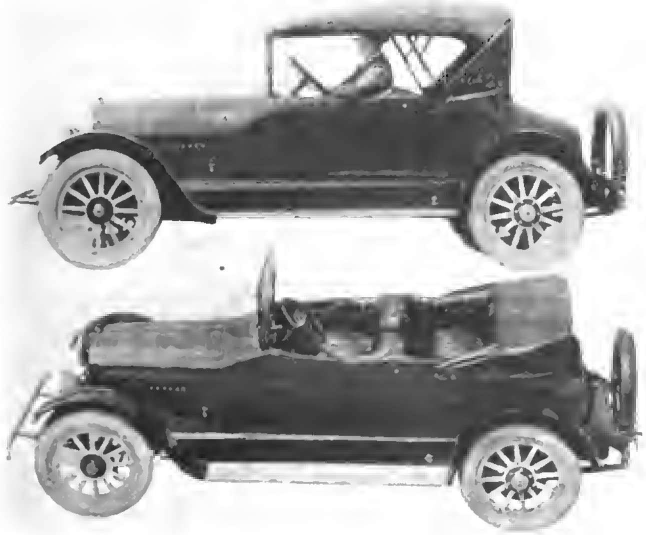
Hotchkiss Drive Employcd

The drive from the motor is conducted to the rear axle through the Hotchkiss principle, double universals and a floating axle being used. Moon engineers have carefully worked out the framing design to take care of the Hotchkiss drive. The frame is of bottle-necked shape in front to enable a short turning radius and is constructed in the rear to form an integral support for the gasoline tank and tire irons.

Although accessibility has been a big factor in the design of the chassis throughout the same careful attention has been given the deslgn of the bodies and the kind and location of the equipment. The touring car tonneaus are unusually large with wide doors having concealed hinges and locks. Both front doors open wide, permitting the driver to enter from either side. Upholstery is of genuine leather, stuffed with curled hair. A slanting windshield has been incorporated to enhance the speedy lines of the cars and a Stewart tire pump and Warner speedometer, driven from a gear which constitutes the flange on the front universal, are standard equipment on both models.

Tires Larger on Big Six

Tire sizes have been increased on the big six. The 6-66 is equipped with 35 by 4½ in place of 34 by 4 tires and the 6-43 carries 34 by 4, the same size as last year. The wheelbase of the larger car, model 6-66, is 125 in., while that of the 6-43 model is 118 in.



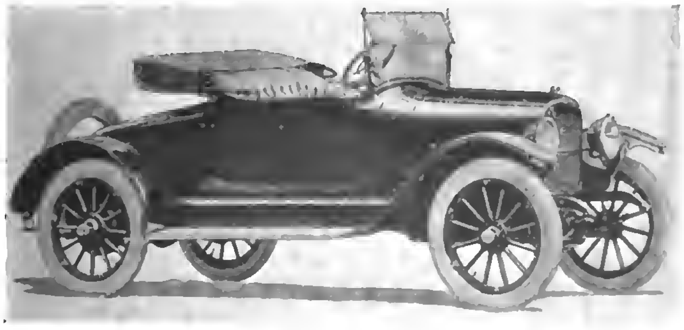
The new Cole eight-cylinder four-passenger Tuxedo roadster

Cole Adds Four-Passenger Tuxedo Roadster Model

CONCENTRATION on the production of one chassis enables the Cole Motor Car Co., Indianapolis, Ind., to offer a wider variety of body styles than heretofore. Distinctive among the new types is the four-passenger Tuxedo roadster mounted on the eight-cylinder Cole chassis. This new model is practically a small touring car, built for four passengers but with sufficient room for traveling accouterment.

Ample Storage Space

The Tuxedo model has a divided center cowl and a rear deck which contains a roomy baggage compartment accessible by tilting the back of the rear seat forward a few inches, furnishing an air, dust and waterproof compartment. There is also a special alcove in the back of the front seats which makes possible additional knee room and foot comfort for those riding in the rear seat. Vanity pockets on the sides of the car afford convenient repositories for veils, goggles and other traveling equipment.



Allen 37 four-cylinder 1917 roadster selling at $795

Allen Brings Out New Roadster

A NEW two-passenger roadster has been brought out by the Allen Motor Car Co., Fostoria, Ohio, selling at $795 f.o.b. the factory. It is mounted on the standard Allen chassis fitted with a 3¾ by 4 in. four-cylinder block unit power plant. The 112-in. wheelbase and 55-in. rear springs insure easy riding qualities, the seats being carefully proportioned and fitted with deep cushions. There is a big waterproof rear deck compartment and the body and wheels are finished in olive green with radiator, hood, fenders and running gear in black enamel.

King 8 on 2-Weeks' Endurance Run

The New York City police had a field day at the speedway but the King eight kept on its way

SHEEPSHEAD BAY, N. Y., June 27—Running steadily, day and night, and circling the board track at a speed of more than 30 m.p.h., the King model E stock car, which started upon its non-motor-stop run on Thursday, June 15, has now completed over 9000 miles of its journey. The motor has never been stopped for a second since the test started, and when it comes to its close on Thursday, June 29, it will have run continuously for 2 weeks.

This test is designed to show the dependability of the car under conditions which are similar to those of actual use by an owner, but more severe as far as average speed is concerned and as far as continued running has its influence. In the 2 weeks of continuous motor running the car will have traveled a distance equivalent to that given in 2 years of service by the ordinary owner. At the end of the first week of travel nearly 6000 miles had been covered or as much as the average car owner will drive in 1 year, and this without a single stop of the motor. Since the car started on its journey at 12.14 on June 15, the crankshaft has not stopped revolving.

In carrying out this test the King company has established a headquarters on the speedway, having moved a corps of drivers and mechanics to the spot and also provided quarters for the American Automobile Assn. officials, under whose direction the test is carried on. The committee in charge is made up of F. E. Edwards, chairman, J. Edward Schipper, Harry A. Tarantous and Fred Elsner. The drivers each take the wheel for 5 hr. at a stretch and have 10 hr. rest between periods. The mechanics are also riding under similar conditions, the same mechanic always being with each driver. The drivers are men from the experimental and testing departments of the King factory in Detroit, and the car is one taken from the regular production in the factory and has been certified as standard stock throughout.

The entire equipment of the car is also stock, even to such small details as the voltage of the lamps, etc. The car is being driven at a speed of very close to 30 m.p.h., the average being somewhat higher than that as it passed the 9000-mile mark.

The whole distance has not been covered on the board speedway, as the car was driven 200 miles over the roads of Long Island during the morning and afternoon of Saturday, June 24. During this time the car was off the track for 9 hr. continuously and was put through touring conditions of hilly country and variable road conditions before returning to the track and continuing its circuit around the same bowl which has staged the Astor cup races and other races.

While the official figures have not yet been checked over and announced by the A. A. A. officials, it is expected that the gasoline and oil consumption of the car will be very low in spite of the 30-m.p.h. speed and the difficult weather conditions such as continuous rain, thunder storms, varying temperatures and humidity, etc. The windshield is up, and besides the driver and mechanic in the front seat, the tonneau of the car is ballasted with sand bags to represent a passenger load. The top is in place but is carried in its down or closed position and an extra tire and rim is carried on the rear so that throughout from one end to the other the entire car is in the same condition as it would be placed on the road by the ordinary owner.

At the conclusion of the test the engine will be torn down and rechecked for the information of the A. A. A. and also for engineering inspection by the King company. During the course of the run there has been no decrease in power of the engine, but, as a matter of fact, while on the track the car has been driven with the hand throttle, and for the same throttle opening higher speeds have been made than with the

Official send-off of the King eight on its 2-weeks' run by Starter Wagner original setting. The tire equipment of the car is exactly the same as stock with Firestone plain tread in front and Firestone non-skids in the rear. The extra tire carried is a Firestone non-skid. The gear ratio is also standard, and while traveling the lamps are carried lit for a large percentage of the time, giving the lighting system as rigid a test as the other parts of the car.

The car making the run has a 3 by 5-in. V motor with a formula rating of 28.8 hp. and a piston displacement of 282.7 cu. in. The motor is cast in blocks of two and is made by the King company. Lubrication is by pressure; Atwater Kent ignition is used; a Ball carbureter with a hot air pipe and vacuum feed is also used. A Ward Leonard starting and lighting system is another feature. Other features include: plate clutch; spiral bevel drive; the car is driven through the springs; has floating rear axle and 33 by 4-in. tires.

Replenishing the supplies of the non-stop-motor King eight

A New Demountable Rim Patent

Hydraulic Pressed Steel Co. Secures Rights on Wood Wheel Rim and Also on New Steel Wheel

TWO new demountable rim constructions which are claimed not to infringe the Perlman patent have been granted by the U. S. Patent Office to O. A. Parker, manager of the wheel department of the Hydraulic Pressed Steel Co., Cleveland, Ohio. The company states that it assumes from the granting of these patents that the essential feature of the Perlman patent is the use of a single nut or similar device which operates a wedge holding the rim both laterally and radially. In the new patents the rim is secured radially by one set of attachments and laterally by another. Further, it is claimed that these individual attachments are of great value in that they prevent the rim from being misplaced. Since neither the radial nor the lateral attachments have a wedging action and simply exert straight pressure, it is possible to tighten one completely before passing on to the next. There is no need to tighten the various securing nuts progressively.

The Wood Wheel Rim

The nature of the invention is shown clearly in the accompanying illustrations. Taking the wood wheel first, this has a felloe band with a flange, which is not coned but merely stands square to the wheel. On one side of the demountable rim, beside the valve hole, there are some dowel pins which take the drive. Opposite the dowel pins several bolts or set screws are threaded radially through the felloe. Close to these radial bolts are two or three transverse bolts by means of which small tongues of steel are drawn against the outer edge of the detachable rim, so pressing it laterally against the flange at the back of the felloe band. To attach the rim the valve dowel pins are hooked into the holes provided for them and the rim is then pushed on the wheel. The lateral clips can then be tightened, pressing the rim back against the shoulder on the felloe band and a few turns of the radial bolts will then complete the locking.

The Steel Wheel Construction

The steel wheel operates on much the same principle and is based upon the already well-known Parker steel wheel. In this case there is no felloe band, the rim attaching to the ends of the spokes. These spokes are provided alternately with radial locking bolts and lateral clips, the detail being shown very clearly in the illustration.

It is claimed that the new rims are lighter than the majority of demountable patterns and that they have a manufacturing advantage in that no hot-rolled parts are required, the rims being rolled up from ordinary sheet. It is announced by the Hydraulic Pressed Steel Co. that it will be in a position to commence deliveries on a large scale almost immediately.

Street Sweeper with Brush Encased to Produce Auxiliary Suction

WHAT may be considered the most up-to-date type of road sweeper is manufactured by Clayton & Co., Ltd., in Grosvenor Road, S. W., under the name of the "Hill's Patent Motor Vacuum Road Cleanser," but it is not really operated on the principle of a vacuum sweeper, having in common with this type mainly that it carries away the sweepings. Some illustrations and a cursory description accompany this statement in *The Commercial Motor* (London) of May 11 and serve as authority for the following:

The machine is built with a "Karrier" motor truck chassis supplying the vehicle features, and its powerful Tylor motor drives the rotary brush sweeper as well as the vehicle. The brush is contained within a steel casing and can be expanded by ingenious means—partly explained below—so as always to scrape the side of the casing and at the same time exert sufficient pressure on the road to remove all loose dirt and dust. The sweepings are carried around by the brush and thrown off by centrifugality through an opening above it leading into a receiver tank of 75 cubic feet capacity, this volume of sweepings representing an average weight of 3 tons.

Above the receiver there is placed a water tank of 100 gallons capacity, whose contents are sprayed in front of the brush, to obviate as much as possible the rising of the dust. A small pump driven from the vehicle motor adds force to the spray and helps to secure against clogging of the nozzles.

As the weight of the vehicle when nearly full is very considerable (apparently about 7 tons), and the work of driving the brush is added, the Tylor motor is necessarily of large dimensions, with 5-inch bore and 6-inch stroke. It is mounted under the driver's seat. The propulsive transmission from the gearbox, which is bolted up to the motor, takes place by means of a pair of bevels to a long shaft carried in a casing at the right-hand side of the chassis, and this drive-shaft conveys the power by worm and worm-wheel to a differential and cross-shafts situated a short distance in front of the rear road wheels. From the cross-shafts to the wheels the final transmission is by chains.

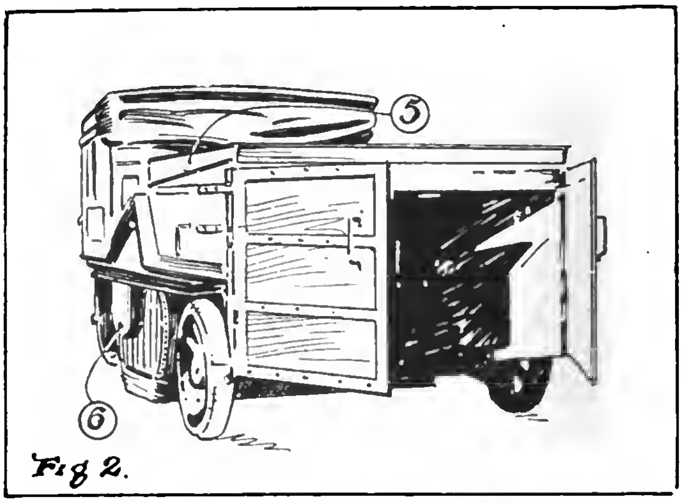

Fig 2.

Fig. 2—Rear and left-side view, with discharge doors of refuse tank open. 5—Location of 100-gallon water tank. 6—Casing for chain operating the brush

The brush is driven from the front end of the motor through a clutch which is operated by a separate control lever. It is entirely independent of the propulsion mechanism of the vehicle. It is 4 feet in diameter and 7 feet long, extending so far to the sides that the edges of the pavement can be swept as well as the middle of the road. Each of the 20 smaller brushes of which it is composed is slung in the outer ends of a pair of levers which are here carried by nuts on a shaft with right and left-hand screwthread. By revolving this shaft the diameter of the whole brush can be altered at will to take up wear, keeping it always 4 feet in diameter until the bristles are quite worn down. Revolving at high speed, the brush sets up a considerable draft within one side of its casing, and this action, intending to collect dust by suction, accounts for the name of the machine.

Figs. 1, 2 and 3 show the general appearance and give the location of details by reference numerals.

[The adjustment of the brush appears to depend on a parallelogram action of the pairs of radiating levers supporting the individual brushes in conjunction with some provision for maintaining the side reach of the brush constant. Suction is probably assisted by the high circumferential speed of the brush, which is operated with the driving movement, not against it.]

Constant-Mesh Gears for New Buses

Paris Renews Omnibus Service with Chassis of Changed Design and New Streamline Bodies—Wood Wheels to Go

New Paris omnibuses have streamline effect with unbroken roof and scuttle dash

PARIS, JUNE 6—Twenty-two months after withdrawal on account of the war, the Paris motorbus service has been partially re-established with a single route served by thirteen buses running on a five-minute schedule. The established line is over the main boulevards from the Madeleine to the Bastille.

Interest attaches to these buses by reason of the good service they have performed in the war, and the modifications which have been carried out on the new models as the result of war experience. It was an old-standing arrangement that in case of mobilization the whole of the motor buses of Paris should be equipped with special meat-carrying bodies or with lighter bodies for the transportation of troops. The parts necessary to modify the buses were kept in stock, so that within 48 hr. the Paris motorbuses were transferred from civilian to war service.

Several attempts have been made by the bus company to re-establish its service, but on every occasion the vehicles were requisitioned by the army as soon as completed. It may be taken that the army now has sufficient supplies, for the last batch of thirteen has been allowed to go on the streets, an assurance having been given that they will not be taken over by the military. There is no intention of resuming the whole of the Paris service while the military situation remains as at present. Before the war Paris got its motorbuses from the De Dion Bouton and the Schneider factories, the bus company making most of its own bodies and its own road wheels. Lately the company has shown a desire to build its own vehicles, although being dependent on the De Dion Bouton and other factories for many components. There is an impression that the company will eventually follow the example of London and build entirely in their own shops.

The single decker type of bus, carrying thirty-five passengers, with driver placed above the engine, has been maintained as the most suitable for Paris conditions. The engines of the new buses are built by the De Dion Bouton Company, and are four-cylinder L-head type, cast separately, of 4.3 by 5.9-in. bore and stroke. There is nothing very distinctive in the design except that, unlike the majority of French trucks, they are governor controlled. Cooling is by thermo-syphon, but instead of the De Dion Bouton radiator the Solex type is used. This is a circular tube radiator with centrifugal fan discharging hot air laterally.

Originally the Paris motorbuses ran on a 50 per cent mixture of benzol and alcohol, but immediately before the war were using benzol only. Now, owing to the commandeering of benzol supplies, they are using gasoline in a modified Zenith carbureter. Lubrication of the engine is by De Dion pressure system to the five main bearings and to the connecting rods.

The entire power plant is carried on an elongated U-subframe 3-point suspended to the main frame and about a couple of inches below this latter. The underpan has been abolished and no attempt has been made to fill up space between main and subframes. As the magneto is driven by a cross-shaft across the front of the engine it appears to be in a rather exposed position, but on city service no trouble is experienced from this cause. The De Dion Bouton type of plate clutch is used.

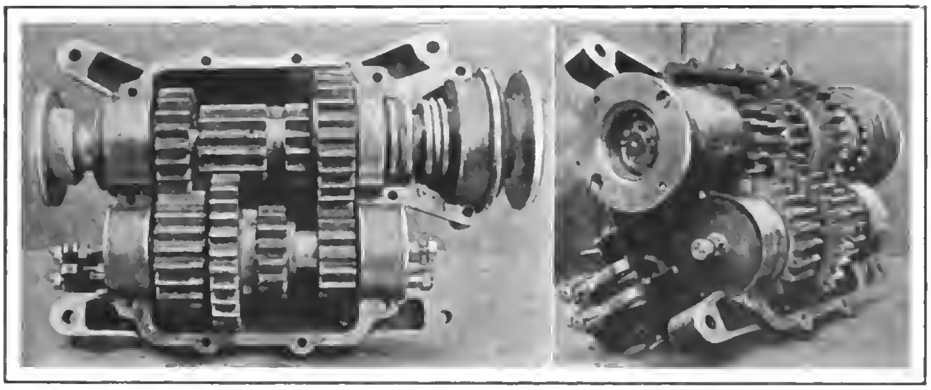
Has Constant Mesh Gears

Before the war practical tests were carried out with various types of gearboxes. These proved the superiority of a patented type of gearset known as the Dux in which the gearwheels are in constant mesh and engagement for each combination is obtained by internal gears. The sliding member on the engine shaft incorporates in itself two gears which mesh with first and second gears on the layshaft. The faces of these teeth are long enough to allow of their being moved in both directions to clutch with the internal teeth of the members for obtaining the third and the direct drive without allowing the gears on the layshaft to come out of mesh. Gear changing is easy; also, all the forward gears engaging with internal teeth which are close to their supporting bearing, there is no bending moment in either the main or the layshaft and the gears remain silent. Both three and four speeds have been used. The former are sufficient for city work, while the fourth gear has been found preferable for army service. Rear axle construction has undergone no change, this being of the internal gear type incorporating Hotchkiss drive through semi-elliptic springs having a face width of 6 in. Rearwheel brakes are formed of hard wood blocks on the internal gear drum. Foot brake is external contracting type with cast-iron ribbed shoes.

Weed Out Wood Wheels

As the result of war experience the Paris Bus Co. has decided on the use of cast steel in place of wood wheels. A few of these latter have gone into service, but this is only to use up stock. The war department will no longer take wood wheels and the company has also concluded that the cast steel type is preferable for city work. Both front and rear wheels have eight spokes, and are fitted with single band tires in front and twins at the rear.

Before the war there was considerable complaint about the mud-flinging propensities of Paris buses. To remedy this evil a public competition was held, with a view to finding some more efficient guard than the square leather splasher suspended from the hub-cap of each wheel. This competition proved the value of a rubber ring, with a face depth of about 2 in. and the same diameter as the tire, attached to the wheel with a gap of about a couple of inches between it and



New gearset with constant mesh pinions adopted by Paris Omnibus Co.

the tire. The device, which has been patented, has been adopted by the company for all its vehicles. The improved method of fitting it is to have the steel rim sufficiently wide to receive the rubber ring with the necessary gap between it and the tire. This device is indestructible and cuts down about 75 per cent of splashing.

There has been a certain attempt at streamline forms in the new bodies. Instead of the dash being vertical, it is of the cowl type, giving the driver the maximum amount of protection. The roof is domed and forms an unbroken surface from the driver's cab to the end of the rear platform. Side windows are bigger and interior fittings are lighter. Acetylene lighting from gas contained in cylinders has been abolished in favor of electricity.

A glance at the accompanying illustration discloses, on the whole, lines and proportions which are bolder and more pleasing than any seen before in omnibus design.

Conflict with Previous Report on Paris Omnibus Construction

On the authority of *Engineering* of London it was stated in a recent article on Paris omnibuses that the two types of chassis, the Schneider and the De Dion-Bouton, which had been gradually developed before the war, and have been found very serviceable during the war, were to be reproduced in all their essential features for the resumption of omnibus service in Paris, and brief illustrated descriptions of these features were therefore presented, deriving their interest largely from the unusual indorsement implied in the re-adoption of them without material changes. But now comes Mr. Bradley, the competent and well-known correspondent of THE AUTOMOBILE in France, and calls attention —in the foregoing account—to some very important changes in the new series of De Dion-Bouton omnibuses which are finally to replace the old ones in the new city service, and the information seems to imply, moreover, that these omnibuses of changed design will largely replace the Schneider omnibuses, which were before in decided majority.

Sharp competition between the Schneider and the De Dion companies, or complete absorption of the large Schneider works in military matters, would seem to be at the bottom of the discrepancies in the reports, but Mr. Bradley's version is doubtless the correct one, as well as more in accordance with what would be expected of the progressive Paris omnibus company, which has never shown any inclination before to rest on its oars. The new change-gear, in which clash is avoided by means of internal-gear clutch pinions with wide-faced teeth, which maintain continuous mesh independently of gear changes, is a departure more than ordinarily significant, the new arrangement demanding much less skill of drivers than the older construction.

The change from wood to cast steel wheels is also nothing more than could be expected, since the same tendency is observed even in this country where the supply of suitable wood is much more dependable.

Cylinder Scores Filled With Nickel

IN order to avoid the necessity for reboring or regrinding cylinders, which are slightly scored by loose pistons or loose wrist pins, a new process is coming into use. The scores in the cylinders are filled with a nickel alloy which is smoothed down to the inner wall of the cylinder and is permanently welded in place. In working with this composition not enough heat is applied to warp the cylinder walls and therefore the necessity for reboring and regrinding is eliminated. The Wilkes-Barre Welding Co. of Wilkes-Barre, Pa., are making a specialty of this work, the cost of which is not high. By the same method repairs can be made on complicated breaks in crankcases, cylinders and housings, if these are made of cast iron, steel or aluminum.

Validity of Mortgage on Dealers' Cars

WHEN a company sells automobiles to a dealer and takes notes secured by a chattel mortgage, the mortgage is not valid in Texas if the automobiles are to be exposed for sale by the dealer in the ordinary course of his business.

The agent of a certain make of automobiles at Houston, Texas, gave a written order for six automobiles and agreed to pay $9,651 for them. Thereafter an ordinary chattel mortgage was given covering the purchased cars. Some time later the dealer sold one of the cars to a man who re-sold it. The company finally had a writ of sequestration issued and the car was seized.

The court held that the company had no right to seize the car under the chattel mortgage, as it had not reserved title to the cars and that, as it had been contemplated they would be exposed for sale by the dealer in the ordinary course of his business, the agreement was invalid. The car owner was therefore allowed $850 as damages against the company for the car which had been taken from him.—(*Case vs. Lipper*, 181 *S. W.* (*Texas*) 236).

Accident Liability Voided

Where an automobile insurance policy issued to a manufacturer of automobiles requires notice to be given of all accidents, the fact that the superintendent of the company, after investigating the report of an accident made to them by an attorney, believed that no accident occurred and failed to notify the insurance company, will not excuse the failure of the automobile company to give the required notice.

Suit was brought by an automobile manufacturer against an insurance company under an automobile liability policy and also for the amount of damages paid by the manufacturer in satisfaction of a judgment against it for personal injuries.

The accident out of which the claim arose occurred as the result of a horse driven by a woman becoming frightened at one of the manufacturer's automobiles which was being tested. Judgment was recovered against the manufacturer on the claim and reimbursement was refused by the insurance company.

The court relieved the insurance company from liability.

Paragraphs on Current Topics

By Marius C. Krarup

Motto: Radical Thought, Conservative Action

Considering that profits are mostly spent in making life more picturesque and interesting for the maker of them, there would seem to be a shorter road to final results in occasionally going in for an unproved side issue in the routine of manufacture and taking a sporty view of the possibilities for profit. But the stockholders' expectations stand in the way of thus humanizing success and getting its rewards before retirement, in the form of new sensations and achievements, and for this reason the participation of the automobile industry in aviation—now so widely expected—and in the improvement of agricultural motor tools and implements must probably take place entirely through new corporations under a predominating personal control. One-man power is apparently still indispensable to make business a picturesque occupation.

* * *

Since one still hears the question asked whether it is expensive to run an automobile, it is not yet too late to answer it with another question: Does it cost something to travel, or have your family travel, about 3000 miles every month at an average speed of 30 m.p.h. and to blow your friends and neighbors to sumptuous suppers at the road houses? Answer: With six up, about 8 cents per mile; suppers *ad lib.* By reducing speed to 15 m.p.h. no gasoline is saved, but the mile comes down to about 4 cents and the friends get scarcer, the meals plainer. The six persons, more or less, lose theoretically 100 hours per month, which may be profit or loss, according to their habits. In real life, however, they lose 1500 miles and gain the cost of them, while seeing more, exercising more and making more new friends with cars of their own.

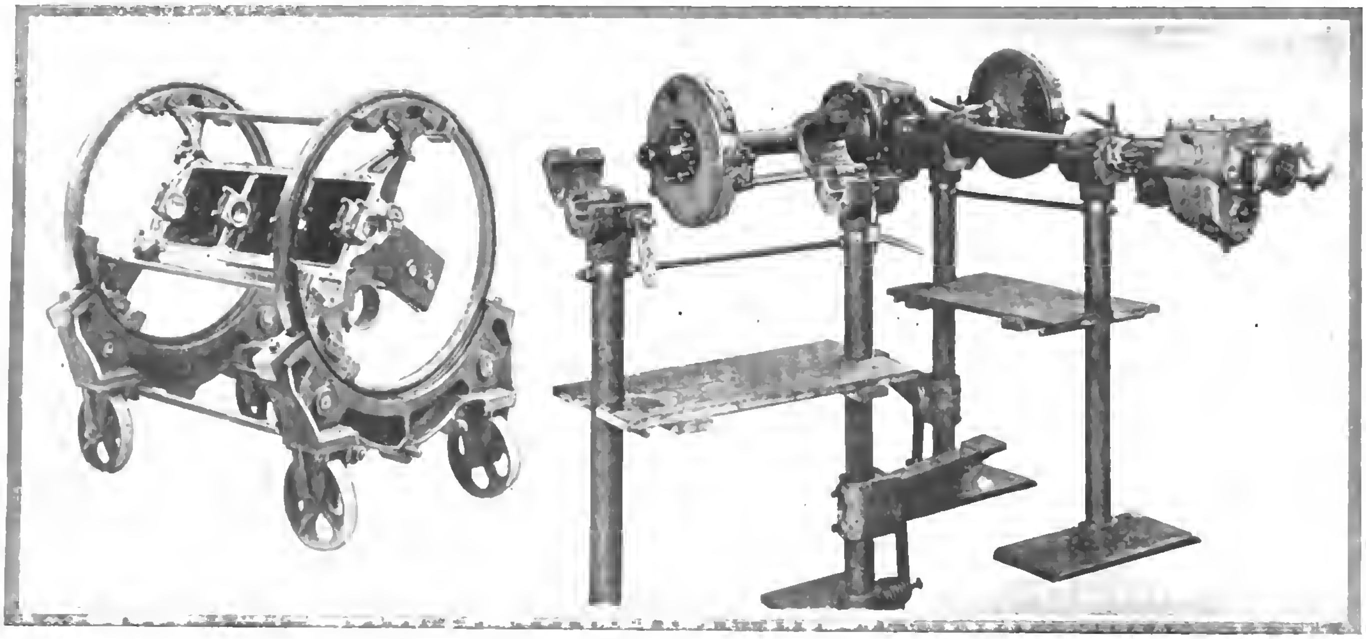
* * *

A sensitive paragrapher finds it disgustingly snobbish to advertise that "Success Rides in Closed Cars." But he underrates the ad-writer's shrewdness and philanthropy. The real parvenus are not numerous enough to bother with. The dart is aimed at the multitudes who need a hint to help success along. It conveys a business-like suggestion for their benefit. And were it snobbery, how and in what category should deliberate and professional snobbery be classified, having a laugh up its own sleeve? Whatever be the ethics of it, the sentiments of an ad-writer must be vicarious and tolerant, like those of a constitutional monarch, an actor or of any other victim of civilization who "represents" somebody or something.

* * *

Willis A. Gibbons writes on "Skin Friction of Various Surfaces in Air" in *Aerial Age* of June 26. Nap on cloth causes considerable additional friction, but a smooth surface, such as that of tinfoil, does not in all cases mean a reduction of it. These test results, contemplated with some imagination as to what they may ultimately signify, are perhaps as worthy of attention as the projected Aerial Derby—the "proposed aviation classic," as Secretary of the Navy Josephus Daniels terms it, with generous anticipation.

Facilities in Assembling of Marmon Cars



A special engine stand (at the left in the illustration) and a special rear system stand are used in the assembling of Marmon 34 cars.

The engine stand is constructed of gray iron castings and is mounted on four wheels so that it can be very readily moved. The engine can be turned in any position in the stand. The aluminum casting is first bolted into it and the other parts of the engine follow till the unit is complete.

The other illustration shows two rear system stands—one open and ready to receive the torque tube and the other with the rear system mounted and clamped in place. The arm extending from one of the uprights has a spring arrangement by which the center piece of the rear axle is held in line with both side housings for insertion of through bolts.

The FORVM

ADVANTAGES OF TWO-CYCLE ENGINE COMPARED WITH FOUR-CYCLE—EXPERIMENTS ON TAXICABS SHOW DIFFERENTIAL TO BE NECESSARY

Two-Cycle Superior to Four-Cycle in Performance

By Chas. E. Duryea
Consulting Engineer

HAVING spent much time and money experimenting with two-cycle engines and knowing by actual results that the two-cycle can be very satisfactory on all points and compare favorably with the four-cycle, I dislike to remain quiet when incorrect views concerning the two-cycle engine are expressed. If the man who thinks the two-cycle cannot handle its charges for lack of time will extend his exhaust ports well around the cylinder he will find he need not open so early as does the four-cycle exhaust valve and that he can run with fair power up to 3000 r.p.m. or over. Nor is there a high heat flow to the cooling jacket. On the contrary, the two-cycle lets its hot gases get out quickly and cool gases enter and absorb the flash of heat before it gets far into the wall. A two-cycle will cool easier than a four-cycle on this account. That a two-cycle is not efficient at full power is largely true but automobile engines seldom work at full power and at part power the two-cycle is more efficient than the other because of the constant compression.

Crank bearings can easily be fitted with stuffing boxes if one is really anxious to hold the crankcase compression. Having but about one-fifth the number of parts that the four-cycle has, we may add many and still have much advantage. But this is not necessary. Splendid two-cycles can be made with very little complication.

Flexibility and Two-Cycle Engines

That they are not flexible is another fallacy. First define flexibility. If we mean that motor is most flexible which develops least power at 300 r.p.m. and most power at 3000 r.p.m. then the four-cycle is winner, but that is not my definition. For automobile use I need a motor which will pull like a mule at 300 r.p.m. and yet be able to speed along over perfect roads at 3000 r.p.m.; and that is just where the two-cycle shines. It takes full charges at low speeds and develops surprising power for mud, sand and hills where power is needed and where one does not like to use the low gear. Perhaps it is wasteful of fuel at such times. So well does it run and so hard does it pull we can afford to overlook this fault. Bad roads do not occur often, we think.

Cooling Ability Not Limiting Factor

That the cooling ability is the limiting factor either is not true, or is misstated. Air-cooled two-cycles can be made as easily as can air-cooled four-cycles. Nor is there any difference in the fuel needs. Or if there is it is in favor of the two-cycle which carries several charges in the crankcase where they are warmed and fully vaporized before passing to the cylinder. I have used crankcases so hot that low test cylinder oil vaporized. Almost any grade of fuel could be used in such an engine after it warmed up.

Every advantage is in favor of the two-cycle. It is cheaper, simpler, lighter, gives double the number of impulses, has constant compression and therefore higher efficiency, except when forced to the point of crowding its new charge out with the old, is more compact, less noisy and has much less internal friction. Many folks think it will not idle, but if one will shut off the fuel or sparks so that half the strokes are idle ones as in the four-cycle it idles even better than the four-cycle. But with every one pushing the four-cycle, the two-cycle like air cooling has a hard time to find buyers. There were almost as many new automobile buyers last year as old users. Can you blame them if in their inexperience they followed the crowd and bought the oldest and best known kinds, even if not so good? But men who know better things should not remain silent.

Taxicab Experiments Show Differential a Necessity

By L. P. Prosson

I HAVE been reading with great interest the different articles published in THE AUTOMOBILE of the possibilities of eliminating the differential in motor vehicles and as I have had quite a little experience along this line I take this opportunity to bring forth the results of my experiments.

In 1913, when I was mechanical superintendent of the Yellow Taxicab Co., I conceived the idea that it was possible to operate a vehicle without a differential and selected two good running cabs, removed the differential, locked the axles in the housings and put them in actual service.

The first day out the drivers complained that the cabs were very hard to steer and that the brakes were binding when going around corners, that the motors were laboring hard through traffic and that they preferred to go around the block instead of turning in the street.

Of course, we immediately knew the trouble, but as we wanted to carry the test further we insisted on keeping the cars in service. We told the drivers that the steering and brakes were in good condition, but they continued to report the same trouble.

After a couple of weeks' running, with many complaints, one of the cabs had a live axle broken and a few days later the same trouble occurred to the other cab. I also kept a very accurate record of the tire wear and gasoline consumption and found both to be excessive.

The result of my experiment was a failure, and I was convinced that it was impossible to operate a vehicle properly and economically without a differential and I also found that it was detrimental to the whole car.

The only time that we could operate these cabs with any degree of satisfaction was on rainy days on account of the wheel slippage being accomplished more easily.

The History of the Pneumatic Tire—8

Great Activity in the Tire Field in Both Europe and America in Early 90's—Jeffery Clincher Tire Patent Invalidated — Many and Varied Types

The History of the American Automobile Industry—35

By David Beecroft

THE A. Strauss cushion tire brought out in 1891, as briefly described in THE AUTOMOBILE for June 22, resembled the Duryea of 4 years earlier, in that the central cavity was of some size, while the open base was comparatively narrow, and not, as in the arched tires, wider at the open base than at any portion of the cavity. It differed from the Duryea, however, in that it fitted a crescent or arc-shaped rim, whereas the Duryea rim had in-turned edges and no other fastening, just as did the later clincher rim.

Much Activity in Early '90s

A very considerable activity existed on both sides of the Atlantic at this time. Of course, the patent record follows the actual work of the inventor by some months, representing the time required in the United States Patent Office. Illustrations of a variety of English designs were printed in American bicycle publications early in 1891. The Columbia and Union tires were brought out about this time while several of Jeffery's devices began to attract attention. His patent issued in June, 1891, shows a casing having metal hooks along its edges and actually hooking into the edges of a rim shaped to receive these hooks. The tire of January, 1892, however, omits the hooks but provides beads which are forced into the overhanging edges of the rim by a stiff base which can be lifted in the center to draw the beads closer together and remove the tire. This tire did not have the open base so desirable in a double tube tire and it was not found easy, by the various inventors, to produce a tire having a base rigid cross-wise and yet flexible enough to be lifted in the center and forced down again in order that the tire might be loosened or locked in place.

Jeffery Patent Invalidated

Jeffery's patent of 1896 shows the more common form of clincher tire and became the accepted type of that kind. The Jeffery patents were supported in the courts for some years and were believed to hold the tire in place by hook action of the bead in its engagement with the edge of the rim. As a matter of fact, this was not what proved to be the holding feature, and the patent was finally invalidated in the courts.

The feverish activity in the eary '90s among tire inventors brought out a surprising number of forms. One of these, by Welch, an Englishman, was adopted by the Dunlop makers in England and was independently developed and patented in this country by Brown & Stillman in 1892. This form used a rim deep in the center but shallow at the sides, forming supports for the edges of the tire casing, which edges each contained an endless wire. To apply the tire, the wired edge was pushed into the center of the rim and thus a sufficient slack gained to bring the last portion over the extreme top of the rim edge, after which the wired edge was brought out against the rim edge, the air tube inserted and the other edge of the tire applied in the same manner. Once in place, the tire could not get off unless the wire broke, but could easily be removed by reversing the process. This form of tire is largely used in automobile work to-day, and is called the straight side tire to distinguish it from the beaded side or clincher type rims with a removable side ring displacing the original type with depressed center.

Stretching Fabric Weakened Tire

Since the endless wires of this straight side tire hold the tire to the rim, and since the shape of the rim prevents the base from spreading, the holding function of the fabric is performed by the cross-wise threads of the fabric rather than by the lengthwise threads. It is impossible to make a constrictive open tire where threads are broken. In the constrictive tire the reverse was true. In order to insure the tire remaining on the rim, the fabric had to be stretched in such a manner that, when inflated, the tire would shorten, and this shortening effect caused great strain lengthwise on the fabric. This strain was objectionable from two standpoints: it tended to cause the tire to burst more quickly because it was already under considerable tension, and passing over an obstacle, threw more strain on the already strained fabric. Second, this fabric, already taut, could not stretch and yield enough to swallow the obstacle, so the wheel is necessarily lifted, which strains both the tire and the mechanism, and is uncomfortable for the passengers. With the wire-edged tire, the fabric could be rather long for a given rim size, and therefore loose and free to yield longitudinally. It therefore could pass over an obstacle without lifting the wheel or straining the fabric so much.

The Rostrum

Would Build Roads Like Railways

EDITOR THE AUTOMOBILE:—The number of automobiles is steadily increasing and likewise the number of accidents, but over 80 per cent of all accidents are the direct result of easily preventable causes. Many preventable accidents can only be prevented by the adoption of a broad and comprehensive system of road operation similar to railroad traffic operation, in which a definite responsibility is recognized as residing in the corporation, state, or town, as well as the automobilist.

In the congested parts of our large cities the traffic is directed by the police and by signs on one-way streets and in the country a few roads, notably State roads, have inadequately posted warning signs and directions, but all through the great number of our country roads there are no warnings whatever to apprise a motorist that he is approaching a dangerous curve, cross road, bridge or other perilous place.

Up to this time the responsibility for nearly all automobile accidents has been laid at the door of the operator of the machine, which is unjust. It is no more right to hold automobile drivers down to 20 or 25 miles an hour in open places than it would be to hold passenger trains down to that limit of speed, if all things were equal as they should be.

A Comparison of Conditions

This brings me to a comparison of the conditions of railway and automobile traffic. Railroad trains travel on a right of way granted them by the State and the State requires them to erect and maintain suitable and safe bridges, viaducts, railroad and wagon road crossings, signs, signals, fences, turnouts, switches, gates or tell-tale bells, flagmen, etc.

Automobiles travel on public roads that also belong to the State, county or town, but with the exception of a few very inadequate signs on some roads, giving warning of dangerous curves, railroad crossings and schools, there are no safeguards erected, no signals or signal lights, no tell-tale bells at hidden crossings, no flagmen or gates except those provided by the railroads where their line is crossed by the carriage road and none whatever where any of the innumerable country roads cross each other.

From early times the law has held the city, town, country or state liable for damages resulting from defects in the roadway, bridges, viaducts, etc., just as it holds the railroads liable for similar defects and in the case of the railroads it includes lack of proper gates, signals, flagmen, etc.

Proper Equipment Required

The proper equipment to meet the requirements of present-day traffic on our common road truck lines or principal state roads would consist of nearly all the appliances in use on railroads, in the line of signals, sign boards, flagmen and tell-tale bells, besides other safety devices not applicable to railroads, owing to the difference in the construction and operation of the two roads.

Take for instance a heavily traveled main road between two large cities much used by automobiles. All the roads crossing or branching from this road, where a clear view is obstructed, should have tell-tale bells set up at such crossings or junctions, automatically constructed to be electrically rung as on railroads, by the passing of any vehicle over the main roads, bearing always in mind that an automobile may very likely have a velocity equal to an ordinary express train.

It would be perfectly practical to arrange this by having a transverse steel bar set across the roadway in the hard surface of the roadbed, which the wheels of any vehicle would depress sufficiently to make an electrical connection and so ring the bell at the crossing or junction when a quarter or half a mile away.

Double Track All Curves

Another safeguard that is imperatively demanded is to double-track every road used by automobiles at all curves where the view is at all obstructed by fences, buildings, or shrubbery. This should be done by building a stout, low fence, longitudinally in the middle of the road around such curves, thus confining the traffic to the right-hand track in both directions and so preventing collisions. This fence should be provided with large signs at each end, directing all vehicles to take the right-hand track, and with red lanterns at night.

The same precautions should be taken at all small hillocks over which the road may run, where the grade is so high as to cut off the sight of an automobile or other carriage on the further side of the rise.

I have several times barely escaped a smash-up in both of such places, for, while you may be keeping close to the right-hand side of the road, the other driver may very likely not do so.

A most reprehensible method of earth road construction, quite common in many places in the rural districts, especially in the West, should no longer be tolerated. This is the practice of using road scrapers to plow up the soft mud and grass roots from the sides of ditches and depositing it in a high ridge in the center of the roadway. I have seen and ridden over roads that were built in this manner, that were crowned as much as four feet in the center and so narrow and steep that the gearboxes plowed a furrow in the top when straddling the center and with such steep sides that it was impossible to turn out when meeting a team without tipping over or going into the ditch.

The construction of such a road should be deemed a misdemeanor. A consideration of these matters forces the logical conclusion that our main arteries of automobile travel should be treated like railroads, for the safety of travel and should be equally well protected as far as is possible, and the state, county or town owning the road should be legally liable for all accidents occasioned by dereliction in their duty to the traveling public, even as a railroad is so held.

Chardon, Ohio. J. FRANCIS LE BARON.

Installing Ammeter on Oldsmobile

Editor THE AUTOMOBILE:—I have a 1915 Model 42 Oldsmobile and wish to install an ammeter. Will you kindly tell me how to do this?

2—Will you please publish a wiring diagram of the electric system on this car?

New York City. R. W. DE V.

—To install an ammeter on a 1915 Oldsmobile the instrument should be mounted at a convenient place on the dash instrument board, and the wire running from the No. 1 post on the switch should be cut and the cut ends of the wire should be connected to each of the connecting posts on the ammeter.

2—Wiring diagram of 1915 Oldsmobile 42, appears in Fig. 1.

Operation of Dual Exhaust System

Editor THE AUTOMOBILE:—How does a dual exhaust operate?

2—Is rain water better than hard water for use in a radiator?

3—In lubricating the spring leaves, how far can they be spread before danger of breakage?

4—Describe the operation of burning carbon out of cylinders.

West La Fayette, Ind. A. H. R.

—You are probably thinking of the design of exhaust manifold fitted to a few four-cylinder engines. In these the four exhaust ports are connected alternately to a pair of pipes which are often integral in a single casting. The two passages become one at the point where the exhaust pipe is attached. The idea is that if cylinder No. 1 has just exhausted and cylinder No. 3 is the next in order it is an advantage to prevent the exhaust from No. 1 from interfering in any way with the exhaust from No. 3. If No. 3 exhaust passes into a separate passage the effect of the exhaust from No. 1 passing down the exhaust pipe may actually exert a suction on the exhaust from No. 3, whereas with the ordinary manifold it can create a back pressure. Thus a dual exhaust consists of dividing the manifold so that the four cylinders exhaust alternately first into one passage in the manifold and then into the other. The same system is sometimes used on six-cylinder motors, using an exhaust pipe for each block of three cylinders.

2—Yes, because containing no lime it can throw down no deposit in the cylinder or in the radiator.

3—To lubricate spring leaves the car should be jacked up by the frame and not by the axle. Lifting the car by the frame will cause the spring to expand, and when the wheel is off the ground the weight of the axle will tend to pull the spring open. Under these conditions the leaves can be spread apart quite wide. Exactly how far apart it is safe to spread them depends upon the design of the spring and a great many other factors. The best way to lubricate the leaves is to use an old steel table knife which can be dipped in the grease and then rubbed between the leaves and you will find it is only necessary to spread the leaves a very small amount to allow the knife to be inserted. The less the leaves are spread the better it is for the spring.

4—The carbon which is deposited in the cylinders will not burn in air, but it will burn in pure oxygen gas. The operation of burning out cylinders is to direct a jet of oxygen gas into the cylinders. At the commencement of the operation a little ordinary gas is injected also. This burns in the oxygen and quickly heats the carbon to a point where it begins to burn by itself. The gas is then turned off and oxygen alone is fed, the carbon continuing to burn until it is entirely consumed. Directly the carbon is burned off the cylinder or piston, combustion ceases, so very little heat is generated.

Safety Fuse May Be Burned Out

EDITOR THE AUTOMOBILE:—Kindly publish information for model OB 2916 magneto and generator on a model R 1914 25-hp. Reo.

The ammeter, with the car running and lights out, shows 2 amp. discharge; with lights on it shows 6 amp. discharge. With the engine idle, ammeter is at zero. The brushes and commutator have both been cleaned without any satisfactory results.

Danbury, Conn. S. M. P.

—The difficulty can be located by ascertaining whether the safety fuse on the generator has burned out, also see that the terminals are securely fastened to the terminal posts as well as seeing to it that the terminals are securely fastened to the end of the cables.

This trouble is most likely to be found in the fuse or the

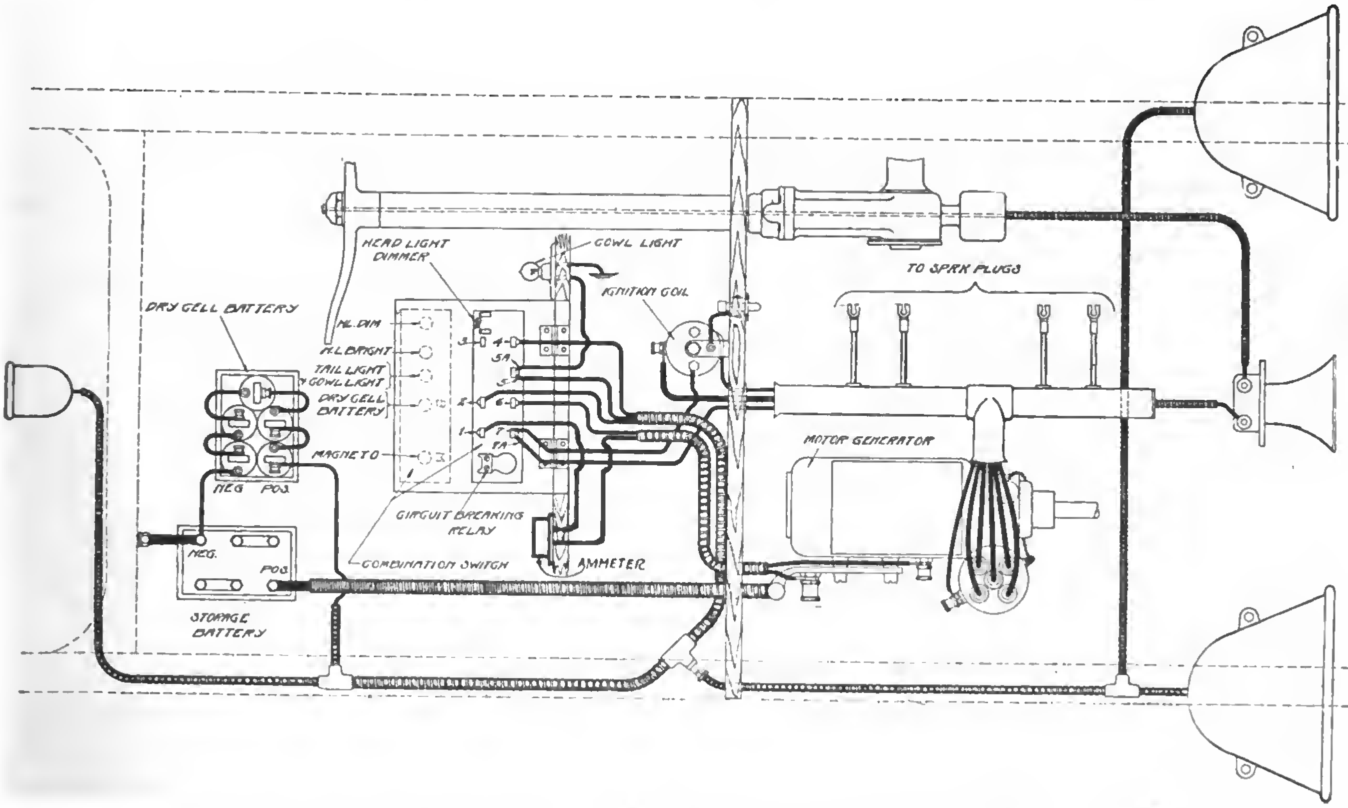


Fig. 1—Wiring diagram of electric system on 1915 model 42 Oldsmobile, showing where to install an ammeter

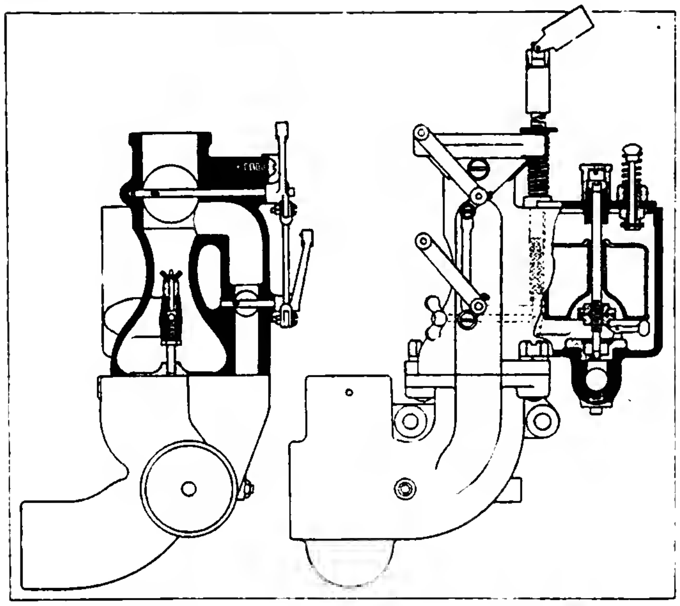

Fig. 2—Sectional views of carbureter used on Franklin

terminal being loose on the top of the generator or cable or at the brushes. It would also be well to inspect the armature for an open circuit and also the field circuit.

The 2-amp. discharge shows the amount consumed for ignition and the 6 amp. shows the consumption of lamps and ignition.

Description of Carbureter on Franklin

Editor THE AUTOMOBILE:—Kindly publish full description, including illustration, of the carbureter used on the Franklin car.

2—What weight would you give to the factors of carbureter design, air cooling and low bearing friction, influencing the remarkable economy developed by this machine?

3—Which is better practice, to make a hill on high at 12 m.p.h. requiring full throttle, or to go into second, making the same speed with a smaller throttle opening?

Miami, Ariz. W. W. J.

—Fig. 2 shows the carbureter used on the Franklin car. Its construction and principles of operation are evident from the illustration except that the needle valve control of the gasoline is carried to the dash where it may be adjusted to suit conditions as they arise.

2—Air cooling and a high over-all efficiency have more to do with the mileage obtained with the Franklin car than has the carbureter design. It is difficult to give any absolute figure of the relative effects of the three points mentioned.

3—It is better to go over a hill on high at 12 m.p.h. with wide open throttle if this condition maintains only momentarily. If the grade is long enough to require continuation of this condition for any length of time we believe the car will be better off by making the hill on second gear.

Locating Cause of Power Loss

EDITOR THE AUTOMOBILE:—Will you explain to me how to remedy loss of power in my 1915 Hupmobile? The cylinders all work fine and would pull any hill on high until about a week ago. Now I have to use second on the same hill that it would pull on high. On the level it runs as fast as ever.

Blackstone, Va. R. I. S.

—Check the adjustment of the valve tappets closely. See that you have at least 0.004 in. clearance between the valve tappets and the valve stems. See that the valves are seating perfectly and are not pitted or corroded. Test the compression of the motor by attaching the hand crank and rocking the motor against compression on each cylinder consecutively. Should you find one that is weaker than the other we would suggest that you immediately endeavor to locate the point of leakage. If you find that the compression is leaking past the piston rings, this, of course, can be remedied by the installation of new piston rings.

See that the motor is entirely free from carbon and that the spark plug electrodes are set 0.020 to 0.022 in. apart.

Be sure that the Atwater Kent header points are perfectly clean and are not pitted or corroded. See that they are adjusted to between 0.010 and 0.012 in. and that they meet squarely.

See that the carbureter and gasoline feed line are entirely clean and not obstructed in any way.

Ascertain that the clutch is not slipping and that the brakes are not dragging.

Information on Norwalk Underslung

EDITOR THE AUTOMOBILE:—Will you kindly publish a list of all Norwalk underslung type cars manufactured, showing model, number of cylinders, developed horsepower, and if possible, the bore, stroke, wheelbase, starting and lighting system and size of wheels.

Also please let me know about what date you figure engine No. 97 was built and where I may obtain parts for these cars. I understand that the reorganizers of the company are at present manufacturing practically the same type of car under a different name. Is this so? If so, what is the name of the company and where are they located?

New York City. W. A. T.

—Herewith is a list of all Norwalk underslung cars. All used six-cylinder engines.

		Bore	Stroke	W.B.			
Model	Hp.	In.	In.	In.	Start	Light	Wheels
1912-6	60	4	5	136	Elec.	Apple	40 x 4½
1913-A	50	3⅞	5	127	G. & D.	G. & D.	38 x 4½
1913-A Special.	60	4	5	131	G. & D.	G. & D.	40 x 4½
1914-1915 D....	60	4	5	131	Wsthse.	Wsthse.	38 x 4½
1915-C	70	4	5½	136	Wsthse.	Wsthse.	39 x 5

Abbreviations: Wsthse., Westinghouse; G. & D., Gray & Davis.

Engine No. 97 was built in 1912 model six, and parts can be obtained from the Norwalk Motor Car Co., Martinsburg, West Va., at the present time. The model C and D with minor improvements and refinements are being built, together with model F.

Making Gage for Gasoline Tank

EDITOR THE AUTOMOBILE:—I noticed in a recent issue of THE AUTOMOBILE an inquiry about the depth of gasoline for different amounts in a cylindrical tank. Wanting to make a gage for my fuel tank, I made the following tables coefficient for certain aliquot parts of tank capacity.

For 10 or 20 gal. tank		For 15 gal. tank	
1/20	0.19442	1/15	0.23677
2/20	0.31291	2/15	0.38205
3/20	0.41481	3/15	0.50808
4/20	0 50808	4/15	0.62488
5/20	0.59592	5/15	0.73500
6/20	0.68021	6/15	0.84213
7/20	0.76203	7/15	0.94766
8/20	0.84213		
9/20	0.92125		

Now, for example, let us consider the Ford tank which is 10 in. in diameter and holds 10 gal. very nearly. For each aliquot part of 10 gal. multiply the corresponding coefficient by one-half the diameter. This gives:

½ gal. depth	0.972 in.	3 gal. depth	3.401 in.
1 gal. depth	1.565 in.	3½ gal. depth	3.810 in.
1½ gal. depth	2.074 in.	4 gal. depth	4.211 in.
2 gal. depth	2.540 in.	4½ gal. depth	4.606 in.
2½ gal. depth	2.980 in.	5 gal. depth	5.000 in.

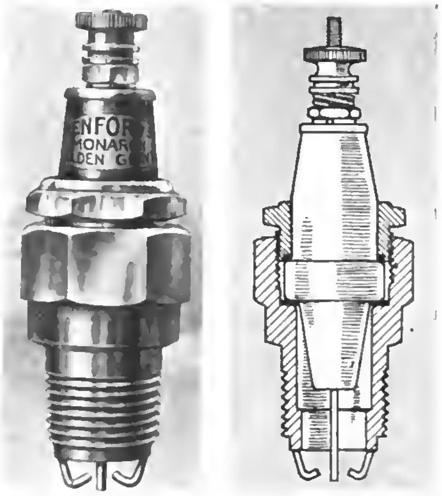
For a 15 gal. tank use the other table and multiply by one-half the diameter.

Port Clinton, Ohio. W. B.

ACCESSORIES

Golden Giant Spark Plug

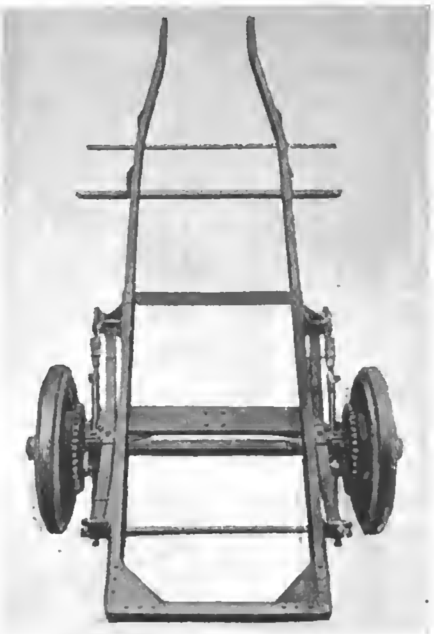
THE manufacturer of this plug has combined the results of 14 years of experience in spark plug manufacture in the Golden Giant, which is illustrated herewith. Although the most striking exterior feature of the plug is that the shell is durably plated with 24-karat gold, there are a number of points in the interior which denote the serviceable design and excellent material and workmanship characterizing the construction. A special insulation called blue adamant is used in connection with copper asbestos gaskets made by a special process and a strongly built shell. The bushing is nickel. Electrodes are of pure nickel, insuring delivery of a spark under all conditions. The manufacturer guarantees each plug unconditionally, the guarantee stating that the plug may be returned to the factory at any time if found unsatisfactory and it will be repaired or replaced free of charge. The company co-operates with both dealers and jobbers with all sorts of dealers' helps, such as wall posters, size cards, display cartons, window cards and trims, etc. The plugs are made in all sizes and are packed in individual tin cartons. They sell for $1 each.—Benford Mfg. Co., Mt. Vernon, N. Y.



Exterior and section of Golden Giant spark plug, showing construction

Ralston Ford Attachment

To change a Ford into a satisfactory 1-ton truck a special frame, rear wheels, axle and springs are supplied, forming a complete unit which is attached as a rearward extension of the Ford frame. The Ford rear axle and wheels are removed; the rear axle is bolted to the frame extension, sprockets are attached in place of the wheels and chains are run to the sprockets on the new rear wheels. The front of the extension frame is attached to the Ford frame near the front; the rear end of the Ford is attached to a cross member of the extension frame. The greater part of the load is carried on the rear wheels, the front wheels carrying only their normal load. Weight of complete converted chassis, 1850 lb.; weight of attachment, 900 lb.; axle, 2 by 2½ in.; tires, 32 by 3½ solid; wheelbase, 124 in. Price, $350.—Curry & Rowe, San Francisco, Cal.



Ralston truck attachment for Fords

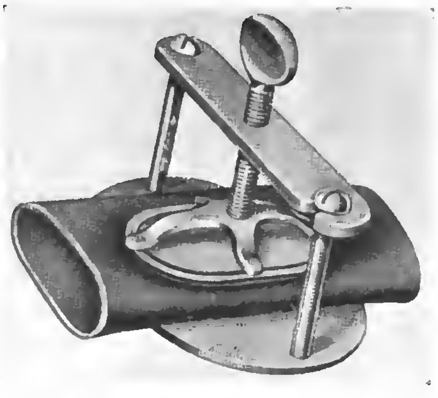
Chadwick & Trefethen Reamer

With this reamer the cylinders of Ford and Dodge Bros. motors can be refinished. It is of the shell type with taper slots fitted with eight blades of semi-high speed steel. Loosening the top nut and screwing up the bottom nut makes the reamer cut larger; there is an adjustment of ⅛ in. The shaft extending through the reamer, which is more than the length of a cylinder, has a taper guide which sets in the bottom of the cylinder, forcing the reamer to cut the cylinder perfectly straight. The makers state that the reamer will not chatter or buck. It is turned by means of a tap wrench 36 in. long, or it may be used in a drill-press; it is not intended for lathe use. Two men can ream a set of cylinders in 25 min. The reamer lists at $30.—Chadwick & Trefethen, Portsmouth, N. H.

Chadwick & Trefethen cylinder reamer

Safety Vulcanizer

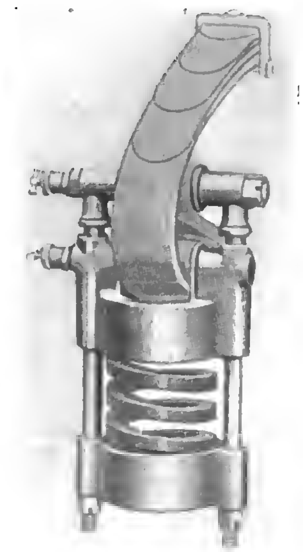
This tube-patching vulcanizer consists of a circular plate, carrying rods which support a yoke through which a clamping screw is threaded. Horizontal arms on the end of the screw press the patch on the tube. A piece of prepared fuel is placed on the patch and ignited with a match. When the fuel has burned out the patch is vulcanized, the time required being 5 min. The outfit consists of the clamp and a dozen patches, together with the prepared fuel. Price, $1.50.—Safety Vulcanizer Co., Mason City, Iowa.



Safety vulcanizer for inner tubes

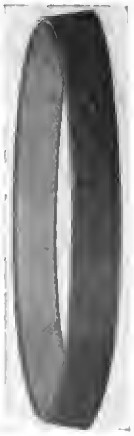
Alisco Shock Absorber

The Alisco shock absorber is of the auxiliary type and is easily adjustable to its load, being unusually well provided with means for guiding its movement. The device is of the open type. Connection between the upper and lower parts is by means of two steel rods; the upper ends are fast in the upper spring shackle fitting and the lower ends pass through the bottom casting and are held by nuts which can be tightened or loosened to provide the proper spring tension. The upper head slides on the rods, which thus constitute guides so widely spaced



Alisco shock absorber

Telescope apartment—It is a complete touring outfit, being practically an entire house on wheels



Leathertex clutch facing

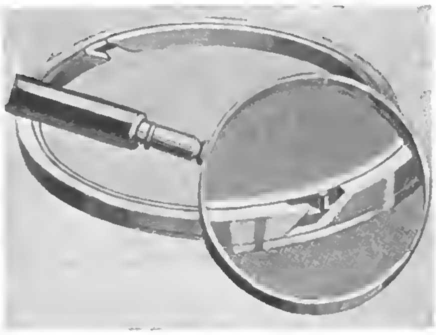
as to give adequate support. All the bearings are long and are provided with grease cups. Price, $18 per pair.—Allen Iron & Steel Co., New York City.

Telescope Apartment

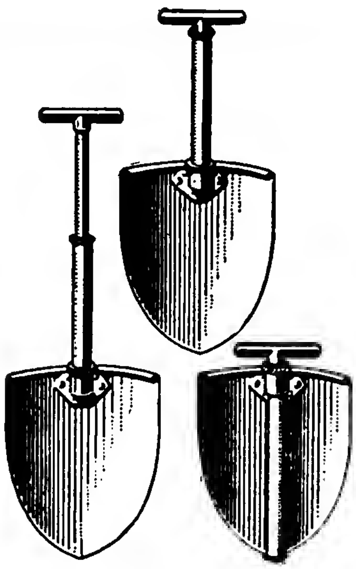
This touring apartment is a complete house on wheels. It is extremely light, however, and is designed particularly for Fords. It is box-like in shape with rounding sides and top and displaces the tonneau. There is a mattress on the floor of the compartment large enough to hold three people and when desired, this bed may be pulled back so that it extends out into the open and thus provides perfect ventilation on the hottest nights. There is a collapsible dressing-room which may also be used for shower baths. In cold weather it may be heated by a special heater attached to the exhaust which also furnishes hot water for bathing. Cooking utensils, food and a stove are carried in a cabinet on the left side. The side of the cabinet is hinged so that when it is opened it forms a table. The opposite side has several drawers which are used for storing clothing. These two cabinets slide laterally so that in the daytime they occupy part of the interior. At night they are pushed out so that this space may be used for sleeping. Price, $100.—Gustav de Bretteville, Seventh and Brannan Streets, San Francisco, Cal.

Ideal Tourist Shovel

This all-steel shovel has a telescoping handle and is particularly suitable for automobilists driving in rough country or camping. The blade is 6¾ by 8½-in., the length of the handle 16 in. and the weight 2 lb. After the handle is extended it is locked by turning two lock rings. It is nickel plated.—Ideal Mfg. Co., North Kansas City, Mo.



Sioux piston rings, showing joint



Ideal shovel with telescopic handle

Advance Overhead Fountain

The feature of this overhead washer is that it effects a saving of 50 per cent in the amount of water used because the water is automatically shut off as soon as the hose is released and turned on by pulling slightly on the hose. The washer consists of a horizontal arm carried in a swivel joint which is part of the ceiling bracket. When the arm is up the valve is closed and when it is down, it is opened. An adjustable counterweight on an extension of the arm makes it possible to quickly adjust the device so that the weight of the hose and the arm is slightly overbalanced by the counterweight. Price $35.—Advance Mfg. Co., Franklin, Pa.

Leathertex Clutch Facing

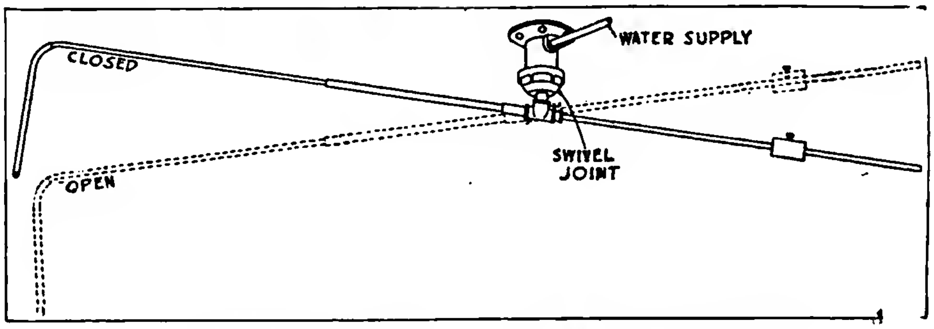
Leathertex cone clutch facings are designed to give greater durability and efficiency, being a combination of specially tanned leather and textile, the two being merged into one under 3000 lb. hydraulic pressure. The outer surface is leather and the inner surface fabric. A smooth, velvety action and unlimited wear are claimed. The company has had more than 50 years' experience in the manufacture of leather goods and guarantees that the facings will hold their shape and will not vary in thickness more than 1/100 in.—Hide, Leather & Belting Co., Indianapolis, Ind.

Sioux Piston Rings

The Sioux is a two-piece ring with joints at the opposite sides. A section of each ring is stepped, the two fitting together to form a rectangle. This construction provides a comparatively long and tortuous path for any gases which may try to leak through. Price, Ford, $1; 2¾ to 3½, $1.25; 3⅝ up, $1.50.—Albertson & Co., Sioux City, Iowa.

Garage Door Stay

A stay designed to hold garage doors open consists of a jointed angle-steel bar with brackets at each end. One bracket is screwed to the door and the other to the frame, both at the top. When the door is closed the stay is folded upon itself. When the door is opened the stay opens and when the folding joint is straightened out it locks in position, holding the door so that it cannot swing either way. To release the door a chain is pulled, throwing the joint off center. No mortising is necessary in applying. Chains are tinned and japanned. The set includes two stays with chains and rings and four chain guides.—Stanley Works, New Britain, Conn.



Advance overhead fountain which automatically shuts off the water

Chassis Quietness

NOT long ago it was usual for the engine of a car to be the greatest noise-producing part, but to-day there has been considerable change in this respect, and the slight sounds made by other portions are becoming more noticeable. At present, with good grade cars, the sounds made in running are mostly very small, that is the sounds produced by running parts such as gears or bearings. The constant mesh gears in the transmission are still a source of trouble, and the spiral bevel is not always absolutely silent, but a little care in inspection overcomes trouble on this score. Most of the noise to be heard in a good car is intermittent, arising from the body and from the various parts made of sheet metal.

The number of cars which can be driven over a rough road without squeaking or rattling is very small, and the tracing down of noise of this sort is very difficult, yet a trained observer could almost estimate the price of a car by being driven in it blindfold over a bit of rough road or street. Thus it is reasonable to assume that care for detail in assembly has much to do with the matter.

A body shell of sheet steel or aluminum can have either great strength or very little, great rigidity or great flexibility. We have not yet begun to study the body from a proper engineering viewpoint, we have little or no information as to the rigidity which should be desired. It seems rather remarkable that so little concentrated study should have been given to this part of a car, that the few bodies which will stay quiet and maintain their door fits, etc., after years of use, have not been studied closely by all manufacturers, and that the *durability* of the average body is not a little better: it easily could be.

Expanding S. A. E. Activities

AT the summer meeting of the Society it was made abundantly clear that there was much work to be done in connection with the standardization of aircraft parts, especially parts of aeronautical engines and the petty details of plane construction. It may, however, be pointed out that such standardization is hardly likely to follow along quite the same lines as the automobile standardizing work already done. For one thing, the aeroplane is a much more recent product and is much further from perfection; there is little about an aeroplane that follows convention, for in air machines "convention" changes every few weeks.

This being the case, any standardizing work that is undertaken will have to be of a highly scientific character, and any committee appointment to handle the subject will have to consider fundamental reasons all the time. They will practically never be called upon to compare existing practice and strike an average, which was the method adopted for establishing many of the earlier S. A. E. standards.

Probably the amount of responsibility resting upon the aeronautic standards committee will be extremely great, and its personnel will be studied with interest when it is completed. Probably it will be found that the automobile industry has a large representation as the amount of engine work being done by automobile manufacturers is greater than might be imagined.

Excess Capacity

WHATEVER may be the result of the Mexican situation, one thing is assured, and this is that the automobile industry is ready and able to supply the utmost needs of the army. Whether it be standard types of truck, or whether special adaptations are needed, supply will follow demand with practically no delay.

It is only possible to judge by rumor at present, but there seems good reason to imagine that the army has in mind the extensive use of automobiles for the transport of troops. In Europe the motor truck and the passenger car has been used for this purpose but, owing to the number of railroads there is seldom any need to send men far by road. On the Mexican border this is not the case. Railways are few and far between, and there are only three ways of moving troops; on foot, by horse traction and by automobile.

It is distinctly gratifying to reflect that the American army, did the need arise, could collect as large a fleet of motor vehicles in a week as was got together by the armies of Europe in 6 months.

King Passes 10,000 Mile Mark

Distance Covered Long Before Close of 2-Weeks' Record Endurance Run

SHEEPSHEAD BAY SPEEDWAY, NEW YORK, June 28—Without once stopping its motor since starting on its run at 12.14 p. m. on June 15, the eight-cylinder King Model E stock car had covered 10,000 miles at 12.18 to-day. The run will be continued until to-morrow noon when the car will have been running day and night for 2 weeks, being subjected in that time to far more severe tests than it would meet in over 2 years of actual use by an owner, the average speed for the entire run being well over 32 m.p.h. as the demonstration draws to a close. For details, see page 1164.

Weather conditions have been most trying throughout the test, thunderstorms, continued rain and rapid changes of temperature, from the chill of Winter to the heat of midsummer, combining to augment the difficulties encountered. In spite of this, however, the car is gradually pulling up its speed average, the lap times varying from 2 min., 50 sec. to 4 min., the average being between 3 min., 25 sec., and 3 min., 30 sec.

To-day representatives of the companies manufacturing the various units used in the King car are assembling at the Speedway to witness the conclusion of the test.

Delling to Leave Mercer

NEW YORK CITY, June 28—It is stated on good authority that Eric H. Delling, at present chief engineer and designer at the Mercer Automobile Co., Trenton, N. J., expects to sever his connections with that company and devote his time to the development of a new car which will probably bear his name. While nothing definite could be learned about the matter it is believed a company is forming to carry out Mr. Delling's ideas. If this information is correct the new car will be anticipated with a great deal of interest as Mr. Delling is recognized as one of the foremost engineers here and abroad.

Benjamin Is Ross Sales Manager

DETROIT, MICH., June 26—The Ross Automobile Co., this city, has appointed C. Arthur Benjamin, veteran automobile man, to the position of sales manager. Benjamin's career with the industry dates back to 1898 when he took the agency for the Stanley steamer at Syracuse, N. Y. In 1900 when the Stanley was taken over by the Locomobile company, he was made Southern sales representative. In 1902 he became salesmanager of the H. H. Franklin company, retaining this connection until 1906 when he became sales manager of the Babcock Electric company at Buffalo. Later he was connected with the Aerocar company, Detroit, and for 6 years following that handled the Packard in Syracuse, in 1913 becoming sales manager of the automobile department of the American Locomotive Co., now discontinued.

Humphrey Out of Chalmers

DETROIT, MICH., June 26—S. H. Humphrey, vice-president in charge of manufacturing of the Chalmers Motor Co., has resigned to take up similar duties with the Briscoe Motor Corp., Jackson, Mich. The Chalmers company has not yet appointed a successor.

Mr. Humphrey joined the Chalmers forces in April of last year, coming from the Hupp Motor Car Co., with which concern he had been connected for 2½ years. He has had a long and varied experience in his field of the industry. On first entering the Chalmers organization, he was works manager, being elected a vice-president during the early part of May of last year.

Walter Marmon Injured in Accident

NEW YORK CITY, June 26—Walter Marmon, president of the Nordyke & Marmon Co., Indianapolis, Ind., is fast recovering from a painful injury received in an accident in this city on June 17 when his car struck an L pillar on 6th Avenue, near 36th Street. Franklin Hall, a retired business man of Philadelphia and father-in-law of Mr. Marmon, died in the Polyclinic Hospital from injuries received in the accident. Mrs. Marmon escaped with slight bruises.

314 Continental Motors in 1 Day

MUSKEGON, MICH., June 24—The Continental Motors Co. established a new record at its local factory with a day's production of 314 engines one day recently. The average is 284 daily.

Schwartz Appointed Schavoir Rubber Co. Sales Manager

STAMFORD, CONN., June 22—A. J. Schwartz has been appointed general sales manager of the Schavoir Rubber Co., Stamford, his duties beginning June 26.

Mr. Schwartz leaves the Automobile Tire Co. of New York and was formerly connected with the Continental Caoutchouc Co., New York City.

The Schavoir company has recently trebled its capacity, and plans are now under way for a still greater extension. Mr. Schwartz for the present will be located at the Stamford plant, pending the opening of a New York office.

New Overland Four at $635

Model 75 B Is Continuation of Model 75—Has ¼-Inch Larger Bore

TOLEDO, OHIO, June 24—Announcement has just been made of a new series of the smaller four-cylinder Overland that was originally brought out last November as model 75. The new car is known as model 75 B, and is very little different from the previous series, except in the increase of the bore from 3⅛-in. to 3⅜-in., with the stroke remaining at 5 in. There are other engineering refinements of a minor character that add to the efficiency, however. The price of the new 75 B touring car of five-passenger capacity is $635, and the roadster costs $620. The previous series touring model was $615 and the roadster $595, and while the greater materials cost would be sufficient reason for a price increase of this amount, the increase of the engine power, together with the other refinements that have been made render the car well worth the additional figure.

There have been no alterations in design to speak of in the power plant, except those changes that have added to the power. The motor now develops 31.5 hp. at 1950 r.p.m. The body looks practically the same. and there are the same little conveniences such as the electrical control box on the steering column, one-man top, demountable rims, and all the fitments of the day.

This model Overland is built on a wheelbase of 104 in.; has cantilever rear springs; retains the characteristic Overland construction of incorporating the gearset with the rear axle, possesses the tapered frame; is fitted with Auto-Lite starting and lighting and has 31 by 4 tires.

Flint Is Wilson Sales Manager

DETROIT, MICH., June 26—Herbert J. Flint, well known in the industry, has joined the forces of the J. C. Wilson Co., this city, as general sales manager. He will have full charge of the distribution of the Wilson truck. Flint was eastern sales manager for the Smith Form-a-Truck, and prior to this was with Thomas J. Hay, distributor of Hupmobile and Chandler cars in Chicago.

Smith, Premier Trustee, Moves Office

INDIANAPOLIS, IND., June 24—Frank E. Smith, trustee of the American Motors Co., and the Premier Motor Mfg. Co., has moved his office to the second floor of the Russel M. Seeds Building, this city.

70% Duty on French Imports

Replaces General Prohibition of American and English Automobile Chassis

PARIS, June 27—*Special Cable*—The French Government has replaced the general prohibition from the United States and England of automobile chassis, with or without motor or body, automobile coach work and other automobile parts, with a 70 per cent duty.

The former decree, issued on May 15 last, authorized the Ministers of Commerce and Agriculture to make exceptions and permit, under conditions to be determined by the Minister of Finance, the importation of particular articles.

No official explanation of the new decree has been made, but is thought that the ruling undoubtedly has been put into effect with a view to procuring more space in vessels coming to French ports for supplies the government needs.

England to Curb Motorists

LONDON, June 21—The Government has decided that more effective diminution in the use of automobiles can be obtained by control than by increasing taxes on cars.

According to an announcement made in the House of Commons to-day, the increased taxes are to be rescinded and a central authority created with power to grant permits for the purchase of specified amounts of gasoline, on which a license of 6 pence per gal. must be paid at the time of purchase. For commercial vehicles or those of doctors and veterinary surgeons the permits will be issued at half rates.

National Twelve Price $160 Higher July 1

INDIANAPOLIS, IND., June 24—Due to the high cost of materials and labor, the National Motor Vehicle Co. will raise the price of its twelve-cylinder model $160 on July 1. The car now sells at $1,990 and the new price will be $2,150.

1917 Marmon Unchanged

INDIANAPOLIS, IND., June 26—No changes of any consequence will be made in the Marmon 34 for 1917. The present model will be continued throughout next year with possibly a few minor refinements in detail.

Brown Carriage Co. Enters Automobile and Truck Fields

CINCINNATI, OHIO, June 24—The Brown Carriage Co., this city, which has heretofore concentrated its manufacturing activities in horse-drawn vehicles, will expand and enter the automobile field with a five-passenger car selling at $735, two light delivery cars at $675 and one at $670.

The models will be assembled at its plant and will include parts of well-known manufacturers. A four-cylinder 3⅛ by 4½-in. LeRoi motor will be used. Other features include: constant level lubrication with positive oil pump delivering oil at both ends of motor; thermo-syphon cooling; Atwater Kent ignition; U. S. L. storage battery; Allis-Chalmers electric starter; electric lighting from storage battery; Kingston carbureter; multiple-disk clutch; left drive; 105-in. wheelbase; Walker & Weiss rear axle; Hyatt roller bearings; and one-man mohair top.

Allen Continues Model 37

FOSTORIA OHIO, June 22—The Allen Motor Co., Fostoria, has announced that its present Model 37 touring car and roadster will be continued, with no change. The price of $795 is given in the announcement of the continuation of this model, but while it states that the car will not be changed, it does not guarantee that there will be no raise in price.

Large Four for Argo

JACKSON, MICH., June 24—A larger four-cylinder model is to be marketed by the Argo Motor Co., this city, as a running mate to the present small four-cylinder car. No details of the new model are as yet forthcoming, but they are expected within the next 30 days.

Empire Continues Present Models

INDIANAPOLIS, IND., June 24—The Empire Automobile Co., this city, will make no change whatever in its present models before about the time of the New York automobile show next January.

Ford Blast Furnaces in Detroit to Cost $8,000,000

DETROIT, MICH., June 26—The Ford Motor Co. has made arrangements for the erection, in West Detroit, of blast furnaces and a plant for making parts. This is distinct and apart from the tractor plant and will be built before the tractor plant so as to make the company independent of other concerns in obtaining parts used in the Ford machine.

It is the plan of the company to have the ore brought direct to the new plant and run through to the completed parts with one heating. At least two blast furnaces will be built and possibly four, and the initial cost of the plant will be $8,000,000. With work beginning on the blast furnaces and parts plant this fall, work on the tractor plant will be put aside until next spring.

Mitchell Motors Co. Formed

To Acquire Business of Mitchell-Lewis Concern—Will Finance Expansion

NEW YORK CITY, June 26—The Mitchell Motors Co. will acquire the business of the Mitchell-Lewis Motor Car Co., Racine, Wis., as a result of the forming of a syndicate to underwrite the capital stock of the new company. The syndicate will be composed of Ladenburg, Thalmann & Co. and A. G. Becker & Co., Chicago, and the issue will be 125,000 shares of common stock without par value. The present capital is $10,000,000.

This new financing will enable the company to greatly enlarge its production of cars. It is stated that the company may expend $100,000 in factory improvements so as to bring the production up to 30,000 cars a year.

No change will be made in the directorate, H. L. McClaren remaining president; W. H. Armstrong, secretary; F. L. Mitchell, treasurer, and J. W. Bate, first vice-president and chief engineer.

Elgin Corp. Merges New Era

CHICAGO, ILL., June 26—The Elgin Motor Car Corp., this city, has absorbed the New Era Motor Car Co., Joliet, Ill., thus acquiring the New Era light four and the light delivery wagon. The Elgin corporation is now assured of an ample supply of materials as the New Era concern had made excellent arrangements in this respect with some of the largest material producers in the country. The plant facilities of the New Era company will enable the Elgin firm to greatly increase its production.

The Elgin corporation reports that its entire season's output is oversold.

Saginaw Co. Starts Work

SAGINAW, MICH., June 24—The Saginaw Motor Car Co., which was organized and financed by persons in this city, and which is manufacturing the Yale eight for an exclusive selling agent, is now in its plant and expects to make first deliveries about Aug. 1. The officers, all of Saginaw, are J. A. Cimmerer, president; J. W. Grant, vice-president; W. C. Wiechmann, secretary; H. E. Oppenheimer, treasurer; L. J. Lampke, general manager.

Schebler Co. Changes Name

INDIANAPOLIS, IND., June 26—The firm name of Wheeler & Schebler, carbureter manufacturers, will be changed July 1 to the Wheeler-Schebler Carbureter Co., Inc. There will be no change in the policy or personnel of the organization.

Maxwell Lowers Prices July 1

Touring Model $595—Roadster $580—100,000-Car Output Planned

DETROIT, MICH., June 27—Effective July 1, the Maxwell Motor Co. will market its touring car at $595, a reduction of $60, and will sell the roadster at $580, a drop of $55. The reduction is ascribed to a greatly increased production that offsets any increases in the cost of materials. The schedule now calls for an output of 100,000 cars for the coming selling year.

The 1917 Maxwell is not changed over the present car. The Maxwell management now believes the car to be standardized, and will not alter the product in any way from the regular chassis of 102 in. wheelbase and powered with a 3⅝ by 4½-in. four-cylinder block motor carrying the same five body types, namely, touring, roadster, cabriolet, town car and sedan.

Plants of the Maxwell company at Newcastle, Ind., Dayton, Ohio, and this city are now working to capacity, and the present production is being stepped up to meet the new schedules.

Detroit Seamless Tubes Co. Buys New Plant Site

DETROIT, MICH., June 24—The Detroit Seamless Steel Tubes Co., maker of a wide variety of tubing for motor vehicles, has purchased a 12-acre site in the western part of the city for the purpose of erecting a new factory that will allow four times the present output. It is estimated that the plant, which will be entirely under one roof, will have a length of 700 ft. and a width of about 400 ft., enabling an output of 5000 tons monthly with a payroll of 1000 men. In this business the furnaces must be kept going continuously, making it necessary to work 24 hr. a day.

The Detroit Seamless Tubes concern is now turning out about 300 tons of tubing monthly with a force between 300 and 400 men, about 80 per cent of the product going to the automobile industry and the balance used in locomotive boiler construction. Rear axle tubes, and a great variety of sizes and shapes of tubing for the needs of the modern car have revolutionized the tube business. This company started in 1900 with a 100-ton monthly capacity and 100 men, an indication of the rapid strides that have been made.

Lakeside Foundry Buys Site

MUSKEGON, MICH., June 24—With the intention of trippling its present output, the Lakeside Foundry Co., producer of automobile castings, has purchased a factory site on Western Avenue, between Seventh and Eighth Streets, having a frontage of 270 ft. and extending back a block. It is the intention to build a structure measuring 75 by 225 ft. with a molding floor 60 by 150 ft. The present buildings are 60 by 90 ft. and the working force fifty-five men, which will be considerably enlarged when the new quarters are occupied.

Young Heads Flint Cushion Spring Co.

DETROIT, MICH., June 24—The L. A. Young Corp., a holding company which owns the Detroit Wire Spring Co., and several other large automobile parts plants here, has purchased a 7-acre tract of land at Flint, Mich., on which will be erected a very large plant for the Flint Cushion Spring Co. L. A. Young of this city is president and C. O. Ormsbee, for 17 years with the Durant-Dort Carriage Co. and 11 years in the trimming end of the Buick organization, has been made factory manager.

To Erect Seven Units

Eventually some seven units will be erected on the Flint site, according to Mr. Young, the first of these being under construction at the present time. All will be of the saw-tooth, one-story type, since there is plenty of room to spread out. The first unit is to measure 620 by 100 ft., but if present plans are carried out it will eventually extend for 800 ft. As the plot of land is diagonal in shape, the other units, between each two of which there will be a side track, will taper off from this maximum length to about 450 ft. for the shortest wing. The first unit will employ 240 men. This move will not affect the Detroit plants, but inasmuch as the concern is doing about 60 per cent of the seat spring business of the Flint factories, it was deemed advisable to get closer to them. Besides cushion springs, other small parts for cars will be made at Flint.

The Detroit spring factory, now making 500,000 sets of springs annually, is being enlarged also by a building 400 by 100 ft.

Celfor Plant Nears Completion

BUCHANAN, MICH., June 24—The new factory building of the Celfor Tool Co., maker of automobile parts and internal gear drive axles, is now nearing completion. It is a structure measuring 137 by 300 ft. and is constructed along modern factory lines of brick and steel, one story in height. This will be ready for occupancy in 4 weeks and will permit of a large increase to the Celfor production.

Wagner and Hoyt Combine

Together with Gerald Laugh Form Company to Manufacture Electrical Equipment

NEW YORK CITY, June 26—A. F. Wagner, president of the Wagner Specialties Co., New York, and Frank Hoyt, formerly chief engineer of the Simms Magneto Co., together with Gerald Laugh, formerly connected with the National Cash Register and Burroughs Adding Machine companies, have formed the Wagner-Hoyt Electric Co. and will manufacture complete electrical equipment for automobiles and market it as a unit. Wagner will be president and general manager of the company, Hoyt treasurer and chief engineer and Laugh secretary. For the present, the salesrooms of the Wagner Specialties Co. in New York City will be maintained and an office has been opened in the Woolworth building. A factory somewhere in New Jersey will be occupied though the exact location has not been decided.

The concern has obtained a license under the patents of the late H. Ward Leonard covering the control of electric lighting systems on motor cars and in addition to producing the complete electrical equipment of a car including starting and lighting, ignition and lamps, will also market a new type of storage battery. The concern will market its product as a complete unit for the entire electrical equipment of a motor car.

New Stover Tractor Engine

FREEPORT, ILL., June 24—A new engine has been added to the list of the Stover Tractor Mfg. & Engine Co. It is known as a four-cycle, semi-Diesel crude oil machine, and is an entirely new departure. William F. Freidag, superintendent, is the designer. This type of engine has been manufactured in Europe for several years, but American manufacturers have been chary of it.

Gordon Co. to Start Tire Manufacture Soon

COLUMBUS, OHIO, June 22—Manufacture of automobile tires will be undertaken by the J. P. Gordon Co., Fourth and Naghten Streets, just as soon as machinery can be installed. Owing to the rush in the factories where the machinery is made, Mr. Gordon said that he did not think it would be possible to start this new department before 4 months. A tire expert has been employed and the preparation of the room and the installation of the machinery will be under his direction.

This company was started 16 years ago by Mr. Gordon and he has seen it grow from one man with a machine to a plant employing 500 people. The company formerly was known as the Vehicle Hood and Apron Co. It makes tire covers and a variety of accessories, including a one-man top. Two new buildings in the factory group have just been completed.

The company has disposed of its raincoat and clothing business to the Cleveland Raincoat Co. and all of the finished stock on hand has been shipped to Cleveland.

General Tire & Rubber Co. to Expand Plant

AKRON, OHIO, June 22—Less than 6 months old and already erecting an addition to its present plant is the record of the General Tire & Rubber Co., Akron's newest rubber factory.

This company was formerly located at Kansas City, Mo. Tire accessories and a few rubber specialties were the principal products, the company being in this line for about 7 years. Increased business in this department, together with a growing tire business makes the additional space necessary. Within 10 days the plant will be manufacturing about 150 tires per day.

M. O'Neil, president of the company, states that with the contemplated increased equipment and floorspace, the capacity of the factory will be 500 tires per day.

Detroit S. A. E. to Repeat Noronic Melodrama July 7

DETROIT, MICH., June 26—So much pressure has been brought to bear on the Detroit Section of the Society of Automobile Engineers that it has been decided to again produce the five-act melodrama that was given by the Section on the Noronic during this year's 4-day boat trip of the Society. The little play bears the imposing title of the "Trials of Gwendolyne, or Snatching Victory from the Jaws of Defeat." Arrangement have been made to give the play in the Lyceum Theater on July 7.

It took much rehearsing to put the piece on on the boat, it being a five-act play, and having the following members of the local section in its cast: B. G. Koether, C. M. White, R. T. Middleton, J. W. Stark, R. S. Lane, W. D. Rockwell, J. Dow, W. H. Conant, P. L. Barter, C. I. Stevens, F. R. Bay, L. J. Schneider, K. W. Zimmerschied, G. W. Dunham, Russell Huff, and J. C. Weed. The section invites all out-of-town members of the Society who wish to see the next president of the Society, the present president and the other prominent members go through their capers again.

The play was written by Frank Briscoe, and produced under the direction of N. A. Pabst.

Three Big Parts Cos. in Merger

Steel Products Co. To Consolidate with Mich. and Metals Welding Cos.

DETROIT, MICH., June 26—In order to effect the usual economies of large scale production and with a view to considerably broadening the service offered the car builder, interests headed by C. E. Thompson, president of the Steel Products Co., Cleveland, Ohio, have obtained control of several large plants specializing in manufacturing and engineering work for the motor vehicle makers. With a capital of $4,000,000, the interests that are to be consolidated under the name of the Steel Products Co., with headquarters at Cleveland, are the present Steel Products Co., Cleveland; the Michigan Electric Welding Co., Detroit, and the Metals Welding Co., Cleveland.

The officers of the new Steel Products Co. are C. E. Thompson, president; W. D. Bartlett, vice-president, and J. A. Krider, secretary and treasurer. The plants will continue to operate under their own names as subsidiary plants of the Steel Products Co., and the consolidation will undoubtedly be developed along the same lines as the Steel Products Co. E. C. Reader, manager of the Metals Welding Co., and C. F. Clark, manager of the Michigan Electric Welding Co. will both continue in their present capacities.

The Steel Products Co. makes valves, spring bolts, and other hardened and ground parts; the Michigan Electric Welding Co. produces drag-links, brakes, torsion radius rods and other rod assemblies, head lamp brackets and round stock spring clips; and the Metals Welding Co. makes acetylene welding equipment, high-speed cutting tools, and does a large business in motor vehicle welding work. Each firm is a leader in its particular line, having for some years furnished parts for nearly all the leading car makers. The equipment owned by the new combine covers some of the most important processes in automobile manufacture, such as metallurgical work, heat treating, precision grinding, polishing, electric welding, acetylene welding, and automatic machine and general steel manufacturing equipment. Extensive additions to all the plants affected are now under way.

Three New Menominee Trucks

MENOMINEE, MICH., June 24—The Menominee Motor Truck Co., this city, announces three new models, one of which is a continuation of the previous ¾-ton truck with a worm-drive axle instead of the helical gear drive, another an entirely new worm drive 1½-tonner known as the model H, and a 3½-tonner of new design, selling at $2,775. The price of the new ¾-tonner is $1,295, an increase of $170 over the selling price of the previous model of the same capacity. The chassis price of the 1½-tonner is $1,775. Other models sell at $2,240 for the 2-tonner and a 1-tonner at $1,575.

The new model H, 3000-lb. capacity, embodies several unusual features such as shock-absorbing radiator support, auxiliary springs to prevent overtaxing of the main springs, automatic governor regulating the speed of the trucks, and brake eveners of the universal type designed to eliminate the possibility of rods or yokes binding.

The motor is Continental, three-point suspension unit power plant with 3¾-in. bore and 5½-in stroke. Other features include Stromberg carbureter, Bosch magneto and combination and forced-feed system of lubrication.

The new ¾-ton model EW has a 3¾ by 5-in. motor. The clutches are Brown-Lipe multiple-disk in both models, with gearsets of the same make, three speeds forward and reverse. The smaller model has a 6 to 1 ratio on high and the large truck 9¼ to 1. Timken worm-drive, floating axles with nickel steel shafts characterize both.

Detroit Battery Co. Moves Into Its New Plant

DETROIT, MICH., June 24—The Detroit Battery Co., maker of automobile storage batteries, is now moving into its new factory, which is a three-story plant of modern fireproof construction, each floor measuring 100 by 90 ft., the total floor space amounting to 25,000 sq. ft. It is stated that the new quarters will enable a production of 500 batteries a day, a big jump from the production in the old plant of fifty to seventy-five batteries daily.

The Detroit Battery Co. is now several years old, has a capital of $60,000 and makes its product in sizes to fit any make of car, numbering among its standard equipment customers Briscoe, Argo and other car builders. The officers are S. W. Elston, president; Wm. Petzold, vice-president; Sol Meyer, treasurer; M. G. Pierson, secretary, and Wm. Ducharme, director.

Pratt Enters Truck Field

BUFFALO, N. Y., June 26—The Higrade Motors Co. has been formed here with a capital of $250,000 and will embark in the manufacture of a medium-sized truck. J. Elmer Pratt heads the organization and associated with him are Will J. Loomis and L. W. Coppock. The truck is described as being between the big vehicle and the little one and will have a wheelbase of 115 in., and be mounted on 4-in. pneumatic tires. It will have a four-cylinder 3¼ by 5 motor, equipped with Bosch ignition and an electric lighting and starting system. Other specifications include Sheldon springs and worm axle, Spicer drive, Fedder cellular radiator, Detroit Gear transmission, Borg & Beck disk clutch, Lavine semi-irreversible steering gear. The chassis will weigh about 2200 lb. and the price will be less than $1 per lb. It is stated that $170,000 of the capital already has been taken up.

$300,000 for Armored Trucks

WASHINGTON, D. C., June 26—The House to-day passed the army appropriation bill, the measure carrying approximately $182,000,000; $300,000 of which is allowed for armored trucks as a result of the Mexican situation. This bill will now go to the Senate where action on it will be expedited.

Depleted Horse Market Stimulates Truck Buying by Army

NEW YORK CITY, June 26—A lack of horses and mules in this country will have a stimulating effect on commercial vehicles sales to the United States Army at the present time. This country has exported since the war began 590,452 horses and 154,077 mules and the U. S. Government finds the market depleted as a result.

The equipping of the forces for the Mexican crisis will be a sharp stimulus to the buying of trucks and passenger cars on account of the scarcity of horses and mules. The United States has been steadily building up truck trains since General Pershing started his advance into Mexico, but it is stated that the truck equipment at present is below requirements.

200 Troy Trailers Ordered

TROY, OHIO, June 22—The announcement is made that the Troy Wagon Works has an order for 200 trailers, equipped with brakes, rubber tires and special bodies from the French Government for war purposes. The order calls for $413,000.

Austrian Firms to Make Trucks

VIENNA, AUSTRIA, June 26—Several Austrian companies will start the manufacture of motor trucks when the war is over. Among those reported that will undertake this business are the Skodawerke A. G., of Pilsen, and the Waffenfabrik at Steyr. These companies have large funds available, highly trained technical staffs, mechanics and business administrations. They will start on a large scale.

Government Opens Truck Bids

Proposal on 1½ to 3-Tonners in Numbers of from One to 1000 of Each

WASHINGTON, D. C., June 23—A proposal has been sent out to manufacturers by the U. S. Government asking for bids on trucks from 1½ to 3 tons, in numbers of from one to 1000 of each. Bids are to be opened for these trucks at the New York post on June 30. This order means that the government is preparing now to supply its troops with adequate motor transportation equipment in case it is necessary to raise a large volunteer army for service in Mexico.

Meantime individual shipments of truck fleets continue to be made. One of the most recent of these included twenty-eight 3-ton Peerless transport trucks and five tank trucks on the same chassis. These vehicles were all equipped with bodies and the Peerless company furnished drivers for them. They were shipped on gondola cars on June 19, being routed over a passenger schedule to reach Brownsville, Tex., June 22. One gondola car was used for two trucks, so that the complete train comprised fourteen of these and one Pullman tourist car for the crew. Previous to this ten 600-gal. tank trucks were shipped by the same company.

Repair Trucks Provided

This order is of especial interest in view of the capacity of the trucks. Besides these, thirty 3-ton Rikers and fifty 3-ton F. W. D., four-wheel-driven trucks are being used by our punitive expedition. Fifteen of the F. W. D. trucks are equipped with 600-gal. tanks, used to haul water for the men and cavalry horses.

The deficiency of repair trucks is rapidly being relieved. The Four Wheel Drive Auto Co. of Clintonville, Wis., has delivered most of an order of eight of these vehicles, mounted on 3-ton chassis, each carrying a 13-in. lathe with a 5-ft. bed, a drill-press, a grinder, a portable drill, a cabinet bench, three vises, a forge, three anvils, an oxy-acetylene welding and cutting outfit and a complete set of blacksmithing, machine and carpenters' tools.

Power is derived from a 9-hp. four-cylinder auxiliary engine, driving a dynamo, each machine having direct electric drive. The dynamo also supplies current for electric lights.

Quick-Firers on Quads

Another new wrinkle in truck equipment is that of quick-firing guns which have been mounted on the steel dashes of a number of the Jeffery Quad transport trucks, so that transport trains can be self-defending in case of an attack.

Road conditions, as is well known, are atrocious. Nevertheless, some amazing records have been made by different trains in the service. Packard train No. 3 recently clipped an hour from the record between Casas Grandes, Mexico, and Columbus, N. M., making the 104 miles in 10 hr. actual running time. On this trip it had been away from its base for 14 days, having traveled about 1000 miles in that time.

Improving the Roads

To improve these roads four Phœnix Centiped creeper-driven good roads trucks, four Acme road scrapers and eighteen steel dump wagons have been shipped from Chicago to Columbus for use in improving the road between Columbus, N. M., and Namiquipa, Mexico, so that in the event of more activity in the southern republic, the use of motor trucks will be facilitated.

Recruiting Drivers

Drivers used in Mexico have been recruited from among the workers in truck factories. Some are New York taxicab drivers, others are college men in search of travel and adventure, others miscellaneous chauffeurs out of work who have answered advertisements, many are enlisted men who have been trained to drive their mounts since the crossing of the border by our troops. Some of them are negroes and all reports agree that their behavior has been excellent. Some of the drivers have performed their duties with great credit and others have been very unruly. In practically all cases, there has been a lack either of military discipline, or, in the case of enlisted novices, of mechanical ability. On several occasions civilian drivers have refused to obey the orders of the army officers commanding them. They have even abandoned their mounts. Some of the officers have taken matters in their own hands and compelled the drivers to do their duty. In other cases the men have been arrested and held under guard until they had agreed to return to work.

Trucks in Mexico

Up to May 1, the trucks in Mexico were as follows:

28 Trucks Each

Company 1, Q.M.C	Jeffery
Company 2, Q.M.C	White
Company 3, Q.M.C	Packard
Company 4, Q.M.C	Jeffery
Company 5, Q.M.C	Jeffery
Company 6, Q.M.C	Jeffery
Company 7, Q.M.C	Jeffery
Company 8, Q.M.C	White
Company 9, Q.M.C	White
Company 10, Q.M.C	Packard
Company 11, Q.M.C	Packard
Company 12, Q.M.C	Packard
Company 13, Q.M.C	Riker
Company 14, Q.M.C	F.W.D.

Miscellaneous trucks for work about

posts and camps on border, as follows:

Signal and Aero Corps.
Fourteen F.W.D.'s.
Seven White tank trucks.
Six Velies.
Two Packard repair trucks.
Two Peerless 4-tonners.
Two Rikers, 3-ton.
Two White radio-telegraph trucks.
Two White 1½-tonners.
One Federal 3½-tonner.
One Kelly-Springfield.
One Lippard-Stewart.
One Mais.
One Peerless.
One Republic.
One White 3-ton.
One White, Signal and Aero Corps.
Jeffery Quads.

Cortland Car & Carriage Co. Busy

SIDNEY, N. Y., June 24—The Cortland Car & Carriage Co., this city, manufacturer of the Hatfield roadster and suburban cars and for nearly 30 years builders of finished carriages, has entered the automobile field. The company will produce a moderate-priced car.

It is now devoting all its factory space to automobile manufacturing and to take care of this production is increasing its capital from $75,000 to $225,000 by issuing 7 per cent accumulative preferred stock, also common stock, both of which are sold at par. The preferred stock will be sold separately but subscribers to the common are required to take an equal amount of the preferred.

Canadian Registrations Gain

WINNIPEG, MAN., June 24—Out of 8616 licensed automobiles in Manitoba, for the year 1915, 3425 were Fords, 1004 were McLaughlin-Buicks and 622 Overlands. In Saskatchewan, where there is about the same number of licensed cars as in Manitoba, there are 3514 Fords, 742 McLaughlins and 304 Overlands. In Alberta, 5586 cars bear license plates. Of this number there are 2695 Fords, 583 McLaughlins and 312 Overlands. Also Chevrolet, Dort, Hudson, Scripps-Booth and others are establishing sales records every day.

According to statistics recently compiled, Toronto leads all other cities in Canada in number of automobiles registered. Toronto at the end of 1915 had 8915, a gain of over 1400 over the preceding year. Montreal comes next with 3917, an increase of less than 100 over 1914. On the whole the Western cities of Canada show themselves to be the heaviest purchasers. Vancouver registered 3719, as against 2578 in 1914.

C. A. A. Wins Interclub Run

CHICAGO, ILL., June 23—The Chicago Athletic Assn. won the Interclub Reliability Contest from the Chicago Automobile Club in the 2-day run to Indianapolis and return, the score standing 277 points penalty for the C. A. A. and 605 points penalty for the C. A. C.

Militiamen Backed by Industry

Car, Truck, Parts and Accessory Concerns to Continue Pay and Positions

NEW YORK CITY, June 27—That the automobile industry is doing its share in helping to swell the list of enrollments in the army for work on the Mexican border is manifested by the number of companies agreeing to compensate their workers who join the army.

The large tire factories in Akron are in the van in their announcement of compensation and open position for all employees who are enrolled in the State militia or who enlist for service on the border in Mexico. The Goodrich company is to give soldier employees, who are married or single and supporting dependents, two-thirds of their average pay, based on their earnings during the past 3 months, after making deductions of the amounts received from the government. Single men and married men not contributing to the support of dependents will receive one-half of their salaries. Payment will be made to their dependents of held in trust until the return of the employee. Absence for military duty will not affect the pension and insurance funds, but employees will be continued on the rolls. The men will be considered on leave of absence and their places will be held open. These conditions apply for 1 year.

Various Companies' Arrangements

The Firestone plan is to give all employees, who have been with the company for 3 years, who have enlisted prior to June 20, full pay, less the government allowance. Employees of 1 to 3 years, two-thirds pay, less the government allowance. The arrangements will hold good for 1 year and will also apply to all employees who enlist hereafter, down to 6 months' service with the company.

The Goodyear company makes a similar announcement, agreeing to give all its employees a large part of their pay, less the government allowance.

The Studebaker Corp. will place all men who go to the Mexican border on full pay for the balance of the year. This applies to men employed at both the Detroit and South Bend plants, who have enlisted to go to the front. At the present time the payroll numbers about 7000 men, and some forty-five to fifty have already gone to the training camps. The Equitable Life Assurance Society has agreed to continue in force the life insurance policy which each of the employees hold under the Studebaker insurance plan.

The U. S. Rubber Co. gives full pay to all called on active service and their positions will be held open for them pending their return.

Packard employees will receive their full pay for the 2 weeks' period immediately following the mobilization order.

The Vacuum Oil Co., New York City, will grant all employees leave of absence and full pay continued until further notice. In addition the firm announced that employees desiring to join the military training camp at Plattsburg would receive 2 weeks with full pay in addition to the regular 2 weeks' vacation.

The Paige-Detroit Co. of New York, through E. M. Dalley, the president, announces that families of its employees who have answered the call to colors will be cared for.

The Pyrene company will give full pay to those employees enlisting.

Ford to Keep Jobs Open

Henry Ford has denied the rumor that he would discharge any of his employees who enlisted in the National Guard. Those men who enlist can return to employment without prejudice, states Mr. Ford.

The following list shows those companies which are taking care of their employees during their enlistment in the army:

Auto Supply Mfg. Co., N. Y. C.
Firestone Tire & Rubber Co., Akron, Ohio.
B. F. Goodrich Co., Akron, Ohio.
Goodyear Tire & Rubber Co., Akron, Ohio.
General Electric Co., Schenectady, N. Y.
H. W. Johns-Manville Co., N. Y. C.
Paige-Detroit Co. of N. Y., N. Y. C.
Packard Motor Car Co., Detroit, Mich.
Pyrene Mfg. Co., New York City.
Studebaker Corp., Detroit, Mich.
R. E. Taylor Corp., N. Y. C.
U. S. Rubber Co., N. Y. C.
Vacuum Oil Co., N. Y. C.

$60,000 Plant for Dort

FLINT, MICH., June 24—To take care of increased business, the Dort Motor Car Co., which has been building motor cars for about 1 year now, and which is the outgrowth of the motor vehicle building operations of the Durant-Dort interests, has purchased several large pieces of land here, on which a $60,000 plant is to be begun immediately. All the buildings formerly utilized by the Durant-Dort Carriage Co. have also been taken over for the manufacture of cars. Besides, several lots adjacent to present factory buildings have been acquired for expansion of these plants.

198,150 Ohio Registrations

COLUMBUS, OHIO, June 22—According to Registrar of Automobiles W. H. Walker, up to June 21, 194,000 licenses have been issued to owners of gasoline cars and trucks. The number of electrics is 4150. Manufacturers and dealers to the number of 2750 have been registered in that period. It is estimated that more than 230,000 cars will be registered by the department if the present rate is maintained.

Paige Earning at 150% Rate

$1,500,000 Per Year Is Present Earning Rate—Assets $1,504,497

NEW YORK CITY, June 26—The Paige-Detroit Motor Car Co., Detroit, is earning at the rate of $1,500,000 per annum, which compares with actual earnings in 1915 of $654,000 and in 1914 of $123,000. With the recent 80 per cent stock dividend and the additional $100,000 stock sold, there is now outstanding $1,000,000 capital stock, par value $10. Earnings this year are at a rate equivalent to 150 per cent on the stock.

The net tangible assets of the company as of June 1, with the full $1,000,000 stock outstanding, were $1,504,497, or $15 per $10 share. The balance sheet as of that date follows:

Assets	
Plant	$158,733
Inventory	742,421
Service station accounts	154,914
Notes and accounts receivable	120,161
Prepaid expenses	4,825
Cash and Detroit bonds	682,808
Total	$1,863,990
Liabilities	
Capital stock	$1,000,000
Current accounts	354,668
Surplus	509,821
Total	$1,863,990

The earnings record and production figures for 1916, estimated, and 2 preceding years follow:

	Production	Earnings	Per Cent on Stock
1916, estimated	16,000	$1,500,000	150
1915	7,749	654,000	65.4
1914	5,262	123,000	12.3

The stock is now on a dividend basis of 3 per cent per month.

—

Westcott Adds to Staff

SPRINGFIELD, OHIO, June 23—With the removal of its factory and general offices from Richmond, Ind., to Springfield, where it has facilities for a largely increased production, the Westcott Motor Car Co. announces several additions to its organization. A. H. Frost, formerly factory manager of the Detroit Wire Spring Co., has become manager of the Westcott service department. He formerly was connected with the service divisions of the Packard and Oakland companies. J. M. Rehe, who has been chief clerk to the general auditor of the Ohio Electric Railway Co. at Springfield, has been appointed auditor of the Westcott company. J. B. Boyle, who has been in the employ of the Westcott company for several months, has been placed in charge of the traffic and order department. He was formerly in the offices of the Pennsylvania lines at Richmond, Ind.

—

May Exports from New York Total $8,501,163

NEW YORK CITY, June 23—May exports from this city of automobiles and parts and tires totaled $8,501,163, as compared with $8,120,672 in April. Automobiles and parts, valued at $7,146,232, were exported in May, while the exportation of tires totaled $1,354,931.

Up to the week ending June 17, exports from this port amounted to $6,934,264, divided into $2,917,517 for commercial vehicles, $1,700,239 for passenger cars, $1,251,161 for parts, and $1,065,347 for tires.

—

Metal Prices Lower

NEW YORK CITY, June 27—A drop in metal prices featured the activities in the automobile materials market last week. Bessemer steel dropped to $42 per ton, a loss of $3; copper went down to 26½c. a pound, just 1c. lower than last week; and tin closed at a loss of $4 per 100 lb., its quotation being $39.50. Open-hearth steel rose to $42 per ton, a gain of $2; lead gained 13c. per 100 lb., its quotation being $6.88. The rest of the stocks remained unchanged and steady.

—

Disco Capital Now $350,000

DETROIT, MICH., June 24—The capital stock of the Disco Electric Starter Corp. has been increased from $250,000 to $350,000, providing for plant expansion and increase of production. At present fifty Disco starters are being made per day, of which three-fifths are of the two-unit variety and the balance of the single-unit type. Considerable new machinery is to be installed to add greatly to this output.

—

Garford Adds $2,500,000 to Stock

LIMA, OHIO, June 20—The capital stock of the Garford Motor Truck Co., this city, has been increased from $2,500,000 to $5,000,000. The common stock is increased from $1,250,000 to $2,500,000 and the preferred on the same basis.

The increase was made to take care of the enlarged business. Preparations are being made for a 40 per cent increase in the capacity of the plant.

—

Stewart-Warner to Retire Preferred

CHICAGO, ILL., June 23—The Stewart-Warner Speedometer Corp., this city, will call for retirement, Aug. 1, its $700,000 of preferred stock at about 110.

—

Rollin White Interested in Wilcox Motor & Mfg. Co.

SAGINAW, MICH., June 24—A concern to manufacture automobile motors has been incorporated here under the name of the Wilcox Motor & Mfg. Co., with a capital stock of $150,000, all of which is said to be subscribed for. The organizers are Rollin H. White of Cleveland, Ohio, and M. L. and M. M. Wilcox of this city.

—

M. & M. Buys Out Two Companies

CLEVELAND, OHIO, June 22—The M. & M. Co., this city, recently closed two large deals in the purchase of the entire business and stock of the Wright Wrench & Forging Co., Canton, Ohio, and the Sprague-Waldo Mfg. Co., Detroit, Mich. The former company makes wrenches and other tools, while the latter concern manufactures lamps.

—

Burke Is Buick Chicago Mgr.

CHICAGO, ILL., June 24—D. A. Burke has been appointed local branch manager of the Buick company, succeeding E. T. Strong. He has been with the company since 1913 and was manager of the Cleveland branch until he disposed of this branch to the Ohio Buick Co. He has specialized in organization work at the Buick plant and has also assisted Mr. Strong in the work of organizing the southern portion of the Chicago territory.

—

Enricht's Fuel Substitute to Be Ready in Three Months

BROOKLYN, N. Y., June 23—Louis Enricht's gasoline substitute will be on the market inside of 3 months and will sell for 5 cents a gallon, according to a

statement made by the inventor recently.

Enricht stated that the Maxim company is building two laboratories in Farmingdale, L. I. He also stated that there was nothing in the theory that he decomposed water and used the hydrogen from it for his motive power. The water is only the carrier which takes the explosives through the motor. It has nothing to do with the fuel properties.

A chain of laboratories all over the country is planned to market the chemical, and of this chain the two buildings now being put up in Farmingdale, are numbers 4 and 5.

13th Year for Ford

DETROIT, MICH., June 24—This is birthday week for the Ford Motor Co., which is now 13 years old. Organized June, 1903, the Detroit factory employed 311 men, and completed a fiscal year's production with 1708 cars to its credit. June this year finds the Detroit organization employing 31,000 men and turning out 500,000 cars. There are twenty-eight branch factories in the United States, besides the Ford Motor Co. of Ford, Ont., which employes 2500 men, and the Ford Motor Co., Manchester, England, with 2000 on its payroll.

Ford has fifty-one branches in this country and 9000 agents; nine branches and 100 dealers in Canada; a branch in London, England; one in Paris; another in Bordeaux, France; one at Buenos Aires, and one at Melbourne, Australia.

Dividends Declared

Standard Screw Co.; semi-annual of 3 per cent on common and an extra of 3 per cent. Regular semi-annual dividends of 3 per cent on the Class A preferred and 3½ per cent on Class B have also been declared. All dividends payable July 1 to stock of record June 23.

Decline in Security Prices

Suffer Setback on Weak Market—Few Gains Made—Losses Are Many

NEW YORK CITY, June 27—Automobile security prices declined last week as a result of the unsettled conditions in this country in regard to the Mexican situation. The market yesterday sold steadily downward on account of the growing imminence of war with Mexico and the general feeling that the United States is as yet unprepared. Publication of the fact that the Government is in the field for 4000 trucks, while it would ordinarily be a bullish argument, because of the increase business to be derived by the automobile trade, did not have a bullish effect this time.

United Motors dropped 11¼ points. Announcement in regard to this stock has been made that the Guaranty Trust Co. has deposited 67,274 shares of Perlman rim stock, which 6 months from May 25 will be exchanged on the basis of one share for two shares of United Motors. The remaining 32,724 shares of Perlman retain their original status, but may not be exchanged, as the time limit has expired and not been extended.

Overland Makes Gain

Willys-Overland common was one of the few stocks to record a gain, amounting to 2 points. In regard to the recent merger failure, in which J. N. Willys figured prominently, it has come to light that the real cause of the failure of the merger was the refusal of Mr. Willys to proceed with the merger because the manager feared to let him have a free market for his stock in the new company. Mr. Willys asked for 2,500,000 shares or more cash than could be raised, in return for selling out. His holdings in stock would have been in the neighborhood of four sevenths of the total stock, and the other members of the financing committee were quite willing to give this in exchange for the Willys-Overland, provided he would agree to withhold it from the market for a stated time. This he refused to do, and the merger was called off.

The Saxon Motor Car Corp. last week made application for listing its stock on the Stock Exchange. The Packard company is offering through William A. Read & Co. at 104 and accrued dividend a block of the 7 per cent cumulative preferred stock, of which the total amount authorized and outstanding is $8,000,000.

Edmunds & Jones Common Pays 4%

DETROIT, MICH., June 25—The common stock of the Edmunds & Jones Corp., which in March took over the Edmunds & Jones Mfg. Co., Detroit, the Canadian Lamp & Stamping Co., Ford City, Canada, and the Chicago Electric Mfg. Co., Chicago, was to-day placed upon a dividend basis of $4 per share. The combination ranks as the largest maker of electric, acetylene and oil lamps for automobiles and trucks.

Now Monarch Governor Co.

DETROIT, MICH., June 24—The name of the Kramer Governor Co., maker of a speed-controlling device for trucks, has been changed to the Monarch Governor Co. The concern's plant remains at Twelfth and Bethune Streets, at which the output is now about 150 instruments a day.

De Palma First at Des Moines

Covers 150 Miles in Mercedes at 92.66 m.p.h—Lewis Wins 50-Mile

WINNERS OF 150-MILE RACE

Car	Driver	Time	Prize
Merecedes.	De Palma	1:36:36.23	$3,000
Maxwell	Henderson	1:38:13.72	1,500
Maxwell	Rickenbacher	1:39:18.72	750
Crawford	Lewis	1:40:00.01	600
Stutz	Cooper	1:40:08.96	500
Hudson	Mulford	1:45:27:15	450
Sunbeam	Galvin	1:46:44.40	400
Stutz	Chandler	Flagged 141 Lap	400

Des Moines, Iowa, June 24—Ralph De Palma won the second annual Des Moines Speedway classic here to-day when he covered 150 miles in 1:36:36.23, or at the rate of 92.66 m.p.h., a speed nearly 6 m.p.h. faster than that of the Des Moines race last year, for a distance of 300 miles in which De Palma was nosed out of first place by Ralph Mulford in a Duesenberg.

Next to De Palma's Mercedes came the two Maxwells which captured second and third places. Rickenbacher, who was the only man to head De Palma during the entire race and who pushed him for the lead during the entire first 140 miles of the race, was robbed of his apparently sure second by a series of tire troubles late in the grind. But his team mate, Pete Henderson, was at his heels and picked up Rickenbacher's place just in the wake of the Mercedes. Henderson, driving a great race throughout, was second in 1:38:13.72, 1 min. and 48 sec. behind De Palma. Rickenbacher, in spite of his troubles, got the checkered flag 1 min., 5 sec. behind Henderson when he finished in 1:39:18.72. Dave Lewis and his Crawford took fourth honors when he finished in 1:40:00.01. Joe Cooper and his Stutz were fifth and Ralph Mulford, Des Moines winner last year with a Duesenberg, could not get better than sixth this year with the Hudson Super-six which he is now driving. Galvin in his Sunbeam was seventh and Chandler, Joe Cooper's teammate, was eighth.

Two Accidents

Two spills, almost coincident and the second directly resultant from the first, failed to mar the race which Starter Wagner declares to have been an ideal contest under ideal conditions. Wilbur D'Alene, one of the Duesenberg team, had his right rear wheel collapse on the last turn of his thirtieth lap. The car leaped into the outer guard rail, rebounded, struck the rail again and then tore downward into the safety apron, where it landed right side up with neither D'Alene nor his mechanician, Ed Miller, injured, except for a slight cut suffered by the latter. Tom Milton, another of the Duesenberg pilots, was just back of D'Alene and took to the safety apron at high speed to avoid mixing with his troubled comrade ahead. His car spurned the rough earth of the apron and turned over several times. Milton and his mechanician, E. Rathbun, were both under the cowl and both came out unscathed. The accident, however, took all of the Duesenberg contenders from the field, except for Eddie O'Donnell, who was out in the 86th lap when his steering gear went wrong.

De Palma won by master work at the wheel and was more fortunate than usual for him in the matter of tire changes. He was called to the pit but once and that was in the 129th lap when his right front tire gave out. The change was made in 20 sec. Rickenbacher was not so fortunate with his tires. His first trouble sent him to the pits in the 108th lap after he and De Palma had driven almost a neck and neck race up to that time. His second tire change came in the 136th lap and he went in for a new tire for the third and last time in the 142d mile. De Palma gained two laps and a half when Rickenbacher went in for the first change and he held a margin over his rival during the entire remainder of the race even though he himself was forced to the pits once during that time.

De Palma Regains Lead

De Palma led with Rickenbacher pushing him at every turn of the race until "Rick" pushed his Maxwell into the lead in the 87th mile. He held the leadership for a short time only, however, for De Palma soon pushed his Mercedes into the head position again on the lower turn of the 94th mile. During the early stages of the race Galvin and his Sunbeam alternated with Henderson and his Maxwell for the third and fourth places except during the time before D'Alene was put out of the race when he held the fourth place.

Twelve cars went away when Starter Wagner waved the red flag at 1.50 with 20,000 people assembled for the event. De Palma and Rickenbacher at once took the lead and the great race between them was fought out mile after mile with honors almost even but with De Palma always in the lead until the race was half over.

Quick work was the rule at the pits. Dave Lewis and his Crawford got a new tire in 30 sec. Chandler, driving the other Crawford was more seriously delayed by spark plug trouble.

Eddie Rickenbacher turned the tables on De Palma in the 50-mile event which followed the main race. He went the entire distance without a call at the pits and his time was 31 min. and 9.17 sec. or an average of 96 m.p.h. De Palma was only seconds behind, 9 of them in fact, although he had lost 18 sec. in a tire change. Rickenbacher's margin, however, would have been much larger except for the fact that he had a bad skid in the back stretch. This thrill was missed by the crowd but was observed by De Palma who knew that Rickenbacher lost time by reason thereof, and who thought he had won the race until it was all over. A rechecking of the tape showed that Rickenbacher was the winner. When he had the bad skid in the back stretch he could not keep his car from the rough and he cut a figure eight but managed to right himself and swing back into his wonderful speed, although the delay caused him a drop from the first to the fourth position, a drop which spectators were at loss to understand because they had not seen his trouble.

The 50-mile event was, if possible, even a more exciting and satisfying spectacle than the longer race. Three, instead of two, drivers, were fighting for the first place in every mile of the grind. Rickenbacher and De Palma were at it again and they were both being fought at every stage of the game by Joe Cooper and his Stutz who took the third place and who was a leader at one stage of the game until tire trouble put him back. Lewis and his Crawford registered again when they won the fourth position in the shorter race and Henderson, second man in the 150-mile race, was fifth, with Galvin and his Sunbeam registering in for the sixth position.

Of the $10,000 given in prizes for the winners of the two races, De Palma carried away the largest share with $3,000 for first in the long race and $500 for second in the 50-mile event. Henderson and Rickenbacher won $1,500 apiece and the rest of the money was divided among contenders who won thirds, fourths, and minor positions.

A. A. A. Temporarily Lifts Ban on Grand Rapids Track

Grand Rapids, Mich., June 24—The A.A.A. contest board, through Chairman Kennerdell, having raised the ban on the local track for 1 day, it ordinarily being an outlaw track, the Automobile Business Assn. has promoted a 100-mile race for July 8 for cars under 450 cu. in. displacement. It is said that Ralph de Palma will drive his Mercedes, Ralph Mulford will pilot his Hudson and Gil Anderson will compete in a Premier.

There will also be a 5-mile amateur free-for-all elimination race, and an invitation Ford race with a final heat of 5 miles, this under Class E, non-stock classification.

Benton Harbor, Mich., is also to have a sanctioned ½-mile meet on July 4.

Saxon 300-Mile Non-Stop Run

2000 Dealers All Over Country To Start Car and Motor Test on July 1

DETROIT, MICH., June 24—The Saxon Motor Car Corp. has laid plans for the staging of what is said to be one of the largest non-stop runs ever held, this to be a test conducted in all parts of the country by the 2000 Saxon dealers who will each run 300 miles without stopping his motor.

The tests will be conducted individually by the dealers, and in each car an official observer who is a newspaper man. A large silver loving cup is to be presented to the dealer who attains the best mileage record per gallon of gasoline.

In addition to keeping an accurate record on all the gasoline and oil used on his run, each entry will also check up on whatever mechanical attention or adjustment is necessary. The run is to take place on July 1.

Buick Wins Canadian Reliability

OTTAWA, ONT., June 20—The reliability tour from the Canadian capital into the State of New York which took place last week-end, excited a great deal of interest all along the route. It not only gave motorists a chance to sample the terrible roads between Ottawa and Prescott, which was the first leg of the journey, and conditions were made worse than ordinary by a heavy rainfall of 18 hr., directly before the start, following on several weeks of more or less continuous rain, but it also enabled an impetus to be given to the Good Roads movement in Ontario, as well as permitted the celebration of the exchange of licenses between Ontario and New York State by a large body of motorists. McLaughlin-Buick cars carried off the first four prizes, the winner being G. B. McKay, who finished the run to Gouverneur with a perfect score of 1000 points, this car not even losing a point on the secret schedule run. The fifth prize went to a Dodge car, and the sixth to an Overland, while the McLaughlins were the next three in order to finish on points, followed by a Russell, Ford, Chevrolet and Brisco.

Dealers See New Buick Four

FLINT, MICH., June 24—This week has been a sort of get-acquainted meeting at the Buick factories here. Buick dealers from various sections have been brought to the city, some sections coming by special trains, others by boat, etc. One of the objects of the gathering was to meet the new general sales manager, E. F. Strong, who succeeded B. H. Collins, resigned. Another was to get a view of the new Buick four-cylinder car, that is to be put on the market both as a touring car and roadster. The convention was addressed by W. C. Durant, president of General Motors, and the selling organization was also informed of the election of W. P. Chrysler to the general managership of the Buick company.

Chalmers Branch in Salt Lake City

DETROIT MICH., June 27—With the intention of erecting a branch and warehouse to take care of the district, the Chalmers organization has incorporated the Chalmers Motor Sales Co. at Salt Lake City, Utah, with a capital of $200,000. W. P. Kiser is secretary.

Allen 4-Day Convention July 17

FOSTORIA, OHIO, June 24—The Allen Motor Co., this city will hold its annual convention of distributors on July 17 and the following 4 days. Monday will be spent at the main factory in Fostoria, Tuesday at the motor plant in Bucyrus, Wednesday and Thursday will be devoted to a tour taking in points of interest in northern Ohio, including Cleveland and Put-in Bay.

Eight New Contracts for Bosch

NEW YORK CITY, June 26—These companies have signed contracts to use Bosch magnetos for the coming season: Mercer Automobile Co., Trenton, N. J.; Diamond T. Motor Car Co., Chicago; Thomas Evarts Adams, Inc., New York; Detroit-Wyandotte Motor Truck Co., Wyandotte, Mich.; Autocar Company, Ardmore, Pa.; Rochester Carriage Co., Rochester, N. Y.; Stegeman Motor Car Co., Milwaukee, Wis.; Republic Motor Truck Co., Alma, Mich.

Texas Dealers Get Army Business

EL PASO, TEX., June 26—Accessory and tire concerns of El Paso are breaking business records every week. Sales have been unusually heavy this year, even leaving the army business out of consideration. Last week one army contract called for $35,000 of solid rubber tires. It is believed that the average amount spent weekly in El Paso for motor supplies for Uncle Sam is in excess of $25,000.

Deaco Creditors' Final Dividend

DETROIT, MICH., June 27—Final dividend to the creditors of the defunct Detroit Electric Appliance Co., maker of the Deaco starting and lighting equipment, has been paid by the Detroit Trust Co., trustee. The final payment checks amount to a little over 3 per cent, bringing the total received by the creditors to about 23 per cent, they having previously received 20 per cent of their claims.

Henning Wins at Galesburg

Ogren Pilot Covers 100-Mile Course at 58.5 m.p.h.—Duesenberg Second

GALESBURG, ILL., June 22—Following two postponements, caused by rain, the third annual 100-mile race was held on Galesburg's mile dirt track and Otto Henning, driving an Ogren car, won first money. Owing to the condition of the course the time was slow, 1:42:34.60, an average of 58.5 m.p.h.

Second to the winner came George Buzane in a Duesenberg. His time was 1:43:15.05, an average of 58.2 m.p.h. Andy Burt in a Stutz was third in 1:44:20.75, or at 57.5 m.p.h., while Art Klein in a Klein Special was fourth in 1:45:22.25, an average of 57 miles per hour. Klein was the hard-luck driver of the contest, for he lost the race after leading the field for 87 miles. Ralph Mulford and Ira Vail, both driving Hudson Super-sixes, were put out of the race early by mechanical troubles. Mulford broke a valve spring and piston and Vail burned out a bearing. Other drivers who competed but who failed to get inside the money were Jack Gable in the Burman Special, Harry McNay in a Cino, Tommy Milton in a Mercer Special and C. R. Parker in a Duesenberg.

Henning went in as a post entry, reached Galesburg after a hard drive of 2 days over muddy roads and then had failed to show up when the field was lined up for the start. The race was held 5 min. and just as the motors had been cranked for the getaway Henning appeared. Without time even to visit his pit the Chicago driver got away in last place.

Then Klein was forced to make a short stop at his pit to fix a broken terminal and Henning gained a half lap. It was neck and neck for another 15 miles, with Henning steadily gaining. Then when Klein had to stop for a tire change that took but 31 sec., Henning went into the lead and was not again headed. Klein's hard luck stuck with him, for he ran out of gasoline near the finish of the race and dropped back to fourth place.

100 Tractor Firms in Demonstration

ST. LOUIS, MO., June 24—The St. Louis Tractor Farming Association, organized to give the National Farming Demonstration here July 31 to Aug. 4, announces that 100 firms have signed exhibition agreements for the demonstration and that a 2000-acre tract of wheat land has been obtained for the tractor contests.

Separator Ordinance Sustained

Suit Between Garagemen and N. Y. City Settled—Law To Be Enforced

NEW YORK CITY, June 26—The gasoline separator ordinance against which the dealers and garagemen of New York City have fought for years has been sustained by the courts. Prosecutions under the ordinance have been held up by the authorities depending on the issue, and it is stated that enforcement of the law will now be required. This ordinance requires the installation in every garage of a device which is designed to separate from the floor sewage any escaping oil or gasoline.

The devices have proved expensive, costing from $200 up, and the automobile interests have maintained that the separators will not do the work and are a needless expense. Exhaustive tests have been made by both sides in the controversy.

The dealers succeeded in having the ordinance repealed by the Board of Aldermen, but their repeal was vetoed by the Mayor and an attempt to pass the repeal over his veto failed.

The Bronx Garage then brought a mandamus action to require the issuance of a garage permit in the garage which had no separator. A jury trial was secured and the decision was favorable to the dealers, but the city carried an appeal to the Appellate Division of the Supreme Court and the latter has decided that the jury trial was improper and that the ordinance is essential to the welfare of the city. The motor car interests are considering further steps in the matter. The Court of Appeals is the only remaining higher court in the State of New York and any further step likely would constitute an appeal to this tribunal.

Receiver for Star Motor Car Co.

ANN ARBOR, MICH., June 24—Judge E. D. Kinne in the Circuit Court here has appointed A. D. Groves of this city receiver for the Star Motor Car Co., which produces a light truck. The receiver will determine whether or not it is advisable to continue the concern as a going business or sell it.

Creditors Wind Up Affairs of Detroit Body Co.

DETROIT, MICH., June 20—At a final meeting of the creditors of the defunct Detroit Body Co. before Referee Lee E. Joslvn here to-day, the affairs of the bankrupt were wound up. This concern, which was adjudicated a bankrupt on April 20, 1915, owned a large body factory in the northeastern manufacturing center of the city. The total indebtedness was $329,650, and the trustee realized by sale of the assets, $260,983. Of this amount, $242,195 was paid to secured creditors, and a dividend of 8 per cent has already been paid to the unsecured creditors. It is understood that a further dividend of from 3 to 4 per cent will go to the latter when the estate is finally closed up.

International Automobile League President Arrested

WASHINGTON, D. C., June 24—Following a hearing before W. H. Lamar, solicitor-general of the Post Office Department, Alfred C. Bidwell, president of the International Automobile League, Inc., of Buffalo, was arrested by Federal authorities. The hearing was upon an application by Richard H. Lee, of Cleveland, chairman of the legislative committee of the American Automobile Assn. for a fraud order refusing the league and the International Automobile, Tire & Rubber Co., of California, a further right to use the mails on the ground that they were making promises they could not keep. It is claimed that many thousand persons joined the league on a promise they would obtain automobile supplies at reduced or wholesale prices, the annual assessment being $10. Bidwell furnished bond in the sum of $5,000 for his appearance before United States Commissioner Taylor here on July 18. It is stated that a fraud order was issued against the league and that counsel for Bidwell has until July 18 to file a brief in the case. A warrant alleging violations of sections of the penal code respecting the use of the mails was sworn out and Bidwell's arrest followed.

Chalmers Sub-Dealers Convene in Detroit

DETROIT, MICH., June 24—More than fifty sub-dealers of the Chalmers Michigan organization, operating under the Michigan distributor, the L. J. Robinson Co., were in the city this week for a 2-day convention to view the 1917 Chalmers cars and to formulate plans for a furtherance of business for the coming season.

Talks were given by President Hugh Chalmers, C. A. Pfeffer, vice-president; Paul Smith, vice-president of the selling division; L. J. Robinson and Harry Newman of Chicago. A big drive-away of new models closed the meeting, and took many of the new cars away from Detroit.

Overland Opens New Branches

TOLEDO, OHIO, June 27—In line with its sales expansion policy, the Willys-Overland Co. has taken steps to facilitate distribution by the opening of new branches at Denver, Col., Jacksonville, Fla., and Omaha, Neb., in addition to increasing its facilities at Columbus, Ohio, Springfield, Mass., and in its home city of Toledo. Buildings have been acquired in the first three named cities, and remodelling and other expansion is being carried on in the latter three. At Toledo, the Atwood Automobile Co., which was the dealer, has been purchased outright to be hereafter conducted as a factory branch, and A. A. Atwood and C. T. Atwood who conducted the local agency have been taken into the Overland organization, the management of the Toledo branch being now under G. C. Morgan.

C. T. Dunkle has been put in charge of the Columbus branch, following the acquiring of the business of O. G. Roberts, former Overland distributer here, the conversion of this location into a service plant, the acquiring of another site for salesroom, and the leasing of the plant formerly occupied by the Columbus Buggy Co. as a storage space. Calvin Eib will be in charge of the Denver branch; and J. R. Jamison is to operate the Omaha branch, having been the dealer there prior to the factory representation. G. H. Johnson, from the Toledo offices, goes to Jacksonville to manage that branch. M. T. White, former Stevens-Duryea official, takes charge of the newly erected branch at Springfield.

$6,000 for Krit Creditors

DETROIT, MICH., June 24—The creditors of the defunct Krit Motor Car Co. will get final dividend checks this week from Referee in Bankruptcy Lee E. Joslyn, the total amount to be distributed being $6,000, bringing the total paid to 5 per cent on $850,000 of allowed claims. The Krit concern was adjudicated bankrupt in December, 1914, and prior to that time had been operating for several months under a creditors' agreement, whereby they were paid about 30 per cent of their claims.

To Sell P. R. Assets Separately

DETROIT, MICH., June 24—Following the placing of the P. R. Mfg. Co., maker of automobile parts and accessories and electric bells, in the hands of a receiver last fall as a result of a disagreement among the directors of the company as to the financial policy to be followed by the management, and the subsequent operation of the plant as a going concern under the receivership of the Security Trust Co., this city, it has now been decided by the Trust company that it will be more advantageous to the creditors and stockholders to sell the real estate of the corporation separately from the tools, equipment and stock. It was the original intention to dispose of the property as a whole as a going business, but the parcel plan was adopted later.

Factory Miscellany

To Make Spark Plugs—The Long Distance Spark Plug Co., Birmingham, Ala., has been incorporated with a capital stock of $10,000 by Solon Jacobs, H. C. Pogue and others. Its factory, located at another point, will be removed to Birmingham.

Barberton Tire Co. to Build—The Punctureless Auto Tire Co., Akron, Ohio, is planning to build a factory at Barberton, Ohio.

Studebaker to Build in St. Paul—The Studebaker Corp., Detroit, is planning to build a plant in St. Paul, Minn.

Firestone Power Plant Burns—Fire practically wiped out the powerhouse of the Firestone Tire & Rubber Co. plant in Akron. An electric transformer blew up, burning out all electric wiring and rendering the plant powerless.

Resilient Wheel Starts Work—The Resilient Auto Wheels Co., organized recently at Wausau, Wis., has started manufacturing operations in the factory building at Ninth Avenue and West Street. Shortage of steel supplies has delayed the company in getting started, but production is now well under way. Fifty skilled men are employed at this time and the force will be increased to eighty and 100 as rapidly as competent help is available. J. E. Berglund is general manager.

Continental Truck to Build—The Continental Motor Truck Co., Superior, Wis., has awarded all contracts for the erection of its new motor truck factory, which will be 80 by 200 ft. in size, and of reinforced concrete, brick and steel construction. The company has been operating in leased quarters for several years, but these now are entirely inadequate.

American Brass Foundry to Move—The American Brass Foundry Co., 198-202 Milwaukee Street, Wilwaukee, Wis., which has been engaged in the manufacture of motor car accessories in connection with its casting business, will move July 1 to larger quarters at 1916-1920 St. Paul Avenue. Hereafter the company will devote its attention exclusively to motor car parts and accessory work and will discontinue the foundry business. The Allis Fire Extinguisher Co., 434 Jefferson Street, has leased the old quarters on Milwaukee Street and will take occupancy as soon as an additional story is erected.

Third Goodyear Stack Finished—The last brick in the third stack which for 2 weeks has been in the process of erection at the Goodyear Tire & Rubber Co., Akron, Ohio, was cemented in place recently. The stack just completed is 21 ft. 6 in. in diameter at the bottom, tapering to 15 ft. 6 in. at the top, which is 250 ft. above floor level.

About 1585 tons of brick entered into the construction of the big shaft, each one of which was placed in position without the use of plumbline or other instrument to determine perpendicularity of the stack.

Through the use of specially designed radial blocks of refractory red clay, so constructed as to fit together to give the proper degree of taper, the stack was built up with no other instruments than the brick mason's trowel and level. It rests on a solid rock foundation, leveled over with concrete, and is equipped with both inner and outer steel ladders, with rungs 18 in. apart.

Goodyear now has the three highest stacks in the State, all of which have been built to withstand a wind velocity of 100 m.p.h. The erection of a fourth stack of the same height will be commenced soon for the new mechanical goods and chemical plant, about a mile up the Little Cuyahoga River from the main Goodyear Tire & Rubber plant in Akron.

To Make Bodies—Commercial Auto Body Co., St. Louis, has been incorporated with $50,000 capital stock; the holders are Hugh F. Cartwright, 498 shares; M. E. Cartwright and X. F. Wilfey, one each. Mr. Cartwright has been conducting a factory at Sixteenth and Pine Streets and during the last year turned out 10,000 bodies. The capacity will be enlarged.

The Automobile Calendar

ASSOCIATIONS

July 9-13 — Detroit, Mich., World's Salesmanship Congress, Detroit Board of Commerce Bldg.
Sept.—Indianapolis, Convention for Formation of Indiana Automobile Trade Assn., under auspices of N. A. T. A., Hotel Claypool.
Oct. 2-5—St. Louis, Fall Meeting Assn. of Automobile Accessory Jobbers.
Dec. 2-9—Electricians' Countrywide Celebration.

CONTESTS

July—La Grande, Ore., Track Race, LaGrande Motor Club.
July 4—Coeur d'Alene, Idaho, Race Meet, Hiller-Riegel Co.

Aug. 28-Sept. 1—Indiana Tractor Demonstration.
Sept. 4-8—Madison, Wis., Tractor Demonstration.
Sept. 11-16 — Milwaukee, Wis., Fall Show. Wisconsin State Fair, Milwaukee Automobile Dealers.

The Week in the Industry

Minneapolis News—Bohn Fawkes, distributor for the Oldsmobile, has moved to a new building at Hennepin Avenue and Harmon Place.

The Brice Auto Co., representing the Grant, has moved to a new building at 1641 Hennepin Avenue.

E. A. Zolle, representing the Hupmobile retail, has moved to a new building at 1639 Hennepin Avenue.

The R. C. Smith Auto Co., distributor for the Velie and truck, the Regal and the Stewart truck, has moved to a new building at 1601-1603 Hennepin Avenue.

The Shattuck Trailer Co. has opened a general office and showroom at 1408-1410 Hennepin Avenue.

A. R. Curtis has opened a display of Curtis trailers and camp outfits at 1411 Hennepin Avenue.

The Twin Bed Trailer has opened a display in the Murphy Building at 1305-1309 Hennepin Avenue.

The Gray Motor Co. has opened a Studebaker service building at Fifteenth Street and Laurel Avenue.

Mich. Items—C. M. Johnson, Alma, Mich., Ford and Overland distributor for Gratiot County, has purchased the garage, supplies and equipment of A. C. Wyant, Reo and Chalmers distributor, on East Superior Street.

E. C. Seale and C. C. Van Veen, Detroit, have purchased the Acme Tire & Repair Co. business at 226 Jefferson Avenue. The company is to be renamed the Acme Tire & Supply Co. and headquarters will be at 1745 Woodward Avenue. The firm will do a general repair business and will handle tires of all popular makes.

Ill. News Items—Judd Seacord & Son, Galesburg, have opened a used-car department on the public square, leasing the building formerly occupied by the Square Garage Co., and will hereafter utilize this structure for second-hand cars exclusively. Lack of room in the North Kellogg Street main building necessitated additional quarters. A separation of the new and old cars was also thought to be an advantage. The Square Garage Co. has removed to a new building on North Cherry Street. Hereafter repair work alone will be given attention.

R. S. Bassett, Elgin, has disposed of his stock in the Elgin Motor Sales Co. to C. E. Heslet and C. C. Gale, both of Michigan City, Ind., and the new owners took possession this week. The business will be continued under the same corporate name. S. S. Bassett, who has been manager, will be retained in the same capacity. Various improvements are planned and the business will be expanded in several ways.

Luckey New Orleans Edison Mgr.—The Edison Storage Battery Supply Co. has established a new sales office at New Orleans and has appointed C. A. Luckey as resident manager.

Mr. Luckey is a graduate of Franklin Military Academy, Franklin, N. Y., 1899, and Bliss Electrical School, Washington, D. C., 1900-1901. He was connected with the Western Electric Co., New York city, during 1901-02, leaving there to go with the Safety Car Heating & Lighting Co., where he remained until 1911, spending the first 4 years in its electrical laboratory and then going with the Chicago branch.

In 1911 Mr. Luckey was with the Railway Utility Co., Chicago. In 1912 he joined the sales force of the Edison Storage Battery Co., Orange, N. J., and was attached to the sales office in Chicago, where he has been until his present appointment.

Mr. Luckey's new address will be Edison Storage Battery Supply Co., 201 Baronne Street, New Orleans, La.

Ohio News Items—The King Sales Co., Toledo, northwestern Ohio agent for the King, will soon move into new quarters on Motor Row. E. A. Wilkinson, president of the company, recently purchased the stock and business of the Madison Garage, conducted by M. M. Mull. The United Garage Co. of Toledo, Ohio, agent for the Reo, has added a line of accessories to its sales and garage business.

The E. F. Loeffler Rubber Co., 85 East Gay Street, Columbus, has been succeeded by the Central Tire & Repair Co., with T. O. Pickering as manager.

C. M. Logan has been made president of the Logan-Fischer Motor Co., 1900 East Nineteenth Street, Cleveland, agent for the Chalmers. C. F. Fischer is vice-president. Paul Smith will be in charge of advertising.

Louisville Items—O. R. Crutcher, distributor for the McFarlan car, has opened an office and salesroom at 206 East Broadway.

The Peoples Motor Co. has acquired the agency for the Inter-State and established headquarters at 951 South Third Street.

The Winklemann-Schade Motors Co. has organized and opened a temporary office and salesroom at 949 South Third Street. The concern has been appointed Maxwell distributor in this territory. W. F. Winklemann, head of the company, was formerly sales manager of the Southern Motors Co.

The Louisville Tire Co., distributor for the Empire, has opened an office and salesroom at 407 East Broadway.

New England Trade News—The Bunker-Bancroft Co., agent for the Elcar at Springfield, Mass., has added the Apperson to its line.

The Peckham Brothers Co., Providence, R. I., has bought a large lot of land on which it will erect a salesroom and service station.

J. W. Cobb, formerly with the Cadillac company of Boston, Mass., has gone to Greenfield, where he has taken the agency for the Cadillac for Franklin County.

The Richmond Garage & Motor Co. of Boston, Mass., has petitioned the supreme court to allow it to wind up its business.

Philadelphia Items—D. K. Moore, formerly of the Weston Motor Co., the Federal Mfg. Co. and the American Distributing Co., has been made assistant general manager of production of the Vim Motor Truck Co., Philadelphia.

The Gorson Automobile Exchange, 238-240 North Broad Street, Philadelphia, purchased the building at Broad and Melon Streets, and will build a four-story building containing four stores on the site. The purchase price was $70,000.

T. W. Simpson has resigned as sales manager of the Philadalphia branch of the Oakland Motor Co., 227 North Broad Street, to become district manager for the New England States of the Grant Motor Car Co. S. K. Patteson, one of the oldest men in point of service with the Oakland here, succeeds Mr. Simpson.

The Buick Motor Co., 235-237 North Broad Street, Philadelphia, has leased the six-story concrete building now being built at the northwest corner of Broad and Poplar Streets, which will be used exclusively by the local branch for wholesale and retail purposes. The present quarters will be vacated Sept. 1, when the transition will be made. The new building has a frontage of 65 ft. on Broad Street and a depth of 160 ft. on Poplar Street.

Seeback N. Y. Chevrolet Mgr.—L. J. Seeback, formerly manager of the Brooklyn branch of the C. T. Silver Motor Co., New York City, and later of the Newark branch, has been appointed manager of the New York City sales of the Chevrolet Motor Co.

EVERY Industry has its accepted leader, the manufacturer whose name carries instant conviction of supreme attainment.

When we buy his goods all thought of price is lost in Pride of Possession; the purchase of other makes calls for explanation—almost apology.

Such leadership comes not by chance. Only long years of unremitting effort enable us now, by reason of the present state of perfection of

GURNEY BALL BEARINGS

with their inbuilt superiority an actually demonstrated and determined quantity, safely to assert that

FROM THE STANDPOINT OF EFFICIENCY THEIR EQUAL DOES NOT EXIST

GURNEY BALL BEARING COMPANY

"Conrad Patent Licensee"

JAMESTOWN - - - - NEW YORK

"In planning our models for the coming year it has been decided to accept your recommendation that

"I have studied this question thoroughly and am convinced that the four types of New Departures afford a bearing suited to every requirement of light or heavy duty.

NEW DEPARTURE BALL BEARINGS

American Made for American Trade

be used throughout every car we build," said the Manufacturer to his Chief Engineer.

"Take for instance the Double Row Type. It will carry the heaviest axle loads and resists the severest shocks and stresses that occur in all parts of the car mechanism. I know that to be a fact.

"Moreover, the Double Row needs no adjustment, no auxiliary bearings to assist it in the full performance of its functions, it is, therefore, the simplest of all bearings, the easiest to install.

"I have visited the New Departure plants at Bristol and Hartford and am satisfied that no better material and workmanship exist in any bearing.

"I am satisfied that New Departure Ball Bearings in these new models will reduce our manufacturing costs and enable us to offer cars, practically frictionless in operation and hence economical throughout a lifelong service.

"Before going ahead it would be well to consult with the New Departure Engineering Department. I find the company always ready to make recommendations for the proper use of its bearings."

New Departure Single Row

A lightly perfected anti-friction Bearing for use where radial loads only are to be carried.

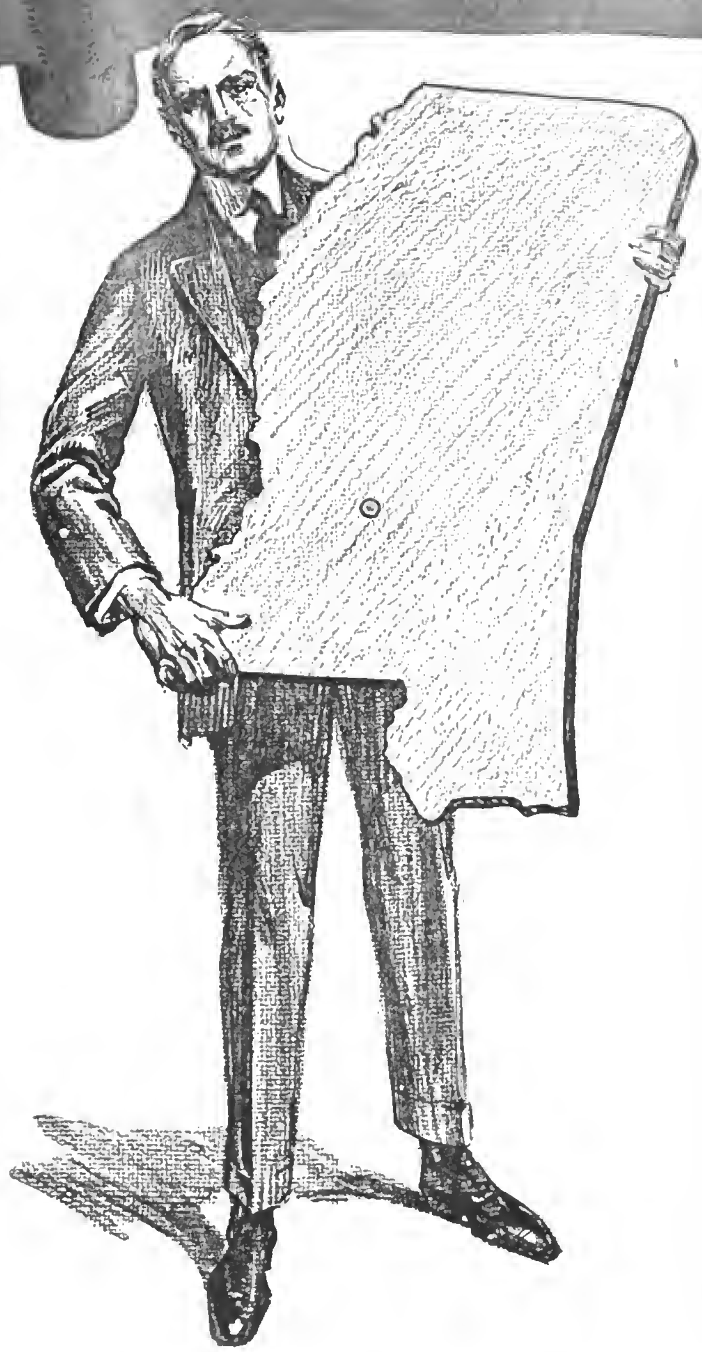
Opportunities

Studebaker



Look at this one in Mississippi—

The second largest city in the State both in population and industrial importance offers a big opportunity for a Studebaker dealer.

Five prominent railroads of the South make this city a terminal point. It is one of the recognized industrial centers in that section of the country. Cotton growing constitutes its chief agricultural occupation, while the manufacture of cotton seed oil, fertilizers and lumber supplies sufficient and well-salaried employment for this city of over 25,000 people.

Studebaker opportunities such as this are rarely offered. Usually there is strong competition among dealers on an occasion like this—so if you are interested write for the facts immediately.

A Warning To Krit Owners— And Others

EVERY once in a while some so-called parts company is overcome with a boundless but misdirected ambition to expand its business. In these times ethics are entirely forgotten.

Such a condition now confronts us.

Advertisements have recently appeared in which certain concerns have purported to supply a full line of Krit repairs. One concern even asserted that it had purchased the Krit Motor Car Company and was now furnishing replacement parts from original patterns.

We therefore issue a warning to Krit owners against the misleading statements which have appeared. The warning applies as well to those who have made these statements. In the future we will take prompt and decided legal action whenever and wherever like offenses occur.

Here are the true facts:

The Krit Motor Car Company is still in operation and will continue in operation indefinitely.

The Krit Motor Car Company has sole possession of all its own jigs, dies, tools, patterns, forms and the engineering records from which its parts are made. It is absolutely impossible for any other individual or company to have access to them or to furnish Krit repairs with any degree of accuracy.

Further, the Krit Motor Car Company alone is obligated to Krit owners. Our service consists not only in supplying repairs but also in furnishing counsel and assistance in the operation and care of every machine.

From now on we propose to render this service undisturbed by unfair competition.

14th and Clinton Streets Nashville, Tenn.

MOTOR BARGAINS

Don't try to buy parts for that old motor. We can sell you one to replace at much less money than you would pay for the parts to put it in running condition.

Used motors thoroughly overhauled, put in perfect condition by the manufacturer as follows:

35 H.P. with carburetor and base for magneto	$95.00
50 H.P. with carburetor and base for magneto	95.00
35 H.P. new with carburetor and base for magneto	120.00
30 H.P. new without carburetor and base for magneto	115.00
35 H.P. new with U. S. starting and lighting outfit, carburetor and Connecticut distributor	180.00

RADIATORS

We manufacture genuine square tube Honeycomb radiators. This type we guarantee will give more cooling surface than any radiator made. Prices on application.

Write for advance spring catalogue on carburetors, horns, tops, bearings, steering gears, magnetos, coils and other parts and accessories.

In this hot weather use a lubricant that will not melt—use

TRADE MARK NON-FLUID OIL REGISTERED IN UNITED STATES PATENT OFFICE

Summer temperatures alone sometimes cause common grease to melt. Besides, grease melts at bearing temperatures, becomes too thin and leaks out proving its unfitness as a lubricant for your car.

Non-Fluid *always* retains its original density, is *always* ready to lubricate and has 3 times as much lubricating value as grease.

Sold only in orange-colored cans at *your* dealer's.

Write for samples and literature

NEW YORK & NEW JERSEY LUBRICANT CO.
165 Broadway New York

DETROIT PLANT FOR SALE

We offer the plant, known as the P. R. Manufacturing Company, located at 621 Bellevue Avenue, Detroit, Michigan, for sale.

The land has a frontage of 416 feet on Michigan Central Belt Railroad and on Bellevue Avenue. The depth is 163 feet. The location is one of the most desirable in the City on account of its railroad connection and its position in the center of a labor residential district.

Not quite one-fourth of the land is at present occupied by buildings, giving ample room for expansion. The present buildings (two-story) provide about 33,000 square feet of floor space, and are brick, mill construction, and equipped with sprinkler system.

SIMMS MAGNETO
SIMMS-HUFF
ELECTRIC STARTING & LIGHTING

"The writer has had several years' experience with magnetos and motor generators and can say that the service that we have gotten out of your magnetos and generators on our cars, for the three years we have been selling them, has been very satisfactory.

We have sure tried out the Simms magneto and generator. Am more than pleased to state that the motor generator can not be beat. We would rather have it than any other system on the market today. It gives good service and will keep storage batteries up which is ninety per cent of the trouble with other motor generators of different makes.

We would be glad to recommend this system to anyone and cannot say enough for it."

Walnut Automobile Company,
Muncie, Indiana

The enormous strength of Parker-Hydraulic Pressed Steel Wheels is due to the fact that the spider is formed from two pieces of steel plate welded together.

PARKER-HYDRAULIC
PRESSED STEEL WHEELS

are the strongest wheels made. A bad skid against a curb might bend these wheels, but it could not break them, and even if bent, they could easily be straightened. The tremendous strength of these wheels insures your safety. In spite of their great strength, Parker-Hydraulic Pressed Steel Wheels weigh half as much as wooden wheels with demountable rims.

Other advantages of Parker-Hydraulic Pressed Steel Wheels are—They give you the easiest and quickest demountable rims, their handsome baked-on finish will not rust—they greatly decrease unsprung weight.

It will pay car manufacturers, dealers and motorists to investigate Parker-Hydraulic Pressed Steel Wheels.

Catalog on request.

These wheels are manufactured under the Gibson Pat.

Seal up these small holes before sand and water work in and the tire blows out. It will save your tires—save you repair bills and triple your mileage.

SHALER Vulcanizer

The Shaler principle is so simple and the Shaler Vulcanizer so easy to use that any motorist can take care of and vulcanize his own tires without trouble in a few moments and make the repair the strongest part of the tire. The Shaler does not have to be watched or regulated. It has an automatic heat control which provides for the exact amount of heat for perfect vulcanization.

FREE to Car Owners Motorists, send for book, "Care & Repair of Tires." The tire information it contains will save you many a dollar. It explains everything about tires and how to care for them. Write today. It's FREE. Shaler Vulcanizers are sold by dealers everywhere.

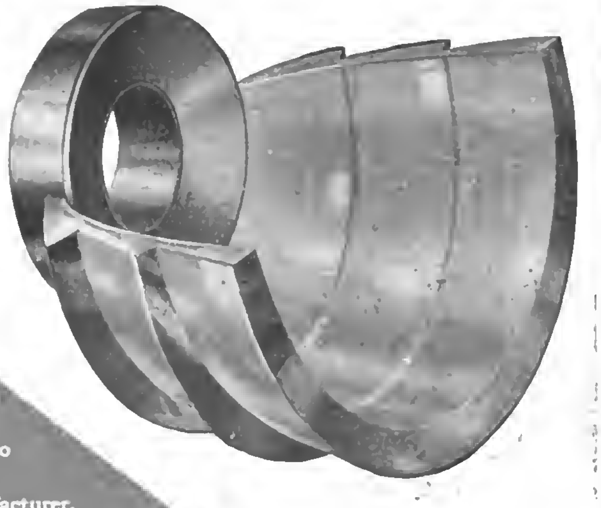
"FRACTO"

$2.75 PER PAIR



Comply with the law without losing the lighting value of your headlights — Equip your lamps with "Fracto."

"Fracto" equipped lamps show every depression, bump, stone and obstruction on the roadway long before you reach them. You get brilliant illumination without the glare which blinds, confuses and endangers approaching motorists and pedestrians.

"Fracto" is a little 2-oz. glass, cup-shaped lens which magnifies and intensifies the light of the bulb under which it is easily and simply attached. It governs the light rays and directs them along the road surface, giving better service than is possible to obtain from any light and ordinary reflector.

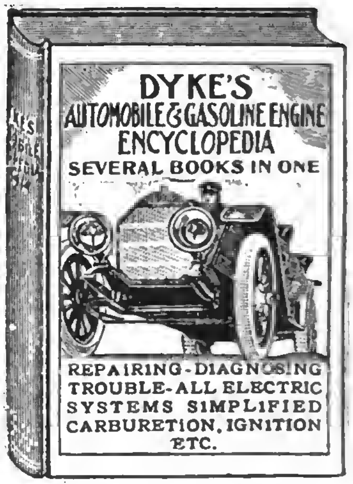
If your dealer can't supply you promptly, send direct to the manufacturer, enclosing price.

FRACTO SPECIALTY CO. 356 Newbury Street BOSTON, MASS.

DYKE'S AUTOMOBILE AND GASOLINE ENGINE ENCYCLOPEDIA—$3.00

FOURTH EDITION—SEVERAL ORDINARY BOOKS IN ONE—

The SIMPLIFIED Book on REPAIRING, TROUBLES, ELECTRIC SYSTEMS, Etc.



Teacher, guide and reference on everything pertaining to motoring,—simple as the a, b, c's. —worth ten times its cost if only used as a reference. Nearly 1750 illustrations, 696 pages in all (large size 6x9). 49 instructions.

The instructions on electric starters, generators and lighting systems, not only deal with the **principle** and **construction** of all leading systems, but the methods for **testing,** such as testing for grounds, short circuits, testing the armature, fields, coils, etc., are thoroughly covered with simplified illustrations.

The Delco and all leading electric systems are thoroughly simplified.

The storage battery is explained in detail; how it is constructed, different connections; how to charge; how to **repair** storage batteries—burning connections, overhauling, etc.

The repair subject is an ordinary book in itself—hundreds of illustrations simplify the text so anyone can understand at a glance. **The repair subject is broad**—it not only covers repairs, adjustments of every part of the car and engine, but such subjects as **equipping a garage for home or business, overhauling cars from the ground up, increasing power of the engine, valve timing, ignition timing, adjusting and relining brakes, differentials, etc., etc.**—every detail is **simplified**—also how to start into the auto repair business.

The 6, 8 and 12 cylinder engine instruction is simplified.

Lack of space prevents a lengthy description of this book. Order the book and see for yourself.

FREE WITH ENCYCLOPEDIA OR AUTO INSTRUCTOR—a Supplement on the detail of construction, principle, operation and care of PACKARD TWIN SIX—KING EIGHT—FORD. Fully illustrated and part printed in two colors.

THEY ACTUALLY WORK BY HAND DYKE'S 4 & 6 CYLINDER ENGINE MODELS ALL MOVING PARTS REAL METAL

Size of 6 Cylinder Model, 11½x11 inches. 4 Cylinder Model, 9¼x11 inches.

At a glance you will learn—the name, purpose and principle of operation and relation of one part to another—firing orders, valve timing, etc.

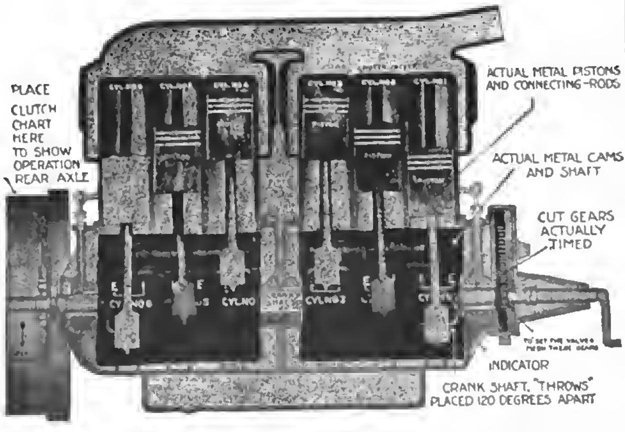
If you had a real engine before you—it would not give you the detail information you would obtain from the models—because you could not see the **inside** operation as you do with Dyke's Models. Each and every part is lettered and full instructions cover every detail.

For instance, when the starting crank is turned, the crank shaft gear turns the cam shaft gear which operates the cam shaft. The cam shaft with its eight or twelve cams are actually turned, and lift the valves at the proper time. As an example; the student can place piston in cylinder No. 1 on power stroke, then refer to chart alongside of engine and see just what all other valves, cams and pistons are doing.

In addition to learning all about the parts of an engine and their purpose; such subjects as valve timing, firing orders of 4, 6, 8 and 12 cylinder engines will be made perfectly clear. **The "eight" and "twin six" engine principles** can be easily understood with these models. The eight uses the same crank shaft as the four, and the twelve the same crank shaft as the six.

Another feature; with the four and six cylinder engine model, we send along charts of **different parts, such as the clutch, gear box, drive shaft, rear axle, the electric starting motor, electric generator, a modern ignition system, inlet and exhaust manifold, etc.** With these charts you can see just how they are applied to the regular engine.

Price of the 4-cylinder engine model (add 35c if to be prepaid)—**$2.50.** Price of 6 cylinder model (add 38c to be prepaid)—**$3.00.**



Crank Shaft, Piston and Connecting Rod side of the 6 Cylinder Engine Model. The opposite side is the valve side. The valves, cams, etc., actually operate and are accurately timed.

DYKE'S AUTO INSTRUCTOR

We combine, the 4 and 6 cylinder models and the Dyke's Auto Encyclopedia, and call this combination the Dyke Auto Instructor. **Price $8.50.** This outfit will enable anyone to become a real expert.

You can learn **quicker** with the book described above and the models, than you can by actual practice, because, with the instruction, you start at the beginning and advance step by step and learn just what you **ought** to know. The models provide the actual practice. You can see the actual **inside** operation, something impossible to see with the real engine. The outfit is worth ten times its cost in actual commercial value to anyone who is not thoroughly posted—and you are your own teacher—during spare time.

A. L. Dyke is the originator of this new idea method of teaching by mail with working models, charts, manikins, etc.

Mr. A. L. Dyke is a pioneer, he originated the first automobile supply business; published the first practical treatise on automobiles; (Dr. Dyke's Diseases of a Gasoline Automobile, 1900); manufactured and marketed the first float feed carburetor in America (1900). In addition he designed and built several early experimental automobiles—both gasoline and electric.

26 Extra Features

Mitchell MID-YEAR MODEL

$1325
F. o. b. Racine

John W. Bate's Surprise

To Motordom in general, this latest Mitchell came as a great surprise. And the place it has gained is amazing.

The efficiency which this car typifies has been a slow result. John W. Bate, the genius behind it, has done his work in quiet. And the facts you know now were never told until his work was done.

His 17th Model

The Mid-Year Mitchell is the 17th model built under Mr. Bate. It represents the result of 700 improvements.

The Mitchell factory is a John W. Bate creation. Its 2092 up-to-date machines are all of his design or selection. But this model plant, covering 45 acres, is a many-year development.

So what seems now a sudden result has been really a slow evolution.

The Right Basis

What we have aimed at is to get the right basis. We have aimed to build a high-grade car for less than anyone else could build it.

We now have the plant to do that. Here we build 98 per cent of the Mitchell under Bate efficiency methods. And no other plant in existence can build a similar car at our cost.

The result shows clearly in extra value. In a price below any other car of like size, grade and power. And in 26 costly extras which other cars omit.

$1325 **F. o. b. Racine**
For 5-Passenger Touring Car or 3-Passenger Roadster
7-Passenger Touring Body $35 Extra
High-speed economical Six. 48 horsepower; 127-inch wheelbase; complete equipment, including 26 extra features.

A Lifetime Car

But Mr. Bate's efficiency doesn't stop with that. He has stood for a lifetime car.

He insists on big margins of safety, on Chrome-Vanadium steel, and for oversize parts to meet strains.

The New Mitchell has hardly a casting. But 440 parts are either drop forged or stamped from toughened steel.

There are six Bate-built cars which have averaged 164,372 miles each, or over 30 years of ordinary service.

Extra Attractions

He has also stood for extra attractions. Before completing this Mid-Year Mitchell he had experts examine 257 Show models. Then he combined in this single car all the best of the new conceptions.

He has made the Mitchell the most complete car on exhibit. It has 26 features which rival cars lack.

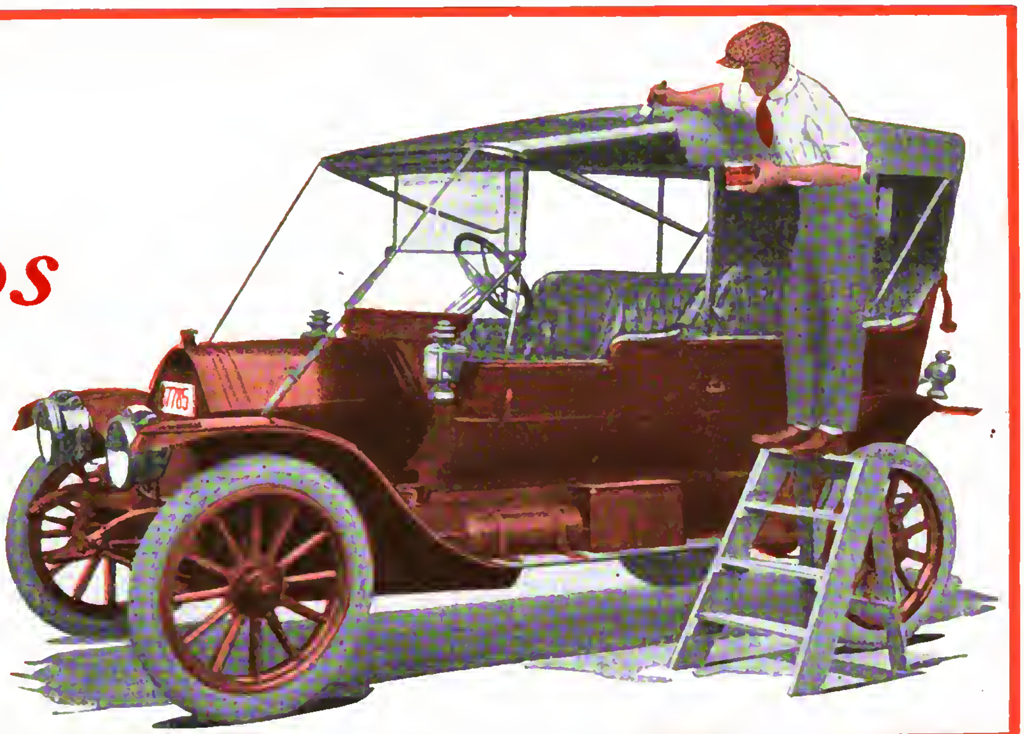
Now we are making these facts known to every motor car buyer. This season alone we spend $500,000 in national advertising.

The demand for the Mitchell has trebled in one year. And the facts behind it are just becoming known.

There are still many chances for dealers who deserve such an opportunity. And we want to hear from them.

MITCHELL-LEWIS MOTOR CO.
Racine, Wis., U. S. A.

"New Tops for Old"



THOUSANDS of automobile owners all over the country who are using Johnson's Prepared Wax and Johnson's Cleaner with such wonderful results will be glad to know about our new product—

JOHNSON'S BLACK-LAC

It is unequalled for touching up **leather cushions—side curtains—tire covers—auto trunks—pantasote** and **mohair tops** and **linings.**

One coat of Johnson's Black-Lac gives a rich, black surface—just like new. It is easy to apply—dries in fifteen minutes—does not rub off on the hands or clothing—is permanent—waterproof and inexpensive.

Do not hesitate to use Johnson's Black-Lac on the finest leather—it acts as a preservative and renders the leather soft and flexible.

For Worn Metal Parts

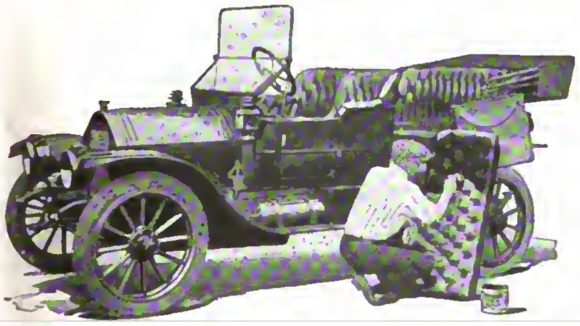
Johnson's Black-Lac is unequalled for blackening **fenders—rims—running boards—hoods—radiators--guards—lamps**—and in fact all worn metal parts. One coat covers. Prevents rust and keeps your car in a high state of repair.

It is no longer necessary to purchase three or four different products for dressing-up your car. Johnson's Black-Lac is six products in one:

1—It is a mohair top dressing.
2—It is a leather top dressing.
3—It is a lining dye.
4—It is a cushion dressing.
5—It is a metal enamel.
6—It is a rim paint.

Use **Johnson's Cleaner** and **Prepared Wax** to keep the body, hood and fenders shining like new Be sure to ask for

JOHNSON'S—"They make old cars New motor stars."



For Sale by Garages and Accessory Dealers

The Big Point in Any Car!

Cuts Gasoline Cost!

WHAT have you been doing toward reducing your gasoline expense? What are you *going* to do?

A lot of you car owners have calmly accepted the tremendous rise in gasoline cost, made a few complaints, then let it go at that.

You think gasoline expense cannot be reduced. But it CAN! It IS being reduced!

Since the rise in gasoline prices the sales of the New Stromberg Carburetor have taken phenomenal leaps. Because thousands of car owners realized that the New Stromberg is one absolutely *sure* way to reduce gasoline consumption.

They have watched it make new world's economy records during the past few years on all kinds of cars in all sorts of tests.

We will send you records to prove that the New Stromberg is positively the world's Economy King. Then figure out the amount of gasoline it will save you and you'll find it a mighty profitable investment for you. It is certainly worth your while investing a few dollars now to save many dollars.

There have been numerous investigations into the high price of gasoline, but no real *action*. The *only* consumers who got results were those who were wise enough to install the New Stromberg Carburetor.

Gasoline prices will not come down. So why wait longer for some one to help you? Help yourself! You are wasting real money every day you delay equipping your car with the New Stromberg Carburetor.

Send name, model and year of your car now and we'll *prove* how the New Stromberg will save you money, increase your speed, your power and get-away.

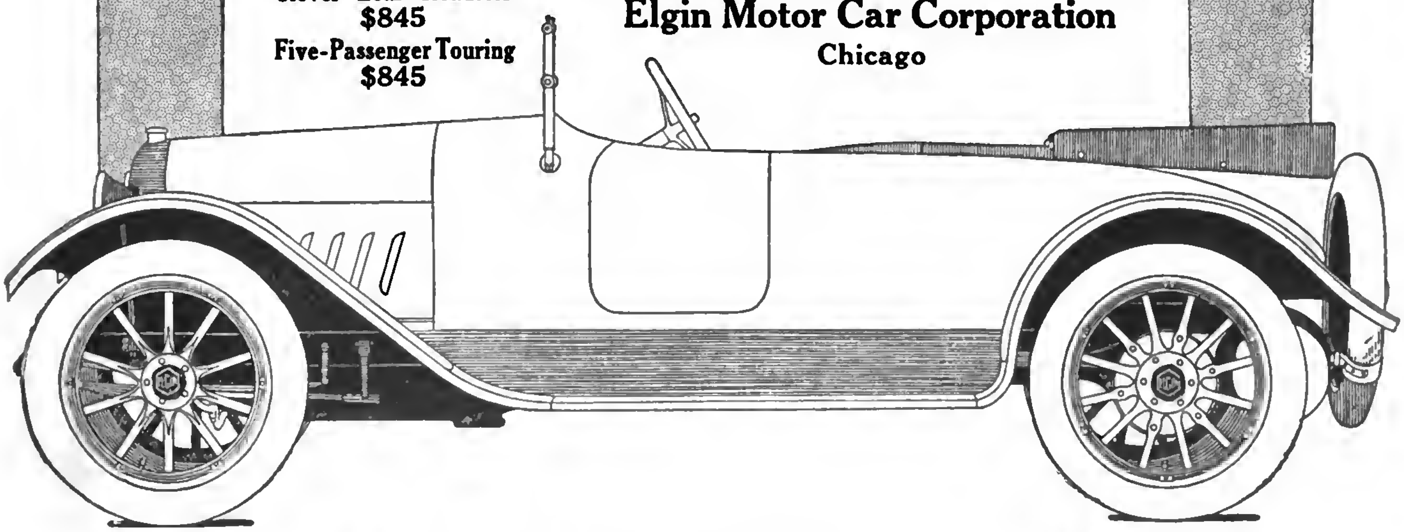
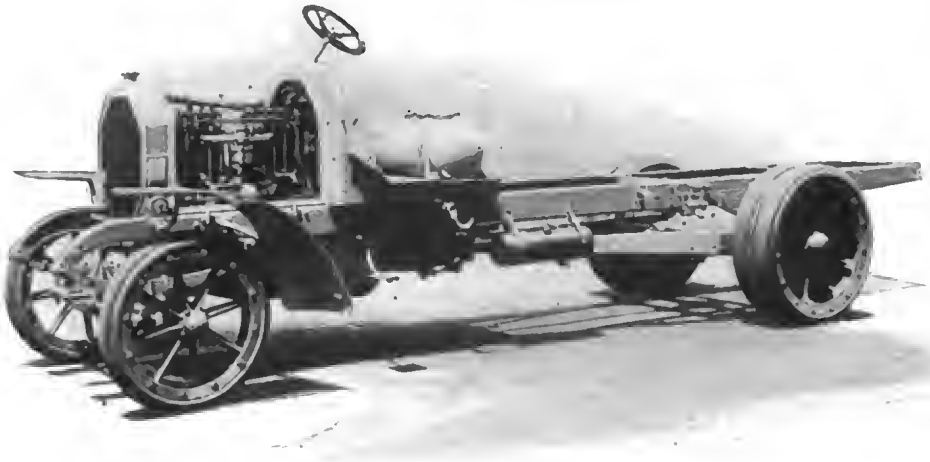
Elgin Motor Car Corporation
Chicago



HERE IS THE
"JASCO TANK" MOUNTED



"JASCO TANK"
IS USED ON
General Vehicle Trucks

The "Jasco" Tank is used and indorsed by the following prominent manufacturers:

PLEASURE CARS

Biddle Motor Car Company, Simplex Automobile Company, Mercer Automobile Company, Lozier Motor Company, Stanley Motor Carriage Company, James Cunningham Son & Company, Murray Motor Car Co.

TRUCKS

Baldwin Locomotive Works, Autocar Company, General Vehicle Company, H. G. Burford Company, Peerless Motor Car Company, Garford Motor Truck Co., Gramm Motor Truck Co.

MOTOR BOATS AND NAVAL ARCHITECTS

William H. Hand, Jr., Mathis Yacht Building Company, Gas Engine & Power Company.

The makers of this truck—whose name has been synonymous with Automobile quality for many years—equip their product with the "Jasco" Tank because:—

They have thoroughly investigated and tested it, and they *know* positively that it will consistently "stand up" in service; never springing a leak under the most severe conditions; they believe it is the tank most worthy of being presented to General Vehicle customers on the product of that company.

Have *you* looked into the important question of fuel receptacles? Do you recognize the value of a tank that protects every drop of your gasoline, saving it from leakage, fire or explosion? The "Jasco" Tank is seamless, tinned and tested; it is made of the finest quality drawn steel and it positively cannot leak.

Look carefully at that car you intend purchasing—if you find a "Jasco" Tank as part of the standard equipment you'll know beyond question that the manufacturer is building his product on a consistent quality basis.

JANNEY, STEINMETZ & CO.

Main Office: PHILADELPHIA

New York Office: Hudson Terminal Building

WITH THE POSSIBLE EXCEPTION OF ONE OR TWO POPULAR CAR AGENCIES THE "CARSPRING" EXCLUSIVE DISTRIBUTOR PROPOSITION OFFERS YOU GREATER PROFITS THAN ANY AUTOMOBILE OR ACCESSORY IN ALL MOTORDOM.

A strong statement in view of the fact that over one hundred tire manufacturers are burning the midnight oil to perfect their sales organizations.

Maybe it is presumptuous on our part to match our conservative production (500 Carsprings every twenty-four hours) against the big two and three thousand per day manufacturers, but it is just this difference that places the Carspring Distributor miles in front of the usual tire dealer.

> Carspring Dealer profits are just as positive as the market for new tires, and the Carspring demand is continually increasing in proportion to our production at the rate of 100% every month.

We did not create a new sales plan to merchandise "CARSPRINGS." On the contrary, we continued our fifty-year-old policy of allotting exclusive territory to one good distributor and protecting each distributor to the extent of guaranteeing a liberal profit on every sale from his territory.

Far beyond the immediate "profit point" we enter into a permanent arrangement that will continue uninterruptedly for many years. You can appoint your own sub-agents and you can deal with your customers on a factory branch adjustment basis that offers you sufficient latitude to maintain a healthy, profitable and pleasant business.

Under this sales plan a comparatively limited number of Distributors handle our entire production, and in direct co-operation with our Distributors we confine our publicity to each individual territory.

IN A FEW WORDS

——the best tire that fifty years' rubber experience and unlimited capital can produce.

——a liberal working agreement and a permanent territorial arrangement protecting your profits for years to come.

——concentration of selling co-operation and publicity in Distributor's Territory.

——absolute and unbounded belief in our distributors and authority to appoint sub-dealers and control their business.

We repeat—Carspring Distributors have an unmatchable profit opportunity. One good Distributor in each territory—will you qualify?

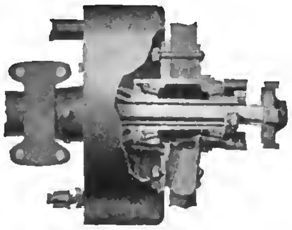
TRADE MARK
Note the Notes



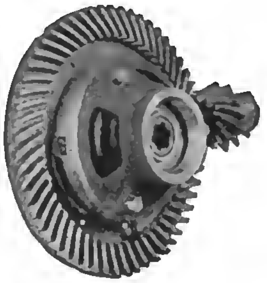
Removable Axle Shafts drive the wheels. One-piece nickel steel Axle Tubes support *entire* weight of car. Hub is of *steel;* Driving Clutch is quickly removable and of *nickel steel.*

Five Features

of Superiority found only in The Full-Floating

American Axle

Equipped with Spiral Bevel Gears and Bock Taper Roller Bearings



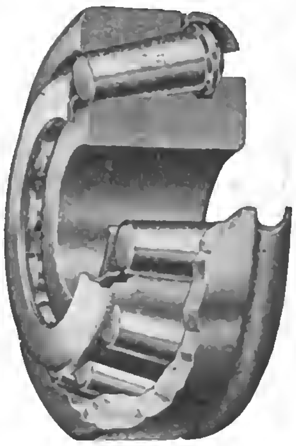
The Spider carrying small differential pinions is free to float—equalizing all strains in the differential.

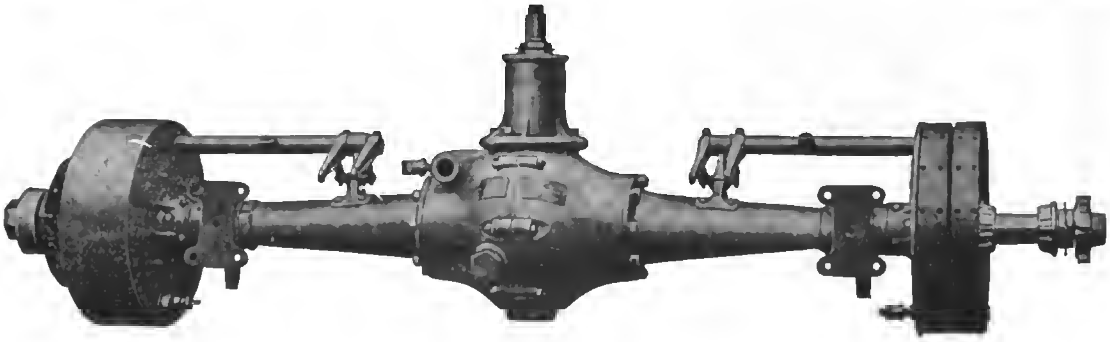
Note the Ball-Shaped Head

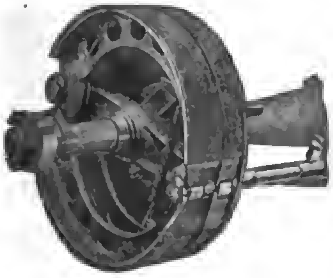
The design of this roller differs from all others in that it has a ball-shaped head which takes the end thrust like a ball thrust bearing, and without the slippage and friction so destructive to other taper roller bearing assemblies.

This design also relieves the tapered roll of having to withstand the jamming caused by end thrust.

Furthermore, the rolls, cones and races of the Bock Bearing are made—*not of ordinary carbon steel*—but of the finest alloy steels obtainable, giving tremendous strength and wear-resisting qualities.







The Twin Internal Brakes do not grab, but exert a brake action always in direct ratio to effort exerted by driver.

MOON
REG. U.S. PAT. OFF.
MOON MOTOR CAR CO.
ST. LOUIS, MO. U.S.A.

The New 1917 Models

Last spring we adopted the double-cowled body on the Moon Six-44. So quickly did it find favor with both dealers and owners, that we have selected this design for the new 1917 models—the Six-66 and the Six-43. In addition to this feature, the 1917 body design (Delauney-Belleville type) exhibits still further refinement. Speed and power are expressed by its long, straight lines—and this impression is heightened by the smart, slanting windshield.

(We venture a prediction: So well has this design been received by the public that we believe by the end of 1917 every car of any moment will have followed our lead in the adoption of this double-cowled body.)

Moon 1917 models will challenge attention and admiration in any company and under any conditions.

But we have not stopped with the improvement of the body design. You will see in this further list of the principal 1917 features many other reasons for Moon desirableness.

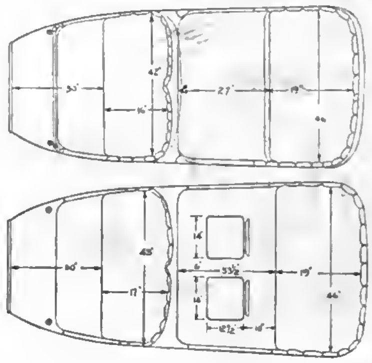
Six-43

Actual Brake Horsepower

AND

Six-66

Actual Brake Horsepower



MOTOR—New Continental-Moon high-speed efficiency type, developing, in the Six-66, full 66 horsepower (actual brake test). The Six-43 develops 43 horsepower (actual brake test). In each case tremendous power in proportion to its weight.

STARTING, ETC.—New two-unit Delco-Moon starting, lighting and ignition system. Bendix automatic drive in connection with starting motor.

UPHOLSTERY—Genuine tan Spanish leather, adding both to the beauty and the comfort of the car.

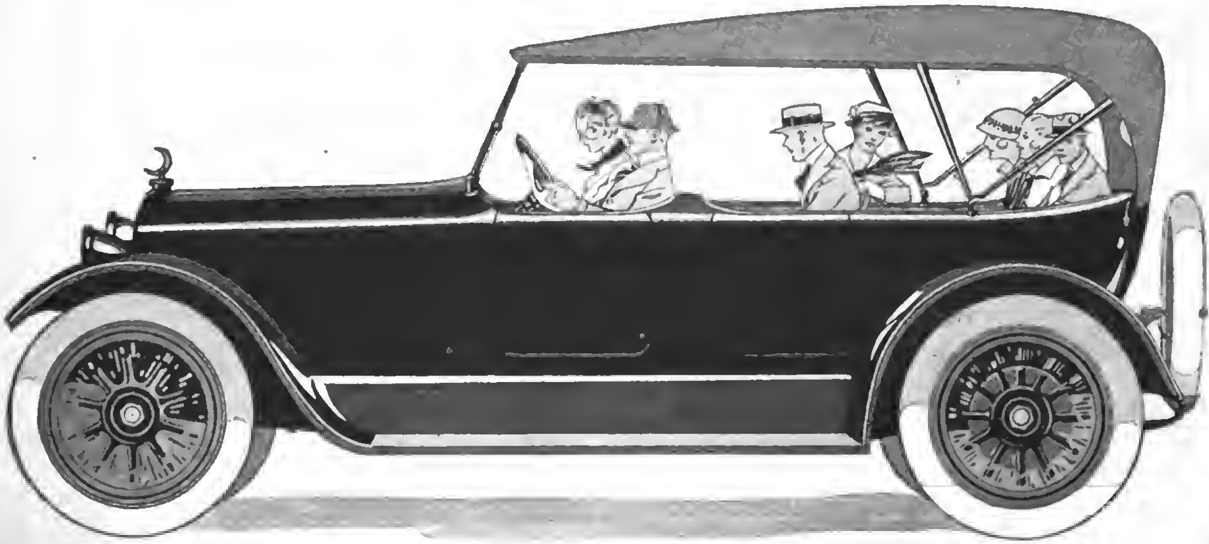
BODY—Delauney-Belleville type, with double cowl and slanting windshield. Big and roomy (Moon cars have always been noted for their roominess in both front and rear compartments). The seats are especially designed to *fit and rest the body.* The Six-43 body is not quite so long as the Six-66, as space is not needed for the extra seats.

REAR AXLE—Of course the spiral gear *noiseless* rear axle.

WHEELBASE—On the Six-66, 125 inches; and on the Six-43, 118 inches. It will be readily seen from this that these are *big sixes*—as big or bigger than many other sixes selling $500 to $600 more.

PRICE—Six-66, seven passenger, fully equipped, $1575; Six-43, five passenger, fully equipped, $1250.

MOON MOTOR CAR COMPANY, St. Louis, Mo.



"The World's Best Carburetor"

In a contest recently appearing in "*Horseless Age*," asking for the name of the World's Best Carburetor, 430 replies were received.

Of this number 300 contestants selected for this honor

RAYFIELD CARBURETORS

Owners who equip their cars with Rayfields solve the problem of high fuel cost; for a saving of 10 to 50 per cent is guaranteed in every instance; a *fact* with which dealers are familiar—a *reason* why dealers substitute Rayfields on demonstrators originally equipped with other carburetors.

A dealer in Tacoma states that the Rayfield installed on his four-cylinder demonstrator increased his mileage from 12 to 20, and on his six-cylinder the increase was from 10 to 18 miles per gallon. The dealer also states that the Rayfield added wonderful flexibility and power. A private owner says: "twice as much mileage out of my gasoline, and no carbon trouble."

Car owners will enjoy reading our book, "A Spoonful of Sugar." Ask us for a copy.

BOSCH

MAGNETOS ARE MADE TO FULFILL A SERVICE—NOT TO MEET A PRICE

THAT in a nutshell is the reason for the wonderful success of Bosch Magnetos, the reason why more than Two Million Bosch Magnetos are in use today, the reason you should insist that a Bosch Magneto be on the motor car you sell, if an agent, or buy, if an owner.

Not "How Reasonable" nor "How Cheap," but "How Good" is the watchword at the Bosch Works. It is your guarantee that your Bosch Magneto will serve faithfully and efficiently without asking for a minute of your time for adjustments or replacements or for battery attention.

Look at any Bosch Magneto, inside and out, compare its material and workmanship with any other ignition device you may have considered—the decision as to Bosch Superiority is left with you.

BE SATISFIED The motor car you buy or sell can be Bosch-Equipt—insist. SPECIFY BOSCH

Service stations in every state. Correspondence invited.

BOSCH MAGNETO COMPANY

220 WEST 46th STREET NEW YORK CITY

KisselKar

Hundred Point Six

$1095

The Stampede to the *Hundred Point Six*

A RUSH of buyers followed the announcement of Kissel's Ultimatum to the automobile world. They instantly recognized that here was a new standard of value by which all other cars will be judged.

Car buyers everywhere were forcibly impressed with the Hundred Quality Features in Kissel's great *Hundred Point Six*.

Have your KisselKar dealer explain the Hundred Quality Features—compare them—and order early for immediate delivery.

The ALL-YEAR Car

Kissel originated the "two-in-one" idea—the one perfected removable top by which others acknowledge leadership by imitation. The new ALL-YEAR models for the *Hundred Point Six* chassis are way ahead of anything attempted before, showing what the originator can do to maintain his leadership. Don't fail to see them.

DEALERS—Car buyers in unoccupied territory want Kissel's Hundred Point Six and ALL-YEAR Cars. It means ALL-YEAR motoring for KisselKar owners and ALL-YEAR business for KisselKar dealers. Write us today.

KISSEL MOTOR CAR CO., Hartford, Wisconsin, U.S.A.

This Regal Has the Most Rugged Chassis Ever Built for a Light Car

REGAL MOTOR CAR CO.
REGAL
DETROIT

$695

¶ 32 h.p. High Speed Motor, Bore 3½", Stroke 4¾". Has detachable head and three bearing Crank-Shaft. 4 point suspension. Motors built in our own Shops.

¶ Two unit Starting and Ignition System. Magneto type. Starter motor engages fly wheel through Bendix Drive.

¶ Extra deep frame with wide side members furnish great strength and maximum support to chassis. Cantilever Springs, shackled at both ends, directly under frame, make Regal one of the easiest riding cars on the market. Brakes equalized—external contracting and internal expanding.

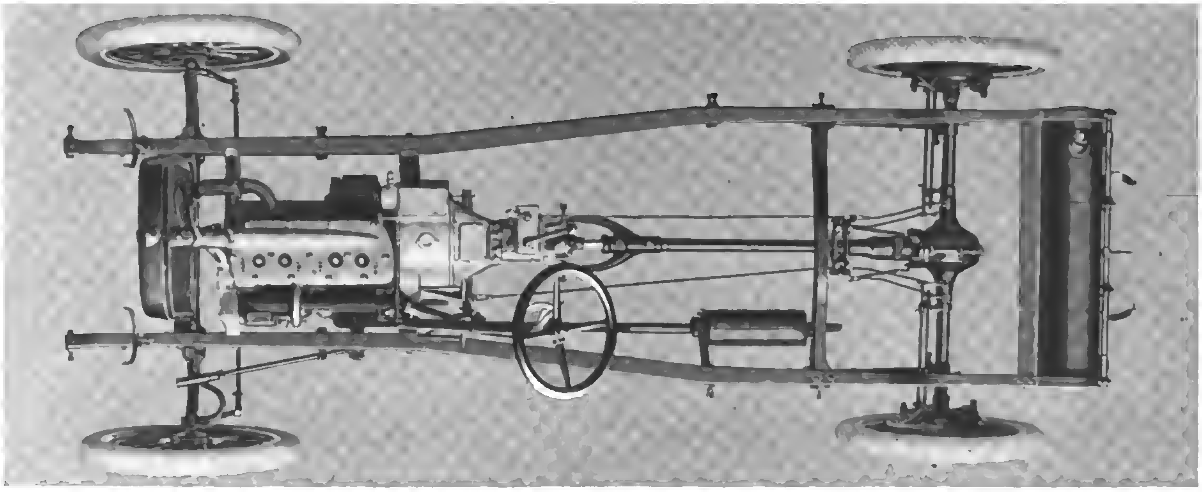
¶ Full floating rear axle. This allows the weight of the car to rest entirely on the axle housing. Front axle, I-Beam, drop forging.

¶ Gasoline tank at rear. 14 gallons. Vacuum feed to Motor.

¶ Add these features to the cruiser type of body design of the Regal 4 Thirty-two, and you have a motor vehicle that will make instant appeal to your prospects.

¶ Complete information as to dealer possibilities and illustrated catalogue on request.

REGAL MOTOR CAR CO. (Dept. C) DETROIT, MICH.



To supply a definite need —with definite finality

Where the family purse cannot afford a big, expensive car—

Where the family pride cannot afford an unsightly, little, uncomfortable car—

There the $615 Overland supplies a definite need with definite finality.

Here is the small, comfortable car—a beauty—complete to the last detail—inexpensive—economical—another and greater Overland success.

And its price—$615—is far below any former price for any completely equipped automobile—regardless of appearance or comfort considerations.

As you look the car over and read its specifications, you realize its absolute completeness.

But you must ride in it to appreciate its comfort.

You must drive it to get the thrill its performance will give you.

You can own one of these cars.

But act promptly—for naturally no car was ever in such demand.

No other car at anywhere near its price can compare with this one for beauty, performance, comfort, completeness and economy.

Get in touch with the Overland dealer today—now.
